This procedure, since it takes sides in a conflict of instinctive beliefs, stands in need of justification by proving the greater trustworthiness of the beliefs on one side than of those on the other. Bergson attempts this justification in two ways, first by explaining that intellect is a purely practical faculty to secure biological success, secondly by mentioning remarkable feats of instinct in animals and by pointing out characteristics of the world which, though intuition can apprehend them, are baffling to intellect as he interprets it.

Of Bergson's theory that intellect is a purely practical faculty, developed in the struggle for survival, and not a source of true beliefs, we may say, first, that it is only through intellect that we know of the struggle for survival and of the biological ancestry of man: if the intellect is misleading, the whole of this merely inferred history is presumably untrue. If, on the other hand, we agree with him in thinking that evolution took place as Darwin believed, then it is not only intellect, but all our faculties, that have been developed under the stress of practical utility. Intuition is seen at its best where it is directly useful, for example in regard to other people's characters and dispositions. Bergson apparently holds that capacity for this kind of knowledge is less explicable by the struggle for existence than, for example, capacity for pure mathematics. Yet the savage deceived by false friendship is likely to pay for his mistake with his life; whereas even in the most civilised societies men are not put to death for mathematical incompetence. All the most striking of his instances of intuition in animals have a very direct survival value. The fact is, of course, that both intuition and intellect have been developed because they are useful, and that, speaking broadly, they are useful when they give truth and become harmful when they give falsehood. Intellect, in civilised man, like artistic capacity, has occasionally been developed beyond the point where it is useful to the individual; intuition, on the other hand, seems on the whole to diminish as civilisation increases. It is greater, as a rule, in children than in adults, in the uneducated than in the educated. Probably in dogs it exceeds anything to be found in human beings. But those who see in these facts a recommendation of intuition ought to return to running wild in the woods, dyeing themselves with woad and living on hips and haws.

Let us next examine whether intuition possesses any such infallibility as Bergson claims for it. The best instance of it, according to him, is our acquaintance with ourselves; yet self-knowledge is proverbially rare and difficult. Most men, for example, have in their nature meannesses, vanities, and envies of which they are quite unconscious, though even their best friends can perceive them without any difficulty. It is true that intuition has a convincingness which is lacking to intellect: while it is present, it is almost impossible to doubt its truth. But if it should appear, on examination, to be at least as fallible as intellect, its greater subjective certainty becomes a demerit, making it only the more irresistibly deceptive. Apart from self-knowledge, one of the most notable examples of intuition is the knowledge people believe themselves to possess of those with whom they are in love: the wall between different personalities seems to become transparent, and people think they see into another soul as into their own. Yet deception in such cases is constantly practised with success; and even where there is no intentional deception, experience gradually proves, as a rule, that the supposed insight was illusory, and that the slower more groping methods of the intellect are in the long run more reliable.

Bergson maintains that intellect can only deal with things in so far as they resemble what has been experienced in the past, while intuition has the power of apprehending the uniqueness and novelty that always belong to each fresh moment. That there is something unique and new at every moment, is certainly true; it is also true that this cannot be fully expressed by means of intellectual concepts. Only direct acquaintance can give knowledge of what is unique and new. But direct acquaintance of this kind is given fully in sensation, and does not require, so far as I can see, any special faculty of intuition for its apprehension. It is neither intellect nor intuition, but sensation, that supplies new data; but when the data are new in any remarkable manner, intellect is much more capable of dealing with them than intuition would be. The hen with a brood of ducklings no doubt has intuition which seems to place her inside them, and not merely to know them analytically; but when the ducklings take to the water, the whole apparent intuition is seen to be illusory, and the hen is left helpless on the shore. Intuition, in fact, is an aspect and development of instinct, and, like all instinct, is admirable in those customary surroundings which have moulded the habits of the animal in question, but totally incompetent as soon as the surroundings are changed in a way which demands some non-habitual mode of action.

The theoretical understanding of the world, which is the aim of philosophy, is not a matter of great practical importance to animals, or to savages, or even to most civilised men. It is hardly to be supposed, therefore, that the rapid, rough and ready methods of instinct or intuition will find in this field a favourable ground for their application. It is the older kinds of activity, which bring out our kinship with remote generations of animal and semi-human ancestors, that show intuition at its best. In such matters as self-preservation and love, intuition will act sometimes (though not always) with a swiftness and precision which are astonishing to the critical intellect. But philosophy is not one of the pursuits which illustrate our affinity with the past: it is a highly refined, highly

civilised pursuit, demanding, for its success, a certain liberation from the life of instinct, and even, at times, a certain aloofness from all mundane hopes and fears. It is not in philosophy, therefore, that we can hope to see intuition at its best. On the contrary, since the true objects of philosophy, and the habit of thought demanded for their apprehension, are strange, unusual, and remote, it is here, more almost than anywhere else, that intellect proves superior to intuition, and that quick unanalysed convictions are least deserving of uncritical acceptance.

In advocating the scientific restraint and balance, as against the self-assertion of a confident reliance upon intuition, we are only urging, in the sphere of knowledge, that largeness of contemplation, that impersonal disinterestedness, and that freedom from practical preoccupations which have been inculcated by all the great religions of the world. Thus our conclusion, however it may conflict with the explicit beliefs of many mystics, is, in essence, not contrary to the spirit which inspires those beliefs, but rather the outcome of this very spirit as applied in the realm of thought.

II. UNITY AND PLURALITY

One of the most convincing aspects of the mystic illumination is the apparent revelation of the oneness of all things, giving rise to pantheism in religion and to monism in philosophy. An elaborate logic, beginning with Parmenides, and culminating in Hegel and his followers, has been gradually developed, to prove that the universe is one indivisible Whole, and that what seem to be its parts, if considered as substantial and self-existing, are mere illusion. The conception of a Reality quite other than the world of appearance, a reality one, indivisible, and unchanging, was introduced into Western philosophy by Parmenides, not, nominally at least, for mystical or religious reasons, but on the basis of a logical argument as to the impossibility of not-being, and most subsequent metaphysical systems are the outcome of this fundamental idea.

The logic used in defence of mysticism seems to be faulty as logic, and open to technical criticisms, which I have explained elsewhere. I shall not here repeat these criticisms, since they are lengthy and difficult, but shall instead attempt an analysis of the state of mind from which mystical logic has arisen.

Belief in a reality quite different from what appears to the senses arises with irresistible force in certain moods, which are the source of most mysticism, and of most metaphysics. While such a mood is dominant, the need of logic is not felt, and accordingly the more thoroughgoing mystics do not employ logic, but appeal directly to the immediate deliverance of their insight. But such fully developed mysticism is rare in the West. When the intensity of emotional conviction subsides, a man who is in the habit of reasoning will search for logical grounds in favour of the belief which he finds in himself. But since the belief already exists, he will be very hospitable to any ground that suggests itself. The paradoxes apparently proved by his logic are really the paradoxes of mysticism, and are the goal which he feels his logic must reach if it is to be in accordance with insight. The resulting logic has rendered most philosophers incapable of giving any account of the world of science and daily life. If they had been anxious to give such an account, they would probably have discovered the errors of their logic; but most of them were less anxious to understand the world of science and daily life than to convict it of unreality in the interests of a super-sensible "real" world.

It is in this way that logic has been pursued by those of the great philosophers who were mystics. But since they usually took for granted the supposed insight of the mystic emotion, their logical doctrines were presented with a certain dryness, and were believed by their disciples to be quite independent of the sudden illumination from which they sprang. Nevertheless their origin clung to them, and they remained--to borrow a useful word from Mr. Santayana--"malicious" in regard to the world of science and common sense. It is only so that we can account for the complacency with which philosophers have accepted the inconsistency of their doctrines with all the common and scientific facts which seem best established and most worthy of belief.

The logic of mysticism shows, as is natural, the defects which are inherent in anything malicious. The impulse to logic, not felt while the mystic mood is dominant, reasserts itself as the mood fades, but with a desire to retain the vanishing insight, or at least to prove that it _was_ insight, and that what seems to contradict it is illusion. The logic which thus arises is not quite disinterested or candid, and is inspired by a certain hatred of the daily world to which it is to be applied. Such an attitude naturally does not tend to the best results. Everyone knows that to read an author simply in order to refute him is not the way to understand him; and to read the book of Nature with a conviction that it is all illusion is just as unlikely to lead to understanding. If our logic is to find the common world intelligible, it must not be hostile, but must be inspired by a genuine acceptance such as is not usually to be found among metaphysicians.

III. TIME

The unreality of time is a cardinal doctrine of many metaphysical systems, often nominally based, as already by Parmenides, upon logical arguments, but originally derived, at any rate in the founders of new systems, from the certainty which is born in the moment of mystic insight. As a Persian Sufi poet says:

"Past and future are what veil God from our sight. Burn up both of them with fire! How long Wilt thou be partitioned by these segments as a reed?"[5]

The belief that what is ultimately real must be immutable is a very common one: it gave rise to the metaphysical notion of substance, and finds, even now, a wholly illegitimate satisfaction in such scientific doctrines as the conservation of energy and mass.

It is difficult to disentangle the truth and the error in this view. The arguments for the contention that time is unreal and that the world of sense is illusory must, I think, be regarded as fallacious. Nevertheless there is some sense--easier to feel than to state--in which time is an unimportant and superficial characteristic of reality. Past and future must be acknowledged to be as real as the present, and a certain emancipation from slavery to time is essential to philosophic thought. The importance of time is rather practical than theoretical, rather in relation to our desires than in relation to truth. A truer image of the world, I think, is obtained by picturing things as entering into the stream of time from an eternal world outside, than from a view which regards time as the devouring tyrant of all that is. Both in thought and in feeling, even though time be real, to realise the unimportance of time is the gate of wisdom.

That this is the case may be seen at once by asking ourselves why our feelings towards the past are so different from our feelings towards the future. The reason for this difference is wholly practical: our wishes can affect the future but not the past, the future is to some extent subject to our power, while the past is unalterably fixed. But every future will some day be past: if we see the past truly now, it must, when it was still future, have been just what we now see it to be, and what is now future must be just what we shall see it to be when it has become past. The felt difference of quality between past and future, therefore, is not an intrinsic difference, but only a difference in relation to us: to impartial contemplation, it ceases to exist. And impartiality of contemplation is, in the intellectual sphere, that very same virtue of disinterestedness which, in the sphere of action, appears as justice and unselfishness. Whoever wishes to see the world truly, to rise in thought above the tyranny of practical desires, must learn to overcome the difference of attitude towards past and future, and to survey the whole stream of time in one comprehensive vision.

The kind of way in which, as it seems to me, time ought not to enter into our theoretic philosophical thought, may be illustrated by the philosophy which has become associated with the idea of evolution, and which is exemplified by Nietzsche, pragmatism, and Bergson. This philosophy, on the basis of the development which has led from the lowest forms of life up to man, sees in _progress_ the fundamental law of the universe, and thus admits the difference between _earlier_ and _later_ into the very citadel of its contemplative outlook. With its past and future history of the world, conjectural as it is, I do not wish to quarrel. But I think that, in the intoxication of a quick success, much that is required for a true understanding of the universe has been forgotten. Something of Hellenism, something, too, of Oriental resignation, must be combined with its hurrying Western self-assertion before it can emerge from the ardour of youth into the mature wisdom of manhood. In spite of its appeals to science, the true scientific philosophy, I think, is something more arduous and more aloof, appealing to less mundane hopes, and requiring a severer discipline for its successful practice.

Darwin's _Origin of Species_ persuaded the world that the difference between different species of animals and plants is not the fixed immutable difference that it appears to be. The doctrine of natural kinds, which had rendered classification easy and definite, which was enshrined in the Aristotelian tradition, and protected by its supposed necessity for orthodox dogma, was suddenly swept away for ever out of the biological world. The difference between man and the lower animals, which to our human conceit appears enormous, was shown to be a gradual achievement, involving intermediate being who could not with certainty be placed either within or without the human family. The sun and the planets had already been shown by Laplace to be very probably derived from a primitive more or less undifferentiated nebula. Thus the old fixed landmarks became wavering and indistinct, and all sharp outlines were blurred. Things and species lost their boundaries, and none could say where they began or where they ended.

But if human conceit was staggered for a moment by its kinship with the ape, it soon found a way to reassert itself, and that way is the "philosophy" of evolution. A process which led from the amoeba to Man appeared to the philosophers to be obviously a progress--though whether the amoeba would agree with this opinion is not known. Hence the cycle of changes which science had shown to be the probable history of the past was welcomed as revealing a law of development towards good in the universe--an

evolution or unfolding of an idea slowly embodying itself in the actual. But such a view, though it might satisfy Spencer and those whom we may call Hegelian evolutionists, could not be accepted as adequate by the more whole-hearted votaries of change. An ideal to which the world continuously approaches is, to these minds, too dead and static to be inspiring. Not only the aspiration, but the ideal too, must change and develop with the course of evolution: there must be no fixed goal, but a continual fashioning of fresh needs by the impulse which is life and which alone gives unity to the process.

Life, in this philosophy, is a continuous stream, in which all divisions are artificial and unreal. Separate things, beginnings and endings, are mere convenient fictions: there is only smooth unbroken transition. The beliefs of to-day may count as true to-day, if they carry us along the stream; but to-morrow they will be false, and must be replaced by new beliefs to meet the new situation. All our thinking consists of convenient fictions, imaginary congealings of the stream: reality flows on in spite of all our fictions, and though it can be lived, it cannot be conceived in thought. Somehow, without explicit statement, the assurance is slipped in that the future, though we cannot foresee it, will be better than the past or the present: the reader is like the child which expects a sweet because it has been told to open its mouth and shut its eyes. Logic, mathematics, physics disappear in this philosophy, because they are too "static"; what is real is no impulse and movement towards a goal which, like the rainbow, recedes as we advance, and makes every place different when it reaches it from what it appeared to be at a distance.

I do not propose to enter upon a technical examination of this philosophy. I wish only to maintain that the motives and interests which inspire it are so exclusively practical, and the problems with which it deals are so special, that it can hardly be regarded as touching any of the questions that, to my mind, constitute genuine philosophy.

The predominant interest of evolutionism is in the question of human destiny, or at least of the destiny of Life. It is more interested in morality and happiness than in knowledge for its own sake. It must be admitted that the same may be said of many other philosophies, and that a desire for the kind of knowledge which philosophy can give is very rare. But if philosophy is to attain truth, it is necessary first and foremost that philosophers should acquire the disinterested intellectual curiosity which characterises the genuine man of science. Knowledge concerning the future--which is the kind of knowledge that must be sought if we are to know about human destiny--is possible within certain narrow limits. It is impossible to say how much the limits may be enlarged with the progress of science. But what is evident is that any proposition about the future belongs by its subject-matter to some particular science, and is to be ascertained, if at all, by the methods of that science. Philosophy is not a short cut to the same kind of results as those of the other sciences: if it is to be a genuine study, it must have a province of its own, and aim at results which the other sciences can neither prove nor disprove.

Evolutionism, in basing itself upon the notion of _progress_, which is change from the worse to the better, allows the notion of time, as it seems to me, to become its tyrant rather than its servant, and thereby loses that impartiality of contemplation which is the source of all that is best in philosophic thought and feeling. Metaphysicians, as we saw, have frequently denied altogether the reality of time. I do not wish to do this; I wish only to preserve the mental outlook which inspired the denial, the attitude which, in thought, regards the past as having the same reality as the present and the same importance as the future. "In so far," says Spinoza,[6] "as the mind conceives a thing according to the dictate of reason, it will be equally affected whether the idea is that of a future, past, or present thing." It is this "conceiving according to the dictate of reason" that I find lacking in the philosophy which is based on evolution.

IV. GOOD AND EVIL

Mysticism maintains that all evil is illusory, and sometimes maintains the same view as regards good, but more often holds that all Reality is good. Both views are to be found in Heraclitus: "Good and ill are one," he says, but again, "To God all things are fair and good and right, but men hold some things wrong and some right." A similar twofold position is to be found in Spinoza, but he uses the word "perfection" when he means to speak of the good that is not merely human. "By reality and perfection I mean the same thing," he says;[7] but elsewhere we find the definition: "By _good_ I shall mean that which we certainly know to be useful to us."[8] Thus perfection belongs to Reality in its own nature, but goodness is relative to ourselves and our needs, and disappears in an impartial survey. Some such distinction, I think, is necessary in order to understand the ethical outlook of mysticism: there is a lower mundane kind of good and evil, which divides the world of appearance into what seem to be conflicting parts; but there is also a higher, mystical kind of good, which belongs to Reality and is not opposed by any correlative kind of evil.

It is difficult to give a logically tenable account of this position without recognising that good and evil are subjective, that what is good is merely that towards which we have one kind of feeling, and what is evil is merely that towards which we have another kind

of feeling. In our active life, where we have to exercise choice, and to prefer this to that of two possible acts, it is necessary to have a distinction of good and evil, or at least of better and worse. But this distinction, like everything pertaining to action, belongs to what mysticism regards as the world of illusion, if only because it is essentially concerned with time. In our contemplative life, where action is not called for, it is possible to be impartial, and to overcome the ethical dualism which action requires. So long as we remain _merely_ impartial, we may be content to say that both the good and the evil of action are illusions. But if, as we must do if we have the mystic vision, we find the whole world worthy of love and worship, if we see

"The earth, and every common sight.... Apparell'd in celestial light,"

we shall say that there is a higher good than that of action, and that this higher good belongs to the whole world as it is in reality. In this way the twofold attitude and the apparent vacillation of mysticism are explained and justified.

The possibility of this universal love and joy in all that exists is of supreme importance for the conduct and happiness of life, and gives inestimable value to the mystic emotion, apart from any creeds which may be built upon it. But if we are not to be led into false beliefs, it is necessary to realise exactly _what_ the mystic emotion reveals. It reveals a possibility of human nature--a possibility of a nobler, happier, freer life than any that can be otherwise achieved. But it does not reveal anything about the non-human, or about the nature of the universe in general. Good and bad, and even the higher good that mysticism finds everywhere, are the reflections of our own emotions on other things, not part of the substance of things as they are in themselves. And therefore an impartial contemplation, freed from all pre-occupation with Self, will not judge things good or bad, although it is very easily combined with that feeling of universal love which leads the mystic to say that the whole world is good.

The philosophy of evolution, through the notion of progress, is bound up with the ethical dualism of the worse and the better, and is thus shut out, not only from the kind of survey which discards good and evil altogether from its view, but also from the mystical belief in the goodness of everything. In this way the distinction of good and evil, like time, becomes a tyrant in this philosophy, and introduces into thought the restless selectiveness of action. Good and evil, like time, are, it would seem, not general or fundamental in the world of thought, but late and highly specialised members of the intellectual hierarchy.

Although, as we saw, mysticism can be interpreted so as to agree with the view that good and evil are not intellectually fundamental, it must be admitted that here we are no longer in verbal agreement with most of the great philosophers and religious teachers of the past. I believe, however, that the elimination of ethical considerations from philosophy is both scientifically necessary and--though this may seem a paradox--an ethical advance. Both these contentions must be briefly defended.

The hope of satisfaction to our more human desires--the hope of demonstrating that the world has this or that desirable ethical characteristic--is not one which, so far as I can see, a scientific philosophy can do anything whatever to satisfy. The difference between a good world and a bad one is a difference in the particular characteristics of the particular things that exist in these worlds: it is not a sufficiently abstract difference to come within the province of philosophy. Love and hate, for example, are ethical opposites, but to philosophy they are closely analogous attitudes towards objects. The general form and structure of those attitudes towards objects which constitute mental phenomena is a problem for philosophy, but the difference between love and hate is not a difference of form or structure, and therefore belongs rather to the special science of psychology than to philosophy. Thus the ethical interests which have often inspired philosophers must remain in the background: some kind of ethical interest may inspire the whole study, but none must obtrude in the detail or be expected in the special results which are sought.

If this view seems at first sight disappointing, we may remind ourselves that a similar change has been found necessary in all the other sciences. The physicist or chemist is not now required to prove the ethical importance of his ions or atoms; the biologist is not expected to prove the utility of the plants or animals which he dissects. In pre-scientific ages this was not the case. Astronomy, for example, was studied because men believed in astrology: it was thought that the movements of the planets had the most direct and important bearing upon the lives of human beings. Presumably, when this belief decayed and the disinterested study of astronomy began, many who had found astrology absorbingly interesting decided that astronomy had too little human interest to be worthy of study. Physics, as it appears in Plato's Timæus for example, is full of ethical notions: it is an essential part of its purpose to show that the earth is worthy of admiration. The modern physicist, on the contrary, though he has no wish to deny that the earth is admirable, is not concerned, as physicist, with its ethical attributes: he is merely concerned to find out facts, not to consider whether they are good or bad. In psychology, the scientific attitude is even more recent and more difficult than in the physical sciences: it is natural to consider that human nature is either good or bad, and to suppose that the difference between good and bad, so all-important in practice, must be important in theory also. It is only during the last century that an ethically neutral psychology has

grown up; and here too, ethical neutrality has been essential to scientific success.

In philosophy, hitherto, ethical neutrality has been seldom sought and hardly ever achieved. Men have remembered their wishes, and have judged philosophies in relation to their wishes. Driven from the particular sciences, the belief that the notions of good and evil must afford a key to the understanding of the world has sought a refuge in philosophy. But even from this last refuge, if philosophy is not to remain a set of pleasing dreams, this belief must be driven forth. It is a commonplace that happiness is not best achieved by those who seek it directly; and it would seem that the same is true of the good. In thought, at any rate, those who forget good and evil and seek only to know the facts are more likely to achieve good than those who view the world through the distorting medium of their own desires.

We are thus brought back to our seeming paradox, that a philosophy which does not seek to impose upon the world its own conceptions of good and evil is not only more likely to achieve truth, but is also the outcome of a higher ethical standpoint than one which, like evolutionism and most traditional systems, is perpetually appraising the universe and seeking to find in it an embodiment of present ideals. In religion, and in every deeply serious view of the world and of human destiny, there is an element of submission, a realisation of the limits of human power, which is somewhat lacking in the modern world, with its quick material successes and its insolent belief in the boundless possibilities of progress. "He that loveth his life shall lose it"; and there is danger lest, through a too confident love of life, life itself should lose much of what gives it its highest worth. The submission which religion inculcates in action is essentially the same in spirit as that which science teaches in thought; and the ethical neutrality by which its victories have been achieved is the outcome of that submission.

The good which it concerns us to remember is the good which it lies in our power to create--the good in our own lives and in our attitude towards the world. Insistence on belief in an external realisation of the good is a form of self-assertion, which, while it cannot secure the external good which it desires, can seriously impair the inward good which lies within our power, and destroy that reverence towards fact which constitutes both what is valuable in humility and what is fruitful in the scientific temper.

Human beings cannot, of course, wholly transcend human nature; something subjective, if only the interest that determines the direction of our attention, must remain in all our thought. But scientific philosophy comes nearer to objectivity than any other human pursuit, and gives us, therefore, the closest constant and the most intimate relation with the outer world that it is possible to achieve. To the primitive mind, everything is either friendly or hostile; but experience has shown that friendliness and hostility are not the conceptions by which the world is to be understood. Scientific philosophy thus represents, though as yet only in a nascent condition, a higher form of thought than any pre-scientific belief or imagination, and, like every approach to self-transcendence, it brings with it a rich reward in increase of scope and breadth and comprehension. Evolutionism, in spite of its appeals to particular scientific facts, fails to be a truly scientific philosophy because of its slavery to time, its ethical preoccupations, and its predominant interest in our mundane concerns and destiny. A truly scientific philosophy will be more humble, more piecemeal, more arduous, offering less glitter of outward mirage to flatter fallacious hopes, but more indifferent to fate, and more capable of accepting the world without the tyrannous imposition of our human and temporary demands.

II

THE PLACE OF SCIENCE IN A LIBERAL EDUCATION

I

Science, to the ordinary reader of newspapers, is represented by a varying selection of sensational triumphs, such as wireless telegraphy and aeroplanes, radio-activity and the marvels of modern alchemy. It is not of this aspect of science that I wish to speak. Science, in this aspect, consists of detached up-to-date fragments, interesting only until they are replaced by something newer and more up-to-date, displaying nothing of the systems of patiently constructed knowledge out of which, almost as a casual incident, have come the practically useful results which interest the man in the street. The increased command over the forces of nature which is derived from science is undoubtedly an amply sufficient reason for encouraging scientific research, but this reason has been so often urged and is so easily appreciated that other reasons, to my mind quite as important, are apt to be overlooked. It is with these other reasons, especially with the intrinsic value of a scientific habit of mind in forming our outlook on the world, that I shall be concerned in what follows.

The instance of wireless telegraphy will serve to illustrate the difference between the two points of view. Almost all the serious intellectual labour required for the possibility of this invention is due to three men--Faraday, Maxwell, and Hertz. In alternating layers of experiment and theory these three men built up the modern theory of electromagnetism, and demonstrated the identity of light with electromagnetic waves. The system which they discovered is one of profound intellectual interest, bringing together and unifying an endless variety of apparently detached phenomena, and displaying a cumulative mental power which cannot but afford delight to every generous spirit. The mechanical details which remained to be adjusted in order to utilise their discoveries for a practical system of telegraphy demanded, no doubt, very considerable ingenuity, but had not that broad sweep and that universality which could give them intrinsic interest as an object of disinterested contemplation.

From the point of view of training the mind, of giving that well-informed, impersonal outlook which constitutes culture in the good sense of this much-misused word, it seems to be generally held indisputable that a literary education is superior to one based on science. Even the warmest advocates of science are apt to rest their claims on the contention that culture ought to be sacrificed to utility. Those men of science who respect culture, when they associate with men learned in the classics, are apt to admit, not merely politely, but sincerely, a certain inferiority on their side, compensated doubtless by the services which science renders to humanity, but none the less real. And so long as this attitude exists among men of science, it tends to verify itself: the intrinsically valuable aspects of science tend to be sacrificed to the merely useful, and little attempt is made to preserve that leisurely, systematic survey by which the finer quality of mind is formed and nourished.

But even if there be, in present fact, any such inferiority as is supposed in the educational value of science, this is, I believe, not the fault of science itself, but the fault of the spirit in which science is taught. If its full possibilities were realised by those who teach it, I believe that its capacity of producing those habits of mind which constitute the highest mental excellence would be at least as great as that of literature, and more particularly of Greek and Latin literature. In saying this I have no wish whatever to disparage a classical education. I have not myself enjoyed its benefits, and my knowledge of Greek and Latin authors is derived almost wholly from translations. But I am firmly persuaded that the Greeks fully deserve all the admiration that is bestowed upon them, and that it is a very great and serious loss to be unacquainted with their writings. It is not by attacking them, but by drawing attention to neglected excellences in science, that I wish to conduct my argument.

One defect, however, does seem inherent in a purely classical education--namely, a too exclusive emphasis on the past. By the study of what is absolutely ended and can never be renewed, a habit of criticism towards the present and the future is engendered. The qualities in which the present excels are qualities to which the study of the past does not direct attention, and to which, therefore, the student of Greek civilisation may easily become blind. In what is new and growing there is apt to be something crude, insolent, even a little vulgar, which is shocking to the man of sensitive taste; quivering from the rough contact, he retires to the trim gardens of a polished past, forgetting that they were reclaimed from the wilderness by men as rough and earth-soiled as those from whom he shrinks in his own day. The habit of being unable to recognise merit until it is dead is too apt to be the result of a purely bookish life, and a culture based wholly on the past will seldom be able to pierce through everyday surroundings to the essential splendour of contemporary things, or to the hope of still greater splendour in the future.

"My eyes saw not the men of old; And now their age away has rolled. I weep--to think I shall not see The heroes of posterity."

So says the Chinese poet; but such impartiality is rare in the more pugnacious atmosphere of the West, where the champions of past and future fight a never-ending battle, instead of combining to seek out the merits of both.

This consideration, which militates not only against the exclusive study of the classics, but against every form of culture which has become static, traditional, and academic, leads inevitably to the fundamental question: What is the true end of education? But before attempting to answer this question it will be well to define the sense in which we are to use the word "education." For this purpose I shall distinguish the sense in which I mean to use it from two others, both perfectly legitimate, the one broader and the other narrower than the sense in which I mean to use the word.

In the broader sense, education will include not only what we learn through instruction, but all that we learn through personal experience--the formation of character through the education of life. Of this aspect of education, vitally important as it is, I will say nothing, since its consideration would introduce topics quite foreign to the question with which we are concerned.

In the narrower sense, education may be confined to instruction, the imparting of definite information on various subjects, because such information, in and for itself, is useful in daily life. Elementary education--reading, writing, and arithmetic--is almost wholly of this kind. But instruction, necessary as it is, does not _per se_ constitute education in the sense in which I wish to consider it.

Education, in the sense in which I mean it, may be defined as _the formation, by means of instruction, of certain mental habits and a certain outlook on life and the world_. It remains to ask ourselves, what mental habits, and what sort of outlook, can be hoped for as the result of instruction? When we have answered this question we can attempt to decide what science has to contribute to the formation of the habits and outlook which we desire.

Our whole life is built about a certain number--not a very small number--of primary instincts and impulses. Only what is in some way connected with these instincts and impulses appears to us desirable or important; there is no faculty, whether "reason" or "virtue" or whatever it may be called, that can take our active life and our hopes and fears outside the region controlled by these first movers of all desire. Each of them is like a queen-bee, aided by a hive of workers gathering honey; but when the queen is gone the workers languish and die, and the cells remain empty of their expected sweetness. So with each primary impulse in civilised man: it is surrounded and protected by a busy swarm of attendant derivative desires, which store up in its service whatever honey the surrounding world affords. But if the queen-impulse dies, the death-dealing influence, though retarded a little by habit, spreads slowly through all the subsidiary impulses, and a whole tract of life becomes inexplicably colourless. What was formerly full of zest, and so obviously worth doing that it raised no questions, has now grown dreary and purposeless: with a sense of disillusion we inquire the meaning of life, and decide, perhaps, that all is vanity. The search for an outside meaning that can _compel_ an inner response must always be disappointed: all "meaning" must be at bottom related to our primary desires, and when they are extinct no miracle can restore to the world the value which they reflected upon it.

The purpose of education, therefore, cannot be to create any primary impulse which is lacking in the uneducated; the purpose can only be to enlarge the scope of those that human nature provides, by increasing the number and variety of attendant thoughts, and by showing where the most permanent satisfaction is to be found. Under the impulse of a Calvinistic horror of the "natural man," this obvious truth has been too often misconceived in the training of the young; "nature" has been falsely regarded as excluding all that is best in what is natural, and the endeavour to teach virtue has led to the production of stunted and contorted hypocrites instead of full-grown human beings. From such mistakes in education a better psychology or a kinder heart is beginning to preserve the present generation; we need, therefore, waste no more words on the theory that the purpose of education is to thwart or eradicate nature.

But although nature must supply the initial force of desire, nature is not, in the civilised man, the spasmodic, fragmentary, and yet violent set of impulses that it is in the savage. Each impulse has its constitutional ministry of thought and knowledge and reflection, through which possible conflicts of impulses are foreseen, and temporary impulses are controlled by the unifying impulse which may be called wisdom. In this way education destroys the crudity of instinct, and increases through knowledge the wealth and variety of the individual's contacts with the outside world, making him no longer an isolated fighting unit, but a citizen of the universe, embracing distant countries, remote regions of space, and vast stretches of past and future within the circle of his interests. It is this simultaneous softening in the insistence of desire and enlargement of its scope that is the chief moral end of education.

Closely connected with this moral end is the more purely intellectual aim of education, the endeavour to make us see and imagine the world in an objective manner, as far as possible as it is in itself, and not merely through the distorting medium of personal

desire. The complete attainment of such an objective view is no doubt an ideal, indefinitely approachable, but not actually and fully realisable. Education, considered as a process of forming our mental habits and our outlook on the world, is to be judged successful in proportion as its outcome approximates to this ideal; in proportion, that is to say, as it gives us a true view of our place in society, of the relation of the whole human society to its non-human environment, and of the nature of the non-human world as it is in itself apart from our desires and interests. If this standard is admitted, we can return to the consideration of science, inquiring how far science contributes to such an aim, and whether it is in any respect superior to its rivals in educational practice.

II

Two opposite and at first sight conflicting merits belong to science as against literature and art. The one, which is not inherently necessary, but is certainly true at the present day, is hopefulness as to the future of human achievement, and in particular as to the useful work that may be accomplished by any intelligent student. This merit and the cheerful outlook which it engenders prevent what might otherwise be the depressing effect of another aspect of science, to my mind also a merit, and perhaps its greatest merit--I mean the irrelevance of human passions and of the whole subjective apparatus where scientific truth is concerned. Each of these reasons for preferring the study of science requires some amplification. Let us begin with the first.

In the study of literature or art our attention is perpetually riveted upon the past: the men of Greece or of the Renaissance did better than any men do now; the triumphs of former ages, so far from facilitating fresh triumphs in our own age, actually increase the difficulty of fresh triumphs by rendering originality harder of attainment; not only is artistic achievement not cumulative, but it seems even to depend upon a certain freshness and _naïveté_ of impulse and vision which civilisation tends to destroy. Hence comes, to those who have been nourished on the literary and artistic productions of former ages, a certain peevishness and undue fastidiousness towards the present, from which there seems no escape except into the deliberate vandalism which ignores tradition and in the search after originality achieves only the eccentric. But in such vandalism there is none of the simplicity and spontaneity out of which great art springs: theory is still the canker in its core, and insincerity destroys the advantages of a merely pretended ignorance.

The despair thus arising from an education which suggests no pre-eminent mental activity except that of artistic creation is wholly absent from an education which gives the knowledge of scientific method. The discovery of scientific method, except in pure mathematics, is a thing of yesterday; speaking broadly, we may say that it dates from Galileo. Yet already it has transformed the world, and its success proceeds with ever-accelerating velocity. In science men have discovered an activity of the very highest value in which they are no longer, as in art, dependent for progress upon the appearance of continually greater genius, for in science the successors stand upon the shoulders of their predecessors; where one man of supreme genius has invented a method, a thousand lesser men can apply it. No transcendent ability is required in order to make useful discoveries in science; the edifice of science needs its masons, bricklayers, and common labourers as well as its foremen, master-builders, and architects. In art nothing worth doing can be done without genius; in science even a very moderate capacity can contribute to a supreme achievement.

In science the man of real genius is the man who invents a new method. The notable discoveries are often made by his successors, who can apply the method with fresh vigour, unimpaired by the previous labour of perfecting it; but the mental calibre of the thought required for their work, however brilliant, is not so great as that required by the first inventor of the method. There are in science immense numbers of different methods, appropriate to different classes of problems; but over and above them all, there is something not easily definable, which may be called _the_ method of science. It was formerly customary to identify this with the inductive method, and to associate it with the name of Bacon. But the true inductive method was not discovered by Bacon, and the true method of science is something which includes deduction as much as induction, logic and mathematics as much as botany and geology. I shall not attempt the difficult task of stating what the scientific method is, but I will try to indicate the temper of mind out of which the scientific method grows, which is the second of the two merits that were mentioned above as belonging to a scientific education.

The kernel of the scientific outlook is a thing so simple, so obvious, so seemingly trivial, that the mention of it may almost excite derision. The kernel of the scientific outlook is the refusal to regard our own desires, tastes, and interests as affording a key to the understanding of the world. Stated thus baldly, this may seem no more than a trite truism. But to remember it consistently in matters arousing our passionate partisanship is by no means easy, especially where the available evidence is uncertain and inconclusive. A few illustrations will make this clear.

Aristotle, I understand, considered that the stars must move in circles because the circle is the most perfect curve. In the absence of evidence to the contrary, he allowed himself to decide a question of fact by an appeal to æsthetico-moral considerations. In such a case it is at once obvious to us that this appeal was unjustifiable. We know now how to ascertain as a fact the way in which the heavenly bodies move, and we know that they do not move in circles, or even in accurate ellipses, or in any other kind of simply describable curve. This may be painful to a certain hankering after simplicity of pattern in the universe, but we know that in astronomy such feelings are irrelevant. Easy as this knowledge seems now, we owe it to the courage and insight of the first inventors of scientific method, and more especially of Galileo.

We may take as another illustration Malthus's doctrine of population. This illustration is all the better for the fact that his actual doctrine is now known to be largely erroneous. It is not his conclusions that are valuable, but the temper and method of his inquiry. As everyone knows, it was to him that Darwin owed an essential part of his theory of natural selection, and this was only possible because Malthus's outlook was truly scientific. His great merit lies in considering man not as the object of praise or blame, but as a part of nature, a thing with a certain characteristic behaviour from which certain consequences must follow. If the behaviour is not quite what Malthus supposed, if the consequences are not quite what he inferred, that may falsify his conclusions, but does not impair the value of his method. The objections which were made when his doctrine was new--that it was horrible and depressing, that people ought not to act as he said they did, and so on--were all such as implied an unscientific attitude of mind; as against all of them, his calm determination to treat man as a natural phenomenon marks an important advance over the reformers of the eighteenth century and the Revolution.

Under the influence of Darwinism the scientific attitude towards man has now become fairly common, and is to some people quite natural, though to most it is still a difficult and artificial intellectual contortion. There is however, one study which is as yet almost wholly untouched by the scientific spirit--I mean the study of philosophy. Philosophers and the public imagine that the scientific spirit must pervade pages that bristle with allusions to ions, germ-plasms, and the eyes of shell-fish. But as the devil can quote Scripture, so the philosopher can quote science. The scientific spirit is not an affair of quotation, of externally acquired information, any more than manners are an affair of the etiquette-book. The scientific attitude of mind involves a sweeping away of all other desires in the interests of the desire to know--it involves suppression of hopes and fears, loves and hates, and the whole subjective emotional life, until we become subdued to the material, able to see it frankly, without preconceptions, without bias, without any wish except to see it as it is, and without any belief that what it is must be determined by some relation, positive or negative, to what we should like it to be, or to what we can easily imagine it to be.

Now in philosophy this attitude of mind has not as yet been achieved. A certain self-absorption, not personal, but human, has marked almost all attempts to conceive the universe as a whole. Mind, or some aspect of it--thought or will or sentience--has been regarded as the pattern after which the universe is to be conceived, for no better reason, at bottom, than that such a universe would not seem strange, and would give us the cosy feeling that every place is like home. To conceive the universe as essentially progressive or essentially deteriorating, for example, is to give to our hopes and fears a cosmic importance which _may_, of course, be justified, but which we have as yet no reason to suppose justified. Until we have learnt to think of it in ethically neutral terms, we have not arrived at a scientific attitude in philosophy; and until we have arrived at such an attitude, it is hardly to be hoped that philosophy will achieve any solid results.

I have spoken so far largely of the negative aspect of the scientific spirit, but it is from the positive aspect that its value is derived. The instinct of constructiveness, which is one of the chief incentives to artistic creation, can find in scientific systems a satisfaction more massive than any epic poem. Disinterested curiosity, which is the source of almost all intellectual effort, finds with astonished delight that science can unveil secrets which might well have seemed for ever undiscoverable. The desire for a larger life and wider interests, for an escape from private circumstances, and even from the whole recurring human cycle of birth and death, is fulfilled by the impersonal cosmic outlook of science as by nothing else. To all these must be added, as contributing to the happiness of the man of science, the admiration of splendid achievement, and the consciousness of inestimable utility to the human race. A life devoted to science is therefore a happy life, and its happiness is derived from the very best sources that are open to dwellers on this troubled and passionate planet.

III

A FREE MAN'S WORSHIP[9]

To Dr. Faustus in his study Mephistopheles told the history of the Creation, saying:

"The endless praises of the choirs of angels had begun to grow wearisome; for, after all, did he not deserve their praise? Had he not given them endless joy? Would it not be more amusing to obtain undeserved praise, to be worshipped by beings whom he tortured? He smiled inwardly, and resolved that the great drama should be performed.

"For countless ages the hot nebula whirled aimlessly through space. At length it began to take shape, the central mass threw off planets, the planets cooled, boiling seas and burning mountains heaved and tossed, from black masses of cloud hot sheets of rain deluged the barely solid crust. And now the first germ of life grew in the depths of the ocean, and developed rapidly in the fructifying warmth into vast forest trees, huge ferns springing from the damp mould, sea monsters breeding, fighting, devouring, and passing away. And from the monsters, as the play unfolded itself, Man was born, with the power of thought, the knowledge of good and evil, and the cruel thirst for worship. And Man saw that all is passing in this mad, monstrous world, that all is struggling to snatch, at any cost, a few brief moments of life before Death's inexorable decree. And Man said: 'There is a hidden purpose, could we but fathom it, and the purpose is good; for we must reverence something, and in the visible world there is nothing worthy of reverence.' And Man stood aside from the struggle, resolving that God intended harmony to come out of chaos by human efforts. And when he followed the instincts which God had transmitted to him from his ancestry of beasts of prey, he called it Sin, and asked God to forgive him. But he doubted whether he could be justly forgiven, until he invented a divine Plan by which God's wrath was to have been appeased. And seeing the present was bad, he made it yet worse, that thereby the future might be better. And he gave God thanks for the strength that enabled him to forgo even the joys that were possible. And God smiled; and when he saw that Man had become perfect in renunciation and worship, he sent another sun through the sky, which crashed into Man's sun; and all returned again to nebula.

"'Yes,' he murmured, 'it was a good play; I will have it performed again.'"

Such, in outline, but even more purposeless, more void of meaning, is the world which Science presents for our belief. Amid such a world, if anywhere, our ideals henceforward must find a home. That Man is the product of causes which had no prevision of the end they were achieving; that his origin, his growth, his hopes and fears, his loves and his beliefs, are but the outcome of accidental collocations of atoms; that no fire, no heroism, no intensity of thought and feeling, can preserve an individual life beyond the grave; that all the labours of the ages, all the devotion, all the inspiration, all the noonday brightness of human genius, are destined to extinction in the vast death of the solar system, and that the whole temple of Man's achievement must inevitably be buried beneath the débris of a universe in ruins--all these things, if not quite beyond dispute, are yet so nearly certain, that no philosophy which rejects them can hope to stand. Only within the scaffolding of these truths, only on the firm foundation of unyielding despair, can the soul's habitation henceforth be safely built.

How, in such an alien and inhuman world, can so powerless a creature as Man preserve his aspirations untarnished? A strange mystery it is that Nature, omnipotent but blind, in the revolutions of her secular hurryings through the abysses of space, has brought forth at last a child, subject still to her power, but gifted with sight, with knowledge of good and evil, with the capacity of judging all the works of his unthinking Mother. In spite of Death, the mark and seal of the parental control, Man is yet free, during his brief years, to examine, to criticise, to know, and in imagination to create. To him alone, in the world with which he is acquainted, this freedom belongs; and in this lies his superiority to the resistless forces that control his outward life.

The savage, like ourselves, feels the oppression of his impotence before the powers of Nature; but having in himself nothing that he respects more than Power, he is willing to prostrate himself before his gods, without inquiring whether they are worthy of his worship. Pathetic and very terrible is the long history of cruelty and torture, of degradation and human sacrifice, endured in the hope of placating the jealous gods: surely, the trembling believer thinks, when what is most precious has been freely given, their lust for blood must be appeased, and more will not be required. The religion of Moloch--as such creeds may be generically called--is in essence the cringing submission of the slave, who dare not, even in his heart, allow the thought that his master deserves no adulation. Since the independence of ideals is not yet acknowledged, Power may be freely worshipped, and receive an unlimited respect, despite its wanton infliction of pain.

But gradually, as morality grows bolder, the claim of the ideal world begins to be felt; and worship, if it is not to cease, must be given to gods of another kind than those created by the savage. Some, though they feel the demands of the ideal, will still consciously reject them, still urging that naked Power is worthy of worship. Such is the attitude inculcated in God's answer to Job out of the whirlwind: the divine power and knowledge are paraded, but of the divine goodness there is no hint. Such also is the attitude of those who, in our own day, base their morality upon the struggle for survival, maintaining that the survivors are necessarily the fittest. But others, not content with an answer so repugnant to the moral sense, will adopt the position which we

have become accustomed to regard as specially religious, maintaining that, in some hidden manner, the world of fact is really harmonious with the world of ideals. Thus Man creates God, all-powerful and all-good, the mystic unity of what is and what should be.

But the world of fact, after all, is not good; and, in submitting our judgment to it, there is an element of slavishness from which our thoughts must be purged. For in all things it is well to exalt the dignity of Man, by freeing him as far as possible from the tyranny of non-human Power. When we have realised that Power is largely bad, that man, with his knowledge of good and evil, is but a helpless atom in a world which has no such knowledge, the choice is again presented to us: Shall we worship Force, or shall we worship Goodness? Shall our God exist and be evil, or shall he be recognised as the creation of our own conscience?

The answer to this question is very momentous, and affects profoundly our whole morality. The worship of Force, to which Carlyle and Nietzsche and the creed of Militarism have accustomed us, is the result of failure to maintain our own ideals against a hostile universe: it is itself a prostrate submission to evil, a sacrifice of our best to Moloch. If strength indeed is to be respected, let us respect rather the strength of those who refuse that false "recognition of facts" which fails to recognise that facts are often bad. Let us admit that, in the world we know, there are many things that would be better otherwise, and that the ideals to which we do and must adhere are not realised in the realm of matter. Let us preserve our respect for truth, for beauty, for the ideal of perfection which life does not permit us to attain, though none of these things meet with the approval of the unconscious universe. If Power is bad, as it seems to be, let us reject it from our hearts. In this lies Man's true freedom: in determination to worship only the God created by our own love of the good, to respect only the heaven which inspires the insight of our best moments. In action, in desire, we must submit perpetually to the tyranny of outside forces; but in thought, in aspiration, we are free, free from our fellow-men, free from the petty planet on which our bodies impotently crawl, free even, while we live, from the tyranny of death. Let us learn, then, that energy of faith which enables us to live constantly in the vision of the good; and let us descend, in action, into the world of fact, with that vision always before us.

When first the opposition of fact and ideal grows fully visible, a spirit of fiery revolt, of fierce hatred of the gods, seems necessary to the assertion of freedom. To defy with Promethean constancy a hostile universe, to keep its evil always in view, always actively hated, to refuse no pain that the malice of Power can invent, appears to be the duty of all who will not bow before the inevitable. But indignation is still a bondage, for it compels our thoughts to be occupied with an evil world; and in the fierceness of desire from which rebellion springs there is a kind of self-assertion which it is necessary for the wise to overcome. Indignation is a submission of our thoughts, but not of our desires; the Stoic freedom in which wisdom consists is found in the submission of our desires, but not of our thoughts. From the submission of our desires springs the virtue of resignation; from the freedom of our thoughts springs the whole world of art and philosophy, and the vision of beauty by which, at last, we half reconquer the reluctant world. But the vision of beauty is possible only to unfettered contemplation, to thoughts not weighted by the load of eager wishes; and thus Freedom comes only to those who no longer ask of life that it shall yield them any of those personal goods that are subject to the mutations of Time.

Although the necessity of renunciation is evidence of the existence of evil, yet Christianity, in preaching it, has shown a wisdom exceeding that of the Promethean philosophy of rebellion. It must be admitted that, of the things we desire, some, though they prove impossible, are yet real goods; others, however, as ardently longed for, do not form part of a fully purified ideal. The belief that what must be renounced is bad, though sometimes false, is far less often false than untamed passion supposes; and the creed of religion, by providing a reason for proving that it is never false, has been the means of purifying our hopes by the discovery of many austere truths.

But there is in resignation a further good element: even real goods, when they are unattainable, ought not to be fretfully desired. To every man comes, sooner or later, the great renunciation. For the young, there is nothing unattainable; a good thing desired with the whole force of a passionate will, and yet impossible, is to them not credible. Yet, by death, by illness, by poverty, or by the voice of duty, we must learn, each one of us, that the world was not made for us, and that, however beautiful may be the things we crave, Fate may nevertheless forbid them. It is the part of courage, when misfortune comes, to bear without repining the ruin of our hopes, to turn away our thoughts from vain regrets. This degree of submission to Power is not only just and right: it is the very gate of wisdom.

But passive renunciation is not the whole of wisdom; for not by renunciation alone can we build a temple for the worship of our own ideals. Haunting foreshadowings of the temple appear in the realm of imagination, in music, in architecture, in the untroubled kingdom of reason, and in the golden sunset magic of lyrics, where beauty shines and glows, remote from the touch of sorrow,

remote from the fear of change, remote from the failures and disenchantments of the world of fact. In the contemplation of these things the vision of heaven will shape itself in our hearts, giving at once a touchstone to judge the world about us, and an inspiration by which to fashion to our needs whatever is not incapable of serving as a stone in the sacred temple.

Except for those rare spirits that are born without sin, there is a cavern of darkness to be traversed before that temple can be entered. The gate of the cavern is despair, and its floor is paved with the gravestones of abandoned hopes. There Self must die; there the eagerness, the greed of untamed desire must be slain, for only so can the soul be freed from the empire of Fate. But out of the cavern the Gate of Renunciation leads again to the daylight of wisdom, by whose radiance a new insight, a new joy, a new tenderness, shine forth to gladden the pilgrim's heart.

When, without the bitterness of impotent rebellion, we have learnt both to resign ourselves to the outward rule of Fate and to recognise that the non-human world is unworthy of our worship, it becomes possible at last so to transform and refashion the unconscious universe, so to transmute it in the crucible of imagination, that a new image of shining gold replaces the old idol of clay. In all the multiform facts of the world--in the visual shapes of trees and mountains and clouds, in the events of the life of man, even in the very omnipotence of Death--the insight of creative idealism can find the reflection of a beauty which its own thoughts first made. In this way mind asserts its subtle mastery over the thoughtless forces of Nature. The more evil the material with which it deals, the more thwarting to untrained desire, the greater is its achievement in inducing the reluctant rock to yield up its hidden treasures, the prouder its victory in compelling the opposing forces to swell the pageant of its triumph. Of all the arts, Tragedy is the proudest, the most triumphant; for it builds its shining citadel in the very centre of the enemy's country, on the very summit of his highest mountain; from its impregnable watchtowers, his camps and arsenals, his columns and forts, are all revealed; within its walls the free life continues, while the legions of Death and Pain and Despair, and all the servile captains of tyrant Fate, afford the burghers of that dauntless city new spectacles of beauty. Happy those sacred ramparts, thrice happy the dwellers on that all-seeing eminence. Honour to those brave warriors who, through countless ages of warfare, have preserved for us the priceless heritage of liberty, and have kept undefiled by sacrilegious invaders the home of the unsubdued.

But the beauty of Tragedy does but make visible a quality which, in more or less obvious shapes, is present always and everywhere in life. In the spectacle of Death, in the endurance of intolerable pain, and in the irrevocableness of a vanished past, there is a sacredness, an overpowering awe, a feeling of the vastness, the depth, the inexhaustible mystery of existence, in which, as by some strange marriage of pain, the sufferer is bound to the world by bonds of sorrow. In these moments of insight, we lose all eagerness of temporary desire, all struggling and striving for petty ends, all care for the little trivial things that, to a superficial view, make up the common life of day by day; we see, surrounding the narrow raft illumined by the flickering light of human comradeship, the dark ocean on whose rolling waves we toss for a brief hour; from the great night without, a chill blast breaks in upon our refuge; all the loneliness of humanity amid hostile forces is concentrated upon the individual soul, which must struggle alone, with what of courage it can command, against the whole weight of a universe that cares nothing for its hopes and fears. Victory, in this struggle with the powers of darkness, is the true baptism into the glorious company of heroes, the true initiation into the overmastering beauty of human existence. From that awful encounter of the soul with the outer world, renunciation, wisdom, and charity are born; and with their birth a new life begins. To take into the inmost shrine of the soul the irresistible forces whose puppets we seem to be--Death and change, the irrevocableness of the past, and the powerlessness of man before the blind hurry of the universe from vanity to vanity--to feel these things and know them is to conquer them.

This is the reason why the Past has such magical power. The beauty of its motionless and silent pictures is like the enchanted purity of late autumn, when the leaves, though one breath would make them fall, still glow against the sky in golden glory. The Past does not change or strive; like Duncan, after life's fitful fever it sleeps well; what was eager and grasping, what was petty and transitory, has faded away, the things that were beautiful and eternal shine out of it like stars in the night. Its beauty, to a soul not worthy of it, is unendurable; but to a soul which has conquered Fate it is the key of religion.

The life of Man, viewed outwardly, is but a small thing in comparison with the forces of Nature. The slave is doomed to worship Time and Fate and Death, because they are greater than anything he finds in himself, and because all his thoughts are of things which they devour. But, great as they are, to think of them greatly, to feel their passionless splendour, is greater still. And such thought makes us free men; we no longer bow before the inevitable in Oriental subjection, but we absorb it, and make it a part of ourselves. To abandon the struggle for private happiness, to expel all eagerness of temporary desire, to burn with passion for eternal things--this is emancipation, and this is the free man's worship. And this liberation is effected by a contemplation of Fate; for Fate itself is subdued by the mind which leaves nothing to be purged by the purifying fire of Time.

United with his fellow-men by the strongest of all ties, the tie of a common doom, the free man finds that a new vision is with him always, shedding over every daily task the light of love. The life of Man is a long march through the night, surrounded by invisible foes, tortured by weariness and pain, towards a goal that few can hope to reach, and where none may tarry long. One by one, as they march, our comrades vanish from our sight, seized by the silent orders of omnipotent Death. Very brief is the time in which we can help them, in which their happiness or misery is decided. Be it ours to shed sunshine on their path, to lighten their sorrows by the balm of sympathy, to give them the pure joy of a never-tiring affection, to strengthen failing courage, to instil faith in hours of despair. Let us not weigh in grudging scales their merits and demerits, but let us think only of their need--of the sorrows, the difficulties, perhaps the blindnesses, that make the misery of their lives; let us remember that they are fellow-sufferers in the same darkness, actors in the same tragedy with ourselves. And so, when their day is over, when their good and their evil have become eternal by the immortality of the past, be it ours to feel that, where they suffered, where they failed, no deed of ours was the cause; but wherever a spark of the divine fire kindled in their hearts, we were ready with encouragement, with sympathy, with brave words in which high courage glowed.

Brief and powerless is Man's life; on him and all his race the slow, sure doom falls pitiless and dark. Blind to good and evil, reckless of destruction, omnipotent matter rolls on its relentless way; for Man, condemned to-day to lose his dearest, to-morrow himself to pass through the gate of darkness, it remains only to cherish, ere yet the blow falls, the lofty thoughts that ennoble his little day; disdaining the coward terrors of the slave of Fate, to worship at the shrine that his own hands have built; undismayed by the empire of chance, to preserve a mind free from the wanton tyranny that rules his outward life; proudly defiant of the irresistible forces that tolerate, for a moment, his knowledge and his condemnation, to sustain alone, a weary but unyielding Atlas, the world that his own ideals have fashioned despite the trampling march of unconscious power.

IV

THE STUDY OF MATHEMATICS

In regard to every form of human activity it is necessary that the question should be asked from time to time, What is its purpose and ideal? In what way does it contribute to the beauty of human existence? As respects those pursuits which contribute only remotely, by providing the mechanism of life, it is well to be reminded that not the mere fact of living is to be desired, but the art of living in the contemplation of great things. Still more in regard to those avocations which have no end outside themselves, which are to be justified, if at all, as actually adding to the sum of the world's permanent possessions, it is necessary to keep alive a knowledge of their aims, a clear prefiguring vision of the temple in which creative imagination is to be embodied.

The fulfilment of this need, in what concerns the studies forming the material upon which custom has decided to train the youthful mind, is indeed sadly remote--so remote as to make the mere statement of such a claim appear preposterous. Great men, fully alive to the beauty of the contemplations to whose service their lives are devoted, desiring that others may share in their joys, persuade mankind to impart to the successive generations the mechanical knowledge without which it is impossible to cross the threshold. Dry pedants possess themselves of the privilege of instilling this knowledge: they forget that it is to serve but as a key to open the doors of the temple; though they spend their lives on the steps leading up to those sacred doors, they turn their backs upon the temple so resolutely that its very existence is forgotten, and the eager youth, who would press forward to be initiated to its domes and arches, is bidden to turn back and count the steps.

Mathematics, perhaps more even than the study of Greece and Rome, has suffered from this oblivion of its due place in civilisation. Although tradition has decreed that the great bulk of educated men shall know at least the elements of the subject, the reasons for which the tradition arose are forgotten, buried beneath a great rubbish-heap of pedantries and trivialities. To those who inquire as to the purpose of mathematics, the usual answer will be that it facilitates the making of machines, the travelling from place to place, and the victory over foreign nations, whether in war or commerce. If it be objected that these ends--all of which are of doubtful value--are not furthered by the merely elementary study imposed upon those who do not become expert mathematicians, the reply, it is true, will probably be that mathematics trains the reasoning faculties. Yet the very men who make this reply are, for the most part, unwilling to abandon the teaching of definite fallacies, known to be such, and instinctively rejected by the unsophisticated mind of every intelligent learner. And the reasoning faculty itself is generally conceived, by those who urge its cultivation, as merely a

means for the avoidance of pitfalls and a help in the discovery of rules for the guidance of practical life. All these are undeniably important achievements to the credit of mathematics; yet it is none of these that entitles mathematics to a place in every liberal education. Plato, we know, regarded the contemplation of mathematical truths as worthy of the Deity; and Plato realised, more perhaps than any other single man, what those elements are in human life which merit a place in heaven. There is in mathematics, he says, "something which is _necessary_ and cannot be set aside ... and, if I mistake not, of divine necessity; for as to the human necessities of which the Many talk in this connection, nothing can be more ridiculous than such an application of the words. _Cleinias._ And what are these necessities of knowledge, Stranger, which are divine and not human? _Athenian._ Those things without some use or knowledge of which a man cannot become a God to the world, nor a spirit, nor yet a hero, nor able earnestly to think and care for man" (_Laws_, p. 818).[10] Such was Plato's judgment of mathematics; but the mathematicians do not read Plato, while those who read him know no mathematics, and regard his opinion upon this question as merely a curious aberration.

Mathematics, rightly viewed, possesses not only truth, but supreme beauty--a beauty cold and austere, like that of sculpture, without appeal to any part of our weaker nature, without the gorgeous trappings of painting or music, yet sublimely pure, and capable of a stern perfection such as only the greatest art can show. The true spirit of delight, the exaltation, the sense of being more than man, which is the touchstone of the highest excellence, is to be found in mathematics as surely as in poetry. What is best in mathematics deserves not merely to be learnt as a task, but to be assimilated as a part of daily thought, and brought again and again before the mind with ever-renewed encouragement. Real life is, to most men, a long second-best, a perpetual compromise between the ideal and the possible; but the world of pure reason knows no compromise, no practical limitations, no barrier to the creative activity embodying in splendid edifices the passionate aspiration after the perfect from which all great work springs. Remote from human passions, remote even from the pitiful facts of nature, the generations have gradually created an ordered cosmos, where pure thought can dwell as in its natural home, and where one, at least, of our nobler impulses can escape from the dreary exile of the actual world.

So little, however, have mathematicians aimed at beauty, that hardly anything in their work has had this conscious purpose. Much, owing to irrepressible instincts, which were better than avowed beliefs, has been moulded by an unconscious taste; but much also has been spoilt by false notions of what was fitting. The characteristic excellence of mathematics is only to be found where the reasoning is rigidly logical: the rules of logic are to mathematics what those of structure are to architecture. In the most beautiful work, a chain of argument is presented in which every link is important on its own account, in which there is an air of ease and lucidity throughout, and the premises achieve more than would have been thought possible, by means which appear natural and inevitable. Literature embodies what is general in particular circumstances whose universal significance shines through their individual dress; but mathematics endeavours to present whatever is most general in its purity, without any irrelevant trappings.

How should the teaching of mathematics be conducted so as to communicate to the learner as much as possible of this high ideal? Here experience must, in a great measure, be our guide; but some maxims may result from our consideration of the ultimate purpose to be achieved.

One of the chief ends served by mathematics, when rightly taught, is to awaken the learner's belief in reason, his confidence in the truth of what has been demonstrated, and in the value of demonstration. This purpose is not served by existing instruction; but it is easy to see ways in which it might be served. At present, in what concerns arithmetic, the boy or girl is given a set of rules, which present themselves as neither true nor false, but as merely the will of the teacher, the way in which, for some unfathomable reason, the teacher prefers to have the game played. To some degree, in a study of such definite practical utility, this is no doubt unavoidable; but as soon as possible, the reasons of rules should be set forth by whatever means most readily appeal to the childish mind. In geometry, instead of the tedious apparatus of fallacious proofs for obvious truisms which constitutes the beginning of Euclid, the learner should be allowed at first to assume the truth of everything obvious, and should be instructed in the demonstrations of theorems which are at once startling and easily verifiable by actual drawing, such as those in which it is shown that three or more lines meet in a point. In this way belief is generated; it is seen that reasoning may lead to startling conclusions, which nevertheless the facts will verify; and thus the instinctive distrust of whatever is abstract or rational is gradually overcome. Where theorems are difficult, they should be first taught as exercises in geometrical drawing, until the figure has become thoroughly familiar; it will then be an agreeable advance to be taught the logical connections of the various lines or circles that occur. It is desirable also that the figure illustrating a theorem should be drawn in all possible cases and shapes, that so the abstract relations with which geometry is concerned may of themselves emerge as the residue of similarity amid such great apparent diversity. In this way the abstract demonstrations should form but a small part of the instruction, and should be given when, by familiarity with concrete illustrations, they have come to be felt as the natural embodiment of visible fact. In this early stage proofs should not be

given with pedantic fullness; definitely fallacious methods, such as that of superposition, should be rigidly excluded from the first, but where, without such methods, the proof would be very difficult, the result should be rendered acceptable by arguments and illustrations which are explicitly contrasted with demonstrations.

In the beginning of algebra, even the most intelligent child finds, as a rule, very great difficulty. The use of letters is a mystery, which seems to have no purpose except mystification. It is almost impossible, at first, not to think that every letter stands for some particular number, if only the teacher would reveal _what_ number it stands for. The fact is, that in algebra the mind is first taught to consider general truths, truths which are not asserted to hold only of this or that particular thing, but of any one of a whole group of things. It is in the power of understanding and discovering such truths that the mastery of the intellect over the whole world of things actual and possible resides; and ability to deal with the general as such is one of the gifts that a mathematical education should bestow. But how little, as a rule, is the teacher of algebra able to explain the chasm which divides it from arithmetic, and how little is the learner assisted in his groping efforts at comprehension! Usually the method that has been adopted in arithmetic is continued: rules are set forth, with no adequate explanation of their grounds; the pupil learns to use the rules blindly, and presently, when he is able to before using this eBook.

Translator’s Preface. Preface To The Third Edition The Case Of Wagner: A Musician’s Problem Nietzsche _contra_ Wagner Selected Aphorisms from Nietzsche’s Retrospect of his Years of Friendship with Wagner. Footnotes

TRANSLATOR’S PREFACE.

Nietzsche wrote the rough draft of “The Case of Wagner” in Turin, during the month of May 1888; he completed it in Sils Maria towards the end of June of the same year, and it was published in the following autumn. “Nietzsche _contra_ Wagner” was written

about the middle of December 1888; but, although it was printed and corrected before the New Year, it was not published until long afterwards owing to Nietzsche's complete breakdown in the first days of 1889.

In reading these two essays we are apt to be deceived, by their virulent and forcible tone, into believing that the whole matter is a mere cover for hidden fire,—a mere blind of æsthetic discussion concealing a deep and implacable personal feud which demands and will have vengeance. In spite of all that has been said to the contrary, many people still hold this view of the two little works before us; and, as the actual facts are not accessible to every one, and rumours are more easily believed than verified, the error of supposing that these pamphlets were dictated by personal animosity, and even by Nietzsche's envy of Wagner in his glory, seems to be a pretty common one. Another very general error is to suppose that the point at issue here is not one concerning music at all, but concerning religion. It is taken for granted that the aspirations, the particular quality, the influence, and the method of an art like music, are matters quite distinct from the values and the conditions prevailing in the culture with which it is in harmony, and that however many Christian elements may be discovered in Wagnerian texts, Nietzsche had no right to raise æsthetic objections because he happened to entertain the extraordinary view that these Christian elements had also found their way into Wagnerian music.

To both of these views there is but one reply:—they are absolutely false.

In the "Ecce Homo," Nietzsche's autobiography,—a book which from cover to cover and line for line is sincerity itself—we learn what Wagner actually meant to Nietzsche. On pages 41, 44, 84, 122, 129, &c, we cannot doubt that Nietzsche is speaking from his heart,—and what does he say?—In impassioned tones he admits his profound indebtedness to the great musician, his love for him, his gratitude to him,—how Wagner was the only German who had ever been anything to him—how his friendship with Wagner constituted the happiest and most valuable experience of his life,—how his breach with Wagner almost killed him. And, when we remember, too, that Wagner on his part also declared that he was "alone" after he had lost "that man" (Nietzsche), we begin to perceive that personal bitterness and animosity are out of the question here. We feel we are on a higher plane, and that we must not judge these two men as if they were a couple of little business people who had had a suburban squabble.

Nietzsche declares ("Ecce Homo," p. 24) that he never attacked persons as persons. If he used a name at all, it was merely as a means to an end, just as one might use a magnifying glass in order to make a general, but elusive and intricate fact more clear and more apparent, and if he used the name of David Strauss, without bitterness or spite (for he did not even know the man), when he wished to personify Culture-Philistinism, so, in the same spirit, did he use the name of Wagner, when he wished to personify the general decadence of modern ideas, values, aspirations and Art.

Nietzsche's ambition, throughout his life, was to regenerate European culture. In the first period of his relationship with Wagner, he thought that he had found the man who was prepared to lead in this direction. For a long while he regarded his master as the Saviour of Germany, as the innovator and renovator who was going to arrest the decadent current of his time and lead men to a greatness which had died with antiquity. And so thoroughly did he understand his duties as a disciple, so wholly was he devoted to this cause, that, in spite of all his unquestioned gifts and the excellence of his original achievements, he was for a long while regarded as a mere "literary lackey" in Wagner's service, in all those circles where the rising musician was most disliked.

Gradually, however, as the young Nietzsche developed and began to gain an independent view of life and humanity, it seemed to him extremely doubtful whether Wagner actually was pulling the same way with him. Whereas, theretofore, he had identified Wagner's ideals with his own, it now dawned upon him slowly that the regeneration of German culture, of European culture, and the transvaluation of values which would be necessary for this regeneration, really lay off the track of Wagnerism. He saw that he had endowed Wagner with a good deal that was more his own than Wagner's. In his love he had transfigured the friend, and the composer of "Parsifal" and the man of his imagination were not one. The fact was realised step by step; disappointment upon disappointment, revelation after revelation, ultimately brought it home to him, and though his best instincts at first opposed it, the revulsion of feeling at last became too strong to be scouted, and Nietzsche was plunged into the blackest despair. Had he followed his own human inclinations, he would probably have remained Wagner's friend until the end. As it was, however, he remained loyal to his cause, and this meant denouncing his former idol.

"Joyful Wisdom," "Thus Spake Zarathustra," "Beyond Good and Evil," "The Genealogy of Morals," "The Twilight of the Idols," "The Antichrist"—all these books were but so many exhortations to mankind to step aside from the general track now trodden by Europeans. And what happened? Wagner began to write some hard things about Nietzsche; the world assumed that Nietzsche and Wagner had engaged in a paltry personal quarrel in the press, and the whole importance of the real issue was buried beneath the

human, all-too-human interpretations which were heaped upon it.

Nietzsche was a musician of no mean attainments. For a long while, in his youth, his superiors had been doubtful whether he should not be educated for a musical career, so great were his gifts in this art; and if his mother had not been offered a six-years' scholarship for her son at the famous school of Pforta, Nietzsche, the scholar and philologist, would probably have been an able composer. When he speaks about music, therefore, he knows what he is talking about, and when he refers to Wagner's music in particular, the simple fact of his long intimacy with Wagner during the years at Tribschen, is a sufficient guarantee of his deep knowledge of the subject. Now Nietzsche was one of the first to recognise that the principles of art are inextricably bound up with the laws of life, that an æsthetic dogma may therefore promote or depress all vital force, and that a picture, a symphony, a poem or a statue, is just as capable of being pessimistic, anarchic, Christian or revolutionary, as a philosophy or a science is. To speak of a certain class of music as being compatible with the decline of culture, therefore, was to Nietzsche a perfectly warrantable association of ideas, and that is why, throughout his philosophy, so much stress is laid upon æsthetic considerations.

But if in England and America Nietzsche's attack on Wagner's art may still seem a little incomprehensible, let it be remembered that the Continent has long known that Nietzsche was actually in the right. Every year thousands are now added to the large party abroad who have ceased from believing in the great musical revolutionary of the seventies; that he was one with the French Romanticists and rebels has long since been acknowledged a fact in select circles, both in France and Germany, and if we still have Wagner with us in England, if we still consider Nietzsche as a heretic, when he declares that "Wagner was a musician for unmusical people," it is only because we are more removed than we imagine, from all the great movements, intellectual and otherwise, which take place on the Continent.

In Wagner's music, in his doctrine, in his whole concept of art, Nietzsche saw the confirmation, the promotion—aye, even the encouragement, of that decadence and degeneration which is now rampant in Europe; and it is for this reason, although to the end of his life he still loved Wagner, the man and the friend, that we find him, on the very eve of his spiritual death, exhorting us to abjure Wagner the musician and the artist.

Anthony M. Ludovici.

PREFACE TO THE THIRD EDITION(1)

In spite of the adverse criticism with which the above preface has met at the hands of many reviewers since the summer of last year, I cannot say that I should feel justified, even after mature consideration, in altering a single word or sentence it contains. If I felt inclined to make any changes at all, these would take the form of extensive additions, tending to confirm rather than to modify the general argument it advances; but, any omissions of which I may have been guilty in the first place, have been so fully rectified since, thanks to the publication of the English translations of Daniel Halévy's and Henri Lichtenberger's works, "The Life of Friedrich Nietzsche,"(2) and "The Gospel of Superman,"(3) respectively, that, were it not for the fact that the truth about this matter cannot be repeated too often, I should have refrained altogether from including any fresh remarks of my own in this Third Edition.

In the works just referred to (pp. 129 _et seq._ in Halévy's book, and pp. 78 _et seq._ in Lichtenberger's book), the statement I made in my preface to "Thoughts out of Season," vol. i., and which I did not think it necessary to repeat in my first preface to these pamphlets, will be found to receive the fullest confirmation.

The statement in question was to the effect that many long years before these pamphlets were even projected, Nietzsche's apparent _volte-face_ in regard to his hero Wagner had been not only foreshadowed but actually stated in plain words, in two works written during his friendship with Wagner,—the works referred to being "The Birth of Tragedy" (1872), and "Wagner in Bayreuth" (1875) of which Houston Stuart Chamberlain declares not only that it possesses "undying classical worth" but that "a perusal of it is indispensable to all who wish to follow the question [of Wagner] to its roots."(4)

The idea that runs through the present work like a leitmotif—the idea that Wagner was at bottom more of a mime than a musician—was so far an ever present thought with Nietzsche that it is ever impossible to ascertain the period when it was first formulated.

In Nietzsche's wonderful autobiography (_Ecce Homo_, p. 88), in the section dealing with the early works just mentioned, we find the following passage—"In the second of the two essays [Wagner in Bayreuth] with a profound certainty of instinct, I already characterised the elementary factor in Wagner's nature as a theatrical talent which, in all his means and aspirations, draws its final

conclusions." And as early as 1874, Nietzsche wrote in his diary—"Wagner is a born actor. Just as Goethe was an abortive painter, and Schiller an abortive orator, so Wagner was an abortive theatrical genius. His attitude to music is that of the actor; for he knows how to sing and speak, as it were out of different souls and from absolutely different worlds (_Tristan_ and the _Meistersinger_)."

There is, however, no need to multiply examples, seeing, as I have said, that in the translations of Halévy's and Lichtenberger's books the reader will find all the independent evidence he could possibly desire, disproving the popular, and even the learned belief that, in the two pamphlets before us we have a complete, apparently unaccountable, and therefore "demented" _volte-face_ on Nietzsche's part. Nevertheless, for fear lest some doubt should still linger in certain minds concerning this point, and with the view of adding interest to these essays, the Editor considered it advisable, in the Second Edition, to add a number of extracts from Nietzsche's diary of the year 1878 (ten years before "The Case of Wagner," and "Nietzsche _contra_ Wagner" were written) in order to show to what extent those learned critics who complain of Nietzsche's "morbid and uncontrollable recantations and revulsions of feeling," have overlooked even the plain facts of the case when forming their all-too-hasty conclusions. These extracts will be found at the end of "Nietzsche _contra_ Wagner." While reading them, however, it should not be forgotten that they were never intended for publication by Nietzsche himself—a fact which accounts for their unpolished and sketchy form—and that they were first published in vol. xi. of the first German Library Edition (pp. 99-129) only when he was a helpless invalid, in 1897. Since then, in 1901 and 1906 respectively, they have been reprinted, once in the large German Library Edition (vol. xi. pp. 181-202), and once in the German Pocket Edition, as an appendix to "Human-All-too-Human," Part II.

An altogether special interest now attaches to these pamphlets; for, in the first place we are at last in possession of Wagner's own account of his development, his art, his aspirations and his struggles, in the amazing self-revelation entitled _My Life_;(5) and secondly, we now have _Ecce Homo_, Nietzsche's autobiography, in which we learn for the first time from Nietzsche's own pen to what extent his history was that of a double devotion—to Wagner on the one hand, and to his own life task, the Transvaluation of all Values, on the other.

Readers interested in the Nietzsche-Wagner controversy will naturally look to these books for a final solution of all the difficulties which the problem presents. But let them not be too sanguine. From first to last this problem is not to be settled by "facts." A good deal of instinctive choice, instinctive aversion, and instinctive suspicion are necessary here. A little more suspicion, for instance, ought to be applied to Wagner's _My Life_, especially in England, where critics are not half suspicious enough about a continental artist's self-revelations, and are too prone, if they have suspicions at all, to apply them in the wrong place.

An example of this want of _finesse_ in judging foreign writers is to be found in Lord Morley's work on Rousseau,—a book which ingenuously takes for granted everything that a writer like Rousseau cares to say about himself, without considering for an instant the possibility that Rousseau might have practised some hypocrisy. In regard to Wagner's life we might easily fall into the same error—that is to say, we might take seriously all he says concerning himself and his family affairs.

We should beware of this, and should not even believe Wagner when he speaks badly about himself. No one speaks badly about himself without a reason, and the question in this case is to find out the reason. Did Wagner—in the belief that genius was always immoral—wish to pose as an immoral Egotist, in order to make us believe in his genius, of which he himself was none too sure in his innermost heart? Did Wagner wish to appear "sincere" in his biography, in order to awaken in us a belief in the sincerity of his music, which he likewise doubted, but wished to impress upon the world as "true"? Or did he wish to be thought badly of in connection with things that were not true, and that consequently did not affect him, in order to lead us off the scent of true things, things he was ashamed of and which he wished the world to ignore—just like Rousseau (the similarity between the two is more than a superficial one) who barbarously pretended to have sent his children to the foundling hospital, in order not to be thought incapable of having had any children at all? In short, where is the bluff in Wagner's biography? Let us therefore be careful about it, and all the more so because Wagner himself guarantees the truth of it in the prefatory note. If we were to be credulous here, we should moreover be acting in direct opposition to Nietzsche's own counsel as given in the following aphorisms (Nos. 19 and 20, p. 89):—

"It is very difficult to trace the course of Wagner's development,—no trust must be placed in his own description of his soul's experiences. He writes party-pamphlets for his followers.

"It is extremely doubtful whether Wagner is able to bear witness about himself."

While on p. 37 (the note), we read:—"He [Wagner] was not proud enough to be able to suffer the truth about himself. Nobody had less pride than he. Like Victor Hugo he remained true to himself even in his biography,—he remained an actor."

However, as a famous English judge has said—“Truth will come out, even in the witness box,” and, as we may add in this case, even in an autobiography. There is one statement in Wagner’s _My Life_ which sounds true to my ears at least—a statement which, in my opinion, has some importance, and to which Wagner himself seems to grant a mysterious significance. I refer to the passage on p. 93 of vol i., in which Wagner says:—“Owing to the exceptional vivacity and innate susceptibility of my nature … I gradually became conscious of a certain power of transporting or bewildering my more indolent companions.”

This seems innocent enough. When, however, it is read in conjunction with Nietzsche’s trenchant criticism, particularly on pp. 14, 15, 16, 17 and 18 of this work, and also with a knowledge of Wagner’s music, it becomes one of the most striking passages in Wagner’s autobiography, for it records how soon he became conscious of his dominant instinct and faculty.

I know perfectly well that the Wagnerites will not be influenced by these remarks. Their gratitude to Wagner is too great for this. He has supplied the precious varnish wherewith to hide the dull ugliness of our civilisation. He has given to souls despairing over the materialism of this world, to souls despairing of themselves, and longing to be rid of themselves, the indispensable hashish and morphia wherewith to deaden their inner discords. These discords are everywhere apparent nowadays. Wagner is therefore a common need, a common benefactor. As such he is bound to be worshipped and adored in spite of all egotistical and theatrical autobiographies.

Albeit, signs are not wanting—at least among his Anglo-Saxon worshippers who stand even more in need of romanticism than their continental brethren,—which show that, in order to uphold Wagner, people are now beginning to draw distinctions between the man and the artist. They dismiss the man as “human-all-too-human,” but they still maintain that there are divine qualities in his music. However distasteful the task of disillusioning these psychological tyros may be, they should be informed that no such division of a man into two parts is permissible, save in Christianity (the body and the soul), but that outside purely religious spheres it is utterly unwarrantable. There can be no such strange divorce between a bloom and the plant on which it blows, and has a black woman ever been known to give birth to a white child?

Wagner, as Nietzsche tells us on p. 19, “was something complete, he was a typical _decadent_ in whom every sign of ‘free will’ was lacking, in whom every feature was necessary.” Wagner, allow me to add, was a typical representative of the nineteenth century, which was the century of contradictory values, of opposed instincts, and of every kind of inner disharmony. The genuine, the classical artists of that period, such men as Heine, Goethe, Stendhal, and Gobineau, overcame their inner strife, and each succeeded in making a harmonious whole out of himself—not indeed without a severe struggle; for everyone of them suffered from being the child of his age, _i.e._, a decadent. The only difference between them and the romanticists lies in the fact that they (the former) were conscious of what was wrong with them, and possessed the will and the strength to overcome their illness; whereas the romanticists chose the easier alternative—namely, that of shutting their eyes on themselves.

“I am just as much a child of my age as Wagner—_i.e._, I am a _decadent_,” says Nietzsche. “The only difference is that I recognised the fact, that I struggled against it”(6)

What Wagner did was characteristic of all romanticists and contemporary artists: he drowned and overshouted his inner discord by means of exuberant pathos and wild exaltation. Far be it from me to value Wagner’s music _in extenso_ here—this is scarcely a fitting opportunity to do so;—but I think it might well be possible to show, on purely psychological grounds, how impossible it was for a man like Wagner to produce real art. For how can harmony, order, symmetry, mastery, proceed from uncontrolled discord, disorder, disintegration, and chaos? The fact that an art which springs from such a marshy soil may, like certain paludal plants, be “wonderful,” “gorgeous,” and “overwhelming,” cannot be denied; but true art it is not. It is so just as little as Gothic architecture is,—that style which, in its efforts to escape beyond the tragic contradiction in its mediæval heart, yelled its hysterical cry heavenwards and even melted the stones of its structures into a quivering and fluid jet, in order to give adequate expression to the painful and wretched conflict then raging between the body and the soul.

That Wagner, too, was a great sufferer, there can be no doubt; not, however, a sufferer from strength, like a true artist, but from weakness—the weakness of his age, which he never overcame. It is for this reason that he should be rather pitied than judged as he is now being judged by his German and English critics, who, with thoroughly neurotic suddenness, have acknowledged their revulsion of feeling a little too harshly.

“I have carefully endeavoured not to deride, or deplore, or detest…” says Spinoza, “but to understand”; and these words ought to be our guide, not only in the case of Wagner, but in all things.

Inner discord is a terrible affliction, and nothing is so certain to produce that nervous irritability which is so trying to the patient as well as to the outer world, as this so-called spiritual disease. Nietzsche was probably quite right when he said the only real and true music that Wagner ever composed did not consist of his elaborate arias and overtures, but of ten or fifteen bars which, dispersed here and there, gave expression to the composer's profound and genuine melancholy. But this melancholy had to be overcome, and Wagner with the blood of a _cabotin_ in his veins, resorted to the remedy that was nearest to hand—that is to say, the art of bewildering others and himself. Thus he remained ignorant about himself all his life; for there was, as Nietzsche rightly points out (p. 37, _note_), not sufficient pride in the man for him to desire to know or to suffer gladly the truth concerning his real nature. As an actor his ruling passion was vanity, but in his case it was correlated with a semi-conscious knowledge of the fact that all was not right with him and his art. It was this that caused him to suffer. His egomaniacal behaviour and his almost Rousseauesque fear and suspicion of others were only the external manifestations of his inner discrepancies. But, to repeat what I have already said, these abnormal symptoms are not in the least incompatible with Wagner's music, they are rather its very cause, the root from which it springs.

In reality, therefore, Wagner the man and Wagner the artist were undoubtedly one, and constituted a splendid romanticist. His music as well as his autobiography are proofs of his wonderful gifts in this direction. His success in his time, as in ours, is due to the craving of the modern world for actors, sorcerers, bewilderers and idealists who are able to conceal the ill-health and the weakness that prevail, and who please by intoxicating and exalting. But this being so, the world must not be disappointed to find the hero of a preceding age explode in the next. It must not be astonished to find a disparity between the hero's private life and his "elevating" art or romantic and idealistic gospel. As long as people will admire heroic attitudes more than heroism, such disillusionment is bound to be the price of their error. In a truly great man, life-theory and life-practice, if seen from a sufficiently lofty point of view, must and do always agree, in an actor, in a romanticist, in an idealist, and in a Christian, there is always a yawning chasm between the two, which, whatever well-meaning critics may do, cannot be bridged posthumously by acrobatic feats _in psychologicis_.

Let anyone apply this point of view to Nietzsche's life and theory. Let anyone turn his life inside out, not only as he gives it to us in his _Ecce Homo_, but as we find it related by all his biographers, friends and foes alike, and what will be the result? Even if we ignore his works—the blooms which blowed from time to time from his life—we absolutely cannot deny the greatness of the man's _private practice_, and if we fully understand and appreciate the latter, we must be singularly deficient in instinct and in _flair_ if we do not suspect that some of this greatness is reflected in his life-task.

ANTHONY M. LUDOVICI

London, _July 1911_.

THE CASE OF WAGNER: A MUSICIAN'S PROBLEM

A LETTER FROM TURIN, MAY 1888

"RIDENDO DICERE SEVERUM…."

Preface

I am writing this to relieve my mind. It is not malice alone which makes me praise Bizet at the expense of Wagner in this essay. Amid a good deal of jesting I wish to make one point clear which does not admit of levity. To turn my back on Wagner was for me a piece of fate, to get to like anything else whatever afterwards was for me a triumph. Nobody, perhaps, had ever been more dangerously involved in Wagnerism, nobody had defended himself more obstinately against it, nobody had ever been so overjoyed at ridding himself of it. A long history!—Shall I give it a name?—If I were a moralist, who knows what I might not call it! Perhaps a piece of _self-mastery_.—But the philosopher does not like the moralist, neither does he like high-falutin' words….

What is the first and last thing that a philosopher demands of himself? To overcome his age in himself, to become "timeless." With what then does the philosopher have the greatest fight? With all that in him which makes him the child of his time. Very well then! I am just as much a child of my age as Wagner—_i.e._, I am a decadent. The only difference is that I recognised the fact, that I struggled against it. The philosopher in me struggled against it.

My greatest preoccupation hitherto has been the problem of _decadence_, and I had reasons for this. "Good and evil" form only a playful subdivision of this problem. If one has trained one's eye to detect the symptoms of decline, one also understands

morality,—one understands what lies concealed beneath its holiest names and tables of values: _e.g._, _impoverished_ life, the will to nonentity, great exhaustion. Morality _denies_ life.… In order to undertake such a mission I was obliged to exercise self-discipline:—I had to side against all that was morbid in myself including Wagner, including Schopenhauer, including the whole of modern _humanity_.—A profound estrangement, coldness and soberness towards all that belongs to my age, all that was contemporary: and as the highest wish, Zarathustra's eye, an eye which surveys the whole phenomenon—mankind—from an enormous distance,—which looks down upon it.—For such a goal—what sacrifice would not have been worth while? What "self-mastery"! What "self-denial"!

The greatest event of my life took the form of a _recovery_. Wagner belongs only to my diseases.

Not that I wish to appear ungrateful to this disease. If in this essay I support the proposition that Wagner is _harmful_, I none the less wish to point out unto whom, in spite of all, he is indispensable—to the philosopher. Anyone else may perhaps be able to get on without Wagner: but the philosopher is not free to pass him by. The philosopher must be the evil conscience of his age,—but to this end he must be possessed of its best knowledge. And what better guide, or more thoroughly efficient revealer of the soul, could be found for the labyrinth of the modern spirit than Wagner? Through Wagner modernity speaks her most intimate language: it conceals neither its good nor its evil: it has thrown off all shame. And, conversely, one has almost calculated the whole of the value of modernity once one is clear concerning what is good and evil in Wagner. I can perfectly well understand a musician of to-day who says: "I hate Wagner but I can endure no other music." But I should also understand a philosopher who said, "Wagner is modernity in concentrated form." There is no help for it, we must first be Wagnerites.…

1.

Yesterday—would you believe it?—I heard _Bizet's_ masterpiece for the twentieth time. Once more I attended with the same gentle reverence; once again I did not run away. This triumph over my impatience surprises me. How such a work completes one! Through it one almost becomes a "masterpiece" oneself—And, as a matter of fact, each time I heard _Carmen_ it seemed to me that I was more of a philosopher, a better philosopher than at other times: I became so forbearing, so happy, so Indian, so _settled_.… To sit for five hours: the first step to holiness!—May I be allowed to say that Bizet's orchestration is the only one that I can endure now? That other orchestration which is all the rage at present—the Wagnerian—is brutal, artificial and "unsophisticated" withal, hence its appeal to all the three senses of the modern soul at once. How terribly Wagnerian orchestration affects me! I call it the _Sirocco_. A disagreeable sweat breaks out all over me. All my fine weather vanishes.

Bizet's music seems to me perfect. It comes forward lightly, gracefully, stylishly. It is lovable, it does not sweat. "All that is good is easy, everything divine runs with light feet": this is the first principle of my æsthetics. This music is wicked, refined, fatalistic, and withal remains popular,—it possesses the refinement of a race, not of an individual. It is rich. It is definite. It builds, organises, completes, and in this sense it stands as a contrast to the polypus in music, to "endless melody". Have more painful, more tragic accents ever been heard on the stage before? And how are they obtained? Without grimaces! Without counterfeiting of any kind! Free from the _lie_ of the grand style!—In short: this music assumes that the listener is intelligent even as a musician,—thereby it is the opposite of Wagner, who, apart from everything else, was in any case the most _ill-mannered_ genius on earth (Wagner takes us as if … , he repeats a thing so often that we become desperate,—that we ultimately believe it).

And once more: I become a better man when Bizet speaks to me. Also a better musician, a better _listener_. Is it in any way possible to listen better?—I even burrow behind this music with my ears. I hear its very cause. I seem to assist at its birth. I tremble before the dangers which this daring music runs, I am enraptured over those happy accidents for which even Bizet himself may not be responsible.—And, strange to say, at bottom I do not give it a thought, or am not aware how much thought I really do give it. For quite other ideas are running through my head the while.… Has any one ever observed that music _emancipates_ the spirit? gives wings to thought? and that the more one becomes a musician the more one is also a philosopher? The grey sky of abstraction seems thrilled by flashes of lightning; the light is strong enough to reveal all the details of things; to enable one to grapple with problems; and the world is surveyed as if from a mountain top—With this I have defined philosophical pathos—And unexpectedly _answers_ drop into my lap, a small hailstorm of ice and wisdom, of problems _solved_. Where am I? Bizet makes me productive. Everything that is good makes me productive. I have gratitude for nothing else, nor have I any other touchstone for testing what is good.

2.

Bizet's work also saves; Wagner is not the only "Saviour." With it one bids farewell to the _damp_ north and to all the fog of the Wagnerian ideal. Even the action in itself delivers us from these things. From Merimée it has this logic even in passion, from him it has the direct line, _inexorable_ necessity, but what it has above all else is that which belongs to sub-tropical zones—that dryness of atmosphere, that _limpidezza_ of the air. Here in every respect the climate is altered. Here another kind of sensuality, another kind of sensitiveness and another kind of cheerfulness make their appeal. This music is gay, but not in a French or German way. Its gaiety is African; fate hangs over it, its happiness is short, sudden, without reprieve. I envy Bizet for having had the courage of this sensitiveness, which hitherto in the cultured music of Europe has found no means of expression,—of this southern, tawny, sunburnt sensitiveness.… What a joy the golden afternoon of its happiness is to us! When we look out, with this music in our minds, we wonder whether we have ever seen the sea so _calm_. And how soothing is this Moorish dancing! How, for once, even our insatiability gets sated by its lascivious melancholy!—And finally love, love translated back into _Nature_! Not the love of a "cultured girl!"—no Senta-sentimentality.(7) But love as fate, as a fatality, cynical, innocent, cruel,—and precisely in this way _Nature_! The love whose means is war, whose very essence is the _mortal hatred_ between the sexes!—I know no case in which the tragic irony, which constitutes the kernel of love, is expressed with such severity, or in so terrible a formula, as in the last cry of Don José with which the work ends:

"Yes, it is I who have killed her, I—my adored Carmen!"

—Such a conception of love (the only one worthy of a philosopher) is rare: it distinguishes one work of art from among a thousand others. For, as a rule, artists are no better than the rest of the world, they are even worse—they _misunderstand_ love. Even Wagner misunderstood it. They imagine that they are selfless in it because they appear to be seeking the advantage of another creature often to their own disadvantage. But in return they want to _possess_ the other creature.… Even God is no exception to this rule, he is very far from thinking "What does it matter to thee whether I love thee or not?"—He becomes terrible if he is not loved in return "_L'amour_—and with this principle one carries one's point against Gods and men—_est de tous les sentiments le plus égoiste, et par conséquent, lorsqu'il est blessé, le moins généreux_" (B. Constant).

3.

Perhaps you are beginning to perceive how very much this music _improves_ me?—_Il faut méditerraniser la musique._ and I have my reasons for this principle ("Beyond Good and Evil," pp. 216 _et seq._) The return to Nature, health, good spirits, youth, _virtue_!—And yet I was one of the most corrupted Wagnerites.… I was able to take Wagner seriously. Oh, this old magician! what tricks has he not played upon us! The first thing his art places in our hands is a magnifying glass: we look through it, and we no longer trust our own eyes—Everything grows bigger, _even Wagner grows bigger_.… What a clever rattlesnake. Throughout his life he rattled "resignation," "loyalty," and "purity" about our ears, and he retired from the _corrupt_ world with a song of praise to chastity!—And we believed it all.…

—But you will not listen to me? You _prefer_ even the _problem_ of Wagner to that of Bizet? But neither do I underrate it; it has its charm. The problem of salvation is even a venerable problem. Wagner pondered over nothing so deeply as over salvation: his opera is the opera of salvation. Someone always wants to be saved in his operas,—now it is a youth; anon it is a maid,—this is _his problem_—And how lavishly he varies his _leitmotif_! What rare and melancholy modulations! If it were not for Wagner, who would teach us that innocence has a preference for saving interesting sinners? (the case in "Tannhauser"). Or that even the eternal Jew gets saved and _settled down_ when he marries? (the case in the "Flying Dutchman"). Or that corrupted old females prefer to be saved by chaste young men? (the case of Kundry). Or that young hysterics like to be saved by their doctor? (the case in "Lohengrin"). Or that beautiful girls most love to be saved by a knight who also happens to be a Wagnerite? (the case in the "Mastersingers"). Or that even married women also like to be saved by a knight? (the case of Isolde). Or that the venerable Almighty, after having compromised himself morally in all manner of ways, is at last delivered by a free spirit and an immoralist? (the case in the "Ring"). Admire, more especially this last piece of wisdom! Do you understand it? I—take good care not to understand it.… That it is possible to draw yet other lessons from the works above mentioned,—I am much more ready to prove than to dispute. That one may be driven by a Wagnerian ballet to desperation—_and_ to virtue! (once again the case in "Tannhauser"). That not going to bed at the right time may be followed by the worst consequences (once again the case of "Lohengrin").—That one can never be too sure of the spouse one actually marries (for the third time, the case of "Lohengrin"). "Tristan and Isolde" glorifies the perfect husband who, in a certain case, can ask only one question: "But why have ye not told me this before? Nothing could be simpler than that!" Reply:

“That I cannot tell thee. And what thou askest, That wilt thou never learn.”

“Lohengrin” contains a solemn ban upon all investigation and questioning. In this way Wagner stood for the Christian concept, “Thou must and shalt _believe_”. It is a crime against the highest and the holiest to be scientific.… The “Flying Dutchman” preaches the sublime doctrine that woman can moor the most erratic soul, or to put it into Wagnerian terms “save” him. Here we venture to ask a question. Supposing that this were actually true, would it therefore be desirable?—What becomes of the “eternal Jew” whom a woman adores and _enchains_? He simply ceases from being eternal, he marries,—that is to say, he concerns us no longer.—Transferred into the realm of reality, the danger for the artist and for the genius—and these are of course the “eternal Jews”—resides in woman: _adoring_ women are their ruin. Scarcely any one has sufficient character not to be corrupted—“saved” when he finds himself treated as a God—he then immediately condescends to woman.—Man is a coward in the face of all that is eternally feminine, and this the girls know.—In many cases of woman’s love, and perhaps precisely in the most famous ones, the love is no more than a refined form of _parasitism_, a making one’s nest in another’s soul and sometimes even in another’s flesh—Ah! and how constantly at the cost of the host!

We know the fate of Goethe in old-maidish moralin-corroded Germany. He was always offensive to Germans, he found honest admirers only among Jewesses. Schiller, “noble” Schiller, who cried flowery words into their ears,—he was a man after their own heart. What did they reproach Goethe with?—with the Mount of Venus, and with having composed certain Venetian epigrams. Even Klopstock preached him a moral sermon; there was a time when Herder was fond of using the word “Priapus” when he spoke of Goethe. Even “Wilhelm Meister” seemed to be only a symptom of decline, of a moral “going to the dogs”. The “Menagerie of tame cattle,” the worthlessness of the hero in this book, revolted Niebuhr, who finally bursts out in a plaint which _Biterolf_(8) might well have sung: “nothing so easily makes a painful impression as _when a great mind despoils itself of its wings and strives for virtuosity in something greatly inferior, while it renounces more lofty aims_.” But the most indignant of all was the cultured woman—all smaller courts in Germany, every kind of “Puritanism” made the sign of the cross at the sight of Goethe, at the thought of the “unclean spirit” in Goethe.—This history was what Wagner set to music. He _saves_ Goethe, that goes without saying; but he does so in such a clever way that he also takes the side of the cultured woman. Goethe gets saved: a prayer saves him, a cultured woman _draws him out of the mire_.

—As to what Goethe would have thought of Wagner?—Goethe once set himself the question, “what danger hangs over all romanticists—the fate of romanticists?”—His answer was: “To choke over the rumination of moral and religious absurdities.” In short: _Parsifal_.… The philosopher writes thereto an epilogue: _Holiness_—the only remaining higher value still seen by the mob or by woman, the horizon of the ideal for all those who are naturally short-sighted. To philosophers, however, this horizon, like every other, is a mere misunderstanding, a sort of slamming of the door in the face of the real beginning of their world,—their danger, their ideal, their desideratum.… In more polite language: _La philosophie ne suffit pas au grand nombre. Il lui faut la sainteté.…_

4.

I shall once more relate the history of the “Ring”. This is its proper place. It is also the history of a salvation except that in this case it is Wagner himself who is saved—Half his lifetime Wagner believed in the _Revolution_ as only a Frenchman could have believed in it. He sought it in the runic inscriptions of myths, he thought he had found a typical revolutionary in Siegfried.—“Whence arises all the evil in this world?” Wagner asked himself. From “old contracts”: he replied, as all revolutionary ideologists have done. In plain English: from customs, laws, morals, institutions, from all those things upon which the ancient world and ancient society rests. “How can one get rid of the evil in this world? How can one get rid of ancient society?” Only by declaring war against “contracts” (traditions, morality). _This Siegfried does._ He starts early at the game, very early—his origin itself is already a declaration of war against morality—he is the result of adultery, of incest.… Not the saga, but Wagner himself is the inventor of this radical feature, in this matter he _corrected_ the saga.… Siegfried continues as he began: he follows only his first impulse, he flings all tradition, all respect, all _fear_ to the winds. Whatever displeases him he strikes down. He tilts irreverently at old god-heads. His principal undertaking, however, is to emancipate woman,—“to deliver Brunnhilda.”… Siegfried and Brunnhilda, the sacrament of free love, the dawn of the golden age, the twilight of the Gods of old morality—_evil is got rid of_.… For a long while Wagner’s ship sailed happily along this course. There can be no doubt that along it Wagner sought his highest goal.—What happened? A misfortune. The ship dashed on to a reef; Wagner had run aground. The reef was Schopenhauer’s philosophy; Wagner had stuck fast on a _contrary_ view of the world. What had he set to music? Optimism? Wagner was ashamed. It was moreover an optimism for which Schopenhauer had devised an evil expression,—_unscrupulous_ optimism. He was more than ever ashamed. He reflected for

some time; his position seemed desperate.… At last a path of escape seemed gradually to open before him—what if the reef on which he had been wrecked could be interpreted as a goal, as the ulterior motive, as the actual purpose of his journey? To be wrecked here, this was also a goal:—_Bene navigavi cum naufragium feci_ … and he translated the “Ring” into Schopenhauerian language. Everything goes wrong, everything goes to wrack and ruin, the new world is just as bad as the old one:—Nonentity, the Indian Circe beckons … Brunnhilda, who according to the old plan had to retire with a song in honour of free love, consoling the world with the hope of a socialistic Utopia in which “all will be well”; now gets something else to do. She must first study Schopenhauer. She must first versify the fourth book of “The World as Will and Idea.” _Wagner was saved.…_ Joking apart, this _was_ a salvation. The service which Wagner owes to Schopenhauer is incalculable. It was the _philosopher of decadence_ who allowed the _artist of decadence_ to find himself.—

5.

The artist of decadence. That is the word. And here I begin to be serious. I could not think of looking on approvingly while this _décadent_ spoils our health—and music into the bargain. Is Wagner a man at all? Is he not rather a disease? Everything he touches he contaminates. _He has made music sick._

A typical _décadent_ who thinks himself necessary with his corrupted taste, who arrogates to himself a higher taste, who tries to establish his depravity as a law, as progress, as a fulfilment.

And no one guards against it. His powers of seduction attain monstrous proportions, holy incense hangs around him, the misunderstanding concerning him is called the Gospel,—and he has certainly not converted only the _poor in spirit_ to his cause!

I should like to open the window a little:—Air! More air!—

The fact that people in Germany deceive themselves concerning Wagner does not surprise me. The reverse would surprise me. The Germans have modelled a Wagner for themselves, whom they can honour: never yet have they been psychologists; they are thankful that they misunderstand. But that people should also deceive themselves concerning Wagner in Paris! Where people are scarcely anything else than psychologists. And in Saint Petersburg! Where things are divined, which even Paris has no idea of. How intimately related must Wagner be to the entire decadence of Europe for her not to have felt that he was decadent! He belongs to it, he is its protagonist, its greatest name.… We bring honour on ourselves by elevating him to the clouds—For the mere fact that no one guards against him is in itself already a sign of decadence. Instinct is weakened, what ought to be eschewed now attracts. People actually kiss that which plunges them more quickly into the abyss.—Is there any need for an example? One has only to think of the régime which anæmic, or gouty, or diabetic people prescribe for themselves. The definition of a vegetarian: a creature who has need of a corroborating diet. To recognise what is harmful as harmful, to be able to deny oneself what is harmful, is a sign of youth, of vitality. That which is harmful lures the exhausted: cabbage lures the vegetarian. Illness itself can be a stimulus to life but one must be healthy enough for such a stimulus!—Wagner increases exhaustion—_therefore_ he attracts the weak and exhausted to him. Oh, the rattlesnake joy of the old Master precisely because he always saw “the little children” coming unto him!

I place this point of view first and foremost: Wagner’s art is diseased. The problems he sets on the stage are all concerned with hysteria; the convulsiveness of his emotions, his over-excited sensitiveness, his taste which demands ever sharper condimentation, his erraticness which he togged out to look like principles, and, last but not least, his choice of heroes and heroines, considered as physiological types (—a hospital ward!—): the whole represents a morbid picture; of this there can be no doubt. _Wagner est une névrose_. Maybe, that nothing is better known to-day, or in any case the subject of greater study, than the Protean character of degeneration which has disguised itself here, both as an art and as an artist. In Wagner our medical men and physiologists have a most interesting case, or at least a very complete one. Owing to the very fact that nothing is more modern than this thorough morbidness, this dilatoriness and excessive irritability of the nervous machinery, Wagner is the _modern artist par excellence_, the Cagliostro of modernity. All that the world most needs to-day, is combined in the most seductive manner in his art,—the three great stimulants of exhausted people: _brutality_, _artificiality_ and _innocence_ (idiocy).

Wagner is a great corrupter of music. With it, he found the means of stimulating tired nerves,—and in this way he made music ill. In the art of spurring exhausted creatures back into activity, and of recalling half-corpses to life, the inventiveness he shows is of no mean order. He is the master of hypnotic trickery, and he fells the strongest like bullocks. Wagner’s _success_—his success with nerves, and therefore with women—converted the whole world of ambitious musicians into disciples of his secret art. And not only the ambitious, but also the _shrewd_.… Only with morbid music can money be made to-day; our big theatres live on Wagner.

6.

—Once more I will venture to indulge in a little levity. Let us suppose that Wagner's _success_ could become flesh and blood and assume a human form; that, dressed up as a good-natured musical savant, it could move among budding artists. How do you think it would then be likely to express itself?—

My friends, it would say, let us exchange a word or two in private. It is easier to compose bad music than good music. But what, if apart from this it were also more profitable, more effective, more convincing, more exalting, more secure, more _Wagnerian_?… _Pulchrum est paucorum hominum._ Bad enough in all conscience! We understand Latin, and perhaps we also understand which side our bread is buttered. Beauty has its drawbacks: we know that. Wherefore beauty then? Why not rather aim at size, at the sublime, the gigantic, that which moves the _masses_?—And to repeat, it is easier to be titanic than to be beautiful; we know that.…

We know the masses, we know the theatre. The best of those who assemble there,—German youths, horned Siegfrieds and other Wagnerites, require the sublime, the profound, and the overwhelming. This much still lies within our power. And as for the others who assemble there,—the cultured _crétins_, the _blasé_ pigmies, the eternally feminine, the gastrically happy, in short the people—they also require the sublime, the profound, the overwhelming. All these people argue in the same way. "He who overthrows us is strong; he who elevates us is godly; he who makes us wonder vaguely is profound."—Let us make up our mind then, my friends in music: we do want to overthrow them, we do want to elevate them, we do want to make them wonder vaguely. This much still lies within our powers.

In regard to the process of making them wonder: it is here that our notion of "style" finds its starting-point. Above all, no thoughts! Nothing is more compromising than a thought! But the state of mind which _precedes_ thought, the labour of the thought still unborn, the promise of future thought, the world as it was before God created it—a recrudescence of chaos.… Chaos makes people wonder.…

In the words of the master: infinity but without melody.

In the second place, with regard to the overthrowing,—this belongs at least in part, to physiology. Let us, in the first place, examine the instruments. A few of them would convince even our intestines (—they _throw open_ doors, as Handel would say), others becharm our very marrow. The _colour of the melody is_ all-important here, _the melody itself_ is of no importance. Let us be precise about _this_ point. To what other purpose should we spend our strength? Let us be characteristic in tone even to the point of foolishness! If by means of tones we allow plenty of scope for guessing, this will be put to the credit of our intellects. Let us irritate nerves, let us strike them dead: let us handle thunder and lightning,—that is what overthrows.…

But what overthrows best, is _passion_.—We must try and be clear concerning this question of passion. Nothing is cheaper than passion! All the virtues of counterpoint may be dispensed with, there is no need to have learnt anything,—but passion is always within our reach! Beauty is difficult: let us beware of beauty!… And also of _melody!_ However much in earnest we may otherwise be about the ideal, let us slander, my friends, let us slander,—let us slander melody! Nothing is more dangerous than a beautiful melody! Nothing is more certain to ruin taste! My friends, if people again set about loving beautiful melodies, we are lost!…

First principle: melody is immoral. _Proof_: "Palestrina". _Application_: "Parsifal." The absence of melody is in itself sanctifying.…

And this is the definition of passion. Passion—or the acrobatic feats of ugliness on the tight-rope of enharmonic—My friends, let us dare to be ugly! Wagner dared it! Let us heave the mud of the most repulsive harmonies undauntedly before us. We must not even spare our hands! Only thus, shall we become _natural_.…

And now a last word of advice. Perhaps it covers everything—_Let us be idealists!_—If not the cleverest, it is at least the wisest thing we can do. In order to elevate men we ourselves must be exalted. Let us wander in the clouds, let us harangue eternity, let us be careful to group great symbols all around us! _Sursum! Bumbum!_—there is no better advice. The "heaving breast" shall be our argument, "beautiful feelings" our advocates. Virtue still carries its point against counterpoint. "How could he who improves us, help being better than we?" man has ever thought thus. Let us therefore improve mankind!—in this way we shall become good (in this way we shall even become "classics"—Schiller became a "classic"). The straining after the base excitement of the senses, after so-called beauty, shattered the nerves of the Italians: let us remain German! Even Mozart's relation to music—Wagner spoke this

word of comfort to us—was at bottom frivolous.…

Never let us acknowledge that music “may be a recreation,” that it may “enliven,” that it may “give pleasure.” _Never let us give pleasure!_—we shall be lost if people once again think of music hedonistically.… That belongs to the bad eighteenth century.… On the other hand, nothing would be more advisable (between ourselves) than a dose of—_cant, sit venia verbo_. This imparts dignity.—And let us take care to select the precise moment when it would be fitting to have black looks, to sigh openly, to sigh devoutly, to flaunt grand Christian sympathy before their eyes. “Man is corrupt who will save him? _what will save him?_” Do not let us reply. We must be on our guard. We must control our ambition, which w

INTRODUCCION

Cirilo Villaverde nació el 28 de octubre de 1812 en el ingenio Santiago, _cercano al pueblo de San Diego de Núñez (Pinar del Río). Su padre era médico del ingenio y en ese medio pasó sus primeros años._

En 1823 vino a La Habana, donde cursó estudios de pintura, filosofía y derecho. Se recibió de Bachiller en Leyes en 1832, pero apenas ejerció esta profesión. Sus principales actividades fueron la enseñanza y el periodismo.

Trabajó como maestro en los colegios Buenavista y Real Cubano de la capital y La Empresa de Matanzas. Publicó para uso de las escuelas un Compendio geográfico de la isla de Cuba (1845), El librito de cuentos y las conversaciones (1847) y El librito de los cuentos (1857).

Su obra es extensa y variada como periodista y literato. Colaboró en las principales publicaciones de la época.

Dio a conocer sus primeras narraciones--El ave muerta, La peña blanca, El perjurio y La cueva de Taganana--en Miscelánea de Útil y Agradable Recreo (1837) y en El Album, Engañar con la verdad, El espetón de oro y la primera parte de Excursión a Vuelta Abajo, todas en 1838. La Cartera Cubana insertó en su sección de folletines Amores y contratiempos de un guajiro y Una cruz negra, en 1839. La Siempreviva en ese mismo año publicó la primera versión de Cecilia Valdés o La loma del Ángel.

Mientras desempeñaba su cátedra en el colegio La Empresa _comenzó a escribir para_ Faro Industrial de La Habana. _De regreso a la capital, fue uno de sus principales redactores y condueño junto a Bachiller y Morales. En este diario aparecieron entre 1842 y 1847 la segunda parte de_ Excursión a Vuelta Abajo _(1842)_, El guajiro _(1842)_, La peineta calada _(1843)_, Dos amores _(1843)_, El penitente _(1844)_, La tejedora de sombreros de Yarey _(1844-45) y otras de menor importancia, así como multitud de notas, crónicas y artículos de crítica literaria y de costumbres calzados con su nombre o con los seudónimos de_ Sansueña, Yo, El ambulante del oeste, Lola de la Habana _y otros_.

Villaverde, defensor de los ideales independentistas, participó como propagandista activísimo en la conspiración de La Mina de la Rosa Cubana _de 1848. Al ser descubierta la misma por delación de un conjurado fue apresado en La Habana y condenado primero a muerte «en garrote vil» y más tarde a diez años de prisión. Escapó el 31 de marzo de 1849 con otros presos y escondido en la bodega de una goleta costera, llegó a los Estados Unidos._

En Norteamérica continuó luchando por sus principios políticos. Fue en Nueva York secretario de Narciso López, a quien conocía desde 1846, y redactor en jefe de La verdad. _Publicó en Nueva Orleans entre 1853 y 1854 el periódico_ El independiente, _etc._

Se trasladó a Filadelfia en 1854, donde vivió como profesor de español y contrajo matrimonio con Emilia Casanova, una destacada activista de la independencia cubana.

Regresó a La Habana en 1858, acogido a la amnistía. Aquí trabajó al frente de la imprenta La Antilla, _que publicara algunas obras de interés para nuestras letras, como los artículos de costumbres de Anselmo Suárez y Romero, y colaboró en el periódico literario_ La Habana _en compañía de Sterling y Calcagno, con importantes juicios críticos sobre Betancourt y otros contemporáneos. Volvió poco después a Nueva York, donde continuó sus labores de maestro y periodista. Fue entonces redactor de_ La América _(1861-62)_, La Ilustración Americana _(1865-1869)_, El Espejo _y_ El Avisador Hispanoamericano. _En 1864 fundó con su mujer un colegio en Wechawken. Durante esta segunda estancia en los Estados Unidos continuó luchando por la independencia de Cuba, como muchos otros cubanos de su tiempo. Sólo regresó a la Isla en 1888 por dos semanas._

Murió en Nueva York el 20 de octubre de 1894. Su figura al morir contaba con la admiración y el reconocimiento de sus contemporáneos por su doble condición de patriota y novelista.

La novela que consolidó su fama literaria fue Cecilia Valdés o La loma del Ángel, _publicada en su forma definitiva en Nueva York en 1882. Ninguna de sus obras anteriores respondió a empeño tan elevado ni despertó como ésta el entusiasmo del público y la crítica. En ella Villaverde recoge el panorama de la vida cubana desde 1812 hasta 1831. Muestra sus categorías políticas, sociales y económicas y las terribles lacras que padecían. La obra, con sus clases poderosas y sus clases oprimidas, con sus funcionarios venales y su burguesía indolente, con sus mulatos discriminados y sus negros esclavos, con sus familias enriquecidas por el régimen esclavista y sus aristócratas de blasones comprados a la decrépita monarquía española, sirve de esclarecedor prólogo a nuestra historia republicana._

El ambiente de esta época colonial, trasladado con amplitud y minuciosidad a las abundosas páginas del libro, es lo decisivo en la obra, lo que determina su vigencia en la apreciación de los críticos. Porque Cecilia Valdés _está muy lejos de ser una obra perfecta. El autor explica en el prólogo su proceso de creación; proceso que indudablemente resintió el saldo final del trabajo. El asunto central--drama de amor, celos, venganza y muerte--apenas difiere de los usuales en los folletines de la época; los

personajes en su mayoría no trascienden de los rasgos externos; la acción es desarticulada y digresiva, hurtada a la historia y los personajes principales por criaturas y sucesos de menor cuantía; el estilo, híbrido, plagado de debilidades románticas entre las que alborean atisbos realistas; el lenguaje, oscilante entre el arcaísmo más rebuscando y el espontáneo giro popular nuestro; el desenlace, atropellado, en contradicción con las dimensiones de la narración._

Pero Cecilia Valdés _es en nuestra historia literaria, a pesar de esas abundantes y graves deficiencias, la mejor creación novelística del siglo_ XIX.

Muchos cubanos de hoy la conocen a través de la adaptación teatral de Agustín Rodríguez y José Sánchez Arcilla, musicalizada admirablemente por Gonzalo Roig; versión que necesariamente fue vertebrada con la historia de los protagonistas. Despojado del lujo descriptivo de su ambiente, el asunto resulta endeble y melodramático. Esta aplaudida adaptación confirma que lo fundamental en Cecilia Valdés _es el ambiente. Su costumbrismo, de vigorosa indagación política, social y económica, es el que atenúa sus defectos y sitúa a la obra en las puertas de la novelística realista._

A LAS CUBANAS

Lejos de Cuba y sin esperanza de volver a ver su sol, sus flores, ni sus palmas, ¿a quién, sino a vosotras, caras paisanas, reflejo del lado más bello de la patria, pudiera consagrar, con más justicia, estas tristes páginas?

EL AUTOR

PROLOGO

Publiqué el primer tomo de esta novela, en la _Imprenta Literaria_ de don Lino Valdés a mediados del año de 1839. Contemporáneamente empecé la composición del segundo tomo, que debía completarla; pero no trabajé mucho en él, tanto porque me trasladé poco después a Matanzas como uno de los maestros del colegio de _La Empresa_, fundado recientemente en dicha ciudad, cuanto porque una vez allí, emprendí la composición de otra novela, _La joven de la flecha de oro_, que concluí e imprimí en un volumen el año de 1841.

De vuelta en la capital el año de 1842, sin abandonar el ejercicio del magisterio, entré a formar parte de la redacción de _El Faro Industrial_, al que consagré todos los trabajos literarios y novelescos que se siguieron casi sin interrupción hasta mediados de 1848. En sus columnas, entre otros muchos escritos de diverso género, aparecieron en la forma de folletines:--_El Ciego y su Perro_; _La Excursión a La Vuelta Bajo_; _La Peineta Calada_; _El Guajiro_; _Dos Amores_; _El Misionero del Caroní_; _El Penitente_, etc.

Pasada la media noche del 20 de octubre del último año citado, fui sorprendido en la cama y preso, con gran golpe de soldados y alguaciles por el comisario del barrio de Monserrate, Barreda; y conducido a la cárcel pública, de orden del Capitán General de la Isla, don Federico Roncaly.

Encerrado cual fiera en una oscura y húmeda bartolina, permanecí seis meses consecutivos, al cabo de los cuales, después de juzgado y condenado a presidio por la Comisión Militar Permanente como conspirador contra los derechos de la corona de España, logré evadirme el 4 de abril de 1849, en unión de don Vicente Fernández Blanco, reo de delito común y del llavero de la cárcel García Rey; quien de allí a poco fue causa de una grave dificultad entre los gobiernos de España y de los Estados Unidos. Por extraña casualidad los tres salimos juntos en barco de vela del puerto de La Habana; pero nuestra compañía sólo duró hasta la ría de Apalachicola, en la costa meridional de Florida, desde donde me encaminé por tierra a Savannah y Nueva York.

Fuera de Cuba, reformé mi género de vida: troqué mis gustos literarios por más altos pensamientos; pasé del mundo de las ilusiones, al mundo de las realidades; abandoné, en fin, las frívolas ocupaciones del esclavo en tierra esclava, para tomar parte en las empresas del hombre libre en tierra libre. Quedáronse allá mis manuscritos y libros, que si bien recibí algún tiempo después, ya no me fue dado hacer nada con ellos; puesto que primero como redactor de _La Verdad_, periódico separatista cubano, luego como secretario militar del general Narciso López, llevé vida muy activa y agitada, ajena por demás a los estudios y trabajos sedentarios.

Con el fracaso de la expedición de Cárdenas en 1850, el desastre de la invasión de las Pozas y la muerte del ilustre caudillo de nuestra intentona revolucionaria en 1851, no cesaron, antes revivieron nuevos proyectos de libertar a cuba, que venían acariciando los patriotas cubanos desde muy al principio del presente siglo. Todos, sin embargo, cual los anteriores terminaron en

desastres y desgracias por el año de 1854.

En 1858 me hallaba en La Habana tras nueve años de ausencia. Reimpresa entonces mi novela _Dos Amores_, en la imprenta del señor Próspero Massana, por consejo suyo acometí la empresa de revisar, mejor todavía, de refundir la otra novela, _Cecilia Valdés_, de la cual sólo existía impreso el primer tomo y manuscrita una pequeña parte del segundo. Había trazado el nuevo plan hasta sus más menudos detalles, escrito la advertencia y procedía al desarrollo de la acción, cuando tuve de nuevo que abandonar la patria.

Las vicisitudes que se siguieron a esta segunda expatriación voluntaria, la necesidad de proveer a la subsistencia de familia en país extranjero, la agitación política que desde 1865 empezó a sentirse en Cuba, las tareas periodísticas que luego emprendí, no me concedieron ánimo ni vagar para entregarme a la obra larga, sin expectativa de lucro inmediato, y por lo mismo tediosa--que demandaba el expurgo, ensanche y refundición de la más voluminosa y complicada de mis obras literarias.

Tras la nueva agitación de 1865 a 1868 vino la revolución del último año nombrado y la guerra sangrienta por una década en Cuba, acompañada de las escenas tumultuosas de los emigrados cubanos en todos los países circunvecinos a ella, especialmente en Nueva York. Como antes y como siempre, troqué las ocupaciones literarias por la política militante, siendo así que acá desplegaban la pluma y la palabra al menos la misma vehemencia que allá el rifle y el machete.

Durante la mayor parte de esa época de delirio y de sueños patrióticos, durmió, por supuesto, el manuscrito de la novela. ¿Qué digo? no progresó más allá de una media decena de capítulos, trazados a ratos perdidos, cuando el recuerdo de la patria empapada en la sangre de sus mejores hijos, se ofrecía en todo su horror y toda su belleza y parecía que demandaba de aquéllos que bien y mucho la amaban, la fiel pintura de su existencia bajo el triple punto de vista físico, moral y social, antes que su muerte o su exaltación a la vida de los pueblos libres, cambiaran enteramente los rasgos característicos de su anterior fisonomía.

De suerte, que en ningún sentido puede decirse con verdad que he empleado cuarenta años (período cursado de 1839 a la fecha) en la composición de la novela. Cuando me resolví a concluirla, habrá dos o tres años, lo más que he podido hacer ha sido despachar un capítulo, con muchas interrupciones, cada quince días, a veces cada mes, trabajando algunas horas entre semana y todo el día los domingos.

Con esta manera de componer obras de imaginación, no es fácil mantener constante el interés de la narrativa, ni siempre animada y unida la acción, ni el estilo parejo y natural, ni el tono templado y sostenido que exigen las producciones del género novelesco. Y tal es uno de los motivos que me impelen a hablar de la novela y de mí.

El otro es, que después de todo, me ha salido el cuadro tan sombrío y de carácter tan trágico, que, cubano como soy hasta la médula de los huesos y hombre de moralidad, siento una especie de temor o vergüenza presentarlo al público sin una palabra explicativa de disculpa. Harto se me alcanza que los extraños, dígase, las personas que no conozcan de cerca las costumbres ni la época de la historia de Cuba que he querido pintar, tal vez crean que escogí los colores más oscuros y sobrecargué de sombras el cuadro por el mero placer de causar efecto a la Rembrandt, o a la Gustavo Doré. Nada más distante de mi mente. Me precio de ser, antes que otra cosa, escritor realista, tomando esta palabra en el sentido artístico que se le da modernamente.

Hace más de treinta años que no leo novela ninguna, siendo Walter Scott y Manzoni los únicos modelos que he podido seguir al trazar los variados cuadros de _Cecilia Valdés_. Reconozco que habría sido mejor para mi obra que yo hubiese escrito un idilio, un romance pastoril, siquiera un cuento por el estilo de _Pablo y Virginia_[1] o de _Atala_ y _Renato_;[2] pero esto, aunque más entretenido y moral, no hubiera sido el retrato de ningún personaje viviente, ni la descripción de las costumbres y pasiones de un pueblo de carne y hueso, sometido a especiales leyes políticas y civiles, imbuido en cierto orden de ideas y rodeado de influencias reales y positivas. Lejos de inventar o de fingir caracteres y escenas fantasiosas e inverosímiles, he llevado el realismo, según entiendo, hasta el punto de presentar los principales personajes de la novela con todos sus pelos y señales, como vulgarmente se dice, vestidos con el traje que llevaron en vida, la mayor parte bajo su nombre y apellido verdaderos, hablando el mismo lenguaje que usaron en las escenas históricas en que figuraron, copiando en lo que cabía, _d'après nature_,[3] su fisonomía física y moral, a fin de que aquéllos que los conocieron de vista o por tradición, los reconozcan sin dificultad y digan cuando menos: el parecido es innegable.

Apenas si he aspirado a otra cosa. Lo único que debo agregar en descargo de mi conciencia, por si alguien juzgare que la pintura no tiene nada de santa ni de edificante, es que, al situar la acción de la novela en el teatro habanero y época corrida de 1812 a 1831, no encontré personajes que pudieran representar con mediana fidelidad el papel, por ejemplo, del payo Lorenzo, o el del

pacato de don Abundio, o el del enérgico padre Cristóbal, o el del santo arzobispo Carlos Borromeo; al paso que abundaban los que podían pasar, sin contradicción, por fieles copias de los Canoso, los Tramoya y los don Rodrigo, matones, bravos y libertinos, cuya generación parece ser de todos los países y de todas las épocas.

Tampoco ha de achacarse a falta del autor si el cuadro no ilustra, no escarmienta, no enseña deleitando. Lo más que me ha sido dado hacer, es abstenerme de toda pintura impúdica o grosera, falta en que era fácil incurrir, habida consideración a las condiciones, al carácter y a las pasiones de la mayoría de los actores de la novela; porque nunca he creído que el escritor público, en el afán de parecer fiel y exacto pintor de las costumbres, haya de olvidar que le merecen respeto la virtud y la modestia del lector.

Por lo demás, si la obra que ahora sale a luz completa, no contiene todos los defectos de lenguaje y de estilo que sacó el primer tomo impreso en La Habana, si hay mayor corrección y verdad en la pintura de los caracteres, si resultan eliminadas ciertas escenas y frases de escasa o dudosa moralidad, si el tono general de la composición es más uniforme y animado, en mucha parte a los consejos de mi esposa, con quien he podido consultar capítulo tras capítulo, a medida que los iba concluyendo.

C. VILLAVERDE

Nueva York, mayo, 1879

PRIMERA PARTE

CAPÍTULO I

Tal es el fruto de la culpa, Tello, cosecha de dolor.

SOLÍS

Hacia el oscurecer de un día de noviembre del año de 1812, seguía la calle de Compostela en dirección del norte de la ciudad, una calesa tirada por un par de mulas, en una de las cuales, como era de costumbre, cabalgaba el calesero negro. El traje de éste, las guarniciones de aquéllas y los ornamentos de plata maciza, mostraban a las claras que era rica la persona a que pertenecía tan lujoso equipaje. Prendida estaba de los calamones, no sólo por el frente, sino también por un costado y hasta la mitad del otro,--la cortina o capacete de paño con banda de vaqueta. Sea el que fuese quien ocupaba el carruaje a la sazón, no puede negarse que tenía interés en guardar la incógnita, aunque parecía excusada la precaución, por cuanto no había alma viviente en las calles, ni se divisaba otra luz que la de las estrellas, o la artificial de algunas casas que se escapaba por las anchas rendijas de las puertas cerradas.

Pararon de repente las mulas al trote en la esquina del callejón de San Juan de Dios y salió a espacio y con no poco trabajo de la calesa un caballero alto, bien puesto, vestido de frac negro abotonado hasta el cuello, dejando ver por debajo el chaleco o chupa de color claro, pantalones de _carranclán_ de pie, corbatín de cerda y sombrero de castor con copa enorme y ala angosta. Por lo que podía distinguirse en aquella media luz de las estrellas, las facciones más notables del hombre eran la nariz, que tenía aguileña, los ojos bastante vivos, el rostro ovalado y la barba pequeña. El color de ésta y el del cabello, las sombras del sombrero y de las paredes alterosas del convento vecino, lo oscurecían tal vez sin ser negro.

--Sigue hasta la calle de lo Empedrado--dijo el caballero en tono imperioso, más bajo, apoyando la mano izquierda en la silla de la mula de varas--y espera inmediato a la esquina. En caso que diese la ronda contigo, di que perteneces a don Joaquín Gómez y que aguardas sus órdenes. ¿Entiendes, Pío?

--Sí, señor, contestó el calesero; quien desde que empezó a hablar su amo tenía el sombrero en la mano.

Y siguió al paso de las mulas hasta el punto que le indicó aquél.

El callejón de San Juan de Dios se compone de dos cuadras solamente, cerrado por un extremo en las paredes del convento de Santa Catalina y por el otro en las casas de la calle de la Habana. El hospital de San Juan de Dios, que le da nombre, y que por sus altas y cuadradas ventanas, siempre deja salir el vaho caliente de los enfermos, ocupa todo un lado de la segunda cuadra y los otros tres, casitas pequeñas de tejas coloradas y un solo piso, el de las últimas en particular más alto que el nivel de la calle, con uno y dos escalones de piedra a la puerta. Las de mejor apariencia de ellas eran las de la primera cuadra entrando de la calle de Compostela. Eran todas de un mismo tamaño, poco más o menos, de una sola ventana y puerta, ésta de cedro con clavos de

cabeza grande, pintadas de color de ladrillo, aquélla o de espejo o volada[4] y de balaustres de madera gruesa. El piso de la calle se hallaba en su estado primitivo y natural, pedregoso y sin banquetas.

El caballero desconocido, arrimado a las paredes, debajo de los salientes aleros de tejas, se detuvo a la puerta de la tercera casita de su derecha y dio dos golpecitos con la punta de los dedos. Allí sin duda le aguardaban, porque tardaron en abrir lo que tardó en pasar de la ventana a la puerta la persona que quitó la tranca con que se cerraba por dentro. Esa resultó ser la ama de la casa; mulata como de 40 años de edad, de estatura mediana, llena de carnes, aunque conservaba el talle estrecho, los hombros redondos y desnudos, la cabeza hermosa, la nariz algo gruesa, la boca expresiva y el cabello espeso y muy crespo. Vestía camisa fina bordada, de manga corta, y enaguas de sarga sin pliegues ni adorno ninguno.

Había pocos muebles en la sala: arrimada a la pared de la derecha una mesa de caoba, sobre la cual ardía una vela de cera, dentro de una guardabrisa o fanal, y varias sillas pesadas de cedro con asiento y respaldo de vaqueta, clavados con tachuelas de cobre. En aquella época esto se tenía por lujo, mucho más tratándose de una mujer de color, que ocupaba aquella habitación como ama y no como criada. El caballero no le dio la mano al entrar, sólo le hizo un saludo grave sin dejar de ser gracioso y amable; lo que sin disputa era aún más extraño, pues aparte de su diferencia de condición y de raza, la de sus edades respectivas era notable a primera vista y no cabía entre ellos otra relación que la de la amistad, más o menos sincera y desinteresada. Enseguida preguntó en tono triste y acercándose a la mujer cuanto podía, a fin de no levantar la voz, que la tenía algo bronca:

--¿Y qué tal la enferma?

La mulata sacudió la cabeza con aire todavía más triste y contestó con tres monosílabos:

--¡Ah! muy mal.

Algo más animada, aunque sin despejársele el semblante, agregó poco después:

--¿No se lo dije al señor? _Entodavía_ ha de acabar con ella el golpe.

--Pues qué, replicó desazonado el caballero, ¿no me dijo Vd. anoche que estaba mejor y más tranquila?

--Lo estaba, sí, señor; pero la mañana la ha pasado muy _desinquieta_ y agitada. Decía que le daban calor las sábanas, que le ardía la cabeza, y varias veces ha tratado de salirse de la cama buscando aire. De manera que fue preciso mandar por el médico. Vino y recetó un calmante: lo tomó, porque la pobrecita toma cuanto le dan. De sus resultas ya se duerme como una piedra, ya _dispierta_ sobresaltada. ¡Ay, señor, su sueño se parece tanto a la muerte! Me da miedo, mucho miedo. Yo se lo decía al señor desde un principio, el golpe era demasiado para ella. Esa muchacha no tiene fuerzas para soportarlo. ¡Ah! mi señor, de esta hecha la perdemos, lo estoy mirando; me lo ha dado el corazón.

Y no dijo más, porque la emoción le ahogó la voz en la garganta.

--Veo que Vd. se acobarda, _seña_ Josefa, dijo el desconocido con dulzura y sentimiento. ¿Pues no ha tratado Vd. de convencerla de que la separación es sólo por muy corto tiempo? No es ella ninguna chiquilla...

--¡Que si no he tratado! El señor parece que no la conoce _entodavía_. Ella no oye razones. Es la más voluntariosa y cabecidura que ha nacido. Además, _dende_ ese lance no está en su cabal juicio y razón. ¿El señor mismo no trató aquella noche fatal de consolarla y tranquilizarla? ¿Y qué sacó? Acuérdese lo que _semos_: nada. El señor va a ver por sus propios ojos que se escogió mal el momento de someterla a semejante prueba. No se habían pasado los cuarenta días y luego tenía una calentura que volaba. Sí, concluyó ya del todo conmovida y llorosa--me tengo tragado que de ésta no sale ella con juicio o con vida.

--Dios querrá, _seña_ Josefa, que no se realicen tan funestos pronósticos, dijo el caballero preocupado. Después de breve rato añadió:--Ella es joven y robusta, y todavía la naturaleza triunfará de todos sus males y penas. Fío más en esto que en la ciencia oscura de los médicos. Aparte de eso, Vd. sabe que se ha hecho lo hecho por el bien de todos, mejor dicho... Más adelante me lo agradecerán, estoy seguro. Yo no podía ni debía darla mi nombre. No, no, repitió como azorado del eco de su propia voz. Nadie mejor que Vd. lo sabe. Vd. que es mujer de razón, conocerá y confesará que así tenía que ser. Es preciso que la chica lleve un nombre, nombre de que no tenga que avergonzarse mañana, ni esotro día, el de Valdés, con que quizás haga un buen casamiento. Para ello no había más remedio sino pasar por la Real Casa Cuna. Esto no ha podido ser más doloroso para la madre, bien lo sé, que para... todos nosotros. Pero dentro de breves días la habrán bautizado y entonces haré que la traiga aquí María de Regla, mi negra, que tres meses hace perdió un hijo del mal de los siete días, y la está amamantando en la Casa Cuna

por orden mía. Ella la devolverá sana, salva y cristiana a los brazos de su madre. Yo tengo arreglado todo eso con Montes de Oca, el médico de la Real Casa, por quien a menudo sé de la chica. Al principio lloraba mucho y se negaba a tomar el pecho de María de Regla, por lo que enflaqueció un poco. Pero ya todo eso ha pasado y ahora está gorda y rozagante, es decir, según me ha informado Montes de Oca, porque yo no la he visto desde la noche en que la hice pasar por el torno... Los ojos se me fueron tras ella. Es indecible cuánto me costó ese paso... Pero, a otra cosa. Vd. sabe, sin embargo, que no cabe equivocación.

--Demasiado que lo sé--dijo la mulata enjugándose las lágrimas. No puede equivocarse, no. Por lo tocante a eso estoy tranquila, como que a pesar de sus chillidos, que me partían el alma, le hice la media luna azul en el hombro izquierdo, según el señor me ordenó. Yo no sé a quién le dolería más, si a ella o a mí... La madre, la madre, mi señor, es la que me tiene sin sosiego. Ella no puede resistir. De por fuerza pierde el juicio o la vida. Yo se lo repito al señor.

Seña Josefa, como la llamó el desconocido, se conocía que era mujer inteligente, si bien por el descuido de su educación incurría a menudo en las faltas de lenguaje comunes al vulgo de las gentes en Cuba. A pesar de la madurez de sus años y de sus pesares, conservaba las muestras de una juventud bella y distinguida, buenos ojos, la expresión amorosa de la boca y la redondez del cuello, de los hombros y de los brazos. Tenía el color cetrino que resulta de la mezcla de hembra negra y varón indio; pero lo crespo del pelo y el óvalo del rostro no admitían la probabilidad de semejante maridaje, sino el de madre negra y padre blanco. Cuando joven llevó vida acomodada, tuvo goces y se rozó con gente bien criada y de buenas maneras. Honda debía de ser la pesadumbre que a la sazón la aquejaba, según eran la frecuencia de sus suspiros, la contracción repetida de su entrecejo y la abundancia del humor acuoso en que nadaban sus grandes ojos y le empañaban el brillo. Por lo demás, había en su actitud más desesperación que verdadero pesar. En efecto, como luego veremos, tenía razón sobrada para lo uno y no le faltaba para lo otro.

Hacía ratos que ambos personajes estaban callados, cada cual a vueltas con sus propios pensamientos, que de seguro no coincidían en ningún punto, a tiempo que se oyeron un lamento y un grito desgarrador salidos del interior de la casa. La mujer hizo una exclamación dolorosa, se llevó ambas manos a la cabeza y corrió como desalada por el primer aposento al segundo cuarto. Maquinalmente el caballero hizo con las manos el mismo movimiento y siguió sus pasos en silencio, aunque a cierta distancia. Allí no había más luz que la mortecina de una lamparita de aceite en una mesa, sobre la cual se veía un nicho o retablo de titiritero, donde se veneraba una figura de talla, con traje talar o de mujer, que miraba al cielo y tenía clavada en el pecho una espada, cuya empuñadura parecía de plata. En el lado opuesto había un catre, con colgaduras de seda, ya ajadas, y a la cabecera una silla de cuero, que en el momento que entró allí _seña_ Josefa, la había desocupado una anciana negra, escuálida, imagen de la muerte, cuya cabeza blanca contrastaba con el ébano de su cuello largo y huesoso. Tenía en la mano derecha un rosario y varios escapularios al pecho sobre la camisa blanca; ciñéndola el talle de la falda de cañamazo, una correa negra y larga a lo fraile agustino. Estaba como embebida o rezando con gran fervor, y al tocarle en el hombro _seña_ Josefa, alzó de repente la cabeza, la volvió hacia la puerta del aposento, vio en ella de pie al desconocido, hizo un movimiento de horror o de susto y desapareció por la puerta del fondo sin decir palabra.

Ocupó su lugar _seña_ Josefa. Abrió con tiento las cortinas del lecho, y por señas indicó al caballero que se acercara; lo que hizo éste, al parecer, con repugnancia. Los ojos de ambos se clavaron en el rostro pálido de una muchacha de 20 años, yaciente boca arriba y aparentemente muerta. Porque no se movía a la sazón, tenía los ojos hundidos y cerrados los párpados, cuyas pestañas eran tan largas que daban sombra a las mejillas. La cabeza era lo único que tenía fuera de las sábanas, y eso casi enterrada en la almohada, la cual desaparecía bajo una mata de pelo negro, undoso y esparcido por todas partes en el mayor desorden. De en medio de aquel fondo negro se destacaba el rostro ovalado, pálido de cera de la enferma, con la barba aguda, la frente cuadrada y alta, la boca pequeña, los labios belfos, y la nariz bastante bien hecha para mujer de raza mezclada, como sin duda era aquélla de que ahora se trata. El conjunto era bueno, femenil; pero había tal expresión de angustia y melancolía en el semblante marchito por la enfermedad, que daba lástima el contemplarle. Movida por este sentimiento tal vez _seña_ Josefa dijo al oído del caballero:--Se ha dormido.

La contestación del caballero fue sacudir la cabeza negativamente, acaso porque en aquel instante creyó notar un temblor convulsivo que recorría de pies a cabeza todo el cuerpo de la paciente. Tras el temblor empezó a levantársele el pecho, movimiento fácil de percibir por encima de la sábana, como una ola en mar sereno que repunta, de repente, y precursor del suspiro que exhaló enseguida del fondo del corazón, acompañado de un gemido doloroso y agudo. Comprendiendo el caballero lo que debía sobrevenir, sin poderlo remediar, apartó primero la vista y disimulada y paulatinamente se retiró a los pies de la cama. Incorporada en aquel instante la enferma, exclamó con aire de espanto:

--¡Mamita! ¿Era su merced?

--¡Hija mía! ¿Qué quieres? ¿Estás mejor?

--¡Ah! ¡Mamita! prosiguió la muchacha en el mismo aire de azorada.--La he visto, la acabo de ver. Sí, no me queda duda. ¡Ahí está! agregó señalando al cielo. ¡Se va! ¡Me la llevan! Debe estar muerta. ¡Ay!--Y se le escapó otro grito desgarrador.

--¡Hija! le observó la madre afligida. _Dispierta._ Tú estás soñando o esas son ilusiones tuyas.

--Venga acá, mamita, mire su merced misma.

Diciendo esto la atraía a sí por el brazo.

--¡Véala! ¿No es aquella la Virgen Santísima dentro de una nube dorada, con los pies desnudos, apoyados en las alas de infinitos ángeles? Ella es. ¡Mire! Por aquí. ¡Allá! Vea. ¡Se eleva!

--Visiones, hija mía. No hagas caso. Acuéstate y descansa.

--¿Cómo quiere su merced que me acueste, si veo que se llevan a mi hija, la hija de mis entrañas?

--¿Pero quién se la lleva, mi vida?

--¿Quién se la lleva? ¿Pues no lo ve su merced? La Virgen Santísima. Se la lleva en los brazos. Debe estar muerta. ¡Ah!

--Ella no se ha muerto, no lo creas; le dijo débilmente _seña_ Josefa, pues sobre este punto no estaba más segura que la enferma. Tu niña está viva y pronto la verás. Esos son sueños tuyos.

--Sueños, sueños, repitió la muchacha, distraída. ¿Yo soñaba? ¿No será más que un sueño? Pero, ¿y mi hija? ¿Dónde está? ¿Por qué me la han quitado? Y de que yo la perdiera su merced tiene la culpa, concluyó diciendo con iracundo ademán y acento.

No tuvo valor _seña_ Josefa para replicar palabra, bien por no irritar más a la enferma con una contradicción poco menos que inútil, bien porque la acusación era directa y fundada. Sólo acertó a volver los ojos hacia su derecha, con lo que los de la enferma naturalmente siguieron la misma dirección y en consecuencia tropezaron con el bulto oscuro del desconocido, que hacía por ocultarse tras las colgaduras de la cama.

--¿Quién está ahí? preguntó apuntando con el dedo. ¡Ah! ¡El es, el ladrón de mi hija! ¡Mi verdugo! ¿Qué vienes a buscar aquí? ¿Vienes, basilisco, a gozarte en tu obra? A tiempo llegas. Gózate a tus anchas. Mi hija ha volado al cielo, lo sé, de ello estoy convencida, yo la seguiré muy pronto; pero tú, tú, causa de nuestra condenación y muerte, tú bajarás... al infierno.

--¡Jesús! exclamó _seña_ Josefa santiguándose. Tú no sabes lo que dices. Calla.

Y anegada en lágrimas se arrojó sobre su hija con el doble objeto de impedirle que se levantara y de que siguiera en aquella terrible increpación contra el caballero desconocido. Por prudencia o por remordimiento, éste callaba e inclinó más la cabeza. El, de todos modos, estaba muy disgustado y luchaba consigo mismo a fin de tomar una resolución. Porque, previéndolo, había venido a ponerse al alcance de las recriminaciones, al parecer justas, de la enferma, quien aunque delirante, le echaba en cara la pérdida de su hija y la ruina de su razón. Mas no hizo por defenderse. Se sentía, al contrario, humillado, altamente ofendido por cuanto siendo sus intenciones las más puras, guiadas por el deseo del bien de todos los inmediatamente interesados, las resultas llevaban camino de ser muy desastrosas. A los ojos de su propia conciencia la justificación era fácil; el mundo, sin embargo, debía juzgarle por los hechos. Y a este juicio le tenía él horror cerval.

Continuaba entre tanto la lucha entre la madre y la hija. Esta, con los ojos de espantada, los cabellos desgreñados, la frente cubierta de sudor copioso, las mejillas encendidas por la fiebre, repelía con ambas manos a la madre y le repetía:--Déjame, mamita, déjame ver esa cara de hereje. Quiero pedirle cuenta de mi hija. El me la ha quitado, él, entrañas de fiera. Y la madre, siempre inundada en lágrimas estrechándola en sus brazos, le respondía:--Por el amor de Dios, hija mía, por la Purísima Concepción de María Santísima, por tu salud, por la de tu hija, que vive y está buena, cállate, tranquilízate. Yo te lo ruego por lo que más quiera.

Pero como se prolongase demasiado aquella lucha, se acercó el caballero a la cama, tomó en la suya una mano de la enferma, la cual ella no rechazó, y con voz grave, mas llena de exquisita ternura, le dijo:

--Charo, óyeme. Te prometo que mañana verás a tu hija. Vuelve en ti. ¡Cálmate! No más locuras.

Séase que de tanto bregar se le agotasen las fuerzas, séase que la impusiese respeto la voz del desconocido, es lo cierto que la enferma, exhalando un profundo suspiro, cayó repentinamente de espaldas en la almohada y allí quedó por breve rato sin movimiento. No creyó menos la madre, al pronto, sino que había expirado. Púsola con ese motivo la mano en el corazón, y como, ya por el susto, ya porque en efecto se le había paralizado la sangre en las venas a la paciente, no sintió por unos instantes las pulsaciones. Así que, grandemente asustada, se volvió para el caballero, que al parecer contemplaba impasible aquella escena muda, y con acento de amarga reconvención le dijo:

--¿Lo ve el señor? Está muerta.

No fue esto parte a hacerle perder al caballero su natural ecuanimidad. Lejos de ello, con mucha calma y deliberación le tomó el pulso a la muchacha, a guisa de médico, y después dijo:

--Traiga Vd. éter. Se ha desmayado. Esta moza está muy débil, necesita alimento.

--El médico lo ha prohibido, observó _seña_ Josefa.

--El médico no sabe lo que se pesca. Dela Vd. caldo. Pero despache con el éter.

Traído el álcali volátil, se le aplicaron a la nariz; pero las únicas señales de vida que dio la muchacha fue un estremecimiento de los párpados, que no abrió por cierto, y un llorar en silencio, o hilo a hilo, según reza la gráfica expresión vulgar. Mientras esto pasaba delante de la cama de la enferma, asomó la cabeza blanca por entre la puerta del fondo, medio abierta, la anciana negra antes mencionada; pero la retiró de golpe persignándose cual si viese al diablo, sin duda porque aún estaba allí el caballero desconocido. Al fin, éste se alejó de aquel sitio de dolor y de tribulación, saludó a _seña_ Josefa con una mera inclinación de cabeza, y salió a la calle murmurando en su despecho:

--¡Y nadie más que yo tiene la culpa!

CAPÍTULO II

Sola soy, sola nací, _Sola me tuvo mi madre,_ _Sola me tengo de andar,_ _Como la pluma en el aire._

Algunos años adelante, mejor, uno o dos después de la caída del segundo breve período constitucional, en que quedó establecido el estado de sitio de la Isla de Cuba y Capitán General de la misma don Francisco Dionisio Vives, solía verse por las calles del barrio del Ángel una muchacha de unos once a doce años de edad, quien, ya por su hábito andariego, ya por otras circunstancias de que hablaremos enseguida, llamaba la atención general.

Era su tipo el de las vírgenes de los más célebres pintores. Porque a una frente alta, coronada de cabellos negros y copiosos, naturalmente ondeados, unía facciones muy regulares, nariz recta que arrancaba desde el entrecejo, y por quedarse algo corta alzaba un si es no es el labio superior, como para dejar ver dos sartas de dientes menudos y blancos. Sus cejas describían un arco y daban mayor sombra a los ojos negros y rasgados, los cuales eran todo movilidad y fuego. La boca tenía chica y los labios llenos, indicando más voluptuosidad que firmeza de carácter. Las mejillas llenas y redondas y un hoyuelo en medio de la barba, formaban un conjunto bello, que para ser perfecto sólo faltaba que la expresión fuese menos maliciosa, si no maligna.

De cuerpo era más bien delgada que gruesa, para su edad antes baja que crecida, y el torso, visto de espaldas, angosto en el cuello y ancho hacia los hombros, formaba armonía encantadora, aun bajo sus humildes ropas, con el estrecho y flexible talle, que no hay medio de compararle sino con la base de una copa. La complexión podía pasar por saludable, la encarnación viva, hablando en el sentido en que los pintores toman esta palabra, aunque a poco que se fijaba la atención, se advertía en el color del rostro, que sin dejar de ser sanguíneo había demasiado ocre en su composición, y no resultaba diáfano ni libre. ¿A qué raza, pues, pertenecía esta muchacha? Difícil es decirlo. Sin embargo, a un ojo conocedor no podía esconderse que sus labios rojos tenían un borde o filete oscuro, y que la iluminación del rostro terminaba en una especie de penumbra hacia el nacimiento del cabello. Su sangre no era pura y bien podía asegurarse que allá en la tercera o cuarta generación estaba mezclada con la etíope.

Pero de cualquier manera, tales eran su belleza peregrina, su alegría y vivacidad, que la revestían de una especie de encanto, no dejando al ánimo vagar sino para admirarla y pasar de largo por las faltas o por las sobras de su progenie. Nunca la habían visto triste, nunca de mal humor, nunca reñir con nadie; tampoco podía darse razón dónde moraba ni de qué subsistía. ¿Qué hacía, pues, una niña tan linda, azotando las calles día y noche, como perro hambriento y sin dueño? ¿No había quien por ella hiciera ni rigiera su índole vagabunda?

Entre tanto la chica crecía gallarda y lozana, sin cuidarse de las investigaciones y murmuraciones de que era objeto, y sin caer en la cuenta de que su vida callejera, que a ella le parecía muy natural, inspiraba sospechas y temores, si no compasión a algunas viejas; que sus gracias nacientes y el descuido y libertad con que vivía, alimentaban esperanzas de bastardo linaje en mancebos corazones, que latían al verla atravesar la plazuela del Cristo, cuando a la carrerita y con la sutileza de la zorra hurtaba un bollo o un chicharrón a las negras que de parte de noche allí se ponen a freírlos; o cuando al descuido metía la pequeña mano en los cajones de pasas de los almacenes de víveres en las esquinas de las calles; o cuando levantaba el plátano maduro, el mango o la guayaba del tablero de la frutera; o cuando enredaba el perro del ciego en el cañón de la esquina, o le encaminaba a San Juan de Dios, si iba para Santa Clara:[5] que todas éstas eran travesuras dignas de celebración en una niña de su edad y parecer.

Su traje ordinario, no siempre aseado, consistía en falda de zaraza, sin más pañizuelo ni otro calzado que unas chancletas, las cuales anunciaban de lejos su aproximación, porque sonaban mucho en las banquetas de piedra de las pocas calles que entonces tenían tales adornos. Llevaba también el cabello siempre suelto y naturalmente rizado. El único ornamento de su cuello era un rosarito de filigrana, especie de gargantilla, con una cruz de coral y oro pendiente, memoria de la madre cara y desconocida.

A pesar de aquella vida suya y de aquel traje, parecía tan pura y linda, que estaba uno tentado a creer que jamás dejaría de ser lo que era, cándida niña en cabello, que se preparaba a entrar en el mundo por una puerta al parecer de oro, y que vivía sin tener sospecha siquiera de su existencia. Sin embargo, las calles de la ciudad, las plazas, los establecimientos públicos, como se apuntó más arriba, fueron su escuela, y en tales sitios, según es de presumir, su tierno corazón, formado acaso para dar abrigo a las virtudes, que son el más bello encanto de las mujeres, bebió a torrentes las aguas emponzoñadas del vicio, se nutrió desde temprano con las escenas de impudicia que ofrece diariamente un pueblo soez y desmoralizado. ¿Y cómo librarse de semejante influjo? ¿Cómo impedir que sus vivarachos ojos no viesen? ¿Qué sus orejas siempre alerta no oyesen? ¿Que aquella alma rebosando vida y juventud no se asomara antes de tiempo a los ojos y a los oídos para juzgar de cuanto pasaba en su derredor, en vez de dormir el sueño de la inocencia? ¡Bien temprano, a fe, llamó a sus puertas la legión de pasiones que gastan el corazón y abaten las frentes más soberbias!

Una tarde, entre otras, pasaba la chica, como de costumbre, a la carrerita, por cierta calle de que no hay para qué mencionar ahora el nombre. Asomadas a una de las altas y anchas rejas de hierro de las ventanas de una casa de apariencia aristocrática, estaban dos niñas poco más o menos de su edad y una joven de 14 a 15, las cuales, como viesen pasar aquella exhalación, según se expresó una de ellas mismas, excitada grandemente la curiosidad de todas, la llamaron con instancia. No se hizo de rogar la mozuela, antes se entró, desde luego por el zaguán, y se presentó con mucho desembarazo a la puerta de la sala, donde ya la esperaba el grupo de las tres jovencitas. Allí, éstas la tomaron por la mano y la llevaron delante de una señora algo gruesa, vestida con mucho aseo, que estaba arrellanada en un ancho sillón y descansaba los pies en un escabel.

--¡Ah! exclamó ésta cuando la hubo visto de cerca. ¡Y qué mona es! Dicho lo cual se enderezó en el asiento, operación que le costó un buen esfuerzo, y agregó:

--¿Cómo te llamas?

--Cecilia, respondió vivamente.

--¿Y tu madre?

--Yo no tengo madre.

--¡Pobrecita! ¿Y tu padre?

--Yo soy Valdés, yo no tengo padre.

--Esa está mejor, exclamó la señora recapacitando.

--Papá, papá, dijo la mayor de las señoritas dirigiéndose a un caballero que estaba recostado en un sofá a la derecha del estrado. Papá, ¿ha visto Vd. niña más preciosa?

--Ya, ya, contestó el padre casi sin volver el rostro. Dejadla en paz. Pero apenas salieron esas palabras de sus labios, reparó en él Cecilia, y entre admirada, y reída, dijo:

--¡Ay! Yo conozco a ese hombre que está ahí acostado. Este, por debajo de las manos, con que ya se sombreaba la frente, le echó una mirada fiera, en que iban pintados su mal humor y disgusto. Enseguida se levantó y dejó la sala, sin decir más palabra. Extraño es en verdad que sólo este hombre no sintiese simpatía por la linda callejera.

--¿Conque no tienes padre ni madre? Tornó a preguntar la buena señora, un si es no es preocupada por la anterior escena. ¿Y cómo vives? ¿Con quién vives? ¿Eres hija de la tierra o del aire?

--¡Ave María Purísima! exclamó la niña doblando la cabeza sobre el hombro derecho y mirando fijamente a sus preguntadoras. ¡Ay, Jesús! ¡Qué gente tan curiosa! Yo vivo con mi abuela, que es una viejecita muy buena, que me quiere mucho y que me deja hacer cuanto yo quiero. Mi madre se murió hace mucho tiempo y... mi padre también. No sé más ni me pregunten más.

Bien quisieran las jovencitas hacer más preguntas, e informarse de otros pormenores acerca de la vida y parentela de Cecilia; pero, por una parte, su padre les había dicho que la dejaran en paz, y, por otra, su madre, ya incapaz de dominar su desazón, les indicó por un gesto muy significativo que era tiempo saliese de allí mozuela tan procaz. Colmada de regalos y despedida al fin, Cecilia, pasaba por el zaguán en vuelta de la calle, a sazón que bajaba de los altos un jovencito en traje veraniego, es decir, de chupa y pantalón de Arabia quien apenas la vio, la reconoció y le dijo desde lo alto:

--Cecilia, ¡eh, Cecilia! Oye, mira.

Ella, sin contener el paso, mas sin dejar de mirar al que le daba voces, le decía hasta la puerta de la calle: ¡Cuico! ¡Cuico! Y al mismo tiempo abría la mano derecha, ponía el dedo pulgar en la punta de la nariz y movía los otros con gran rapidez. Que es una manera de burla que a menudo se hacen los muchachos en nuestras calles, como diciendo: ¡Ah! ¡que te engañé! ¡Ah! que me escapé de tus majaderías.

No es para referir aquí la escena que se siguió a la ida de la chica de aquella casa. Del señor y de la señora puede decirse que no volvieron a mencionar su nombre. Las señoritas, al contrario, aún cuando tornaron a la ventana para ver y saludar a sus amigas, que de vuelta del paseo pasaban en sus lujosas volantas, no cesaron de hablar de Cecilia y de repetir su nombre, ayudándoles entonces el hermano mayor, quien la conocía y a menudo se encontraba con ella cuando iba a la clase de latín del padre Morales, enfrente del convento de Santa Teresa.

En el medio tiempo la chica, siguiendo por la calle adelante salió a la plazuela de Santa Catalina, cuyo terraplén, que corre por todo el frente, subió a saltos, y luego bajó a la calle del Aguacate por una escalera de mampostería. Una vez allí, se dirigió derecho, aunque con cierta cautela, a la casita inmediata a la esquina ocupada por una taberna. No tocó ni se detuvo delante de la puerta, sino que empujó con suavidad la hoja de la derecha o macho, la cual estaba sujeta con una media bala de hierro en el suelo. Había sido de bermellón la pintura de dicha puerta, pero lavada por las lluvias, el sol y el tiempo, no le quedaban sino manchas oscuras en torno de la cabeza de los clavos y en las molduras profundas de los tableros. La ventanilla, que era de espejo y alta, sólo tenía tres o cuatro balaustres, había perdido la pintura primitiva, quedándole un baño ligero de color de plomo. Por lo que toca al interior, su apariencia era más ruin, si cabe, que el exterior. Se componía de una salita, dividida por un biombo para formar una alcoba, cuya puerta daba precisamente hacia la de la calle, y otra a la derecha con salida al patio angosto y no más largo que el fondo de la casita. A la izquierda de la entrada y a la altura de una vara, había un hueco en la pared medianera, a modo de nicho, en cuyo fondo se veía una Madre Dolorosa de cuerpo entero, aunque muy reducido, con una espada de fuego que le atravesaba el pecho de parte a parte. Alumbraban día y noche tan peregrina pintura dos mariposas, es decir, dos hornillas con su pabilo correspondiente, flotando en tres partes de agua y una de aceite, dentro de vasos ordinarios de vidrio. Una guirnalda de todas flores artificiales y de pedazos de cartulina dorada y plateada, ajadas, descoloridas y polvorosas adornaba el retablo. Y en torno, por las paredes, en el biombo y detrás de las puertas y ventanas, gran número de letreros, por ejemplo: ¡Ave María Purísima! ¡La Gracia de Dios sea en esta casa! ¡Viva Jesús! ¡Viva María! ¡Viva la Gracia y muera el Pecado! Con otros muchos por el estilo, que no hay para qué repetirlos. Las estampas, sin cuadro, pegadas a las paredes con obleas o engrudo, eran más numerosas que los letreros, todas de santos, impresas por el impresor Boloña[6] en papel común y recogidas de manos de los demandantes de los conventos a cambio de limosnas, o compradas a la puerta de las iglesias en los días de fiestas.

Reducíase a bien poco el mueblaje, aunque en su poquedad y ruina se conocía que había visto mejores tiempos cuando nuevo. El más apetecible de la casa era una butaca de Campeche, ya coja, con orejas grandes y desvencijada. Agregábanse tres o cuatro sillas de cedro con asiento y respaldo de vaqueta, del mismo estilo, fuertes, macizas y antiquísimas. Hacía juego con ellas una rinconera de la propia madera, cuyos pies estaban labrados en forma de pezuña de sátiro, con molduras y hojas de parra.

A pesar de la estrechez de aquel albergue, había un gato dormilón, varias palomas y gallinas, muy familiarizadas sin duda con sus dos únicos huéspedes humanos, pues que iban y venían, saltaban sobre los respaldos de las sillas, maullaban, arrullaban y cacareaban sin consideración ni temor. A un lado de la alcoba había una cama alta, cuadrilonga, que siempre estaba de recibo, como que era de cuero sin curtir, cuya dureza la suavizaba un colchón de plumas, cubierto perennemente con una colcha de mil y un retazos o taracea. Las columnas salomónicas, en vez de colgaduras, sostenían San Blases, escapularios, cruces de cartón, piedras de vidrio y palmas benditas de los domingos de ramos de muchos años atrás.

En realidad aquélla no era casa sino en cuanto daba abrigo a dos personas, porque, fuera de las dos piezas mencionadas, no tenía comodidad ni más desahogo que el patio dicho, donde estaba la cocina, mejor, fogón, cajoncito de madera lleno de ceniza, montado sobre cuatro pies derechos, y protegido de la lluvia por una especie de alero de mesilla. Nos hemos detenido tanto en la descripción de la casucha donde entró Cecilia, porque pare su imaginación el benigno lector en el contraste que ofrecería una niña tan linda, rebosando vida y juventud, en medio de tanta antigualla, que no parecía sino que el cielo la había colocado allí para decirle a cada rato al oído:--Hija, contempla lo que serás y sé más cuerda.

Pero estamos seguros que eso era lo menos en que ella pensaba, y entonces con doble motivo, cuanto que más le importaba que no la sintiese entrar cierta persona que, de espaldas en la butaca, frente al nicho, parecía rezar o dormitar. Sin embargo, por más tiento que pusiese la picaruela en el modo de asentar la planta, no lo pudo hacer tan callandito que no la oyese y sintiese distintamente la vieja, cuyos oídos eran muy finos, y que entonces no rezaba ni dormía, sino que leía, hecha un arco, en un libro pequeño de oraciones con forro de pergamino.

--¡Hola! le dijo mirándola de soslayo por encima de los aros perfectamente redondos de sus gafas, enhorquilladas en la punta de la nariz, a guisa de muchacho a la grupa de un caballo, ¡Hola señorita! ¿Aquí está Vd? ¿Eh? ¡Qué bueno! ¿Son éstas horas de venir a pedir la bendición de su abuela? (Porque la chica se acercaba con los brazos cruzados.) ¿Dónde has estado hasta ahora, buena pieza? (Habían tocado ya las oraciones.) ¡Qué linda estabas para ir por los óleos! Y echándole mano de pronto, en cuyo acto se le cayó el libro y se espantaron el gato que pestañeaba a menudo sentado en una silla, las palomas y las gallinas. Ven acá, espiritada, añadió; mariposa sin alas, oveja sin grey, loca de cepo; ven, que he de averiguar dónde has estado hasta estas horas. ¿Qué, tú no tienes rey ni Roque que te gobierne, ni Papa que te excomulgue? ¿Adónde se ha visto de eso? ¿Tú no tienes más vida que correr por las calles? ¿No se puede averiguar nadie contigo? Yo te haré entender que hay quien puede. ¡No me quedaba que ver!

Cecilia, lejos de asustarse, ni de huir, con mucha risa se echó en brazos de la malhumorada y gruñidora abuela, y, como para anudarle la lengua, le entregó cuanto le habían regalado las señoritas donde había estado.

CAPÍTULO III

Malditas viejas, Que a las mozas malamente Enloquecen con consejas.

ZORRILLA

Con más zalamería y astucia de las que cabían en una niña de su edad, Cecilia abrazó y besó a su abuela, a la cual dio el nombre de Chepilla (alteración caprichosa de Josefa), que así generalmente la llamaban. Bastó eso para aplacar su enojo, y nada hay en ello que extrañar, porque, según adelante veremos, había sido tan infeliz aquella mujer, sentía tal necesidad de ser amada por el único ser que la interesaba de cerca en el mundo, que mantener seriedad con la nieta, hubiera sido lo mismo que prolongar su propio martirio. Por supuesto que selló sus labios de golpe, y no acertó a otra cosa que a contemplarla, bien así como momentos antes había estado contemplando el dulce rostro de María Santísima, en fervorosa oración.

Mientras la niña estrechaba por la cintura a la vieja con sus torneados brazos y recostaba la hermosa cabeza en su pecho, semejante a la flor que brota en un tronco seco y con sus hojas y fragancia ostenta la vida junto a la misma muerte, la figura de _seña_ Josefa se mostraba más extraña y fea de lo que era naturalmente. Su rostro mismo formaba contraste con lo demás del cuerpo. Ya fuese porque tenía la costumbre de llevarse el cabello atrás, ya porque lo sacó de naturaleza, la verdad es que le lucía la frente demasiado ancha, la nariz grande y roma, la barba aguda, y la cuenca de los ojos hundida. Esto daba aviesa expresión a su semblante, no muy fácil de pasar por alto al menos avisado observador. Aún había morbidez en sus brazos, y sus manos podían calificarse de lindas. Pero lo más notable de su fisonomía eran sus ojos grandes, oscuros y penetrantes, restos de una facciones que habían sido agradables, desarmonizadas ahora por una vejez prematura.

Mulata de origen, su color era cobrizo, y con los años y las arrugas se le había vuelto atezado, o _achinado_; para valernos de la expresión vulgar con que se designa en Cuba al hijo de mulato y negra, o al contrario. Podía tener 60 años de edad, aunque aparentaba más, porque ya empezaba a blanquearle el cabello, cosa que en las gentes de color suele suceder más tarde que en las de raza caucásica. Los padecimientos del ánimo aniquilan primero el semblante que el cuerpo mortal del hombre. Como veremos después, la resignación cristiana, obra de su fe en Dios, pasto con que al fin alimentaba su espíritu en las largas horas consagradas al rezo y a la meditación, sólo la hubiera mantenido en pie contra los embates de su miserable suerte. Por otra parte, con el triste convencimiento del que de una ojeada midió su pasado y su porvenir, y lo que debía y podía esperar de su nieta, hermosa flor arrojada en mitad de la plaza pública, para ser hollada del primer transeúnte, ya en el último tercio de su vida, con los remordimientos de la pasada, antes de airarse, comprendió que le tocaba aplacar la cólera de su juez invisible y procurarse momentos de calma, ínterin sonaba la hora postrimera.

En aquélla en que la sorprende nuestra narración, aunque hubiese cumplido los 80 de su vida, habría creído que había vivido muy poco tiempo si llegaban sus últimos momentos y dejaba tras sí a la nieta joven y desamparada en el mundo, y no le era dado asistir al desenlace de un drama en que ella, bien a su pesar, sin ser la heroína, representaba, hacía tiempo, papel muy importante. Acomodado el carácter de _seña_ Josefa, naturalmente irascible, a la regla de conducta de que antes se ha hablado, como medio de alcanzar el perdón de sus propias culpas, fácil es comprender por qué, si bien justamente enojada con Cecilia porque llegaba tarde, y por otras muchas faltas anteriores, se sentía más bien dispuesta a disculparla que a reñirla. Después, como ella le vino con sus zalamerías, en vez de hurtarle el cuerpo, esto la sirvió de pretexto plausible para confirmarse en su propósito. En su virtud, cambiando prontamente de tono y aspecto, se contentó con preguntarle por segunda vez dónde había estado.

--¿Yo? repitió la niña apoyando ambos codos en las rodillas de la abuela y jugando con los escapularios que le pendían del pescuezo. ¿Yo? En casa de unas muchachas muy bonitas que me vieron pasar y me llamaron. Allí estaba una señora gorda sentada en un sillón, que me preguntó cómo me llamaba yo, y cómo se llamaba mi madre, y quién era mi padre, y dónde vivía yo...

--¡Jesús! ¡Jesús! exclamó _seña_ Josefa persignándose.

--¡Ay! continuó la chica sin parar mientes en la abuela. ¡Qué gente tan preguntona! ¿Y no sabe su merced cómo una de las muchachas aquellas me quería cortar el pelo para hacer una _cachucha_? Sí, señor. Pero yo me zafé.

--¡Vea Vd. espíritu maligno y por dónde trepa! volvió a exclamar la abuela como si hablase consigo misma.

--Y si no es por un hombre, prosiguió Cecilia, que estaba acostado en el sofá, y regañó a las muchachas y les dijo que me dejaran quieta y luego se fue para su cuarto bravísimo... ¿Su merced no sabe quién es ese hombre, abuelita? Yo lo he visto hablar con su merced algunas veces allá en Paula, cuando vamos a misa. Sí, sí, él es, no me cabe duda. Y ahora recuerdo que es el mismo que cada vez que me encuentra en la calle me dice callejera, perdida, pilluela y muchas cosas. ¡Ah! Y dice que mandará a los soldados que me cojan y me lleven a la cárcel. ¡Qué sé yo cuánto más! Le tengo mucho miedo a ese hombre. ¡Debe ser muy regañón!

--¡Niña! ¡Niña! exclamó sordamente la anciana apartándola un poco de su pecho y mirándola de un modo extraño y fijo, más enojada que sorprendida. Pero como si le ocurriese un grave pensamiento o un doloroso recuerdo y entre amonestarla y aconsejarla, lo que acaso equivalía a alumbrarle aquello de que debía estar ignorante toda la vida, su ánimo triste luchase en un mar de dudas, con sorpresa de la nieta selló de golpe sus labios. Poco a poco fue serenándose el piélago alborotado: se desvanecieron una después de la otra las nubes apiñadas en aquel horizonte naturalmente sombrío; y volviendo a estrechar la niña en sus desnudos brazos, añadió con toda la dulzura que pudo dar a su voz, por naturaleza bronca, con toda la calma de que pudo revestir su semblante:

--¡Cecilia! Hija de mi corazón, no vayas más a esa casa.

--¿Por qué, mamita?

--Porque, contestó la abuela como distraída, no sé verdaderamente, mi alma, no lo sé, no podría decirlo si quisiera..., pero es claro y constante, niña, que esa gente es muy mala.

--¡Mala! repitió Cecilia azorada, ¿y me hicieron tantas caricias, y me dieron dulces, y raso para zapatos? ¡Si tú supieras lo que me chiquearon...!

--Pues no te fíes, niña. Tú eres muy confiada y eso no está bien. Por lo mismo que te chiquearon tanto debías de andar con cuatro ojos. Querían atraerte para hacerte algún daño. Uno no puede decir de qué son capaces las gentes. ¡Tantas cosas suceden ahora que no se veían en mi tiempo...! Cuando menos lo que procuraban era que te descuidaras, para coger unas tijeras y ¡tris! tumbarte el pelo. Sería una lástima, porque tú lo tienes muy hermoso. Además, que ese pelo no te pertenece, sino a la Virgen, que te salvó de aquella grave enfermedad... ¡Acuérdate! Yo le ofrecí que si te ponías buena le daría tu cabellera para adornar su efigie en Santa Catalina. No te fíes te digo.

Esto diciendo, le cogía la cabeza a la nieta entre ambas manos y le desparramaba los copiosos rizos por la espalda y los hombros.

--Sí, replicó Cecilia apretando los labios y levantando con aire de desdén la frente, como yo soy tan boba para que me engañen así, así...

--Sin embargo, hija, lo mejor de los dados es no jugarlos. Yo bien sé que tú eres una muchacha dócil y entendida; pero estoy cierta que no conoces a esa gente. Mira, no les hagas caso; aunque se les seque el gañote llamándote, no vayas a donde están. Mas ahora que me acuerdo: lo mejor es que ni por cien leguas te acerques por su rededores. Luego, ese hombre que tú misma dices que donde quiera que te topa te pone mala cara. ¡Sabe Dios quién será! Aunque no debemos pensar mal de nadie, con todo, como puede ser un santo puede ser un de... (Y se persignó sin concluir la palabra.) El Señor sea con nosotras. Además, Cecilia, tú eres muy inocente, algo atolondrada, y en esa casa... ¿Tú no lo sabes? hay una bruja que se roba a las muchachas bonitas. Por milagro de su Divina Majestad has escapado. Tú estuviste allí por la tarde, ¿no?

--Por la tardecita; todavía no habían encendido las luces en las casas.

--¡Ay de ti si llegas a entrar de noche! Vamos, no vayas más en tu vida a esa casa, ni pases tampoco por la cuadra.

--¡Anjá! Con que allí vive también un muchacho ya grande, que a cada rato lo topo por Santa Teresa con un libro debajo del brazo. Siempre que me ve me quiere coger, me corre detrás y sabe mi nombre...

--Estudiante, perverso, como todos ellos. Cuando menos se le cayó de las uñas al mismo Barrabás. Pero voy viendo que tú tienes una cabecita dura como una piedra, y que por más que me afano en aconsejarte no consigo nada. En efecto, ¿quién ha visto que una niña tan linda como tú se ande azotando calles, con la chancleta arrastro y el pelo suelto y desgreñado, hasta las tantas más cuantas de la noche? ¿De quién aprendes estas malas mañas? ¿Por qué no me has de hacer caso?

--Y Nemesia, la hija de _seño_ Pimienta el músico, ¿no se está en la calle hasta las diez? Antenoche nada menos la topé en la plazuela del Cristo jugando a la _lunita_ con una porción de muchachos.

--¿Y tú te quieres comparar con la hija de _seño_ Pimienta, que es una pardita andrajosa, callejera, y mal criada? El día menos pensado traen a esa espiritada, a su casa en una tabla con la cabeza partida en dos pedazos. La cabra, hija, siempre tira al monte. Tú eres mejor nacida que ella. Tu padre es un caballero blanco, y algún día has de ser rica y andar en carruaje. ¿Quién sabe? Pero Nemesia no será nunca más de lo que es. Se casará, si se casa, con un mulato como ella, porque su padre tiene más de negro que de otra cosa. Tú, al contrario, eres casi blanca y puedes aspirar a casarte con un blanco. ¿Por qué no? De menos nos hizo Dios. Y has de saber que blanco, aunque pobre, sirve para marido; negro o mulato ni el buey de oro. Hablo por experiencia... Como que fui casada dos veces... No recordemos cosas pasadas. Si tú supieras lo que le sucedió a una muchachita, cuasi de tu misma edad, por no hacer caso de los consejos de una abuela suya, la cual le pronosticó que si daba en andar por las calles tarde de la noche le iba a suceder una gran desgracia...

--Cuéntemelo, cuéntemelo, Chepilla, repitió la niña con la curiosidad de tal.

--Pues, señor: una noche muy _escura_, en que soplaba el viento recio, por cierto que era día de San Bartolomé, en que, como ya te he dicho otras veces, se suelta el diablo desde las tres de la tarde, estaba la muchacha Narcisa, que éste era su nombre, sentada cantando bajito en el quicio de piedra de su casa, mientras su abuela rezaba arrinconada detrás de la ventana... Me acuerdo como si fuera ahora mismo. Pues señor, habían tocado ánimas en el Espíritu Santo, y como el viento había apagado los pocos faroles, las calles estaban muy _escuras_, silenciosas y solitarias, como boca de lobo. Pues según iba diciendo, la muchachita cantaba y la vieja rezaba el rosario, cuando estando así, cate que se oye tocar un violín por allá en vuelta del Ángel. ¿Qué se figuró la Narcisa? Que era cosa de baile, y sin pedirle permiso a la abuela, sin decir oste ni moste, echó a correr y no paró hasta la loma. Así que la vieja acabó de rezar, creyendo que su nieta estaba en la cama, según era natural, cerró la puerta.

--¿Y dejó en la calle a la pobrecita? interrumpió Cecilia a la contadora con muestras de ansiedad y lástima.

--Ahora verás. La viejecita, antes de acostarse, porque ya era tarde y se caía del sueño, cogió una vela y fue al catre de la nieta para ver si dormía. Figúrate cuál no se quedaría ella que la amaba tanto, al encontrarse con el catre vacío. Corrió a la puerta de la calle, la abrió, llamó a gritos a la nieta: ¡Narcisa! ¡Narcisa! Pero Narcisa no responde. Ya se ve, ¿cómo había de responder la infeliz si el diablo se la había llevado?

--¿Cómo fue eso? preguntó azorada la niña.

--Yo te lo contaré, prosiguió _seña_ Chepa con calma, notando que producía el efecto deseado su cuento de cuentos. Pues, señor, al llegar Narcisa a las cinco esquinas del Ángel, se le apareció un joven muy galán, que le preguntó a dónde iba a aquella hora de la noche.--A ver un baile, contestó la inocente.--Yo te llevaré, repuso el joven; y cogiéndola por un brazo la sacó a la muralla. Aunque era muy _escuro_, reparó Narcisa que según iban andando el desconocido se ponía prieto, muy prieto, como carbón; que los pelos de la cabeza se le enderezaban como lesnas; que al reír asomaba unos dientes tamaños como de cochino jabalí; que le nacían dos cuernos en la frente; que le arrastraba un rabo peludo por el suelo, vamos, que echaba fuego por la boca como un horno de hacer pan. Narcisa entonces dio un grito de horror y trató de zafarse, pero la figura prieta le clavó las uñas en la garganta para que no gritara, y, cargando con ella, se subió a la torre del Ángel, que, según habrás reparado, no tiene cruz, y desde allí la arrojó en un pozo hondísimo que se abrió y volvió a cerrarse tragándosela en un instante. Pues esto es, hija, lo que le sucede a las niñas que no hacen caso de los consejos de sus mayores.

Dio aquí fin a su cuento _seña_ Chepa y comenzó la admiración, el pavor de Cecilia, la cual se puso a temblar de pies a cabeza y a dar diente con diente, aunque sin cesar de bostezar, porque más era el sueño que el miedo; con lo que, dando traspiés, se fue a la cama, que es a lo que tiraba la astuta vieja. Muchos otros cuentos por el estilo le hizo a la andariega muchacha; pero estamos seguros que no sacó otro fruto con ellos que llenar su cabeza de supersticiones y amilanar su espíritu. Ello es, que no por eso dejó la chica de hacer su gusto, escapándose a veces por la ventana, aprovechándose otras del momento en que la enviaban a la taberna de la esquina inmediata, para andarse de calle en calle y de plaza en plaza: cuándo en pos de la incitativa música de un baile; cuándo tras los tambores de los relevos; cuándo de los carruajes del entierro; cuándo, en fin, de la turba muchachil que arrebata el medio de plata en el bautizo.

CAPÍTULO IV

Traen el pensamiento _Lleno de impudicia, y lo derraman_ _En torpes mil escandalosas voces,_ _Que inficionan el viento_ _Y altamente publican lo que aman._

GONZÁLEZ CARVAJAL

Cinco o seis años después de la época a que nos hemos contraído en los dos capítulos anteriores, a fines del mes de setiembre, había dado principio el convento de la Merced a la serie de ferias con que hasta el año de 1832, acostumbraban a solemnizar en Cuba las fiestas titulares religiosas, consagradas a los santos patrones de las iglesias y conventos; novenarios coincidentes a veces con el circular del Sacramento, introducido en el culto de Cuba desde los primeros años del siglo por el Señor Obispo Espada y Landa.

El novenario, de paso diremos, comenzaba nueve días anteriores a aquél en que caía el del santo patrono, prolongándose hasta otros nueve, con lo que se completaban dos novenas seguidas. Es decir, dieciocho días de fiesta, religiosas y profanas, que tenían más de grotescas y de irreverentes que de devotas y de edificantes. En ese tiempo se decía misa mayor con sermón por la mañana y se cantaba salve a prima noche dentro de la iglesia, con procesión por la calle el día del santo.

Fuera del templo había lo que se entendía por feria en Cuba, que se reducía a la acumulación en la plazuela o en las calles inmediatas, de innumerables puestos ambulantes, consistentes en una mesa o tablero de tijeras, cubiertos con un toldo y alumbrados por uno o más candiles de quemar grasa, donde se vendía, no ciertamente artículo alguno de industria o comercio del país, ni producto del suelo, caza, ave ni ganado, sino meramente baratijas de escasísimo valor, confituras de varias clases, tortas, obra de masa, avellanas, alcorza, agua de Loja y ponche de leche. Aquello no era feriar en el sentido recto de la palabra.

Pero esto no era por cierto el rasgo más notable de nuestras fiestas circulares. Había en el espectáculo algo que se hacía notable por demasiado grosero y procaz. Nos contraemos ahora a los juegos de envite y de manos que hacían parte de la feria y que provocaban con sus estupendas, aunque mentirosas ganancias, la codicia de los incautos. Los dirigían y ejecutaban en su mayoría hombres de color y de la peor ralea. Si bien groseros los artificios, no dejaban de engañar a muchos que se daban por

muy avisados. Estos tenían lugar en la plazuela o en la calle, a la luz mortecina de los candiles o de los faroles de papel, y tomaban en ellos parte gentes de todas clases, condiciones, edades y sexos. Para las de alta posición social, queremos decir, para los blancos, había algo más decente, había la casa de bailes, donde un Farruco, un Brito, un Illas o un Marqués de Casa Calvo tenían puesta la banca o juego del monte desde el oscurecer hasta pasada la media noche, mientras duraban los dieciocho días de la feria.

Procurábase que la casa o casas de bailes estuviesen lo más vecino que se pudiera a la parroquia o convento en que se celebraba el novenario. En la sala se bailaba, en el comedor tocaba la orquesta, y en el patio se jugaba al juego conocido por del monte. La mesa era larga y angosta, para que cupiesen los más de los jugadores sentados a ambos lados, el tallador a una cabeza y en la otra su ayudante, que dicen gurrupié. Para la protección de los jugadores y de los naipes, en caso de lluvia, frecuentes en el otoño, se tendía un toldo del alero de la casa al caballete de la tapia divisoria de la vecina. No todos los tahures, para vergüenza nuestra sea dicho, eran del sexo fuerte, hombres ya maduros, ni de la clase lega, que en el grupo apiñado y afanoso de los que arriesgaban a la suerte de una carta, quizás el sustento de su familia el día siguiente, o el honor de la esposa, de la hija o de la hermana, podía echarse de ver una dama más ocupada del albur que de su propio decoro, o un mozo todavía imberbe, o un fraile mercenario en sus hábitos de estameña color de pajuela, con el sombrero de ala ancha encasquetado, las cuentas del largo rosario entre el índice y el pulgar de la mano izquierda, y la derecha ocupada en colocar la moneda de oro o plata en el punto que más se daba, perdiendo o ganando siempre con la misma serenidad de ánimo que de semblante.

El banquero, para llamarle por su nombre más decente, era quien hacía el gasto del alquiler de la casa, el de la música y el de las velas de esperma con que se alumbraban la sala de baile, el comedor y la mesa del juego. Todo esto se hacía para atraer a los jugadores. La entrada, por supuesto, era libre, aunque el bastonero, que también tiraba sueldo, no admitía toda clase de persona. En aquella época corría mucho la moneda fuerte, los duros españoles y las onzas de oro. La plata menuda escaseaba, y era cosa de oír el continuo retintín de los pesotes columnarios y sonoras onzas, que maquinalmente dejaban caer los tahures de una mano a otra o sobre la mesa, como para distraer el pensamiento y de algún modo interrumpir el solemne silencio del azaroso juego.

Que nada de lo que aquí se traza a grandes rasgos estaba prohibido o no más que tolerado por las autoridades constituidas, se desprende claramente del hecho de que los garitos en Cuba pagaban una contribución al gobierno para supuestos objetos de caridad. ¿Qué más? La publicidad con que se jugaba al monte en todas partes de la Isla principalmente durante la última época del mando del capitán general don Francisco Dionisio Vives, anunciaba, a no dejar duda, que la política de éste o de su gobierno se basaba en el principio maquiavélico de corromper para dominar, copiando el otro célebre del estadista romano: _divide et impera_. Porque equivalía a dividir los ánimos, el corromperlos, cosa que no viese el pueblo su propia miseria y su degradación.

Pero esta digresión, por más necesaria que fuese, nos ha desviado un tanto del punto objetivo de la presente historia. Nuestra atención la atraía por completo un baile de la clase baja que se daba en el recinto de la ciudad por la parte que mira al Sur. La casa donde tenía efecto, ofrecía ruín apariencia, no ya por su fachada gacha y sucia, como por el sitio en que se hallaba, el cual no era otro que el de la garita de San José, opuesto a la muralla, en una calle honda y pedregosa. Aunque de puerta ancha con postigo, no formaba lo que se entiende en Cuba por zaguán, pues abría derecho a la sala. Tras ésta venía el comedor con el correspondiente tinajero, armazón piramidal de cedro, en que persianas menudas encerraban la piedra de filtrar, la tinaja colorada barrigona, los búcaros, de una especie de _terra cotta_ y las pálidas alcarrazas de Valencia, en España. Al comedor dicho daba la puerta lateral del primer aposento, ocupado en su mayor parte por dos órdenes de sillones de vaqueta colorada, una cama con colgaduras de muselina blanca y un armario, al que dicen en La Habana escaparate. Otros cuartos seguían a ése, atestados de muebles ordinarios, y paralelo a ellos un patio largo y angosto, también obstruido en parte por el brocal alto de un pozo cuyas aguas salobres dividía con la casa contigua, terminando cuartos y patio en una saleta atravesada y exenta.

En esta última se hallaba una mesa de regular tamaño, ya vestida y preparada con cubiertos como para hasta diez personas; algunos refrescos y manjares, agua de Loja, limonada, vinos dulces, confituras, panetelas cubiertas, suspiros, merengues, un jamón adornado con lazos de cintas y papel picado, y un gran pescado, nadando casi en una salsa espesa de fuerte condimento. En la sala había muchas sillas ordinarias de madera arrimadas a las paredes, y a la derecha, como se entra de la calle, un canapé, con varios atriles de pie derecho por delante. Aquél, a la sazón que principia nuestro cuento, le ocupaban hasta siete negros y mulatos músicos, tres violines, un contrabajo, un flautín, un par de timbales y un clarinete. El último de los instrumentos aquí mencionados se hallaba a cargo de un mulato joven, bien plantado y no mal parecido de rostro, quien, no obstante sus pocos años, dirigía aquella pequeña orquesta.

Ese se veía de pie a la cabeza del canapé por el lado de la calle. Sus compañeros, casi todos mayores que él, le decían Pimienta, y ya fuese un sobrenombre, ya su verdadero apellido, por éste lo designaremos de aquí adelante. Su mirada distraída y aun sombría, no se apartaba de la puerta de la calle, como si esperase algo o a alguien, en los momentos de que hablamos ahora.

Pero aquella puerta, lo mismo que la ventana de bastidor cuadrado, se veía asediada de una multitud de curiosos de todas edades y condiciones, que apenas permitían acceso a la sala a las mujeres y hombres con derecho o voluntad de entrar. Y decimos con derecho o voluntad porque nadie presentaba papeleta, ni había bastonero que recibiese o aposentase. El baile, conocidamente era uno de los que, sin que sepamos su origen, llamaban _cuna_ en La Habana. Sólo sabemos que se daban en tiempo de ferias, que en ellos tenían entrada franca los individuos de ambos sexos de la clase de color, sin que se le negase tampoco a los jóvenes blancos que solían honrarlos con su presencia. El hecho, sin embargo, de tenerse preparado en el interior un buen refresco, prueba, que si aquella era una _cuna_ en el sentido lato de la palabra, parte al menos de la concurrencia había recibido previa invitación o esperaba ser bien recibida. Así era en efecto la verdad. La ama de la casa, mulata rica y rumbosa, llamada Mercedes, celebraba su santo en unión de sus amigos particulares, y abría las puertas para que disfrutaran del baile los aficionados a esta diversión y contribuyeran con su presencia al mayor lustre e interés de la reunión.

Serían las ocho de la noche. Desde por la tarde habían estado cayendo los primeros chubascos de otoño, y aunque habían suspendido hacia el oscurecer, tras haber empapado el suelo, dejando las calles intransitables, no habían refrescado la atmósfera. Lejos de ello, había quedado tan saturada de humedad, que se adhería a la piel y hervía en los poros. Pero no eran estos inconvenientes para los curiosos que, según hemos dicho antes, asediaban la puerta y la ventana, hasta llenar casi la mitad de la angosta y torcida calle; ni para los concurrentes al baile, que a medida que avanzaba la noche llegaban en mayor número, unos a pie, otros en carruaje. Cosa de las nueve la sala de baile era un hervidero de cabezas humanas; las mujeres sentadas en las sillas del rededor y los hombres de pie en medio, formando grupo compacto, todos con los sombreros puestos; por lo cual la cabeza que sobresalía, de seguro que tropezaba con la bomba de cristal, suspendida de una vigueta por tres cadenas de cobre, en que ardía la única vela de esperma para alumbrar a medias aquella tan extraña como heterogénea multitud.

Bastante era el número de negras y mulatas que habían entrado, en su mayor parte vestidas estrafalariamente. Los hombres de la misma clase, cuya concurrencia superaba a la de las mujeres, no vestían con mejor gusto, aunque casi todos llevaban casaca de paño y chaleco de piqué, los menos chupa de lienzo, dril o Arabia, que entonces se usaban generalmente, y sombrero de paño. No escaseaban tampoco los jóvenes criollos de familias decentes y acomodadas, los cuales sin empacho se rozaban con la gente de color y tomaban parte en su diversión más característica, unos por mera afición y otros movidos por motivos de menos puro origen. Aparece que algunos de ellos, pocos en verdad, no se recataban de las mujeres de su clase, si hemos de juzgar por el desembarazo con que se detenían en la sala de baile y dirigían la palabra a sus conocidas o amigas, a ciencia y presencia de aquéllas que, mudas espectadoras, los veían desde la ventana de la casa.

Distinguíase entre los jóvenes dichos antes, así por su varonil belleza de rostro y formas, como por sus maneras joviales, uno a quien sus compañeros decían Leonardo. Vestía pantalón y chupa de dril crudo con listas rosadas, chaleco blanco de piqué, corbata de seda ajustada al cuello por un anillo de oro y las puntas sueltas, sombrero de yarey, tan fino que parecía hecho de holán Cambray, calcetín de seda de color de carne y zapato bajo con hebillita de oro al lado. Por debajo del chaleco, asomaba una cinta de aguas rojo y blanco, doblada en dos y sujetas las puntas con una hebilla también de oro. Esta servía de cadena al reloj en el bolsillo del pantalón. Había allí otro hombre que se distinguía más si cabe que Leonardo, aunque por distinto camino, esto es, por lo que diferían a su opinión y se reían de sus chocarrerías los negros y mulatos, y por la familiaridad con que trataba a las mujeres, sobre todas al ama de la casa. Frisaba ya en los cuarenta años de edad ese sujeto, no tenía pelo de barba, era blanco de rostro, con ojos grandes y alocados, la nariz larga, roja hacia la punta, indicio de su poca sobriedad, la boca grande, más expresiva. Portaba siempre debajo del brazo izquierdo una caña de Indias con puño de oro y borlas de seda negra. Le acompañaba a todas partes, como la sombra al cuerpo, un hombre de facha ordinaria, notable por la estrechez de la frente, por sus movibles y ardientes ojicos, y, sobre todo, por sus enormes patillas negras, que le daban el aire antes de bandolero que de alguacil; empleo que desempeñaba entonces, pues el otro a quien seguía era nada menos que Cantalapiedra, comisario del barrio del Ángel, el cual abandonaba por andarse tras la tentadora cuna.

Rato hacía que la música tocaba las sentimentales y bulliciosas contradanzas cubanas, aunque todavía el baile, para valernos de la frase vulgar, no se había rompido. Acomodaba afanosa el ama de la casa a sus amigas particulares y de más edad en los sillones del aposento, para que a salvo de las pisadas y tropiezos pudiesen gozar de la fiesta al mismo tiempo que no perder de vista a los objetos o de su cuidado, o de su cariño, que como jóvenes quedaban en la sala. Pimienta, el clarinete, se mantenía en pie a la cabeza de la orquesta, tocando su instrumento favorito, casi de frente para la calle, cual si no hubiese entrado aún la

persona digna de su música, o quisiera ser el primero en verla entrar. Parecía, sin embargo, inútil este cuidado, por cuanto no entraba hombre ni mujer que no tuviera algo que decirle al paso. A todos estos saludos contestaba él invariablemente con un movimiento de cabeza, si se exceptúa que cuando le tocó su vez al capitán Cantalapiedra, quien con su acostumbrada familiaridad le puso la mano en el hombro y le habló en secreto, contestó quitándose el instrumento de la boca:--Así parece, mi capitán.

Podía advertirse que cada vez que entraba una mujer notable por alguna circunstancia, los violines, sin duda para hacerle honor, apretaban los arcos, el flautín o requinto perforaba los oídos con los sones agudos de su instrumento, el timbalero repiqueteaba que era un primor, el contrabajo, manejado por el después célebre Brindis,[7] se hacía un arco con su cuerpo y sacaba los bajos más profundos imaginables, y el clarinete ejecutaba las más difíciles y melodiosas variaciones. Aquellos hombres, es innegable, se inspiraban, y la contradanza cubana, creación suya, aun con tan pequeña orquesta, no perdía un ápice de su gracia picante ni de su carácter profundamente malicioso-sentimental.

CAPÍTULO V

--¿Habéis visto en vuestra vida _Mujer más airosa?_ _--No._ _Ni al Parque jamás salió_ _Más aseada y bien prendida_

CALDERÓN

Mañanas de Abril y Mayo

Después de dar una vuelta por la sala, el comisario Cantalapiedra se entró de rondón en el aposento, y en son de broma le tapó por detrás los ojos al ama de la casa, en los momentos en que ella se inclinaba sobre la cama para depositar la _manta_ de una de sus amigas que acababa de entrar de la calle. La tal ama de la casa, Mercedes Ayala, era una mulata bastante vivaracha y alegre a pesar de sus treinta y pico cumplidos, regordeta, baja de cuerpo y no mal parecida. Atrapada y todo por detrás, no se cortó ni turbó por eso; antes por un movimiento natural acudió con entrambas manos a tentar las del que la impedía ver, y sin más dilación dijo:--Este no puede ser otro que Cantalapiedra.

--¿Cómo me conociste, mulata? preguntó él.

--¡Toma! repuso ella. Por el aquel de algunas gentes.

--¿El aquel mío o tuyo?

--El de los dos, señor, para que no haya disgusto.

Tras lo cual el comisario la atrajo a sí suavemente por la cintura con el brazo derecho y le dijo una cosa al paño que la hizo reír mucho; aunque, apartándole con ambas manos, repuso:

--Quite allá, lisonjero. La que trastorna el juicio está al caer. Ya yo ya... Cátela Vd.

Si con estas últimas palabras aludía la Ayala a una de las dos muchachas que en aquel mismo punto se apearon de un lujoso carruaje a la puerta de la casa, hecho anunciado por el movimiento general de cabezas de dentro y fuera de ella, no cabe duda que tenía sobrada razón. No la había más hermosa ni más capaz de trastornar el juicio de un hombre enamorado. Era la más alta y esbelta de las dos, la que tomó la delantera al descender del carruaje lo mismo que al entrar en la sala de baile, de brazo con un mulato que salió a recibirla al estribo, y la que, así por la regularidad de sus facciones y simetría de sus formas, por lo estrecho del talle, en contraste con la anchura de los hombros desnudos, por la expresión amorosa de su cabeza, como por el color ligeramente bronceado, bien podía pasar por la Venus de la raza híbrida etiópico-caucásica. Vestía traje de punto ilusión sobre viso de raso blanco, mangas cortas con ahuecadores, que las hacían parecer dos globos pequeños, banda de cinta ancha encarnada a través del pecho, guantes de seda largos hasta el codo, tres sartas de brillantes corales al cuello, y una pluma blanca de marabú con flores naturales, las que, con el pelo hecho un rodete bajo y un orden de rizos de sien a sien, por detrás, daban a su cabeza el aire de una gorra antigua de terciopelo negro, que es lo que ella o su peluquero se había propuesto contrahacer. La compañera iba vestida y peinada con poco más o menos como ella, pero no siendo ni con mucho tan esbelta y bella, no atrajo tanto la atención.

Volvíanse las mujeres todo ojos para verla, los hombres le abrían paso, le decían alguna lisonja o chocarrería, y en un instante el rumor sordo de:--La _Virgencita de bronce, la Virgencita de bronce_, recorrió de un extremo a otro la casa del baile. Que la reina de éste acababa de presentarse, sin la orquesta, dieron de ello claras muestras la animación y el movimiento difundidos por todas

partes. Al pasar ella por junto al clarinete Pimienta, le tocó con el abanico en el brazo, acompañando la acción con una sonrisa, que fueron parte para que el artista, que por lo visto esperaba aquel instante con ansia devoradora, sacara de su instrumento las melodías más extrañas y sensibles, cual si la musa de sus sueños platónicos hubiese bajado a la tierra y adoptado la forma de una mujer sólo para inspirarle. Puede decirse en resumen que el golpe del abanico surtió en el músico el efecto de una descarga eléctrica cuya sensación, si es dable expresarlo así, podía leerse lo mismo en su rostro que en todo su cuerpo, desde el cabello a la planta. No se cruzaron palabras entre ellos, por supuesto, ni parecían necesarias tampoco, al menos por lo que a él tocaba, pues el lenguaje de sus ojos y de su música era el más elocuente que podía emplear ser alguno sensible, para expresar la vehemencia de su amorosa pasión.

También le tocó con su abanico y se sonrió con Pimienta la compañera de la llamada _Virgencita de bronce_ pero el menos observador pudo advertir que el toque y la sonrisa de la una no tuvieron sobre él, ni con mucho, la influencia mágica de los de la otra. Al contrario, sus miradas se encontraron con natural y sereno movimiento, por donde era fácil colegir que había inteligencia entre ella y el músico, pero aquella inteligencia que tiene por origen la amistad o el parentesco, no el amor. Sea de esto lo que se fuere, Pimienta siguió con la vista a las dos muchachas, en cuanto se lo permitían las gentes, hasta que entraron en el primer aposento, por la puerta del comedor, entonces cesó de tocar y paró la música.

Los jóvenes blancos, con Cantalapiedra a su cabeza, se habían situado al fin en el comedor, cerca de esa puerta de comunicación, para hallarse a la mira, lo mismo de las mujeres que entraban de la calle, como de las que salían a bailar en la sala. El que llamaban Leonardo, no bien notó la aproximación del carruaje en que llegaban las dos muchachas arriba mencionadas, se abrió camino a la calle con alguna dificultad, y se dirigió derecho al calesero, al cual le habló en baja voz. Este, para oírlo, se inclinó desde la silla del caballo que montaba, se quitó el sombrero en señal de respeto, y diciendo,--sí, señor,--al punto echó a escape con el carruaje la vuelta del hospital de mujeres de Paula.

Mientras las dos muchachas pasaban del comedor al cuarto, la más hermosa preguntó a su amiga en tono de voz que pudieron oír algunos de los circunstantes:

--¿Lo has visto, Nene?

--¿Te ciega el amor? contestó la compañera con otra pregunta.

--No es eso, china, sino que no lo he visto. ¿Qué quieres?

--Pues por tu lado pasó como un reguilete, cuando nosotras entrábamos.

Con esto la otra echó una rápida ojeada en torno del grupo de cabezas que la rodeaban y se inclinaban sobre ella, en el afán de verla a su sabor y de atraer sus miradas. Pero no cabe duda que sus ojos no tropezaron con los del individuo, cuyo nombre ninguna de las dos mencionó, porque torció el ceño y dio claras muestras de su desazón. Cantalapiedra, sin embargo, oyendo sus palabras y observando su semblante, dijo: ¡Cómo! ¿Qué, no me ves? ¡Aquí me tienes, cielo!

La joven hizo un mohín muy sonoro y no replicó palabra. Por el contrario, Nemesia, que se perecía por los dimes y diretes, contestó con más viveza que gracia:

--Ahí se podía estar el señor toda la vida. _Naide_ preguntaba por el señor.

--Ni yo hablaba contigo, poca sal.

--Ni se necesita, cristiano.

--¡Qué lengua, qué lengua! repitió el comisario.

Todo esto pasó en un instante, sin volver atrás la cara las muchachas, ni pararse a conversar, sino el tiempo necesario para que los hombres les abrieran paso. Ya en la puerta del aposento, la Ayala recibió a sus amigas con los brazos abiertos y muchas demostraciones de alegría y de cariño. Y ya fuese por cumplimiento, ya porque así en efecto lo sentía, dijo casi a gritos:--Por ustedes se aguardaba para romper el baile. ¿Cómo está Chepilla? continuó hablando con la más joven. ¿No ha venido? Empezaba a creer que había habido novedad.

--Por poco no vengo, contestó la preguntada. Chepilla no se sentía buena, y luego se ha puesto tan impertinente. El quitrín esperó por nosotras media hora por lo menos.

--Más vale que no haya venido, continuó la Mercedes. Porque la cosa va a durar hasta el alba y ella no podría resistir. Denme sus _mantas_.

Tiempo era ya de que la fiesta comenzase. En efecto, no tardó en presentarse en el aposento ocupado por las matronas un mulato alto, calvo, algo entrado en años, aunque robusto, quien plantándose delante de la Mercedes Ayala, le dijo en voz bronca y con los brazos levantados:

--Vengo por la gracia y la sal para romper el baile.

--Pues, hermano, a la otra puerta, que aquí no es, repuso la Ayala con mucha risa.

--No hay que venirme con ésas, señora, porque yo soy porfiado. Además, que a nadie sino al ama de la casa corresponde el honor de romper el baile; con más que es su natalicio.

--Eso sería bueno si no hubiera en esta selecta reunión muchachas bonitas, a quienes de derecho corresponde el dominio y la gloria en todas partes.

--Ya se ve, agregó el calvo, que no faltan esta noche en tan selecta reunión muchas y muy bonitas muchachas, pero esta circunstancia, que concurre también en el ama de la casa, no les da derecho a romper el baile. Hoy en el día de su santo, Merceditas, es Vd. el ama de la casa, donde celebramos tan fausto día, y es Vd. la gracia y la sal del mundo. ¿He dicho algo? concluyó recorriendo con la vista los circunstantes en busca de su aprobación.

Todos, que más que menos, ya con palabras, ya con la acción, manifestaron su aquiescencia, de manera que la Ayala tuvo que ponerse en pie, y mal su grado seguir al compañero a la sala. Por entonces ya habían despejado los hombres, dejando un buen espacio libre en el centro. El calvo llevaba de la mano a la Ayala, y con ella se cuadró de frente para la orquesta, a la cual mandó en tono imperioso que tocase un minué de corte. Este baile serio y ceremonioso estaba en desuso en la época de que hablamos; pero por ser propio de señores o gente principal, la de color de Cuba le reservaba siempre para dar principio a sus fiestas.

Bailaba aquella anticuada pieza con bastante gracia por parte de la mujer y con aire grotesco por la del hombre, saludaron a la primera los circunstantes con estrepitosos aplausos, y luego, sin más demora, comenzó de veras el baile, es decir, la danza cubana, modificación tan especial y peregrina de la danza española, que apenas deja descubrir su origen. Uno de tantos presentes se arrestó a invitar a la joven de la pluma blanca, como si dijéramos, a la musa de aquella fiesta, y ella, sin hacerse de rogar ni poner ningún reparo, aceptó de plano la invitación. Cuando pasaba del aposento a la sala, para ocupar su puesto en las filas de la danza, se le escapó a una de las mujeres la siguiente audible exclamación:

--¡Qué linda! Dios la guarde y la bendiga.

--El mismo retrato de su madre, que santa gloria haya, agregó otra.

--¡Cómo! ¿Que murió la madre de esa niña? preguntó muy azorada una tercera.

--¡Toma! ¿Que ahora se desayuna Vd. de eso? repuso la que habló en segundo lugar. ¿Pues no oyó Vd. decir que había muerto de resultas de haber perdido a su hija a los pocos días de nacida?

--No entiendo cómo la perdió si vive.

--No me ha dejado Vd. explicar, _seña_ Caridad. Perdió a su hija a los pocos días de nacida porque se la quitaron cuando menos lo esperaba. Hay quien diga que la abuela, para ponerla en la Real Casa Cuna y hacerla pasar por blanca; hay quien diga que la abuela no fue la ladrona, sino el padre de la muchacha, que era un caballero de muchas campanillas y ya se había arrepentido de sus tratos y contratos con la madre. Esta perdió junto con la hija el juicio, y cuando le volvieron la hija, por consejo de los médicos, ya fue tarde, porque si recobró el juicio, que hay quien lo duda, no recobró la salud, y murió en Paula.

--Ha contado Vd. una historia, _seña_ Trinidad, dijo pasito la Ayala con sonrisa de incredulidad a la mulata que acababa de hablar.

--Hija, replicó la Trinidad alto, como me la contaron la cuento; ni quito ni pongo de mi caudal.

--Pues según mis informes, que son de buena tinta, continuó la Ayala, Vd. o la que le contó la historia añadió mucho de su propio caudal. Lo digo porque no se sabe de cierto si la madre de la niña ésta vive o muere; lo único que está bien averiguado es que la abuela oculta a la nieta el nombre de su padre, aunque es preciso ser ciega para no verlo o conocerlo. Cuando menos anda ahora

mismo por las ventanas, siguiéndole los pasos a la hija, como que no la pierde de vista un punto. Parece que ese hombre ingrato y desnaturalizado, arrepentido de su conducta con la infeliz Rosarito Alarcón, no halla otro medio de expiar su culpa que seguir a la hija de cuna en cuna y de ponina en ponina, para ver si la liberta de los peligros del mundo. No tenga cuidado. Trabajo le mando. Como que así así se le cortan las alas al pájaro que una vez emprendió el vuelo.

--Pero se puede saber, preguntó la que dijeron Caridad, ¿quién es el señorón de que se trata? Porque aquí tiene Vd. una persona que no lo conoce ni lo ha visto nunca, y no me parece que soy sorda ni ciega.

--Como sé lo que es una curiosidad no satisfecha, _seña_ Caridad, voy a sacarla de dudas, dijo la Ayala acercándose. Creo que hablo con una mujer de secreto, y por eso le digo todo lo que hay en el asunto. Apuradamente no tengo por qué andar con tapujos a estas horas. Sepa que el hombre es...; y poniéndole ambas manos en los hombros a la curiosa, le comunicó en secreto el nombre del individuo. ¿Lo conoce Vd. ahora? concluyó preguntando la Ayala.

--Por supuesto que sí, contestó _seña_ Caridad. Como a mis manos. Lo más que yo conocía. Por cierto que...; pero cállate, lengua.

Serían las diez de la noche y entonces estaba en su punto el baile. Bailábase con furor. Decimos con furor porque no encontramos término que pinte más al vivo aquel mover incesante de pies, arrastrándolos muellemente junto con el cuerpo al compás de la música; aquel revolverse y estrujarse en medio de la apiñada multitud de bailadores y mirones, y aquel subir y bajar la danza sin tregua ni respiro. Por sobre el ruido de la orquesta con sus estrepitosos timbales, podía oírse, en perfecto tiempo con la música, el monótono y continuo chis, chas de los pies; sin cuyo requisito no cree la gente de color que se puede llevar el compás con exacta medida en la danza criolla.

En la época a que nos referimos, estaban en boga las contradanzas de figuras, algunas difíciles y complicadas, tanto que era preciso aprenderlas por principio antes de ponerse a ejecutarlas, pues se exponía a la risa del público el que las equivocaba, equivocación a que decían _perderse_. Aquel que se colocaba a la cabeza de la danza ponía la figura, y las demás parejas debían ejecutarla o retirarse de las filas. En todas las _cunas_ generalmente había algún maestro a quien cedían o se tomaba el derecho de _poner la figura_, la misma que al volver a la cabeza de la danza la cambiaba a su antojo. El que más raras y complicadas figuras ponía, más crédito ganaba de excelente bailador, y se tenía a honra entre las mujeres el ser su compañera o pareja. Con el maestro _per se_, fuera de esa distinción, que se disputaba a veces, había la seguridad de no _perderse_, ni verse en la triste necesidad de sentarse, sin haber bailado, después de haberse colocado en las filas de la danza.

En la noche en cuestión, bailaba el maestro con Nemesia, la amiga predilecta de la joven de la pluma blanca. Había él puesto muchas y muy raras figuras, dejando conocidamente para lo último la más difícil y complicada. La segunda, tercera, cuarta y quinta parejas salieron airosas de la prueba, ejecutando la figura con los mismos enlaces, desenlaces y actitudes del maestro; pero no obstante el espacio que tuvo para estudiarla y aprenderla el compañero de la apellidada _Virgencita de bronce_, pues ocupaba en las filas el sexto lugar, a medida que se acercaba su turno, crecía su ansiedad y volvía el rostro hacia los músicos, en ademán suplicatorio, como esperando que adivinaran su aprieto y parasen la música. Aquella inquietud se comunicó a la muchacha, la cual conoció que iba a pasar por la vergüenza de tener que sentarse en lo más animado y divertido de la danza. El temor llegó a dominar todo su ser, poniéndola pálida y nerviosa. Lo que pasaba en el ánimo de esa pareja no tardó en hacerse visible a los ojos de las demás parejas y de muchos de los espectadores del baile.

La idea no más de que la hasta allí reina de la _cuna_ podía verse obligada a retirarse, antes de tiempo, de las filas, había llenado de cruel y envidioso regocijo a las otras muchachas a quienes habían mortificado sobre manera las preferencias y públicos elogios que de ella hacían los hombres desde el momento de su entrada en el baile. En aquellas críticas circunstancias, Pimienta, que no la había perdido tampoco un punto de vista en medio de sus caprichosos giros y del tumulto de la danza, comprendió al vuelo lo que pasaba, y sin advertir a nadie de su intento, paró la música de golpe. Respiró con desahogo el compañero de la joven, y ésta pagó con una sonrisa celestial aquel socorro tan a tiempo del director de la orquesta.

CAPÍTULO VI

Y del tumulto indiscreto _Que ardiente en su torno gira,_ _Ninguno le dijo: "mira,_ _Aquél te adora en secreto._ _Que oyendo y viéndote está"._

RAMÓN DE PALMA

Quince de Agosto

Habrá comprendido ya el discreto lector, que la _Virgencita de bronce_ de las anteriores páginas no es otra que Cecilia Valdés, la misma jovenzuela andariega que procuramos darle a conocer al principio de esta verídica historia. Hallábase, pues, en la flor de su juventud y de su belleza, y empezaba a recoger el idólatra tributo que a esas dos deidades rinde siempre con largueza el pueblo sensual y desmoralizado. Cuando se recuerde la descuidada crianza y se una a esto la soez galantería que con ella usaban los hombres, por lo mismo que era de la raza híbrida e inferior, se formará cualquier idea aproximada de su orgullo y vanidad, móviles secretos de su carácter imperioso. Así es que, sin vergüenza ni reparo, a menudo manifestaba sus preferencias por los hombres de la raza blanca y superior, como que de ellos es de quienes podía esperar distinción y goces, con cuyo motivo solía decir a boca llena,--que en verbo de mulato sólo quería las _mantas_ de seda[8], de negro sólo los ojos y el cabello.

Fácil es de creer, que una opinión tan francamente emitida como contraria a las aspiraciones de los hombres de las dos clases últimamente mencionadas, no les haría buena sangre, según suele decirse. Con todo eso, bien porque no se creyese sincera a su autora cuando la expresaba, bien porque se esperaba que hiciera una excepción, bien porque siendo tan bella era imposible verla sin amarla, lo cierto es que más de un mulato estaba perdido de amores por ella, sobre todos Pimienta, el músico, como habrá podido advertirse. Este tal gozaba la inapreciable ventaja sobre los demás pretendientes, de ser hermano de la amiga íntima y compañera de la infancia de Cecilia, con cuyo motivo podía verla a menudo, tratarla con intimidad, hacérsele necesario y ganar tal vez su rebelde corazón a fuerza de devoción y de constancia. ¿A quién no ha halagado en su vida esperanza más efímera? De todos modos, él siempre tenía presente aquel canto popular de los poetas españoles, que principia:--Labra el agua sin ser dura, un mármol endurecido,--y puede decirse, en honor de la verdad, que Cecilia le distinguía entre los hombres de su clase que se le acercaban a celebrarla, si bien semejante distinción, hasta la fecha presente, no había pasado de uno que otro rasgo de amabilidad con un hombre por otra parte muy amable, cortés y atento con las mujeres.

Acabada la danza, se inundó de nuevo la sala y comenzaron a formarse los grupos en torno de la mujer preferida por bella, por amable o por coqueta. Pero en medio de la aparente confusión que entonces reinaba en aquella casa, podía observar cualquiera que, al menos entre los hombres de color y los blancos, se hallaba establecida una línea divisoria que, tácitamente y al parecer sin esfuerzo, respetaban de una y otra parte. Verdad es que unos y otros se entregaban al goce del momento con tal ahinco, que no es mucho de extrañar olvidaran por entonces sus mutuos celos y odio mutuo. Además de eso, los blancos no abandonaron el comedor y aposento principal, a cuyas piezas acudían las mulatas que con ellos tenían amistad, o cualquier otro género de relación, o deseaban tenerla; lo cual no era ni nuevo ni extraño, atendida su marcada predilección. Cecilia y Nemesia, por uno u otro de estos motivos, o por su estrecha amistad con el ama de la casa, no bien concluyó la danza se fueron derecho al aposento y ocuparon asiento detrás de las matronas hacia el comedor. Allí, sin más dilación, se formó el grupo de los jóvenes blancos, porque, ya se ha dicho, aquellas dos muchachas eran las más interesantes del baile. Las personas conspicuas de ese grupo, sin disputa que eran tres: el comisario Cantalapiedra, Diego Meneses y su amigo íntimo el joven conocido por Leonardo. Este último tenía apoyada la mano derecha en el canto del respaldo de la silla ocupada por Cecilia, quien, por casualidad o a posta, le estrujó los dedos con la espalda.

--¿Así trata Vd. a sus amigos? Le dijo Leonardo sin retirar la mano, aunque le escocía bastante.

Contentose Cecilia con mirarlo de soslayo y torcerle los ojos cual si la palabra amigo sonase mal en quien debía saber que era tratado como enemigo.

--Esa niña está hoy muy desdeñosa, dijo Cantalapiedra, que notó la acción y la mirada.

--¿Y cuándo no? dijo Nemesia sin volver la cara.

--Nadie te ha dado vela en este entierro, repuso el comisario.

--Y al señor ¿quién se la ha dado? agregó Nemesia mirándole entonces de reojo.

--¿A mí? Leonardo.

--Pues a mí, Cecilia.

--No hagas caso, mujer, dijo esta última a su amiga.

--Si no fuera por qué... yo te ponía más suave que un guante, añadió Cantalapiedra hablando directamente con Cecilia.

No ha nacido todavía, dijo ella, el que me ha de hacer doblar el cocote.

--Tienes esta noche palabras de poco vivir, le dijo entonces Leonardo, inclinándose hasta ponerle la boca en el oído.

--Me la debe Vd. y me la ha de pagar, le contestó ella en el propio tono y con gran rapidez.

--Al buen pagador no le duelen prendas, dice a menudo mi padre.

--Yo no entiendo de eso, repuso Cecilia. Sólo sé que Vd. me ha desairado esta noche.

--¿Yo...? Vida mía...

En aquella misma sazón se acercó Pimienta por la puerta de la sala saludando a un lado y a otro a sus amigas, y cuando se puso al alcance de Cecilia ésta le echó mano del brazo derecho con desacostumbrada familiaridad, y le dijo, afectando tono y aire volubles:--¡Oiga! ¡Qué bien cumple un hombre su palabra empeñada!

--Niña--contestó con solemne tono, aunque acaso no era para tanto--José Dolores Pimienta siempre cumple su palabra.

--Lo cierto es que la contradanza prometida aún no se ha tocado.

--Se tocará, Virgencita, se tocará, porque es preciso que sepa que a su tiempo se maduran las uvas.

--La esperaba en la primera danza.

--Mal hecho. Las contradanzas dedicadas no se tocan en la primera, sino en la segunda danza, y la mía no debía salir de la regla.

--¿Qué nombre le ha puesto? preguntó Cecilia.

--El que se merece por todos estilos la niña a quien va dedicada: _Caramelo vendo_.

--¡Ah! Esa no soy yo por cierto, dijo la joven corrida.

--¡Quién sabe, niña! ¡Qué tarde vinieron! agregó hablando con su hermana Nemesia.

--No me digas nada, José Dolores, repuso ésta. Costó Dios y ayuda persuadir a Chepilla el que nos dejase venir solas, porque lo que es ella no podía acompañarnos. Consintió a lo último porque vinimos en quitrín. Y aún así, (para añadir estas palabras miró a Cecilia como consultando su semblante), si no tomamos la determinación de meternos en él, nos quedamos... Chepilla se puso furiosa en cuanto que se asomó a la puerta y conoció...

--Chepilla no se puso _brava_ por nada de eso, mujer; interrumpió Cecilia con gran viveza a su amiga. No quería que viniésemos porque la noche estaba muy mala para baile. Y tenía mucha razón, sólo que yo había dado mi palabra...

Por prudencia o por cualquier otro motivo, Pimienta se alejó de allí sin aguardar a más explicaciones. No sucedió lo mismo con Cantalapiedra, que era hombre curioso si los hay, por lo que con sonrisa maliciosa le preguntó a Nemesia:--¿Se puede saber por qué la Chepilla se puso furiosa luego que reconoció el quitrín en que ustedes vinieron al baile?

--Como que yo no soy baúl de _naiden_, contestó la Nemesia prontamente, diré la verdad. (Cecilia le pegó un pellizco, pero ella acabó la frase.) Claro, porque conoció que el quitrín era del caballero Leonardo.

Naturalmente las miradas de Cantalapiedra y de los demás presentes al alcance de las palabras de Nemesia, se concentraron en el individuo que ella había nombrado, y aquél, tocándole en el hombro, le dijo:

--Vamos, no se ponga colorado, que el prestar el carruaje a dos reales mozas como éstas en noche tan fea, no es motivo para que nadie sospeche malas intenciones de un caballero.

--Ese quitrín, lo mismo que el corazón de su dueño, repuso Leonardo sin cortarse, están siempre a la orden de las bellas.

Salía entonces Pimienta por la puerta del comedor y oyó distintamente las palabras del joven blanco, convenciéndole, desde luego, de quién era el quitrín en que Cecilia y su hermana Nemesia habían venido al baile. El desengaño le hirió en lo más vivo del alma; por lo que echando una mirada triste al grupo de jóvenes blancos, de seguidas pasó a la sala donde, después de armar el clarinete, tocó algunos registros a fin de que entendieran sus compañeros que era tiempo de que se reuniera de nuevo la orquesta. Afinados los instrumentos, sin más dilación rompió la música con una contradanza nueva, que a los pocos compases no

pudo menos de llamar la atención general y arrancar una salva de aplausos, no sólo porque la pieza era buena, sino porque los oyentes eran conocedores; aserto éste que creerán sin esfuerzo los que sepan cuán organizada para la música nace la gente de color. Se repitieron los aplausos luego que se dijo el título de la contradanza, _Caramelo vendo_, y a quién estaba dedicada, a la _Virgencita de bronce_. De paso puede añadirse que la fortuna de aquella pieza fue la más notable de las de su especie y época, porque después de recorrer los bailes de las ferias por el resto del año e invierno del subsecuente, pasó a ser el canto popular de todas las clases de la sociedad.

Excusado parece decir que con una contradanza nueva, guiada por su mismo autor y tocada con mucho sentimiento y gracia, los bailadores echaron el resto, quiere decirse, que llevaron el compás con cuerpo y pies; cuyo monótono rumor en toda apariencia duplicaba el número de la orquesta. Bien claro decía el clarinete en sus argentinas notas: _caramelo vendo, vendo caramelo_; al paso que los violines y el contrabajo las repetían en otro tono, y los timbales hacían coro estrepitoso a la voz melancólica de la vendedora de ese dulce. Pero ¿qué era del autor de la pieza que tanta impresión causaba? En medio del delirio de la danza, ¿había quien se acordara de su nombre? ¡Ay! No. Como la noche avanzaba sin señales de bonanza, desde temprano la gente curiosa de la calle empezó a desamparar la puerta y ventanas del baile, y a las once no quedaba en ellas caras blancas, al menos de mujer. De esta circunstancia se aprovecharon los jóvenes de familias decentes, a que nos hemos referido más arriba, que abrigaban un cierto escrúpulo para ponerse a bailar con las mulatas amigas o conocidas. Cantalapiedra tomó por pareja a la ama de la casa, Mercedes Ayala; Diego Meneses, a Nemesia y Leonardo a Cecilia; y parte por guardar en lo posible la línea de separación, parte por un resto de ese mismo tardío escrúpulo, establecieron la danza en el comedor, no obstante la estrechez y desaseo de la pieza.

Con semejante ocurrencia puede imaginar cualquiera la agonía de alma de Pimienta. Su musa inspiradora, la mujer adorada, se hallaba en brazos de un joven blanco, tal vez del preferido de su corazón; pues como sabemos, no ocultaba ella sus sentimientos, se entregaba toda al delirio del baile, mientras él, atado a la orquesta cual una roca, la veía gozar y contribuía a sus goces sin participar de ellos en lo más mínimo. La turbación de su espíritu no fue, sin embargo, bastante a perjudicar su dirección de la orquesta, ni a influir desfavorablemente en el manejo de su instrumento favorito. Por el contrario, su inquietud y su pasión no parece sino que encontraron desahogo por las llaves del clarinete; se exhalaron, por decirlo así, según lo peregrino y suave de las notas que de él sacaba, esparciendo el encanto y la animación entre los bailadores. Como suele decirse, no quedó títere con cabeza que no bailara, pues se armó la danza en la sala, en el comedor, en el aposento principal y en el angosto y descubierto patio de la casa. ¿Qué mucho, pues, que entonces no pasara siquiera por la mente de los que tanto se divertían y gozaban, que el autor y el alma de toda aquella alegría y fiesta, José Dolores Pimienta, compositor de la contradanza nueva, agonizaba de amor y de celos?

Pasadas serían las doce de la noche cuando cesó de nuevo la música, con lo que a poco empezaron a retirarse las personas que podían considerarse extrañas para el ama de casa, porque hasta entonces no levantó ésta la voz diciendo que era hora de cenar. Y para apresurar la marcha, agarró ella por el brazo a dos de sus mejores amigas y arrastro casi las llevó al fondo del patio donde dijimos que estaba puesta la mesa del ambigú. Tras ellas siguieron las demás mujeres y los hombres, entre los segundos Pimienta y Brindis, los músicos; Cantalapiedra y su inseparable corchete, el de las grandes patillas, Leonardo y su amigo Diego Meneses. Tomaron asiento en torno de la mesa las mujeres, únicas que cupieron, aunque eran pocas; los hombres se mantuvieron en pie cada cual detrás de la silla de su amiga o preferida. Quedaron juntos a una de las cabeceras Cantalapiedra y la Ayala, sin que sepamos decir si por casualidad o por hacer honor al comisario y a su categoría.

No cabe duda sino que el ejercicio del baile había aguzado el apetito de los comensales de ambos sexos, porque apoderándose los unos del jamón, los otros del pescado, aceitunas y demás manjares en algunos minutos, todos comían y habían aliviado la mesa de una buena porción de su peso. Satisfecha la primera necesidad, hubo lugar a los rasgos de galantería y cariño que en todos los países llevarán el sello de la educación que alcanzan las personas que los ejercen. Las de la verídica historia cuya fisonomía trazamos ahora a grandes pinceladas, no eran, en general, de la clase media siquiera, ni de la que mejor educación recibe en Cuba, y puede creerse sin esfuerzo que sus rasgos de galantería y de cariño en ninguna circunstancia tenían nada de delicados ni de finos.

--Que diga algo Cantalapiedra, dijo alguien.

--Cantalapiedra no dice nada cuando come, contestó él mismo mientras roí a la pierna del pavo.

--Pues que no coma si ha de callar, saltó otro.

--Eso no, porque comeré y diré hasta el juicio final, repuso el comisario. ¿Cómo quieren, sin embargo, que diga si aún no he remojado la garganta?

--¡Ahí va mi copa! ¡Ahí va la mía! ¡Tome ésta! exclamaron diez voces por lo menos, y otros tantos brazos se cruzaron sobre la mesa en dirección del comisario, quien, empuñando una tras otra copa, cada cual llena de un vino diferente, se las fue echando al coleto, sin presentar más muestra del efecto que le causaban que ponerse algo rubicundo y aguársele los ojos. Después, llenando su propia copa de rico champaña, tosió, levantó el pecho, y en voz campanuda, aunque un si es no es carrasposa, dijo:

--¡Bomba! En los felices natales de mi amiga Merceditas Ayala, décima:

Yo te digo en la ocasión, _Merceditas de mis ojos,_ _Que tu vista guarda abrojos,_ _Pues que punza el corazón._

Ten de un triste compasión, _Que por tus ojos suspira,_ _Que por tus ojos delira,_ _Que por tus ojos alienta,_ _Que por tus ojos sustenta_ _Esta vida de mentira._

Tras esta improvisación ramplona y de mal gusto, resonaron vivas y aplausos repetidos y estrepitosos, con destemplado golpeo de los platos con los cuchillos. Y como en recompensa de su poética labor, de ésta recibió una aceituna ensartada en el mismo tenedor con que acababa de llevarse el alimento a la boca, de esotra una tajada de jamón, de la de más allá un pedazo de pavo, de aquélla un caramelo, de su vecina una yema azucarada, hasta que la Ayala puso término al torrente de obsequios levantándose y pasando su copa, llena de Jerez, a Leonardo para que improvisara también como lo había hecho el complaciente comisario. Aprovechose éste de la tregua que se le concedía tácitamente, para levantarse de la mesa, ir derecho, aunque disimuladamente, hasta el brocal del pozo, donde, introduciéndose dos dedos en la boca, arrojó cuanto había comido y bebido, que no había sido poco. Y muy fresco y repuesto se volvió a la mesa. Merced a un medio tan sencillo como expedito, pudo tornar a comer y a beber cual si no hubiera probado bocado ni pasado gota en toda la noche. De los demás hombres que habían bebido con exceso y no conocían el remedio eficaz de Cantalapiedra, que más que menos, pocos acertaban a tener firme la cabeza, sin exceptuar al mismo joven Leonardo.

A esa lamentable circunstancia debe atribuirse el que un mozo tan fino como bien educado, se prestara también a hacer coplas y en obsequio de aquella heroína de la fiesta. Pero bien que mal las hizo, siendo no menos aplaudido y regalado que el anterior coplero, aunque fue de notarse que, lejos Cecilia Valdés de celebrar, como los demás, su esfuerzo poético, se mantuvo callada y visiblemente corrida. Tampoco tomó parte Nemesia en la celebración, si bien por causa muy distinta, a saber: por hallarse empeñada en un diálogo rápido y secreto con su hermano José Dolores Pimienta.

--¿Pues no va desocupada la zaga? le decía él.

--Tal vez no, le replicaba ella.

--¿Y tú cómo lo sabes?

--Como sé muchas cosas. ¿Necesito yo tampoco que me den la comida con cuchara?

--Ya, pero tú no te explicas.

--Porque no hay tiempo ahora.

--Sobrado, hermana.

--Luego, las paredes oyen.

--¡Vaya! Cuando se grita.

--Vamos, no seas porfiado. Te digo que no lo hagas.

--Yo no pierdo la ocasión.

--Vas a pasar un mal rato.

--¿Qué me importa si hago mi gusto?

--Te repito, José Dolores, no te metas en camisa de once varas. No seas cabezadura. Con esa porfía me quitas las ganas de ayudarte. Yo entiendo de eso mejor que tú, lo estoy viendo.

Antes que se hubiese calmado el ruido de voces, de palmadas y de golpes en los platos y la mesa, Leonardo le dijo algo en secreto a Cecilia, y salió a la calle arrastrando a Meneses por el brazo, sin despedirse de nadie, a la francesa, como dijo Cantalapiedra cuando los echó de menos. Una vez fuera, a pesar de la lluvia menuda, ambos jóvenes, siempre de brazo, tomaron a pie la calle de La Habana hacia el centro de la ciudad, y en la primera esquina, que era la de San Isidro, Meneses siguió derecho y Leonardo tomó la vuelta del hospital de Paula.

Nubes ligeras, claro oscuras, despedazadas por el viento fresco del nordeste, pasaban unas tras otras en procesión bastante regular por delante de la luna menguante, que ya traspasaba el cenit, y a veces dejaba caer rayos de luz blanquecina. La calle traviesa, angosta y torcida que llevaba el joven Leonardo no se despejó jamás, ni vio él a derechas su camino hasta que llegó a la plazuela del hospital antes dicho, y entonces sólo el lado izquierdo se alumbraba a ratos, pues las paredes de la iglesia de Paula, elevadas y oscuras, proyectaban una doble sombra sobre el espacio exento. Arrimado a ellas, sin embargo, pudo distinguir su carruaje, los caballos del cual agachaban la cabeza y las orejas, en su afán de evitar la lluvia y el viento que les herían de frente. Estaba echado el capacete y no parecía el jinete por ninguna parte, ni en la silla, su puesto acostumbrado, ni en la zaga, ni en el vano de la ancha puerta de la iglesia, que podía servirle de abrigo. Pero a la segunda ojeada comprendió Leonardo dónde estaba. Sentado en el pesebrón del quitrín, le colgaban las piernas cubiertas con las botas de campana, mientras descansaba la cabeza y los brazos, medio vuelto, en los muelles cojines de marroquí. En el suelo yacía la _cuarta_ que en el sueño se le había desprendido de las manos, la recogió Leonardo al punto, levantó un canto del capacete y con todas sus fuerzas le pegó dos o tres zurriagazos a manteniente, por las espaldas presentadas.

--¡Señor! exclamó el calesero, entre asustado y dolorido, descolgándose.

Ya de pie pudo verse que era un mozo mulato, bastante fornido, ancho de hombros y de cara, más fuerte si no más alto que el que acababa de calentarle las espaldas con el zurriago. Vestía a la usanza de los de su oficio en la isla de Cuba, chaqueta de paño oscuro, galoneado de pasamanería, chaleco de piqué, el cuello de la camisa a la marinera, pantalón de hilo, botas enormes de campana, a guisa de polainas, y sombrero negro redondo, galoneado de oro. Debemos mencionar también, como signos característicos del calesero, las espuelas dobles de plata, que no llevaba a la sazón el mulato de que ahora se habla.

--¡Oiga! le dijo su amo, pues lo era en efecto el joven Leonardo; dormías a pierna suelta, mientras los caballos quedaban a su albedrío. ¿Eh? ¿Qué hubiera sucedido si espantados por casualidad, echan a correr por esas calles de Barrabás?

--Yo no estaba _dormiendo_, niño; se atrevió a observar el calesero.

--¿Conque no dormías? Aponte, Aponte, tú parece que no me conoces, o que crees que yo me mamo el dedo. Mira, monta, que ya ajustaremos cuentas. Lleva el quitrín a la _cuna_, toma las dos muchachas que trajiste en él y condúcelas a su casa. Yo te espero en el paredón de Santa Clara, esquina a la calle de La Habana. No consientas que nadie monte a la zaga. ¿Entiendes?

--Sí, señor; contestó Aponte, partiendo en dirección de la garita de San José. En la puerta de la casa del baile, sin desmontarse, dijo a un desconocido que entonces entraba:

--¿Me hace el favor de decirle a la niña Cecilia que aquí está el quitrín?

A pesar del aditamento de _niña_ de que hizo uso el calesero hablando de Cecilia, que sólo se aplica en Cuba a las jóvenes de la clase blanca, el desconocido pasó el recado sin equivocación ni duda. Y ella incontinente se levantó de la mesa y fue a coger su _manta_, seguida de Nemesia y de la Ayala. Esta última las acompañó hasta la puerta de la calle, en donde ya se habían agrupado los pocos hombres que aún no se habían despedido. Allí, teniendo todavía por la cintura a Cecilia, en señal de amistad y cariño, la dijo:

--No te fíes de los hombres, china, porque llevas la de perder.

--Y ¿yo me he fiado de alguno a estas horas, Merceditas? repuso Cecilia sorprendida.

--Ya, pero ese quitrín tiene dueño, y nadie da palos de balde. Tenlo por sabido. Me parece que me explico.

Con esto y con fingir Cantalapiedra que lloraba por la partida de Cecilia, cosa que causó mucha risa, ésta y Nemesia subieron al carruaje dándoles la mano Pimienta, y de hecho quedó desbaratada la reunión.

Podía ser entonces la una de la madrugada. El viento no había abatido ni cesado la llovizna que, de cuando en cuando, arrojaban las voladoras nubes sobre la ciudad dormida y en tinieblas. Conforme reza la expresión vulgar, la oscuridad era como boca de lobo. No por eso, sin embargo, perdió el joven músico la pista del carruaje que conducía a su hermana y a su amiga, antes por el ruido de las ruedas en el piso pedregoso de las calles, le fue siguiendo las aguas, primero al paso redoblando y luego al trote, hasta que le alcanzó cerca de la calle de Acosta. Puso la mano en la tabla de atrás, se impulsó naturalmente con la carrera que llevaba y quedó montado a la mujeriega. Al punto le sintió el calesero e hizo alto.--Apéate, le dijo Nemesia por el postigo.--No hay para qué, dijo Cecilia.--Yo les voy guardando las espaldas, dijo Pimienta.--Apéese Vd., dijo en aquella sazón Aponte, que ya había echado pie a tierra.--¿No te lo decía? añadió Nemesia, hablando con su hermano.--Aquí dentro va mi hermana y mi amiga, observó el músico dirigiéndose al calesero.--Será así repuso éste; pero no consiento que nadie se monte atrás de mi quitrín. Se echa a perder, camará; agregó notando que se las había con un mulato como él.--Apéate, repitió Nemesia con insistencia.

Obedeció José Dolores Pimienta, conocidamente después de una lucha sorda y terrible consigo mismo, en que triunfó la prudencia; pero cediendo y todo en aquella coyuntura, no renunció a la resolución tomada de seguir el carruaje. Volvió a montar el calesero y continuó la carrera derecho hasta desembocar en la calle de Luz, torciendo allí a la izquierda hacia la de La Habana. Cerca del cañón de la esquina estaba un hombre de pie, guarecido del viento y de la menuda llovizna, con las elevadas tapias del patio perteneciente al monasterio de las monjas Claras. En ese punto, paró Aponte por segunda vez el quitrín, el hombre en silencio subió a la zaga, diciendo luego a media voz: ¡Arrea! Partió entonces aquél a escape, pero no sin dar tiempo a que se acercara lo bastante el músico, para advertir que el individuo que le reemplazó en la zaga del carruaje era el mismo joven blanco, Leonardo, que tantos celos le había inspirado en la _cuna_.

CAPÍTULO VII

¿Y qué modo de hombre es él, _es negocio moscatel,_ _es discreto vergonzoso,_ _o dulce o acibaroso?_

LOPE DE VEGA

La Buscona

En el barrio de San Francisco y en una de las calles menos torcidas, con banquetas o losas en una o dos cuadras, había, entre otras, una casa de azotea, que se distinguía por el piso alto sobre el arco de la puerta, y balconcito al poniente. La entrada general, como la de casi todas las casas del país--para los dueños, criados, bestias y carruajes, dos de los cuales había comúnmente de plantón--era por el zaguán; especie de casapuerta o cochera, que conducía al comedor, patio y cuartos escritorios.

Llamaban bajo este último nombre los que se veían a la derecha, a continuación del zaguán, ocupados, el primero por una carpeta doble de comerciante, con dos banquillos altos de madera, uno a cada frente, y debajo una caja pequeña de hierro, cuadrada, que en vez de puerta tenía tapa para abrirse o cerrarse, siempre que se guardaban en ella o se sacaban los sacos de dinero. En el lado opuesto de la casa se veía la hilera de cuartos bajos para la familia, con entrada común por la sala, puerta y ventana al comedor y al patio.

Este formaba un cuadrilátero, en cuyo centro sobresalía el brocal de piedra azul de un aljibe o cisterna, donde, por medio de canales de hoja de lata y de cañerías enterradas en el suelo, se vertían las aguas llovedizas de los tejados. Una tapia de dos varas de elevación, con un arco hacia el extremo de la derecha, separaba el patio de la cocina, caballeriza, letrina, cuarto de los caleseros y demás dependencias de la casa.

Entre el zaguán y los cuartos llamados escritorios, descendía al comedor, apoyada en la pared divisoria, una escalera de piedra tosca con pasamanos de cedro, sin meseta ni más descanso que la vuelta violenta que hacían los últimos escalones casi al pie. Esa escalera comunicaba con las habitaciones altas, compuestas de dos piezas: la primera que hacía de antesala, tan grande como el zaguán; la segunda, todavía mayor, como que tenía las mismas dimensiones que los escritorios sobre los cuales estaba construida y servía de dormitorio y estudio. Con efecto, los muebles principales que la llenaban casi, eran una cama o catre de armadura de caoba, cubierto con un mosquitero de rengue azul, un armario de aquella propia madera, un casaquero o percha de lo mismo, un sofá negro de cerda, unas cuantas sillas con asiento de paja, una mesa a modo de bufete, y una butaca campechana.[9] Sobre los tales muebles se hallaban varios libros, unos abiertos, otros cerrados o con una o más hojas dobladas por la punta, empastados a la española, con canto rojo, todos al parecer de leyes, según podía notarse, leyendo los letreros dorados en los lomos de algunos. En el sofá únicamente dos periódicos en forma de folletos: el más voluminoso con un malísimo

grabado que representaba los figurines de un hombre, una mujer y un niño, y llevaba por título _La moda o Recreo Semanal_,[10] el otro _El Regañón_.[11]

Abajo, en el comedor había una mesa de alas de caoba, capaz para doce cubiertos, hasta seis butacas en dos hileras frente a la puerta del aposento; en el ángulo el indispensable jarrero, mueble _sui generis_ en el país, y para proporcionar sombrío a la pieza y protegerla contra la reverberación del sol en el patio, había dos grandes cortinas de cañamazo, que se arrollaban y desarrollaban lo mismo que los telones de teatro. En la pared medianera entre el zaguán y la sala, había una reja de hierro, y para dar paso a la luz exterior en esta última, dos ventanas de lo mismo voladizas, que desde el nivel del piso de la calle subían hasta el alero del techo. De la viga principal colgaba por sus cadenas una bomba de cristal; de la pared del costado dos retratos al óleo, representativos de una dama y de un caballero en la flor de su edad, hechos por Escobar;[12] debajo de éstos un sofá, y en dirección perpendicular al mismo, en dos filas, hasta seis sillones con asiento y respaldo de marroquí rojo; en los cuatro ángulos, rinconeras de caoba, adornadas con guardabrisas de cristal o con floreros de china. En la pared, entre ventanas, una mesa alta con pies dorados y encima un espejo cuadrilongo; llenando los huecos intermedios, sillas con profusión.

Era de notarse la cortina de muselina blanca, con fleco de algodón, que pendía de los dinteles de las puertas y ventanas de los cuartos, como para dar libre paso al aire y ocultar sus interioridades de las miradas de los que pasaban por el comedor y el patio. En resumen, la casa aquella, peculiarmente habanera, según se habrá echado de ver por la menuda descripción que de ella hemos hecho, respiraba por todas partes aseo; limpieza y... lujo, porque tal puede llamarse, en efecto, si se tiene en cuenta el país, la época de que se habla, el estilo y calidad del mueblaje, los dos carruajes en el zaguán y la capacidad misma de la morada. ¿Vivía allí una familia decente, bien educada y feliz? Vamos a verlo en breve.

A la hora en que principia nuestro cuento, entre seis y siete de la mañana de uno de los días de octubre, ocupaba una de las butacas del comedor un caballero de hasta cincuenta años de edad, alto, robusto, entrecano, nariz grande aguileña, boca pequeña, los ojos pardos y vivos, la color del rostro rubicunda, la cabeza redonda por detrás; signos éstos característicos de pasiones fuertes y firmeza de carácter. Llevaba el cabello corto, la barba rasurada completamente; vestía bata talar de zaraza sobre chaleco largo de piqué blanco, pantalones de dril y chinelas de ante. Descansaba los pies en una silla con asiento de paja y con ambas manos se llevaba a los ojos un periódico impreso en papel español de hilo del folio común, titulado _El Diario de la Habana_.[13]

Mientras leía se le presentó un muchacho como de doce años de edad, vestido de pantalones y camisa de listadillo, que venía del fondo del patio y traía en la mano derecha una taza de café con leche, puesta en un plato, y en la otra un azucarero de plata. El caballero, sin enderezarse en la butaca, tomó la taza, endulzó y se puso a sorber y leer con toda calma, mientras el criado, con los brazos cruzados sobre el pecho, se quedó delante de él en pie, conservando en las manos respectivas el plato y el azucarero. Concluida la poción de café con leche, no obstante que el muchacho se hallaba a pocos pasos, le dijo en tono de voz atronadora:--¡Tabaco y lumbre! Salió aquél de carrera a la cocina y volvió a poco por los cuartos escritorios, trayendo entonces una vejiga grande con algunos cigarros[14] arrollados en el fondo y un braserillo de plata con una brasa de carbón vegetal, medio enterrada en un montón de cenizas. El caballero encendió un cigarro y cuando el muchacho se disponía a emprender de nuevo la carrera, le gritó:--¡Tirso!

--¡Señor! contestó también en alta voz como si ya estuviera en la cocina o hablara con sordo.

--¿Has estado arriba? le preguntó el amo.

--Sí, señor, _dende_ que llegó de la plaza el cocinero.

--¿Y cómo es que el niño Leonardo no ha bajado todavía?

--Es querer decir a su merced que el niño Leonardo no quiere que lo _dispierten_ cuando ha pasado mala noche.

--¡Mala noche! repitió el caballero mentalmente. Anda (al esclavo), despiértale y que baje.

--Señor, dijo el muchacho titubeando y confuso. Señor, su merced sabe...

--¿Qué sucede? volvió a tronar el amo, luego que echó de ver que el esclavo se estaba parado y no le había obedecido.

--Señor, es querer decir a su merced, que el niño se pone bravo cuando lo _dispiertan_, y...

--¿Qué? ¿Qué dices? ¡Ah! ¡Perro! Anda, corre si no quieres subir a puntapiés.

Y como el caballero medio se incorporase para ejecutar la amenaza, no esperó a que se la repitieran para obedecer la orden. En cuatro saltos se puso en lo alto de la escalera, desapareciendo en el dormitorio del joven Leonardo. A tiempo mismo que el muchacho corría escaleras arriba, asomaba por la puerta del aposento una señora algo gruesa, hermosa, de amabilísimo aspecto, las facciones menudas, con el cabello todavía negro, aunque pasaba de los cuarenta de edad, vestida de holán clarín blanco, y abrigada con una manta de burato color canario y toda ella muy pulcra y de ademán reposado y señoril. Sentose al lado del caballero de la bata, a quien, preguntándole por las noticias del día, dio el nombre de Gamboa. Este le contestó entre dientes que la única importante que traía _El Diario_ era la aparición del cólera morbus en Varsovia, donde hacía estragos espantosos.

--¿Y dónde es eso? preguntó la señora bostezando.

--¡Toma! contestó Gamboa. Eso es muy lejos. Figúrate, allá, cerca del Polo Norte, en Polonia. Ya tiene que rodar el señor cólera para llegar hasta nosotros, y entonces... ¡quién sabe dónde estaremos tú y yo!

--¡Dios nos libre de horas menguadas, Cándido! volvió a exclamar la señora con el mismo aire de indolencia de antes.

Bajaba Tirso en este punto los escalones con doble precipitación, si cabe, de aquella con que los había subido; y a no ser porque en tiempo agacha la cabeza, le alcanza en ella un libro que le arrojaron de lo alto, el cual, con la violencia del golpe se hizo pedazos en la puerta del escritorio. Don Cándido alzó la cabeza y la señora se levantó y fue hacia el pie de la escalera, preguntando:--¿Qué ha sido eso? Por toda respuesta el muchacho, muy asustado, le indicó con los ojos al joven Leonardo, que se hallaba en lo alto, envuelto en la sábana, con los puños apretados en señal de cólera y de amenaza. Pero no bien descubrió a su madre, pues lo era aquella señora, cambió de actitud y de semblante; e iba sin duda a explicarle la ocurrencia, cuando ella le contuvo haciéndole una seña muy significativa, que equivalía, poco más o menos a decirle:--Calla, que ahí está tu padre. Por lo que él, sin más demora, dio media vuelta y se volvió al dormitorio.

--¿Viene el niño Leonardo? preguntó Gamboa al esclavo, cual si no hubiera notado la carrera de éste, el librazo contra la puerta del escritorio ni la acción de su esposa.

--Sí, señor, contestó Tirso.

--¿Le diste mi recado? insistió don Cándido en tono de voz más recio y áspero.

--Es querer decir a su merced, repuso el esclavo todo turbado y tembloroso, que... el niño... el niño Leonardo no me dio tiempo.

La señora se había vuelto a sentar, y seguía llena de ansiedad las palabras y los movimientos del semblante de su marido. Le vio ponerse rojo a medida que Tirso soltaba las pocas frases de que en su turbación pudo hacer uso; aún le pareció que iba a levantarse, acaso para pegarle al esclavo, o hacer bajar por la fuerza a Leonardo; en cuya confusa alternativa, a fin de ganar tiempo, le dejó caer la mano derecha en el brazo izquierdo y le dijo en voz muy baja y musical:

--Cándido, Leonardito se viste para bajar.

--Y tú ¿cómo lo sabes? replicó don Cándido con gran viveza, volviéndose para su esposa.

--Acabo de verle a medio vestir, en lo alto de la escalinata, contestó ella con calma.

--Pues tú siempre estás al tanto de cuando Leonardo cumple con su deber, pero eres ciega para sus faltas.

--No sé yo que el porbrecito haya cometido ninguna, al menos recientemente.

--¡Ya! ¿No lo decía yo? Ciega, cieguecita, Rosa, tus mamanteos van a perder a ese muchacho. ¡Tirso! tronó don Cándido.

Antes que volviese Tirso de la cocina, en donde se había refugiado, luego que sus amos entablaron el anterior, brevísimo diálogo, entró por el zaguán adelante el mulato calesero que ya conocen nuestros lectores, por aquella escena en el barrio de San Isidro y noche del 24 de setiembre. Vestía ahora solamente camisa y pantalones cuyas piernas estaban arremangadas hasta poco más abajo de las rodillas, como para dejar ver el borde de los calzoncillos blancos, que formaba dientes en vez de dobladillos. Los zapatos eran de vaqueta muy escotados, con hebilla de plata al lado, y tenía argollas de oro en las orejas, pañuelo atado en la cabeza, el sombrero de paja en la mano derecha, y en la izquierda el ronzal de un caballo que traía rabiatado otro del mismo color y estampa, ambos recién salidos del baño, pues aun escurrían agua o sudor, y el último tenía la cola hecha un nudo. El mulato había cabalgado en el primero desde la caballeriza al baño, cerca del Muelle de Luz, porque todavía llevaba el sudadero, a falta de

silla.

--Pero aquí está Aponte, agregó don Cándido viéndole asomar. ¡Aponte!

--No hay necesidad de que preguntes a los criados interpuso doña Rosa.

--Quiero que oigas una de las recientes gracias de tu hijo, insistió el marido. ¿A qué hora trajiste anoche (_hablando con Aponte_) a tu amo?

--A las dos de la _madrugá_, contestó Aponte.

--¿Dónde pasó tu amo la noche? añadió don Cándido.

--Es inútil que lo diga, interrumpió la señora. Aponte, lleva esos caballos al pesebre.

--¿Dónde pasó tu amo la noche? repitió don Cándido en voz de trueno, viendo al calesero dispuesto a obedecer la orden de su ama.

--Es dificultoso que yo le diga a su merced mi amo, dónde pasó la noche mi amo el niño Leonardito.

--¡Qué! ¿Cómo se entiende?

--Le digo a su merced, mi amo, que es muy dificultoso, apresuróse Aponte a explicar, notando que don Cándido montaba en cólera; porque primeramente yo llevé el niño Leonardito a Santa _Catarina, dispués_ lo llevé al muelle de Luz, _dispués_ lo estuve esperando en el muelle de Luz hasta las doce de la noche, _dispués_ lo llevé otra vuelta a Santa _Catarina, dispués_...

--¡Basta! dijo doña Rosa enojada. Quedo enterada.

Aponte se retiró con los caballos, pasando por el comedor y el patio en dirección de la caballeriza, y don Cándido, volviéndose para su mujer, le dijo:

--¿Qué te-a-ele-tal? ¿No te parece reciente la de anoche? Yo no sabía nada, sospechaba únicamente, porque conozco a mi hijo mejor que tú, y ya has oído que se ha estado en Regla hasta las doce de la noche. Tal vez no fue solo. ¿Quiéres oír ahora con quiénes y cómo pasó la mitad del tiempo en Regla? ¿No lo adivinas? ¿No lo sospechas?

--Suponiendo que lo adivinase, que lo palpase, observó doña Rosa con ligero desdén, ¿qué aprovecharía? ¿Dejaría yo por eso de quererlo como lo quiero?

--Pero si no se trata de quererle ni desquererle, Rosa; saltó impaciente don Cándido. Se trata de poner remedio a sus faltas, que ya rayan en lo serio.

--Sus faltas, si las comete, no pasan de calaveradas propias de la juventud.

--Es que las calaveradas, cuando son repetidas y no se les pone coto a tiempo, suelen parar en cosas graves que dan mucho que llorar y que sentir.

--Pues tus calaveradas no te trajeron, que yo sepa, serios ni graves resultados, y eso que las suyas, comparadas con las tuyas, son meros pasatiempos juveniles; dijo doña Rosario con refinado sarcasmo.

--Señora, repuso don Cándido irritado, por más que hiciese esfuerzo visible por ocultarlo: sean cuales fueren las locuras que yo haya podido cometer en mi juventud, ellas no autorizan a Leonardo para que lleve la vida que lleva con... aprobación y aplauso de Vd.

--¡Mi aprobación! ¡mi aplauso! Esa sí que está buena. Nadie mejor que tú es testigo de que, lejos de aprobar y aplaudir las locuras de Leonardito, siempre le estoy aconsejando y aún reprendiendo.

--¡Ya! Por un lado le aconsejas y le reprendes, y por otro le das quitrín y calesero y caballos y media onza de oro todas las tardes para que se divierta, triunfe y corra la tuna con sus amigos. No apruebas ni aplaudes sus locuras, pero le facilitas el modo y medios de cometerlas.

--Eso es, yo facilito el modo y medio cómo se pierda el muchacho. Tú no, tú eres un santo. ¡Oh! Sí, tu vida ha sido ejemplar.

--No sé a qué conduce tan amarga sátira.

--Conduce a que eres muy duro con él, y a que estaría buena tu aspereza si fueses intachable, si no hubieses pecado...

--¿Me tiene él en tan buen concepto como el que la merezco a Vd. señora? ¿Sabe que yo haya pecado?

--Tal vez lo sepa.

--Si Vd. no se lo ha contado...

--No hay necesidad de que yo le enseñe cosas malas. Sería madre desnaturalizada si tal hiciera. Pero él no es ningún tonto, y luego fue demasiado público, escandaloso lo de María de Regla.

--No sería mucho que haya llegado a sus oídos y le provoque a imitarte. El mal ejemplo...

--Basta, señora, dijo don Cándido más desazonado que irritado. Creía, tenía razón para esperar que Vd. hubiese dado eso al olvido.

--Mala creencia, porque hay cosas que no es posible olvidarlas jamás.

--Ya lo veo. Lo que quiere decir eso es, que me he engañado; quiere decir que las mujeres, algunas mujeres, no olvidan ni perdonan ciertas faltas de los hombres. Pero, Rosa, agregó cambiando de tono, nosotros vamos fuera del carril y eso no está bien. La verdad es que si yo soy muy duro, como dices, con Leonardo, tú eres muy débil, y no sé yo qué será peor. El es un loco, voluntarioso y terco, necesita freno más que el pan que come. Advierto, sin embargo, con dolor, que, por pensar en mi dureza, le llevas sin querer, por supuesto, como por la mano a su pronta perdición. De veras, Rosa, tiempo es ya de que sus locuras y sus debilidades cesen; tiempo es ya de tomar una determinación que le libre a él de un presidio y a nosotros de llanto y de infamia eternos.

--¿Y qué remedio adoptar, Cándido? Ya es tarde, ya él es un hombrecito.

--¿Qué remedio? Varios. En los buques de guerra de S. M. hasta a los hombronazos se les mete en cintura. Pensando estaba que no le vendría mal oler a brea por corto tiempo. Apuradamente mi amigo Acha, comandante de La Sabina, está empeñado en enseñarle la maniobra. Ayer nada menos me dijo que me resolviera y se lo entregara, seguro de que le pondría más derecho que un mastelero de gavia. Sí, ésa fue la expresión de que hizo uso. De todos modos, estoy resuelto a poner freno a las demasías de ese mozo.

Conmoviose doña Rosa al oír las últimas palabras de su marido, mucho más al notar el tono de firme resolución con que las emitió; y parte para ocultar las lágrimas que le rebosaban en los ojos, parte por variar el objeto de una conversación que le hería en lo más vivo del alma, se levantó otra vez y se dirigió al patio. En aquel momento mismo bajaba Leonardo la escalera, vestido como para salir a la calle; y ella, que sintió sus pasos, retrocedió al sitio que acababa de dejar al lado de su marido, y en tono de humilde súplica, con voz temblosa por la emoción, le dijo:

--Por el amor de ese mismo hijo, Gamboa, no le digas nada ahora. Tu severidad le rebela y me mata a mí.

--¡Rosa! murmuró don Cándido echándole una mirada de reconvención. Tú le pierdes.

--¡Prudencia, Cándido! replicó doña Rosa, respirando más libremente; porque comprendió que su esposo estaba inclinado por entonces a ejercer aquella virtud. Advierte que ya es un hombre y que le tratas como si fuera un niño.

--¡Rosa! repitió don Cándido con otra mirada de reconvención ¿Hasta cuándo?

--Será ésta la última vez que interceda por él, se apresuró a decir doña Rosa. Te lo prometo.

En esto acababa de bajar la escalera el joven Gamboa y se encaminó derecho a su madre, la cual le salió al encuentro como para mejor protegerle del enojo de su padre. Pero éste, silencioso y cabizbajo, ya penetraba en el escritorio y no vio o se hizo que no vio al hijo besar a la madre en la frente, ni la seña con que ella le indicó que debía saludar también a su padre.

Leonardo no dijo palabra, ni hizo ademán de cumplir con la indicación. Sólo se sonrió, levantó los hombros y se encaminó a la calle, llevando debajo del brazo izquierdo un libro empastado a la española, con los cantos rojos, y en la mano derecha una caña de Indias cuyo puño de oro figuraba una corona.

CAPÍTULO VIII

¡Para hacer bien por el alma _Del que van a ajusticiar!_

ESPRONCEDA

El reo de muerte

Tiró el estudiante en dirección de la Plaza Vieja por la calle de San Ignacio. En la esquina de la de Sol tropezó con otros dos estudiantes poco más o menos de su edad, que en toda apariencia esperaban su llegada. El uno de ellos no es desconocido para el lector, pues le ha visto en la _cuna_ de la calle de San José. Nos referimos a Diego Meneses. Era el otro de figura menos galana y esbelta, agregando a su baja estatura un cuello muy corto y hombros bastante levantados, entre los cuales llevaba como enterrada una cabeza redonda y chica. Había cierta confusión en su frente más angosta y levantada; los ojos tenía pequeños y penetrantes, la nariz algo arremangada, la barba aguda y la boca fresca y húmeda, por cierto la más expresiva de sus menudas facciones; el cabello crespo y así en su semblante como en su cuerpo se descubría desde luego la gran malicia que animaba su travieso espíritu. Junto con una fuerte palmada en el hombro, Leonardo le dio el nombre de Pancho Solfa. Este, medio sonreído, medio mal humorado del golpe dijo:

--Cada animal tiene su lenguaje, y el tuyo, Leonardo, es a veces muy expresivo.

--Porque te quiero te aporreo, Pancho. ¿Quieres otra caricia?

--Basta, chico. Y se desvió, haciendo un movimiento con la mano izquierda.

--¿Qué hora es? preguntó Leonardo. Recuerdo que no le di cuerda anoche a mi reloj y se ha parado.

--Las siete acaban de dar en el reloj del Espíritu Santo, respondió Diego. Nos marchábamos sin ti, creyendo que se te habían pegado las sábanas.

--Por poco no me levanto en todo el día. Me acosté tarde y mi padre me hizo llamar al amanecer. Él, como se acuesta con las gallinas, madruga siempre. ¿No les parece a ustedes que hay tiempo de dar una vueltecita por la Loma del Ángel?

--Soy de opinión que no, dijo Pancho. A menos que tú, cual otro Josué, tengas la virtud de parar el sol.

--Te pereces por una cita, Pancho, venga o no venga a pelo. ¿Pues no sabes que el sol no camina desde que Josué le mandó parar su carrera? Si hubieses estudiado astronomía sabrías eso.

--Di, más bien, que si hubiera estudiado historia sagrada, dijo Meneses.

--El cuento es, observó Pancho, que sin estudiar a fondo una cosa y otra, sé que el caso participa de ambas y no son ustedes los que me corrigen la plana.

--A todas éstas, caballeros ¿qué lección tenemos hoy? No concurrí a la clase el viernes, ni he abierto el libro en todo este tiempo.

--Govantes señaló para hoy el título tercero, que trata del derecho de las personas, respondió Diego. Abre el libro y verás.

--Pues no he saludado esa materia siquiera, agregó Leonardo. Sólo sé que según el derecho patrio, hay personas y hay cosas; que muchas de éstas, aunque hablan y piensan, no tienen los mismos derechos que aquéllas. Por ejemplo, Pancho, ya que te gustan los símiles, tú a los ojos del Derecho no eres persona, sino cosa.

--No veo la similitud, porque no soy esclavo, que es a quien considera cosa el derecho romano.

--Ya. No eres esclavo, pero alguno de tus progenitores lo fue sin duda y tanto vale. Tu pelo al menos es sospechoso.

--Dichoso tú que le tienes flechudo como los indios. Si vamos a examinar, sin embargo, nuestros árboles genealógicos respectivos, hallaremos que aquéllos que pasan por ingenuos entre nosotros, son cuando menos libertinos.[15]

--Resuellas por la herida, compadre. Vamos, que no es ningún pecado amarrar la mula tras de la puerta. Mi padre es español y no tiene mula; mi madre sí es criolla y no respondo que sea de sangre pura.

--Es que tu padre por ser español, no está exento de la sospecha de tener sangre mezclada, pues supongo que es andaluz, y de Sevilla vinieron a América los primeros esclavos negros. Tampoco los árabes, que dominaron en Andalucía más que en otras partes de España, fueron de raza pura caucásica, sino africana. Por otra parte, era común ahí, entonces, la unión de blancos y negros, según el testimonio de Cervantes y de otros escritores contemporáneos.

--Ese rasguito histórico, don Pancho, vale un Potosí. Se conoce que la cuestión de razas te ha costado algunos quebraderos de cabeza. No paro yo en eso la atención, ni creo que hace bulto ni peso la sangre mezclada. Lo que puedo decir es que, no sé si porque tengo algo de mulato me gustan un puñado las mulatas. Lo confieso sin empacho.

--La cabra siempre tira al monte.

--El refrán no viene al caso; mas si lo dices para afirmar que no te gusta la _canela_, peor para ti, Pancho, porque eso quiere decir que te gusta el _carbón_, género mucho más inferior.

En este punto de su conversación iban, cuando entraron por los portales de la Plaza Vieja llamados del Rosario. Estos los forman unas cuatro o cinco casas, pertenecientes a familias nobles o ricas de La Habana, con anchos balcones, apoyados en altos arcos de piedra, cuyas luces cubren durante el día unas cortinas de cañamazo, a manera de velas mayores de barcos. El piso superior de esas casas lo ocupan los dueños o inquilinos, que viven de sus rentas; pero en los bajos, salones en general oscuros y poco ventilados, tienen sus tiendas unos mercaderes al por menor, que llaman baratilleros, quinquilleros propiamente dichos, los cuales, en absoluto, son españoles, por lo común montañeses. Dentro guardan el acopio de géneros y baratijas, y al frente, bajo los arcos de piedra, exponen lo que se entiende por quincalla en unas vidrieras o muestrarios portátiles, que descansan sobre una especie de tijeras. Por la mañana temprano los exponen y por la noche los guardan.

Poco después de las siete de la mañana se principia generalmente la primera de las operaciones aquí mencionadas. Los mercaderes, de dos en dos, sacan las vidrieras, sujetando uno por una cabeza, otro por la otra, como si fueran ataúdes o que pesaran mucho para un solo hombre.

Algunos estaban ya expuestos, y los vendedores se paseaban por delante de ellos en mangas de camisa, a pesar del airecillo de la mañana, cuando entraron en los portales nuestros tres estudiantes.

Llevaban la delantera Leonardo y Diego, riendo y charlando, sin hacer caso de los mozos españoles que iban y venían, afanados en la obra de exponer sus mercancías a tiempo. Detrás, y a paso mesurado, inclinada la cabeza y taciturno, los seguía su condiscípulo Pancho, y ya por esto, ya porque les chocase su facha, la verdad es que el primer buhonero con quien tropezó le echó mano por un brazo y le dijo: ¡Hola, rubio! ¿no quieres comprar un par de navajas de primera? Se desprendió de éste con un esguince y le cogió otro para decirle: Acá, primo, vendo gafas excelentes. Adelante se le interpuso un tercero para ofrecerle tirantes elásticos; un cuarto para meterle por los ojos cortaplumas vizcaínos, superiores a los ingleses. Rodando de uno para otro, ora sonriéndose, ora haciendo un gesto de enfado, el ya molesto estudiante logró adelantar algunos pasos. Al fin, rodeado por varios baratilleros más dispuestos a la burla que a encarecer sus baratijas, se quedó parado y cruzó los brazos. Por fortuna en aquel momento le echaron de menos sus compañeros, volvieron la cara y notaron el cerco que le habían formado. Ignorando la causa, Leonardo, que era intrépido, retrocedió a la carrera, penetró por fuerza por el corrillo y sacó a su amigo del apuro. Mas así que se informó por él mismo de lo que había pasado, rió de ganas y le dijo: Te tomaron por montuno, Pancho. Tú también tienes una figura...

--Mi figura no tiene nada que ver con el asunto, le interrumpió Pancho de mal talante; es que estos españoles tienen más de judíos que de caballeros.

Siguiendo la calle de San Ignacio nuestros estudiantes, a poco andar desembocaron en la Plazuela de la Catedral. Cuando llegaban a los portales de la casa conocida por de Filomeno, les llamó la atención un grupo numeroso y compacto de pueblo que entraba en la misma por el lado opuesto, es decir, por la calle de Mercaderes y el Boquete. La vanguardia, compuesta en su mayor parte de gente de color, hombres, mujeres y muchachos sucios, harapientos y descalzos, ya marchaba, ya hacía alto, y de cuando en cuando volvía atrás la cabeza, como por resorte. Entre dos filas de soldados equipados a la ligera, pues su uniforme consistía de chaqueta de paño azul, pantalón blanco, canana atada al cinto por delante, sombrero redondo y carabina corta, que portaban por los tercios, iban hasta doce mulatos y negros vestidos en traje talar de sarga negra, con caperuza de muselina blanca, cuya punta larga flotaba por detrás de la cabeza, a guisa de gallardete; y cada cual llevaba en la mano derecha una cruz negra de brazo corto y árbol largo. Cuatro de esos lúgubres hombres conducían al hombro, en silla de mano, a una al parecer criatura humana,

cuya cabeza y cuerpo desaparecían bajo los pliegues de un paño negro (manto de estameña), cayendo a plomo por fuera de todo el aparato.

A un lado de este ser misterioso venía un sacerdote con sotana negra de seda, bonete en la cabeza y un crucifijo en ambas manos; al otro un negro bastante joven, robusto y ágil. Este vestía pantalón blanco, sombrero redondo y chaqueta de paño negro, en cuya espalda se le descubría una como escalera bordada de seda amarilla. Eso indicaba su oficio, y era nada menos que el verdugo. Andaba a paso medido y no levantaba los ojos del suelo. Detrás venía un hombre blanco vestido de calzón corto, medias de seda, chupa de paño y sombrero de tres picos, todos de color negro. Este era el escribano. Inmediato a él marchaba un militar de alta graduación indicada por los tres entorchados de la casaca y el sombrero de tres picos galoneado de oro, con pluma blanca de avestruz. Cerraban el cortejo otros negros y mulatos en el traje negro talar y caperuza blanca, ya descrito, y más pueblo, todos moviéndose en solemne y silenciosa procesión, pues no se oía otro ruido que los pasos acompasados de la tropa y la voz gangosa del sacerdote recitando las oraciones de los moribundos.

Por esta rápida descripción advertirá el lector habanero que se trataba de un reo de muerte que conducían al patíbulo, acompañándole los hermanos de la Caridad y de la Fe, institución religiosa compuesta exclusivamente de gente de color que se ocupaba en asistir a los enfermos y moribundos y en enterrar a los muertos, principalmente los cadáveres de los ajusticiados. Es bien sabido que la justicia española lleva su saña hasta las puertas del sepulcro, y he ahí la necesidad de la institución religiosa dicha, que se encarga de recoger el cadáver del criminal y de darle sepultura, en vez de los parientes y amigos, privados de esos oficios por la ley o la costumbre.

La tropa que custodiaba al reo en tales circunstancias, en La Habana al menos, era un piquete de la célebre partida de Armona, especie de guardia civil, establecida por Vives, que desempeñaba el papel de la policía de otras partes: el militar de alta graduación, el mayor de plaza, a la sazón coronel Molina, después castellano del Morro, en cuyo empleo murió cargado con el odio de aquéllos a quienes había oprimido y explotado mientras desempeñó el primero de estos cargos: el individuo que conducían al suplicio de la manera referida no era hombre, sino mujer y blanca; la primera tal vez de su clase que ejecutaban en La Habana.

CAPÍTULO IX

...Esta es la justicia _Que facer el Rey ordena..._

EL DUQUE DE RIVAS

D. Alvaro de Luna.

Contarse merece, siquiera sea brevemente, la historia de la mujer cuyo delito se castigaba con la pena de muerte. Casada con un pobre campesino, vivía en los arrabales de la pequeña población del Mariel, no sabemos cuanto tiempo hacía, ni hace mucho al caso tampoco. Pero sin ser joven ni hermosa, contrajo ella relaciones ilícitas con un hombre soltero del mismo pueblo. Séase que el marido averiguara lo que pasaba y amenazara tomar venganza, séase que los amantes quisieran librarse de aquel estorbo, el hecho fue que entre los dos concertaron matarle. Y conseguido esto, que no cuesta gran trabajo matar a un hombre, trataron de ocultar las huellas del crimen descuartizando el cadáver y arrojando a un río inmediato los cuartos ensangrentados, cosidos en un saco. Tales fueron los hechos principales dilucidados en la causa.

Ahora bien, ¿qué papel desempeñó la mujer en el horrible drama? Eso no se puso en claro. En su defensa desplegó tan desinteresada como rara elocuencia el joven y brillante abogado Anacleto Bermúdez,[16] que acababa de llegar de España, en cuyos consejos se había recibido de abogado e hizo en esa causa su estreno como hábil criminalista. El hecho era atroz, sin embargo, y la criminalidad de la mujer quedó probada, pues si no había herido con su propia mano, había tomado parte principal en el asesinato y en la ocultación del cadáver. Se hizo, por tanto, necesaria su condenación a último suplicio, aunque éste fuese el de horca, pues que entonces sólo se aplicaba el del garrote a la gente noble, suceso todavía más raro en Cuba que el de ejecutar a una mujer blanca.

La pena de muerte en horca, en los dominios españoles era, si cabe, más terrible que la del garrote, introducida o generalizada algún tiempo después de aquel a que nos referimos ahora. El verdugo, así que ataba dos sogas al pescuezo del reo, le lanzaba desde lo alto de la escalera, se le montaba a horcajadas en los hombros, y con los calcañales le golpeaba el estómago para apresurar su fin; deslizándose por los pies del ajusticiado, cuyo cadáver, dentro de un traje talar, quedaba meciéndose al aire libre

por ocho horas, a dos varas del suelo. Semejante espectáculo no debía presentarse en La Habana con una mujer blanca, por vulgar que ella fuese u horrible su delito.

En tal situación, y cuando hubo fallado el recurso de una supuesta preñez, Bermúdez solicitó y obtuvo como gracia especial que se la hiciera morir en garrote. Recordará el lector que siete u ocho años después de aquel a que nos contraemos ahora, se abolió el suplicio de horca en Cuba, y que hallándose la cárcel en el ángulo occidental del edificio conocido por la Casa de Gobierno, donde funcionaba asimismo el Ayuntamiento con todas sus dependencias, donde residía el Capitán General con las suyas, y existían las escribanías públicas, tenía el reo que recorrer una larga y angustiosa carrera antes que se pusiera fin a su vida en el campo de la Punta, inmediato a la mar. En efecto, por la calle de Mercaderes pasaba a la plazuela de la Catedral, torcía luego a la de San Ignacio, luego a la de Chacón, luego a la de Cuba, enseguida por la orilla de la muralla a pasar por debajo de la puerta abovedada y oscura llamada de la Punta, en que había cuerpo de guardia y daba salida a los cadáveres de la ciudad que llevaban a enterrar en el cementerio general.

Al salir por aquella puerta de plaza sitiada, podía distinguir el reo a lo lejos, frente al arrecibe de la costa contra la cual se rompían las olas del mar en menudos copos de brillante espuma, la máquina terrible, horca, garrote o banquillo en que había de tener fin su vida. Para los de ánimo apocado, la muerte con todos sus horrores era fuerza que se les presentase mucho antes de recibirla. Por suerte, la mujer de que ahora hablamos, desde el momento que la metieron en capilla perdió las fuerzas, y con ellas la conciencia de su horrible situación, siendo preciso, como se ha visto, que la condujeran al lugar del suplicio en silla de mano, sentarla a brazos en el banco del garrote, y, muerta ya, dislocarle la vértebra del cuello para sofocar en su pecho el último soplo de vida.

Cinco o seis años después de los sucesos que acaban de referirse, había cambiado de un todo el aspecto del campo de la Punta. Al yermo desolado y polvoroso que limitaba al oeste las primeras casas de madera de la barriada de San Lázaro, por el sur rimeros de tablas y alfardas importadas de los Estados Unidos del Norte de América, por el norte la mar y el castillo de la Punta, que asomaba sus enanas almenas detrás de apiñadas calderas férreas de Carrón para la elaboración del azúcar, sucedió un edificio de tres cuerpos, macizo, cuadrangular, erigido por el Capitán General don Miguel Tacón para cárcel pública, depósito presidial y cuartel de infantería.

El espacio descubierto que quedó al lado septentrional de ese edificio, todavía se obstruyó más con la construcción de unos cobertizos de madera para abrigo de una parte del presidio, empleada en picar piedra menuda a martillo, con destino al empedrado de las calles de la ciudad, según el sistema de McAdam. Pero, de todos modos, así quedó separada la prisión de la Casa de Gobierno; los presos pasaron a un edificio, aunque defectuoso en muchos respectos, fabricado expresamente para su desahogo y seguridad; hubo más conveniente separación de sexos y de delitos, y, en especial, se redujo a la tercera parte la _via crucis_ de los infelices reos de muerte, pues que apenas se cuentan doscientos pasos de la cárcel nueva a la orilla del arrecife, donde se efectuaban las ejecuciones capitales. De allí y de la Punta, a la parte opuesta, salieron a recibir la muerte del patriota y del héroe, años adelante, Montes de Oca y el joven Facciolo; el General López y el español Pintó; el bravo Estrampes; y, en nuestros días, Medina y León y los inocentes estudiantes de la Universidad de La Habana.

Incorporáronse los tres amigos a la lúgubre procesión, y la acompañaron por el costado de la Catedral hasta la puerta del Seminario, edificio que se extiende por el fondo de ella y da sobre el puerto. No habían abierto aún la entrada a las aulas, y el golpe como de doscientos estudiantes de derecho, filosofía y latín, la flor de la juventud cubana, se dilataba desde las gradas de piedra de la portería hasta el cuartel de San Telmo por un lado, y por el otro largo trecho hacia las bocacalles del Tejadillo y de San Ignacio, a causa de la estrechura de la vía. Por un movimiento espontáneo, la muchedumbre estudiantil se dividió en dos filas, dando paso franco por medio de la calle a la extraña comitiva, a la cual precedía un rumor sordo como de enjambre de abejas que busca donde posarse.

Hizo alto por un momento ante la puerta del Seminario, para dar tiempo a que cuatro hermanos de la Caridad y de la Fe relevasen a los que portaban la silla de mano desde la cárcel. La figura entre tanto, no cambió de posición ni hizo el menor movimiento; pero aunque los pliegues del manto negro ocultaban por completo sus facciones, su nombre y la historia de su crimen corrieron de boca en boca entre todos los estudiantes.

--Nadie diría que llevan ahí a una mujer, dijo un estudiante de latín.

--En efecto, más parece la estatua de una llorona que ser viviente, agregó otro.

--El remordimiento la agobia, dijo un tercero. Por eso dobla la cabeza sobre el pecho.

--Ya, exclamó un estudiante alto, de aspecto amulatado; el caso no es para menos. Ahora supongo yo que está horrorizada de su propio crimen.

--¿Pero está probado, como luz del mediodía, según reza la ley de Partida, preguntó nuestro conocido Pancho, que Panchita mató a su marido?

--Tan cierto es que lo mató que le van a dar garrote, volvió a observar el estudiante amulatado, con cierta sonrisa de desdén. Por más señas que después de muerto le hizo tasajo, y, cosiéndole en un saco de henequén, le arrojó al río para pasto de los peces.

Todo eso no constituía un argumento de la criminalidad de Panchita Tapia, y su tocayo iba a replicar cuando otro estudiante se interpuso diciendo en voz campanuda y acento español:

--Por un tris hace la chica con su consorte lo que dispone la ley de Partida que se haga con el parricida. Sólo faltó que el saco fuera de cuero, que tuviese pintadas llamas coloradas al exterior y que hubiese puesto en el interior un gallo, una víbora y un mono, animales que no conocen padre ni madre.

--La ley de las Doce Tablas,[17] se apresuró a decir Pancho alzando la voz y empinándose un tanto, contento de poder corregirle la plana al estudiante españolado--copiada _pedem litterae_ en las Partidas, que mandó compilar don Alfonso el Sabio--no habla de gallos, sino de perro, víbora y mono, y no porque estos animales conozcan o desconozcan padre o madre, sino simplemente para entregar el criminal a su furor. El Código Alfonsino considera parricida aún a la mujer que mata a su marido. La práctica hoy día es arrastrar al reo en un serón atado a la cola de un caballo hasta el pie del patíbulo. De suerte que, si no arrastran a Panchita Tapia, acusada de ese horrendo crimen, la razón es porque no lo consienten nuestras costumbres. He dicho.

Con esto Pancho se alejó prontamente de aquel grupo, cosa de no dar tiempo a una réplica de parte del estudiante españolado. Pero éste se contentó con decir, viéndole alejarse:

--Se conoce que el chico ha estudiado la lección.

En aquel mismo punto se abrieron las ponderosas hojas de cedro de la puerta del Seminario, más conocido entonces bajo el nombre de Colegio de San Carlos. El gran patio lo constituían cuatro corredores anchos, de columnas de piedra, formando un cuadrado. En el centro había una fuente, y por todo el derredor naranjos lozanos y frondosos. En el lado opuesto a la entrada principal, a la izquierda, había una escalera de piedra que conducía a los claustros de los profesores; a la derecha, una reja que separaba el corredor de un callejón oscuro y húmedo, por el cual se penetraba en un salón lateral, largo y sucio, separado de las aguas del puerto por un jardín o huerto de tapias elevadas. Hacia allá daban unas cuatro ventanillas altas por donde entraba la única luz que a medias alumbraba el salón. Contra la pared de enfrente, en el centro, se poyaba una mala cátedra, y a ambos lados de ella había muchos bancos de madera, rudos, fuertes y de elevado respaldo, colocados transversalmente.

Ahí se enseñaba filosofía; ahí enseñó por la primera vez esta ciencia a la juventud cubana el ilustre padre Félix Varela, quien para ello redactó un texto, apartándose enteramente del aristotélico, único seguido en Cuba hasta entonces, desde la fundación de la Universidad de La Habana, en 1714, en el Convento de Santo Domingo. Cuando después, en 1821, el padre Varela marchó de representante a las Cortes españolas, quedó sustituyéndole en la misma cátedra el más aventajado de sus discípulos, José Antonio Saco, y en los momentos de nuestra historia la desempeñaba el abogado Francisco Javier de la Cruz, por ausencia en el norte de América del propietario y expatriación de su virtuoso fundador.

En el ángulo de la izquierda había otro salón, con entrada directamente del corredor, donde enseñaba latín el padre Plumas. Luego, ocupando casi todo el otro lado, estaba el refectorio de los seminaristas y algunos profesores que residían permanentemente en el mismo edificio, y a la izquierda de la entrada principal estaba la ancha escalinata, dando acceso a los corredores del piso alto. Por ésta subían los estudiantes de derecho no seminaristas; mientras los de filosofía y latín entraban en los salones respectivos, ya mencionados, por las puertas al ras del patio.

En la mañana del día que vamos refiriendo, cuando los estudiantes de derecho ponían el pie en el primer escalón de la escalinata, se detuvieron en masa como reparasen en un grupo de tres sujetos en animada conversación cerca de allí, bajo el corredor. El que llevaba la palabra podía tener de 28 a 30 años de edad. Era de mediana estatura, de rostro blanco, con la color bastante viva, los ojos azules y rasgados, boca grande de labios gruesos y cabello castaño y lacio, aunque copioso. Había cierta reserva en su aspecto y vestía elegantemente, a la inglesa. El otro de los tres personajes se podía decir el reverso de la medalla del ya descrito, pues a un cuerpo rechoncho, cabeza grande, cuello corto, cabello crespo y muy negro: los ojos grandes y saltones, el labio inferior

belfo, dejando asomar dientes desiguales, anchos y mal puestos agregaba un color de tabaco de hoja que hacía dudar mucho de la pureza de su sangre. El tercero difería en diverso sentido de los dos mencionados, siendo más delgado que ellos, de más edad, de color pálido y aspecto muy amable y delicado. Este era el catedrático de filosofía, Francisco Javier de la Cruz; el anterior José Agustín Govantes, distinguido jurisconsulto que regentaba la cátedra de derecho patrio; y el primero, nombrado José Antonio Saco, recién llegado del Norte de América.

Precedía a éste la fama de sus escritos en el _Mensajero Semanal_, que publicaba en Nueva York, según decían, con la cooperación del muy amado padre Varela, principalmente los que versaban acerca de los sucesos y eminentes personajes de la revolución de México y de Colombia. Sobre todo, acababa de leerse en La Habana, produciendo un vivo entusiasmo, su polémica crítico-política con el encargado del Jardín Botánico, don Ramón de la Sagra, en defensa del poeta matancero[18] José María Heredia.

De resultas de eso, los jóvenes cubanos, que ya se daban a la política, comenzaron a alejarse de la clase de botánica que pretendía enseñar La Sagra, burlándose de él a medida que admiraban a Saco, a quien tenían por un insurgente decidido, con cuya opinión, cosa singular, concurría de plano el gobierno de la colonia.

Algunos de los estudiantes de derecho le reconoció, desde luego, por haber estudiado filosofía con él en 1823 y murmuró su nombre, lo que fue bastante para que se pararan e hicieran una exclamación más bien de curiosidad que de otra cosa. Esto hubo de atraer la atención de Govantes, el cual, por señas, ordenó a sus discípulos que salieran al salón de clase, adonde él los seguiría en breve.

Allá, en efecto, se encaminaron de tropel y entraron en el salón con gran algazara, hablando de Saco, de Heredia, de su célebre _Himno del desterrado_ y su no menos famosa oda _Al Niágara_, inclusa en la colección de sus poesías impresas en Toluca, México; de las lecciones de botánica de La Sagra, y de los héroes de la revolución de Colombia, aunque entonces imperfectamente conocida por la juventud habanera. Cuando, poco después, entró Govantes a paso tardo, con un libro debajo del brazo y el semblante risueño y animado, callaron de golpe los estudiantes y reinó allí completo silencio. Ascendió los tres o cuatro escalones de la cátedra, puso el libro en el ancho pretil y se sentó en la silla de paja, a mano constantemente.

No era el salón de la clase de derecho sólo el más amplio y extenso del seminario, sino también el mejor situado bajo todos conceptos. Tenía la entrada por un extremo, con cuatro ventanas anchas abiertas al corredor, y otras tantas al puerto de La Habana, que daban luz y aire, dejando ver los valuartes de la ciudadela de la Cabaña y parte de los del Morro. Apoyada en la pared medianera, entre las ventanas centrales, se elevaba la cátedra; en frente había dos órdenes de bancos paralelos y a entrambos lados otros muchos colocados transversalmente, de modo que el catedrático, desde su elevado asiento, dominaba toda la clase, no obstante su extensión. Probablemente habría allí congregados hasta 150 estudiantes de varios cursos.

Los que habían estudiado la lección y creían poder explicarla con alguna claridad, presentaban el cuerpo y seguían los movimientos del catedrático. Los que no habían abierto siquiera el libro de texto, por el contrario, no sabían donde esconder la cara ni cómo encogerse. En este caso se hallaba nuestro conocido Leonardo Gamboa, según él mismo lo había dicho a sus amigos Meneses y Pancho Solfa. Como por su talla y su carácter no le fuera fácil ocultarse, nunca se sentaba en frente de la cátedra, sino a los costados, y eso en los últimos bancos. El día que vamos narrando ocupó el asiento de la cabeza en el rincón, desalojando para ello a su amigo Solfa. Después de recorrer Govantes con la vista toda la clase, se dirigió a un estudiante de su derecha, a quien llamó por el apellido de Martiartu, el españolado antes dicho, y le ordenó explicara la lección, cosa que hizo con facilidad y aún lucidez. Luego ordenó hiciera lo mismo al amulatado, que llamó Mena; enseguida a otro de apellido Arredondo, el cual ocupaba puesto frente a frente de la cátedra. Cuando éste hubo concluido la explicación más o menos textual, Govantes volvió los ojos a su izquierda, los pasó por encima de Leonardo--el cual de golpe bajó la cabeza con achaque de recoger el pañuelo dejado caer de intento y los detuvo en el joven que se sentaba en la otra cabecera del mismo banco. No se sabía éste la lección y se quedó callado, por lo cual, tras breve rato, el amable profesor dijo:--el otro, con idéntico resultado. Saltó enseguida al cuarto, luego al sexto, que tampoco pudo responder, hasta que dejando tres o cuatro por medio, dijo a Gamboa:--Usted. Disimuló él cuanto pudo, hizo como que no había oído ni entendido, mas su amigo Pancho le llamó la atención, y entonces, medio mohino, medio corrido, se puso en pie y dijo:

--Maldito si he estudiado la lección.

Semejantes palabras produjeron una risa general. Gamboa, sin inmutarse, continuó:

--Mas, por lo que han dicho los señores que me han precedido en el uso de la palabra, saco en consecuencia que el asunto de que hoy se trata es de los más importantes, y creo que no se me olvidarán los puntos principales para el caso de su aplicación en nuestro foro.

Con esto se sentó de pronto, pegando al mismo tiempo un puntazo con el dedo índice al sufrido Pancho, por el costado, quien, ya de dolor, ya de las cosquillas que le produjo, no pudo menos de dar un salto en el asiento. Su discurso, lo mismo que su acción, por inesperados, causaron una explosión de risa de que, no obstante su seriedad, participó el mismo Govantes; quien, sin más dilación, comenzó la explicación del texto, que versaba, como ya dicho, sobre el derecho de las personas. Definió primero lo que se entendía por persona, según el derecho romano; luego por estado, que dijo se dividía en natural y civil, y que este último podía ser de tres maneras, a saber: de libertad, de naturaleza y de familia. Y entró de lleno en lo que podía denominarse historia de la esclavitud, pintándola no ciertamente en sus relaciones con la sociedad antigua o moderna, sino con el derecho romano, el de los godos y el patrio; porque si bien reinaba bastante libertad de enseñanza entonces en Cuba, las ideas abolicionistas no habían empezado a propagarse en ella.

Govantes en aquel día, como solía, estuvo inspirado, elocuente, dando muestras repetidas de su vasta erudición; en lo cual sin duda no había tenido pequeña parte su reciente entrevista con Saco, el traductor y anotador de las _Recitaciones de Heinecio_,[19] de texto en el Colegio San Carlos desde el año anterior de 1829. Al ponerse él en pie, pues había sonado la hora de las nueve, los estudiantes imitaron su ejemplo, prorrumpiendo en estrepitosos aplausos.

CAPÍTULO X

Engañó al mezquino _Mucha hermosura;_ _Faltó la ventura,_ _Sobró el desatino;_ _Errado el camino_ _No pudo volver_ _El que por amores_ _Se dejó prender._

D. HURTADO DE MENDOZA

Decíamos que los estudiantes de derecho patrio imitaron el ejemplo de su profesor poniéndose todos de pie. Pero aunque ganosos de salir del aula, según es de suponerse, permanecieron en sus puestos respectivos hasta que aquél descendió de la cátedra y se dirigió a la puerta de salida, cabeza baja y libro de texto debajo del brazo; entonces desfilaron en dos columnas tras él, en respetuoso silencio.

Los pocos que le acompañaron hasta la puerta de su celda, al fondo de la galería, fueron los seminaristas, pupilos del colegio, los cuales se distinguían por la ropa talar de estameña color pardo que vestían y que les daba la apariencia de monacillos; si bien es seguro que ninguno de ellos seguiría la carrera eclesiástica.

Los otros estudiantes no seminaristas, en el número ya dicho, luego que se alejó el catedrático, deshicieron la formación que traían, se precipitaron por la ancha escalera de piedra, en tropel bajaron al corredor y en el mismo desorden salieron a la calle, cual si los hubiera vomitado de un golpe la amplia portería del Colegio de San Carlos.

Ya en la calle, se derramaron por diferentes rumbos de la ciudad. Un grupo bastante numeroso tomó la vuelta del cuartel de San Telmo en que termina la calle de San Ignacio, torció la de Chacón, enseguida a la de Cuba, en fin, por la de Cuarteles se encaminó a la Loma del Ángel, que era su destino. En este grupo estudiantil, marchando con gran algazara, bien podía notar el curioso lector de anteriores páginas, a los tres constantes amigos: Gamboa, Meneses y Solfa. El primero de éstos sin duda capitaneaba a los demás, porque iba a la cabeza blandiendo en la mano derecha, a guisa de bastón de tambor mayor, la caña de Indias con puño de oro y regatón de plata. A medida que se acercaban a la iglesia del Santo Ángel Custodio, que, como sabe el lector habanero, se halla sentada en la planicie de la Peñapobre, se estrechaba más la vía a causa del declive y del golpe de gentes de ambos sexos, de todos colores y condiciones que llevaban la misma dirección.

Las mujeres blancas, al menos las que no se dirigían a la iglesia, iban en quitrines, los cuales entonces empezaban a generalizarse y a sustituir a las _volantes_ o calesas, que venían usándose desde fines del siglo pasado. Casi todos los ocupaban tres señoras sentadas en el único asiento o de testera de esos carruajes, las mayores a los lados, recostadas muellemente; la más joven en medio y erguida siempre, porque nuestros quitrines ni nuestras _volantes_ se construyen en realidad para tres personas, sino para dos. Aunque pasadas las nueve de la mañana, no calentaba demasiado el sol, a causa de lo adelantado de la estación; por eso casi todos los quitrines llevaban el fuelle caído, mostrando a toda su luz la preciosa carga de mujeres, jóvenes en su mayor parte, vestidas de blanco o colores claros, sin toca ni gorra, la trenza negra de sus cabellos sujeta con el peine de carey

llamado peineta de teja, y los hombros y brazos descubiertos.

Las mujeres blancas que iban a pie por aquellas calles pedregosas sin aceras, de seguro se dirigían a la iglesia; lo que podía advertirse por el traje negro y la mantilla de encaje. La gente de color de ambos sexos, en doble número que la blanca, iba toda a pie, parte también a la iglesia, parte paseando o vendiendo tortillas de maíz en tableros de cedro, que era uno de los motivos de la fiesta. Las que se hallaban arrimadas a una u otra pared de la calle, eran por lo común negras de África, pues las criollas desdeñaban la ocupación, sentadas en sillas enanas de cuero, con una mesita por delante y el burén en el brasero a un lado. En la tal losa de piedra oscura tendían con una cuchara de madera la porción de harina de maíz mojada que constituía una torta de tres o cuatro onzas de peso, y cuando estaba doradita con el calor del burén, le esparcían por encima un poco de manteca de vacas, y así calientita y jugosa la ofrecían de venta al transeúnte a razón de medio de plata el par. Muchas señoritas no tenían a menos parar el carruaje y comparar las tortillas de San Rafael, según las denominaban, calientes todavía del indiano burén, pues por lo que parece, era como sabían mejor.

La ocasión de todo aquel bullicio y movimiento era la fiesta de San Rafael, que cae el 24 de octubre, cuya celebración se había principiado, según ya indicamos, nueve días antes. En cada uno de ellos se decía una misa rezada en las primeras horas de la mañana, misa mayor y sermón de diez a doce y salve a la hora de víspera. Durante la novena o circular se mantenía de manifiesto el Santísimo Sacramento, y con tal motivo la iglesia nunca se veía desocupada de los fieles que acudían de todas partes del barrio a ganar indulgencia plenaria.

Como hemos dicho anteriormente, la pequeña iglesia del Santo Ángel Custodio se halla asentada en la planicie estrecha de la Peñapobre, especie de arrecife de poca extensión, aunque bastante elevado respecto al plano general de la ciudad. Para subir a ella había, y hay ahora, dos escalinatas de piedra oscura y tosca, con repechos de lo mismo: una que arranca del fondo de la calle de los Cuarteles, la otra que desciende a la de Compostela, siendo ésta la más larga y pendiente.

En llegando a lo alto de la meseta, que también tiene repecho de piedra, se está en el piso del templo, cuya única nave, en los días de función, como de la que ahora se trata, se descubre toda entera--el altar mayor al fondo, retablo de madera de dos cuerpos--más allá de las dos puertas laterales, casi oculto tras el bosque de cirios blancos, candelabros dorados y plateados, macetas de flores artificiales y gran profusión de relumbrantes cartulinas. A izquierda y derecha se veían dos retablos de menos adornos, en el promedio de la puerta principal y las laterales, y en la media naranja otros dos retablos, en cada uno de los cuales se veneraba algún santo, por lo regular de madera de talla, encerrado en un nicho de cristal. El techo, en forma de caballete, dejaba al desnudo el maderamen de la armadura que estaba cubierta de tejas coloradas, y encima del arco toral, dentro del que había un pequeño coro, se levantaba el cuadrado campanario de piedra de tres cuerpos en disminución ascendente. Hacia el oeste, detrás del cuerpo de la iglesia, se hallaba la sacristía, la habitación del cura enseguida, y otra escalera de piedra menos espaciosa que las del frente, que daba salida a la calle de Egido, especie de callejón hondo, torcido y desigual que corre a lo largo de las paredes de las casas y los baluartes que circundaban la ciudad por la parte de tierra. El patio, por el frente, tiene un malecón de mampostería, al modo de muro de azotea. Pues en ese malecón, en la mañana del día que vamos refiriendo, el segundo o tercero de la novena de San Rafael, varios negros carpinteros se entretenían en levantar con tablas de pino, pintadas de color de cantos de piedra, algo que se asemejaba a las almenas de un castillejo, habiendo ya plantado el asta bandera y casi concluido la obra principal.

Los estudiantes se habían apoderado de todo el repecho de las escalinatas y mesetas; Leonardo Gamboa en lo más alto, con su caña al hombro dirigiendo la maniobra, y no subía por éstas persona alguna, ni pasaba por la calle mujer especialmente, en carruaje o a pie, sin que tuvieran ellos algo que decirle y aún hacerle. El más conspicuo por su voz, por el puesto que ocupaba y por su aventajada talla era Gamboa, prodigando, sin cesar dichos y requiebros, sobre todo a las muchachas bonitas, con sobra de galantería y lastimosa falta de buena crianza. Ellas, sin embargo, ya por el hábito de oírlos desde la cuna, ya porque siempre halaga la celebración, no se daban por ofendidas, antes éstas se sonreían; aquéllas, con el abanico entreabierto, hacían un saludo gracioso a los conocidos o amigos, y no faltaban quienes correspondían a una pulla, con otra pulla, por cierto no de la mejor ley.

Había Leonardo arrebatado un pedazo de tortilla a uno de sus compañeros, y, teniéndole en la mano izquierda, lo brindaba a la joven que mejor le parecía, sin ánimo de dársela a ninguna, ni probarlo él, hasta que, de tres que iban en un quitrín, creyó reconocer la que ocupaba el lado opuesto; por cuya razón, en vez de hacerle el mismo ofrecimiento que a las demás, bajó la mano de pronto y trató de ocultarse tras el repecho de la meseta. La joven le había visto, y reconocido desde luego; sólo que, lejos de sonreírse, como es natural cuando se divisa a un amigo entre multitud de gentes extrañas, se puso más seria y pálida de lo que era, aunque mientras pudo estuvo mirando el sombrero y la frente del estudiante, asomados a pesar suyo por encima del borde

del muro de piedra. A tiempo de agacharse Gamboa, por un movimiento involuntario, le echó garra por un brazo a su amigo Meneses, y de modo le apretó, que éste no pudo menos de quejarse y preguntarle:

--¿Qué sucede, Leonardo? Por Dios bendito, suelta, que me desprendes el brazo.

--¿No la conociste? repuso Leonardo enderezándose poco a poco.

--¿A quién? ¿Qué dices?

--A la muchacha aquella del quitrín azul que va sentada a la parte opuesta de nosotros. Pasa ahora las Cinco esquinas. Todavía mira hacia acá. De seguro me ha reconocido. ¡Y yo que la hacía a muchas leguas de distancia! ¿Si creerá que todavía duran los aguinaldos de pascuas?

No sé aún de quién hablas.

--De Isabel Ilincheta, hombre. ¿No la conociste? Bien que te gustaba su hermana Rosa.

--Acabáramos. No la conocí, en efecto. Me pareció muy delgada y trigueña, allá era la más linda del partido.

--Todas las muchachas cuando van para tías se ponen delgadas y palidecen; y lo que es Isabel tiene razón para ambas cosas, pues cuenta mi edad y no abriga esperanzas de casarse pronto.

--Todavía te casas tú con ella el día menos pensado.

--¿Yo? Primero con una escopeta. La chica me gusta, no lo niego; pero más me gustaba allá, en medio de las flores y del aire embalsamado, a la sombra de los naranjos y de las palmas, en aquellas guardarrayas y jardines del cafetal de su padre. Y luego, es una bailadora... de primera. No menos que tu Rosa.

--Deja tranquila a Rosa y volvamos a tu Isabel. Estaba lo que se llama enamorada de ti. ¡La pobre! no te conoce, a lo que entiendo. Porque si vale decir verdad, eres el más inconstante y voluble de los hombres.

--Lo confieso, lo siento, mas no puedo remediarlo; me empeño por una muchacha mientras me dice que no; en cuanto me dice que sí, aunque sea más linda que María Santísima, se me caen a los pies las alas del corazón. Desde mayo no le escribo. ¿Qué pensará de mí? Y es que estas muchachas criadas en el campo son tan empalagosas con su querer... Se figuran que nosotros los mozos de La Habana somos todo cera y miel.

--¿Dónde parará ella?

--De seguro en casa de las Gámez, sus primas, detrás del Convento de las monjas Teresas.

--¿Esperas tropezar ahí con Rosa? Cuando no estaba en el quitrín con Isabel, es claro que no ha venido del campo. En cuanto a mí, te juro que no deseo y temo encontrarme cara a cara con Isabel. Estará ella hecha un moderno virago conmigo. No es mujer a quien se puede ofender impunemente.

--Razón tiene sobrada para estar enojada contigo, y en conciencia debes hacer por aplacar su enojo...

--Conciencia, conciencia, repitió Leonardo en tono desdeñoso. ¿Quién la tuvo jamás en tratándose de mujeres?

--¡Hombre! No digas blasfemias, que hijo eres de mujer.

Esta última observación la hizo Pancho Solfa, que había estado oyendo el breve diálogo de los dos amigos. Leonardo le miró de alto a bajo; no por desprecio, sino porque le sacaba al menos dos palmos de ventaja en estatura, y le dijo serio:

--Tú vas a parar en fraile capuchino. Luego, volviéndose con viveza para Meneses, añadió: Esa muchacha va a trastornar todos mis planes.

--No lo comprendo, dijo Meneses.

--Ya lo verás, repuso Leonardo pensativo. Caballeros, prosiguió hablando con los que le seguían desde el colegio; vámonos que ya esto fastidia.

Conocidamente Leonardo se había puesto de mal humor; algo le contrariaba el ánimo, y él no era hombre para sobrellevar estorbos. Pero apenas bajó a la calle por el lado de la de Compostela, y se vio una vez más en medio del bullicio popular, cuando volvió a su ser natural y a las vivezas de su carácter. En efecto al llegar a las Cinco esquinas, alcanzó un caballero de mediana edad que llevaba la misma dirección que los estudiantes. Leonardo le pasó los brazos por debajo de los suyos, le cubrió los ojos con ambas manos y le dijo, variando el acento:--Adivina quién soy.

En vano el desconocido trató de desasirse de las garras del estudiante, en la persuasión quizás de que el objeto de aquella violencia era robarle a la claridad del día y a la vista del pueblo. Pero Leonardo, luego que se le reunieron los compañeros y multitud de curiosos, soltó al hombre; y, con el sombrero en la mano y la cabeza inclinada, en señal de respeto y arrepentimiento, le dijo:--Pido a Vd. mil perdones, caballero. He sufrido una equivocación lamentable, pero Vd. tiene la culpa, porque se parece a mi tío Antonio como un huevo a otro huevo.

Los estudiantes soltaron la carcajada, por lo mismo que el caballero desconocido, comprendiendo la burla, estalló en expresiones de mal humor y de enojo contra la juventud malcriada e insolente de la época. Aquella ridícula escena pasó con más rapidez de lo que hemos acertado a pintarla, y, como para hacer contraste con ella, no bien pasó Leonardo la calle de Chacón, metió la punta de su caña de Indias en una rolliza tortilla de maíz que empezaba a dorarse al calor del burén de una negra más rolliza todavía y casi desnuda, arrimada a la pared de la esquina y rodeada de sus cachivaches, y la levantó en el aire. Hizo la tortillera una exclamación de angustia, y al enderezarse en el enano asiento, como era tan gorda y pesada, echó a rodar la mesita que tenía delante, donde había otras tortillas ya cocidas, con lo cual se aumentó su disgusto y se menudearon sus gritos. Todos rieron de la ocurrencia, Diego Meneses, quien, por uno de aquellos impulsos nobles y generosos de su buen corazón, sacó del bolsillo del chaleco unos cuantos reales, se los arrojó al pecho abultado de la negra, y acertó a depositárselos en el seno, no obstante el bajo escote del cuerpo de su escasísimo traje.

Si con esto se le pasó el enojo o cesaron sus lamentos, los estudiantes no se detuvieron a averiguarlo. Adelante, en la calle del Tejadillo corta la de Compostela en ángulo recto y luego se encuentra la del Empedrado, dicha así por haber sido la primera en que se empezó a ensayar el sistema de pavimento de las calles de La Habana con chinas rodadas y arroyo en medio. Por ella torció Leonardo a la derecha, y después de saludar a sus compañeros y decir a sus íntimos amigos Meneses y Solfa que podían, si querían, esperarlo en la plazoleta inmediata de Santa Catalina, donde se reuniría con ellos dentro de un cuarto de hora. Pero siendo ya la de almorzar, según la costumbre de Cuba, ellos prefirieron continuar a sus casas respectivas, y así se separaron de Leonardo hasta la noche en la feria del Santo Ángel Custodio.

Una vez solo el estudiante de derecho, cambió de paso y de aspecto repentinamente. Se puso serio y pensativo, mucho más de lo que cabía esperar en un carácter tan alegre y vivaz. Era que le preocupaba demasiado la aparición en La Habana y en la feria, de la joven de Alquízar a quien denominó Isabel Ilincheta. No obstante que lo negase, estaba enamorado de ella, y recelaba que su repentina llegada diese ocasión a revelaciones desagradables, sobre todo, al descubrimiento de sus veleidades, que, por pervertido que tuviese el sentimiento de la decencia, no podían hacerle honor ni dejar de sacarle los colores a la cara.

Varias veces se detuvo y pegó con la punta del bastón en las angostas losas de la acera, de cuyo lujo gozaba entonces, entre otras pocas, la calle famosa de lo Empedrado. Entre seguir y volverse fluctuaban grandemente, pues es bueno que se sepa que aquella no era la dirección de su casa. Dio, al fin, un golpe más recio que los demás con la caña, se la echó al hombro, como solía, y apresuró el paso, murmurando:--¡Qué diablos! A lo hecho, pecho. Todo esto, para confirmarse en la resolución tomada.

A poco andar se encontró en la esquina de la calle del Aguacate, y arrimado a las alterosas paredes del Convento de Santa Catalina, no hizo alto hasta cerca de la esquina en que la calle de O'Reilly corta la que llevaba a la sazón. Allí, dirigió una mirada oblicua a la ventanilla cuadrada y alta de una casucha en la acera opuesta, inmediata a la esquina. Dicha casucha la hemos descrito minuciosamente al final del capítulo II de esta verídica historia. Las hojas de la ventanilla se hallaban entornadas, y por entre los balaustres de cedro, se veían los pliegues de una cortinilla de muselina blanca, la cual se agitaba ligeramente entonces, ya a causa del airecillo de la mañana, ya de los movimientos de alguna persona que estuviese detrás. En la misma disposición, aunque inversa, se veía la desvencijada puerta: la media bala de hierro, de que hemos hablado en otra parte, impedía que se cerrase del todo.

Que había una persona apostada entre la hoja entornada de la ventanilla y la cortina blanca, no cabe duda ninguna, porque apenas Leonardo cruzó y puso la mano derecha en el hueco que dejaba en el marco un balaustre caído, cuando se asomó la cara más linda de mujer que quizás existía en aquel tiempo en La Habana. A su vista, aunque los ojos de la mulata despedían rayos, y

no de amor, sino de cólera, quedó completamente subyugado Leonardo, y se olvidó de Isabel, de los bailes de Alquízar y de los paseos por las guardarrayas de palmas y de naranjos en los cafetales de esa comarca. El lector de los primeros capítulos de esta historia tiene delante a Cecilia Valdés. Mantenía los ardientes labios apretados, la sangre quería brotarle de sus redondas mejillas, el abultado seno con dificultad se contenía dentro de las ligaduras del traje de yocó. Al fin fue ella la primera a hablar, diciendo más con el semblante que con la voz:

--¿Para qué ha venido?

--Acabo de salir de la clase, contestó Leonardo en tono humilde y bajo, mas recio.

Cecilia miró al soslayo para adentro, con la mano izquierda abierta hizo seña a Leonardo que bajara algo más la voz y añadió con vehemencia:

--Le han visto hace poco en la loma del Ángel.

--Puede ser, venía para acá.

--Pero se ha detenido mucho, la distancia no es tan grande. ¡Ah! ¡Maldita la mujer que ama!

--Nada se ha perdido, Cecilia. Heme aquí.

--Ya. ¿Mas quién sabe la causa de su demora? Tal vez una mujer...

--Mujer no, te lo juro.

--No me jure, porque entonces menos le creo. El caso es que Chepilla ya está de vuelta de Paula y Vd. se aparece ahora. Ya no hay tiempo de hablar. Hace rato que llegó. Rezaba y dormitaba, supongo que de cansada; y ya levanta la cabeza y pone el oído de ético. (Esto lo dijo mirando otra vez hacia dentro.) A Vd. no le interesa mi amistad, se conoce, y soy una boba que le espero. ¡Maldita sea la mujer que quiere como yo!

--Tu desesperación me asusta, alma mía. Siento el percance, será mañana.

--Es que Chepilla no va todos los días a Paula.

--Me levanté cerca de las siete. Tú sabes a la hora que vinimos de Regla, cerca de la una de la madrugada.

--Eso no impidió que yo me despertase al amanecer. Me acosté con el cuidado y Vd. no, esto hace mucha diferencia.

--Déjate de ese tono irónico que no te sienta ni un poquito. Demasiado sabes tú que te idolatro.

--Obras son amores y no buenas razones, y el hombre que no cumple con una cita...

--No me condenes de ligero. Ya te he dicho la causa de mi demora. Te protesto, sin embargo, que lo siento en el alma, y ya te probaré...

--Malhaya viene tarde. En vano me protesta de su cariño. La persona que quiere bien no engaña. Sí, Vd. me está engañando. Me tiene muy herida. Váyase. Truena Vd., no habla.

Leonardo le cogió la mano y se la llevó a los labios, sin que ella opusiera la menor resistencia, por donde conoció que había pasado el furor de la tormenta y que la muchacha admitiría su visita en primera oportunidad. Con esto él siguió camino y al entrar en la calle de O'Reilly, puso el pie izquierdo en el estribo de una volanta que bajaba de la puerta del Monserrate, zarandeándose dentro de dos larguísimas varas, pendientes de dos enormes ruedas y del lomo de un verdadero Rocinante, y quedó sentado en el cojín de vaqueta. El estremecimiento producido por la repentina entrada del joven, llamó la atención del calesero, quien incontinente volvió la cara a fin de ver la casta de pasajero que había conseguido sin solicitarlo ni esperarlo. Este, a tiempo de caer en el asiento, tronó en voz campanuda y de mando:--A casa.

--¿Y dónde vive el niño? naturalmente preguntó el azorado calesero.

--¡Bruto! ¿Que no lo sabes? Calle de San Ignacio esquina a Luz. Arrea.

--¡Ah! exclamó el calesero, y le pegó tan fuerte latigazo a la pobre bestia en los ijares, que se estremeció toda dentro de la armazón de huesos, doblándose casi en dos, bien del dolor, bien del peso del carruaje, del pasajero y del jinete.

Mientras el estudiante, sacudido como una pelota va camino de su casa en la desvencijada volante séannos permitidas algunas reflexiones. ¿A qué aspiraba Cecilia al cultivar relaciones amorosas con Leonardo Gamboa? El era un joven blanco, de familia rica, emparentado con las primeras de La Habana, que estudiaba para abogado y que, en caso de contraer matrimonio, no sería ciertamente con una muchacha de la clase baja, cuyo apellido sólo bastaba para indicar lo oscuro de su origen, y cuya sangre mezclada se descubría en su cabello ondeado y en el color bronceado de su rostro. Su belleza incomparable era, pues, una cualidad relativa, la única quizás con que contaba para triunfar sobre el corazón de los hombres; mas eso no constituía título abonado para salir ella de la esfera en que había nacido y elevarse a aquélla en que giraban los blancos de un país de esclavos. Tal vez otras menos lindas que ella y de sangre más mezclada, se rozaban en aquella época con lo más granado de la sociedad habanera, y aún llevaban títulos de nobleza; pero éstas o disimulaban su oscuro origen o habían nacido y se habían criado en la abundancia; y ya se sabe que el oro purifica la sangre más turbia y cubre los mayores defectos, así físicos como morales.

Pero estas reflexiones, por naturales que parezcan, estamos seguros que jamás ocuparon la mente de Cecilia. Amaba por un sentimiento espontáneo de su ardiente naturaleza y sólo veía en el joven blanco el amante tierno, superior por muchas cualidades a todos los de su clase, que podían aspirar a su corazón y a sus favores. A la sombra del blanco, por ilícita que fuese su unión, creía y esperaba Cecilia ascender siempre, salir de la humilde esfera en que había nacido, si no ella, sus hijos. Casada con un mulato, descendería en su propia estimación y en la de sus iguales: porque tales son las aberraciones de toda sociedad constituida como la cubana.

El calesero, entre tanto, bajó por la calle de O'Reilly al trote, tomó la de Cuba, cruzó diagonalmente la plazoleta de Santa Clara, torció luego a la calle de San Ignacio, y sin adelantarse un paso paró la carrera a la puerta de la casa que le habían designado. Aquélla era una prueba de que el negro calesero no merecía el dictado de bruto que le dio Leonardo al entrar en la volante. No había acabado de parar ésta, cuando el estudiante saltó a la acera y con la misma rapidez le lanzó una moneda al calesero. Recibiola él en el aire, se la llevó a los ojos, vio que era una peseta columnaria, se persignó con ella, picó espuelas y siguió viaje, diciendo:--Mucha salud, niño.

CAPÍTULO XI

De mi patria _bajo el desnublado cielo_ _no pude resolverme a ser esclavo,_ _ni consentir que todo en la natura_ _fuese noble y feliz menos el hombre._

JOSÉ MARÍA HEREDIA

A Emilia.

Creyó advertir Leonardo cuando saltó de la volante a la acera, que un militar, en completo uniforme, que caminaba de prisa hacia la Plaza Vieja, se había separado de la segunda ventana de su casa, y que contemporáneamente se había desprendido de un postigo de la misma el bien conocido rostro de una de sus hermanas. Apresuró el paso, y, en efecto, a través de otro postigo de la reja del zaguán, vio a su hermana mayor Antonia, en el acto de alzar la cortina para entrar en el primer aposento, por la puerta que daba a la sala. Le desazonó más de lo que puede imaginarse este inesperado descubrimiento, porque atando cabos se convenció, a no quedarle duda, de que mientras él galanteaba a la mulata allá por el barrio del Ángel, un capitán del ejército español, a la clara luz de una mañana de octubre, le galanteaba la hermana acá por el barrio de San Francisco. El recuerdo del momento placentero que había gozado y que aún se cernía en su mente cual visión brillante, quedó enturbiado, se desvaneció del todo ante la desagradable escena a la ventana de su casa.

De la generación que procuramos pintar ahora bajo el punto de vista político-moral, y de la que eran muestra genuina Leonardo Gamboa y sus compañeros de estudios, debemos repetir que alcanzaba nociones muy superficiales sobre la situación de su patria en el mundo de las ideas y de los principios. Para decirlo de una vez, su patriotismo era de carácter platónico, pues no se fundaba en el sentimiento del deber, ni en el conocimiento de los propios derechos como ciudadano y como hombre libre.

El sistema constitucional que había regido en Cuba, la primera vez de 1808 a 1813, la segunda de 1821 a 1823, nada le había enseñado a la generación de 1830. Para ella habían pasado como un sueño, como cosas del otro mundo o de otro país, la libertad de imprenta, la milicia nacional, el ejercicio frecuente del derecho del sufragio, las reuniones populares, las agitaciones y

propaganda de los más exaltados, los conciliábulos de las sociedades masónicas, las cátedras de Derecho y de Economía Política, las lecciones de Constitución del Padre Varela. Después de cada uno de esos dos breves períodos había pasado sobre Cuba la ola del despotismo metropolitano y borrado hasta las ideas y los principios sembrados con tanto afán por ilustres maestros y eminentes patriotas. Habían desaparecido los periódicos libres, los folletos y los pocos libros publicados en las dos épocas memorables, de los cuales, si existía uno que otro ejemplar, era en manos del bibliógrafo, que tenía doble empeño en ocultarle.

Sujeta a la previa censura, había enmudecido la prensa en toda la Isla desde 1824, no mereciendo ese nombre los poquísimos periódicos, que después se publicaban en una que otra población grande de la misma. El estado de sitio en que desde entonces quedó avasallado el país, no consentía la discusión de las cuestiones que más podían interesar al pueblo. Delito grave era tratar de política en público y en privado, hasta el uso de ciertos nombres de personas y aún de cosas estaba estrictamente prohibido. Los sucesos pasados, pues, así dentro como fuera de Cuba, los conatos de revolución en ésta, las resultas de la tremenda lucha por la libertad e independencia en el continente, todo esto quedó sepultado en el misterio y en el olvido para la generalidad de los cubanos. La historia, además, que todo recoge y guarda para la ocasión oportuna, aún no se había escrito.

No faltaban fuera quienes tratasen contemporáneamente de la política militante y se afanasen por hacer llegar a la patria la noticia de lo que pasaba en torno de ella y que podía enseñar al pueblo sus deberes y recordarle sus derechos. A ese fin, entre otros, el virtuoso Padre Varela publicó en Filadelfia _El Habanero_, de 1824 a 1826; pero el gobierno español le declaró papel subversivo y prohibió su entrada en Cuba. De suerte que puede asegurarse que muy pocos ejemplares circularon en ella. Más tarde, es decir, de 1828 a 1830, emprendió Saco también en el Norte de América la publicación de _El Mensajero Semanal_, periódico científico-político-literario, el cual, por iguales motivos que el anterior, tuvo escasa circulación en La Habana y no ejerció influencia apreciable en las ideas políticas. Lo único que en ese periódico hizo eco en la juventud habanera, según se ha indicado anteriormente, fue la polémica que su ilustre redactor sostuvo con el director del Jardín Botánico de La Habana, don Ramón de la Sagra, por la apasionada crítica que éste había hecho del tomo de poesías dado a luz en Toluca, en el año de 1828, por el insigne Tirteo[20] cubano, José María Heredia.

Mayor y más general influencia ejercieron en el ánimo de la juventud los patrióticos versos de ese célebre poeta. Sobre todos su oda _La Estrella de Cuba_, octubre de 1823; su epístola _A Emilia_, 1824; su soneto a don Tomás Boves. Su _Himno del Desterrado_, 1825, causó un vivo entusiasmo en La Habana; muchos lo aprendieron de memoria y no pocos lo repetían cuando quiera que se ofrecía la ocasión de hacerlo sin riesgo de la libertad personal. Pero ni aquellos periódicos, ni estos fogosos versos, magüer que rebosando en ideas libres y patrióticas, bastaban a inspirar aquel sentimiento de patria y libertad que a veces impele a los hombres hasta el propio sacrificio, que les pone la espada en la mano y los lanza a la conquista de sus derechos.

Quedaban, además, confusas, si ya no tristes, reminiscencias de las pasadas conjuraciones. De la del año 12 sólo sobrevivía el nombre de Aponte,[21] cabeza motín de ella, porque siempre que se ofrecía pintar a un individuo perverso o maldito, exclamaban las viejas:--¡Más malo que Aponte! De la del año 23 se sabía por tradición, que Lemus, el cabecilla, gemía en un presidio de España; que Peoli se había escapado del cuartel de Belén disfrazado de mujer; que Ferrety, el delator, gozaba de la privanza o favores del Gobierno; y que Armona, el aprehensor y perseguidor de los principales conjurados, continuaba siendo el jefe de la única gendarmería del Capitán General don Francisco Dionisio Vives.

Como rumor no más había corrido que el gobierno de Washington se había opuesto a la invasión de Cuba y Puerto Rico por las tropas de México y de Colombia, y que de esas resultas habían ahorcado allá por Puerto Príncipe en 1826, como emisarios de los insurgentes, a Sánchez y a Agüero.[22] Pero a tal punto habían llegado el olvido y la indiferencia, que en los mismos días a que nos referimos en las anteriores páginas, se seguía causa de infidencia a los cómplices de la conjuración llamada del _Aguila Negra_, muchos de los cuales estaban presos en el cuartel de Dragones, en el de las Milicias de color, en el castillo de la Punta y en otras partes, y no se echaban de ver síntomas de descontento, siquiera de interés en el pueblo.

También los conjurados cubanos de anteriores intentonas malogradas, o se hallaban aún lejos de la patria, o habían muerto en el destierro, o se les había entibiado el ardor patriótico y llevaban vida oscura y pacífica, consagrados a la reparación de los estragos que habían producido en su salud y su fortuna, el tiempo y las contradicciones de los hombres. No era, pues, ni podía ser ocupación de los que habían vuelto a la patria, la propaganda de las opiniones y proyectos políticos concebidos y acariciados durante los días de la exaltación y de la fe ciega en la libertad.

Por su parte, los criollos y peninsulares emigrados del continente, como para subsanar su conducta cobarde, egoísta o retrógrada en la guerra por la independencia, a su llegada a Cuba, sólo se ocuparon de falsear el carácter de los sucesos, calificando de

injustos, de perversos y de innobles los motivos de los sacrificios patrióticos de los revolucionarios, amenguando sus hazañas, convirtiendo en ferocidad hasta sus actos de justicia y de meras represalias. Para esos renegados el republicano o patriota era un insurgente, esto es, un sedicioso, enemigo de Dios y del rey; el corsario, un pirata o musulmán, como llamaba el pueblo a los argelinos que hasta fines del siglo pasado infestaban las costas del Mediterráneo.

El lector habanero, conocedor de la juventud de la época que procuramos describir, nos creerá fácilmente si le decimos que Gamboa no se cuidaba de la política, y por más que le ocurriese alguna vez que Cuba gemía esclava, no le pasaba por la mente siquiera entonces, que él o algún otro cubano, debía poner los medios para libertarla. Como criollo que empezaba a entrar en el roce de las gentes mayores y a estudiar jurisprudencia, sí se había formado idea de un estado mejor de sociedad y de un gobierno menos militar y opresivo para su patria. Sin embargo, aunque hijo de padre español, que, siendo rico y del comercio visitaban con preferencia paisanos suyos, ya sentía odio hacia éstos, mucho más hacia los militares, en cuyos hombros, a todas luces, descansaba la complicada fábrica colonial de Cuba. No cabía, por tanto, que le hiciera buena sangre el que un militar le soplase la hermana querida, antes fueron tan vivos los celos que experimentó, como profundo era el odio que le inspiraba el hombre en su doble carácter de soldado y de español.

En consecuencia, entró en su casa disgustado. La mesa estaba puesta para el almuerzo, y Leonardo, en vez de ir en busca de su madre, como solía, sin ver a nadie se quitó la casaca de paño y arrojó el libro de clase en un asilla, se quitó la casaca de paño y se puso una chupa de dril de rayitas de color. Por breve rato estuvo indeciso entre si se echaría en la cama, la cual con su frescura y mosquitero de rengue azul le convidaba a reposar, o si salía al balcón, donde aún había sombra, se apareció el negrito Tirso y dijo:--Niño, el almuerzo está en la mesa. Y se apresuró a bajar, encontrando ya sentados a su madre y a su padre. A las calladas tomó asiento al lado de la primera, quien desde lejos le echó una mirada amorosa, cual si extrañara y la tuviese desazonada el que él no se le presentara cuando entró de la calle. El segundo ni siquiera levantó la vista del plato en que comía huevos fritos con salsa de tomates, aunque a derechas no había visto al hijo desde el día anterior.

Enseguida fueron saliendo una tras otra de las alcobas las hermanas de Leonardo, preparadas para salir a la calle, y sentándose a la mesa, en silencio, como monjas en el refectorio. Cada cual ocupó en ella su puesto respectivo, es decir, doña Rosa con su hijo preferido a un lado, las tres hijas de esa señora al otro, y don Cándido y el mayordomo en las opuestas cabeceras de la mesa. No era casual, pues, sino constante y deliberada esta distribución; salvo que se alterase por la aparición de algún comensal con quien debía usarse cumplimiento. Indicaba claramente el carácter, los hábitos y predilecciones de la familia entre sí y sobre todo de los padres respecto de sus hijos.

Las preferencias de doña Rosa no podían equivocarse: todas en favor de Leonardo. Las de don Cándido, si algunas dejaba ver en ocasiones señaladas, hacían foco en su hija mayor Antonia.

Era él hombre de negocios, más bien que de sociedad. Con escasa o ninguna cultura, había venido todavía joven a Cuba de las serranías de Ronda, y hecho caudal a fuerza de industria y de economía, especialmente de la buena fortuna que le había soplado en la riesgosa trata de esclavos de la costa de África.

Su tráfico principal en La Habana, aquel que le sirvió de peldaño para subir a la cima de la riqueza, consistió en la negociación de maderas y ripia del Norte de América, teja colorada, ladrillos y cal del país, si bien en el día no se ocupaba de eso exclusiva ni personalmente, sonándole mejor en los oídos el título de hacendado que le daban sus amigos, por el ingenio de fabricar azúcar, _La Tinaja_, que poseía en la jurisdicción del Mariel, el cafetal _Las Mercedes_, en la Güira de Melena, y el potrero o dehesa de Hoyo Colorado.

Por hábito, antes que por índole, era reservado y frío en el trato de su familia, teniéndole de ella alejado la naturaleza de sus primitivas ocupaciones y el afán de acumular dinero que se apoderó de su espíritu, luego que contrajo matrimonio con una criolla rica, y de las más encopetadas familias de La Habana.

Al principio de su nueva vida no había sido ejemplar su conducta, ni digna de servir de guía a Leonardo, según nos lo ha dado a entender doña Rosa al final del VII capítulo. Por uno y otro motivo, quizás por su ignorancia supina, no se ocupaba de la educación de sus hijos, mucho menos de su moralidad. Ambos deberes corrían a cargo de aquella discreta señora que, si no poseía la ciencia, sí el instinto y el amor materno más acendrado, con los cuales bien se puede dar la mejor dirección a las arrebatadas pasiones de la juventud. Señaladamente en materia de educación, la caridad es la fuente y el espejo de todas las virtudes.

Como hombre ignorante y rudo, tenía, además, don Cándido, extraño modo de reprender a sus hijos. Ya se ha visto que cuando Leonardo se presentó en el comedor, ni siquiera le miró a la cara. Esta era señal infalible que continuaba enojado con él. En efecto, siempre que alguno de ellos le daba motivo de queja, cosa al parecer frecuente, le castigaba, o creía castigarle, negándole la palabra por días y aún meses seguidos. De suerte que por el padre casi nunca averiguaban los hijos la causa real de su enojo; la madre en estos casos, servía siempre de conducto o intermediario para mantener la paz y la concordia en el seno de la familia.

Antonia, el vivo retrato de doña Rosa en lo físico, contaba 22 años de edad. Leonardo pasaba de los 20, y fluctuaban entre los 18 y 17 sus hermanas menores, Carmen y Adela. Esta última podía pasar en cualquier parte por un modelo acabado de belleza. Poseía todas las condiciones que requerían los estatuarios griegos en la persona cuya estatua debía tallarse: buena cabeza, facciones regulares, formas simétricas, airoso porte, talla esbelta, frente alta y mirada de fuego. Con parecerse ella a la Venus[23] griega más bien que a una de las Parcas,[24] tenía más semejanza con don Cándido que con doña Rosa. Había entre la hija y el padre algo más de lo que se entiende generalmente por aire de familia: la misma expresión fisonómica, el mismo espíritu, llevaba impreso en el rostro el sello de su progenie.

Ocupaba Leonardo en la mesa sitio opuesto al de su hermana Adela, y siempre que el padre se hallaba delante, mientras duraba el almuerzo, o la comida, se cruzaban entre ellos miradas de inteligencia, se sonreían a menudo, sostenían, en suma, conversaciones cariñosas y fraternales con los ojos y los labios, sin proferir una palabra. Que ligaban a los hermanos fuertes lazos de simpatía, parecía del todo evidente. Había del uno para la otra lo que se llama ángel. A no ser hermanos carnales se habrían amado, como se amaron los amantes más célebres que ha conocido el mundo. En la mañana del día que vamos refiriendo no sucedió, sin embargo, lo de costumbre. Leonardo estaba enojado o triste, o extraña y honda preocupación le dominaba el ánimo; lo cierto es que en vano Adela, cual solía, buscó su mirada, puso el entrecejo y trató de quemarle la frente con los rayos de sus divinos ojos, a través de la mesa. Ni una vez se cruzaron sus miradas, no hubo para ella en aquel rostro repentinamente petrificado, un rasgo de cariño. La inocente niña llegó a afligirse. ¿Habíale dado motivo de enojo sin saberlo? ¿Qué tenía su hermano querido? ¿Por qué en las dos o tres veces que le sorprendió mirándola en sorda y muda contemplación, bajó él los ojos de repente o fingió perfecta abstracción e indiferencia? Quizás Leonardo no se explicaba claramente y Adela era muy joven para comprender que aquél hacía, sin quererlo, un estudio comparativo de la encantadora fisonomía de su hermana. ¿Qué pensamientos cruzaban entonces por su mente? Difícil es decirlo; lo único que puede asegurarse como cosa positiva es que había en la contemplación de Leonardo más embebecimiento que distracción mental, más deleite que fría meditación, cual si hubiese descubierto ahora en el semblante de su hermana algo en que antes no había reparado.

Duró el almuerzo como una hora, reinando todo ese tiempo en la mesa el mayor silencio, pues apenas se oía otro ruido que el de los cubiertos de plata, ni más voz que la del que pedía éste o aquel plato distante al negrito Tirso, que ya conocen nuestros Lectores, y a una negra joven y bien parecida, los cuales, con los brazos cruzados sobre el pecho cuando esperaban órdenes, estaban atentos a las exigencias del servicio. El primero, con todo eso, servía principalmente a los hombres, la segunda a las mujeres. Pero uno y otra, era de notarse, le adivinaban a don Cándido hasta los pensamientos, poniéndole delante el plato designado con un mero movimiento de los ojos, a cuyo efecto no apartaban de él los suyos Tirso ni la criada Dolores, mientras servían a los demás comensales. ¡Ay de ellos si esperaban la orden o equivocaban el plato con que deseaba reemplazar el saboreado! El castigo no se hacía esperar: le arrojaba a la cabeza lo primero que se le venía a las manos.

La abundancia de las viandas corría pareja con la variedad de los platos. Además de la carne de vaca y de puerco frita, guisada y estofada, había picadillo de ternera servido en una torta de casabe mojado, pollo asado relumbrante con la manteca y los ajos, huevos fritos casi anegados en una salsa de tomates, arroz cocido, plátano maduro también frito, en luengas y melosas tajadas, y ensalada de berros y de lechuga. Acabado el almuerzo, se presentó un tercer criado, en mangas de camisa, y que por el pringue de su ropa parecía el cocinero, con una cafetera de loza en cada mano y principió a llenar de café y de leche, primero la taza de don Cándido y sucesivamente la de doña Rosa, la de Leonardo, las de las hermanas de éste, acabando por la del Mayordomo, aunque no ocupaba el último lugar en una mesa donde hacía de cabeza el amo y de cola la hija mayor. El Mayordomo no era sino un criado blanco, y nadie mejor que los otros criados definían su posición en aquella casa.

Tomaba la familia el café con leche hirviendo cuando pasó por el comedor en dirección de la calle, nuestro conocido, el calesero Aponte. Aunque todavía en mangas de camisa, llevaba calzadas las altas botas de montar y las macizas espuelas de plata. Conducía del diestro dos caballos enjaezados, cuyas colas estaban cuidadosamente trenzadas y las puntas atadas por un cordón de estambre a una argolla en el fuste de la silla por detrás. Al entrar en el zaguán soltó Aponte la pareja, y sin más demora abrió de par en par la ancha puerta de la calle, suspendió en peso las varas del quitrín por las argollas plateadas que tenían atornilladas al extremo, y gritando:--¡Atrás!, le sacó rodando hasta el medio de la calle, le hizo girar, y le arrimó a la acera de su casa.

Enseguida volvió a tomar por la brida la misma caballería de antes, le pegó una fuerte palmada en el vientre con la mano izquierda, casi por fuerza la metió entre varas, y luego colgó éstas por las argollas a unos ganchos dobles de hierro que pendían de la silla, cubiertos por pequeños faldones de vaqueta negra. La otra caballería, la de monta, quedó atada al carruaje por dos fuertes tirantes de cuero, adheridos por sus gazas a un balancín.

Después del café sacó don Cándido la vejiga de los tabacos (cigarros) y metió en ella el brazo hasta el codo; tan honda era. A su vista, Tirso voló a la cocina en busca del braserillo de plata con la brasa del carbón vegetal. Antes que el amo mordiera el remate del cigarro, sin cuyo requisito no arde bien, ya el esclavo, con expresión humilde mezclada de temor, le acercaba la lumbre para que encendiera de su mano. Con la primera bocanada de humo azuloso y acre que sacó del cigarro, se puso en pie y, seguido del Mayordomo, se entró en el escritorio, tan callado como cuando salió de él, una hora antes, para sentarse a la mesa del almuerzo.

La desaparición del padre determinó por sí sola un cambio repentino y completo en el ánimo y conducta de la familia, sin excluir la madre. El corazón de los hijos quedó aliviado, por lo visto, del peso que lo había oprimido, siendo así que a todos ellos, como por concierto, se les alegró el semblante y se les desató la lengua. Leonardo especialmente llevó el entusiasmo al punto de atraer a sí a su madre con el brazo izquierdo para darle uno y otro beso en la mejilla y decirle:

--¿Y qué tiene? (indicando su padre). ¿Está _bravo_?

--Contigo; repuso concisamente su madre.

--¿Conmigo? Pues ya le mando trabajo.

A poco, sin embargo, se puso de nuevo serio porque, habiendo reparado en su hermana Antonia, que no mostraba tanta expansión como los demás, recordó el incidente en la ventana de la calle.

--Mamá, agregó con más seriedad, se me figura que a ti te pasan la mota y que no lo sientes.

--¿Por qué me dices eso, hijo mío? replicó doña Rosa en el tono de voz más blando imaginable.

--¿Se lo digo, Antonia? preguntó a su hermana con aire malicioso.

Antonia, en vez de contestar, se puso más seria e hizo ademán de levantarse de la mesa, con lo cual añadió Leonardo a la carrera:

--Peor para ti, Antonia, si te levantas y me dejas con la palabra en la boca. No diré nada a mamá; pero es porque tengo ya hecha mi resolución. Se acabaron las visitas de los militares en mi casa.

--Hablas como si fueras el amo, repuso Antonia con desdén.

--No soy el amo, es cierto, mas puedo romperle las patas a uno el día menos pensado, y tanto vale.

--Te expones a que te la rompan a ti.

--Eso lo veremos.

--Supón que en vez de militar español fuera un cadete el que nos visitase, ¿también te opondrías?

--¡Cadete! ¡Cadete! repitió Leonardo con marcado desprecio. Nadie habla de cadetes, que cual los oficiales de milicia son nada entre dos platos. Ya la moda de los cadetes pasó; los últimos quedaron enterrados en las playas de Tampico, a donde, por dicha, se los llevó Barradas. Los que de ellos han sobrevivido a la desastrosa campaña, de seguro le han perdido la afición a las armas. Gracias a Dios que nos vemos libres de su fatuidad.

--De suerte que tu tirria es contra los españoles, como si tu padre fuese habanero.

--Ese odio tuyo a los españoles, dijo doña Rosa, todavía ha de costarnos caro, Leonardo.

--Es que mi odio no es ciego, mamá, ni general contra los españoles, sino contra los militares. Ellos se creen los amos del país, nos tratan con desprecio a nosotros los paisanos, y porque usan charreteras y sable se figuran que se merecen y que lo pueden todo. Para meterse en cualquier parte, no esperan a que los conviden y una vez dentro se llevan las primeras muchachas y las más lindas. Esto es insufrible. Aunque si bien se mira, las muchachas son las que tienen la culpa. Parece que les deslumbra el

brillo de las charreteras.

--Respecto de mí, observó Carmen, la regla padece una excepción.

--Y respecto de mí, añadió Adela, sucede la misma cosa. Los militares, por decentes que sean, trascienden a cuartel.

--No hables así, niña, le dijo su madre, que hay militares muy dignos, y sin ir lejos, mi tío Lázaro de Sandoval, que fue coronel del Regimiento Fijo de La Habana, estuvo en el sitio de Pensacola y murió lleno de honores y de cicatrices.

--Pero no se habla de esos militares, mamá, saltó y dijo Leonardo. Se habla de los militares que vinieron de España para reconquistar a México, y que habiendo fracasado allá vuelven aquí para que nosotros paguemos el mal humor de la ignominiosa derrota. A estos militares son a los que ahora me refiero. No es lo peor que trasciendan a cuartel, como dice Adela, sino que son, como hombres, malditísimos maridos. Mientras no llegan a brigadier, viven en los cuarteles o en los castillos, donde tienen por casa pabellones; por criados, asistentes rudos y desvergonzados; por diversión las palizas y carreras de baqueta que les pegan a los soldados; por música, el tambor de diana. Casi nunca se fijan en ninguna parte, porque cuando menos lo esperan, tienen que salir destacados, ya para Trinidad, ahora para Puerto Príncipe, luego para Santiago de Cuba, después para Bayamo... Y si son casados, la mujer y los hijos y los penates, por supuesto, tienen que seguirlos de cuartel en cuartel, de castillo en castillo, de destacamento en destacamento cuando por motivos de economía no se queda ella con sus padres y él no se marcha con sus soldados. Como su objeto es encontrar mujer rica con quien casarse, poco se cuidan del carácter y de los antecedentes de las que al cabo toman por esposa, tarde que temprano, ellas les arañan la cara y ellos las arrastran por el pelo.

No pudo Antonia sufrir más: se levantó de la mesa y se fue a la sala, callada y muy molesta.

--Has zaherido a tu hermana sin motivo, le dijo doña Rosa. Ella no piensa en militar alguno, por mucho que alguno la celebre.

--No piensa en ellos, pero admite galanteos por la ventana, y he aquí lo que me irrita.

--Antonia no es de ésas, por fortuna, hijo mío.

--¿No?--¡Ay, mamá! Parece vas perdiendo la vista del entendimiento y de la cara... No quiero hablar, lo único que digo y repito es que el día menos pensado le rompo una pata a uno de esos soldados.

Enseguida se levantó y cual si nada hubiese ocurrido, o dicho que le desazonara, fue para el puesto que ocupaba su hermana Adela, la estrechó con ambos brazos por la cintura y le dio muchos besos.

--Quita, quita, dijo ella. ¿Pues no estabas enojado conmigo? Me lastimas con la barba.

--¿A dónde bueno, tan emperifollada? le preguntó Leonardo esquivando el asunto indicado por la hermana.

--Vamos a la tienda de Madama Pitaux, que ahora vive en la calle de La Habana número 153. Hace poco que ha llegado de París y, según dicen, ha traído mil curiosidades. De camino pensábamos dar una vuelta por la Loma del Ángel.

Para ir a la Loma ya es muy tarde. Pasa de las once. Y ahora que me acuerdo, ¿han visto Vds. el número IV de _La Moda o Recreo Semanal_?[25] Desde el sábado se repartió, y está muy interesante.

--¿Tú le tienes ahí? preguntó Carmen. Es extraño que no nos hayan enviado nuestro ejemplar, estando suscritas.

--¿En dónde se suscribieron ustedes?

--En la librería de _La Coba_, calle de la Muralla, que es el punto más cercano.

--Pues reclamen allá. El ejemplar que yo leí estaba en el mostrador de la botica de San Feliú, porque el mío me ha faltado también. No son nada exactos, que digamos, los repartidores.

--¿Has averiguado quién es la Matilde de que habla _La Moda_? preguntó Adela a su hermano. Porque Carmen cree que es una que todos nosotros conocemos.

--A mí se me figura, dijo Leonardo, que es un ente imaginario. Tal vez Madama Pitaux sepa algo.

--Pues a mí se me ha puesto, dijo Carmen, que la Matilde de _La Moda_ no es otra que Micaelita Junco. Sucede que ella es la más elegante de La Habana; que su hermano, un verdadero lechuguino, se llama Juanito; que tiene una abuela de nombre doña

Estefanía de Menocal--apellido semejante al de Moncada--que le dan en _La Moda_.

--Voy creyendo que tienes razón, dijo Adela. No puedo negar que el vestido y el peinado que llevaba anteayer en el Paseo Micaelita Junco son idénticos al figurín de _La Moda_ del sábado antes pasado. Por cierto que no me gustó el peinado a la Jirafa. La trenza es demasiado ancha y los bucles muy altos; luego, por detrás la cabeza luce desairada. Las mangas cortas, aglobadas, con sobremangas de blonda, sí me parecen bonitas y le sientan bien a la que tiene el brazo torneado, como Micaelita. Su hermano Juanito, que nos saludó junto a la fuente de Neptuno, ¿te acuerdas?, iba también a la última moda igual al figurín. Le sentaban los pantalones de Mahón sin pliegues, el chaleco blanco y la casaca de paño verde sin carteras. Esa es la moda inglesa, según dicen. ¿Reparaste en el sombrero? La copa tropezaba en las ramas de los árboles de la Alameda con ser Juanito Junco un chiquirritín.

--El corbatín es lo que no me peta, dijo Leonardo. Es tan alto que no deja juego al pescuezo. No los usaré jamás. No me gustan esos collares de perro. Tampoco me petan las casacas a _la dernier_;[26] parecen de zacatecas. Los angostos faldones bajan hasta las corvas y se me figura que con esa moda se ha querido imitar la cola de las golondrinas. Sobre que se ha empeñado Federico en vestirnos a la inglesa y nosotros estamos mejor hallados con las modas francesas. Uribe tiene más gracia, si no más hábil tijera.

--No saques a Uribe, que es un sastre mulato de la calle de la Muralla y no sabe jota de las modas de París ni de Londres, dijo Carmen con marcado desprecio.

--No piensa así la gente principal de La Habana, repuso Leonardo prontamente. Los Montalvo, los Romero, los Valdés Herrera de Guanajay, el Conde de la Reunión, Filomeno, el Marqués Morales, Peñalver, Fernandina... no se visten con otro sastre. Yo le prefiero a Federico. El, además, recibe los periódicos de modas de París por todos los paquetes[27] del Havre.

Tan entretenida conversación de los hermanos, la interrumpió el calesero presentándose con la _cuarta_ engarzada en la muñeca de la mano derecha y el sombrero redondo en la izquierda, para anunciar que el quitrín estaba listo a la puerta. Luego al punto las dos hermanas menores fueron en busca de la mayor y de sus características _mantas_ y juntas rodearon a la madre para pedirle sus órdenes. Esta señora les hizo el encargo de algunas compras en las tiendas de lencería, o de ropa, y luego se dirigieron ellas por el zaguán a la calle.

No ha de extrañar el lector forastero ver a tres señoritas de la clase que podemos llamar media, salir a las calles de La Habana sin dueña, padre, madre o hermano que las acompañase. Pero con tal que no fueran a pie ni a pagar visita de etiqueta, bien podían dos, mucho más tres jóvenes, recorrer toda la ciudad, hacer sus compras, picotear con los mozos españoles de las tiendas y en las noches de retreta en la Plaza de Armas o en la Alameda de Paula, recibir al estribo del carruaje el homenaje de sus amigos y la adoración de sus amantes. Eso sí, aún para hacer una visita en la vecindad de su casa y a pie, exigía la costumbre, que la cubana, cuando no había pariente de respeto, se acompañase siquiera de su mismo esclavo.

Al entrar Carmen en el quitrín, le dio la mano para subir un joven desconocido que acertó a pasar por allí, después a Adela y últimamente a Antonia, recibiendo de ellas, en pago de su galantería, una sonrisa de agradecimiento.

Así, la más joven y bella de las hermanas ocupó el asiento de en medio, el menos cómodo ciertamente, pero sin duda el más conspicuo y propio para desplegar la habanera sus gracias naturales a maravilla. Desde luego, montó el calesero el caballo de fuera de varas, el que por su suave paso, buena estampa y cola cuidadosamente trenzada, era al mismo tiempo el descanso y el orgullo del jinete; y partió a escape el carruaje en vuelta de la Plaza Vieja.

CAPÍTULO XII

Por sus juguetes se conoce el niño, y se conjetura cuales han de ser sus obras.

Parábolas de Salomón

Quedaron al fin solos doña Rosa Sandoval de Gamboa y su hijo Leonardo.

No había sacado éste el talento de su padre para los negocios. Tampoco anunciaba disposición ninguna para la carrera literaria a que le dedicaban, aunque solía hacer versos y escribir articulejos para el _Diario_ y otros periódicos. Su madre, sin embargo, quería que fuese abogado, doctor de la Universidad de La Habana, halagándola la esperanza de que podría por este camino, llegar a oidor de la Audiencia de Puerto Príncipe, y hasta a Teniente Gobernador, como llamaban entonces a los jueces letrados de nombramiento real. Creía ella con razón que, mediante el dinero y las relaciones de su marido en la Corte, bien podía

conseguirse para su primogénito cualquier gracia, honor o título, entre los muchos que, merced a aquellos estímulos, es uso conceder la Corona.

De comerciante, en concepto del padre, no había esperanza de que el mozo llegase a más que alcalde municipal, a consiliario o diputado del Tribunal de Comercio o Real Consulado, empleos de mala muerte, sin honores ni emolumentos. Por otra parte, don Cándido, en realidad, no hacía hincapié en que su hijo estudiase y siguiese ésta ni esotra carrera literaria. ¿Abogado? Ni pensarlo. Se aficionaría a los pleitos, y acabaría con un caudal y con el de sus clientes. Tampoco don Cándido conocía más letras que las del Catón,[28] lo que no le había impedido acumular una fortuna respetable.

Ahora, además, le había nacido el deseo de titular, y no le parecía bien que su hijo, al menos, trocase los libros o la vara del mercader, ni el bonete de doctor, por la corona del conde, aunque hubiese un Santovenia, que por aquellos días precisamente, había hecho el último de los trueques mencionados. No obstante su ignorancia, reconocía que Leonardo no haría raya como hombre de letras, ni como de negocios, y decía para sí o cuando trataba del asunto con su esposa:

--No debemos forjarnos ilusiones. El (su hijo) no dará nunca mucho de sí, por más que uno se afane y gaste dinero en sus estudios. Ahí no hay cabeza sino para enamorar y correr la tuna. Eso se conoce a tiro de ballesta. Pero ¿necesita él tampoco de grandes conocimientos para hacer papel en el mundo?

--¡Ca! No, señor. Fortuna, esto es, dinero te dé Dios, hijo, que el saber poco te vale; reza el proverbio castellano. Y dinero no ha de faltarle cuando yo muera. Luego si logro el título de Conde de Casa Gamboa, que pretendo en Madrid, reunirá el monis con la nobleza, dos adminículos éstos con que el más bruto puede figurar en primera línea, gozar fuero y echarse a roncar a pierna suelta, cierto y seguro de que no le atropellarán por deudas, antes todos le sacarán el sombrero, le traerán en palmitas y le bailarán el agua delante, lo mismo los chicos que los grandes, los hombres de copete que las mujeres bonitas. ¡Ah! ¡Qué tiempo se ha perdido! Si yo hubiese titulado diez años ha, otro gallo nos cantara.

En efecto, Leonardo descubría menos ambición que talento. Por sentado, la esperanza de ser algo por sus conocimientos, por sus estudios, o por su industria, jamás calentó su corazón. Antes confiado en que a la muerte de sus padres sería bastante rico, no hacía esfuerzo ninguno por saber, ni se apuraba por estudiar las lecciones de derecho, y se reía a carcajadas cuando, en son de broma, se decía entre la familia que él podía llegar a ser oidor o conde, o que su padre hacía construir en España, con el fin de titular, un árbol genealógico en que no había de verse ni una gota de sangre de judío ni de moro. Por otra parte, tan humildes eran a la sazón sus inclinaciones, como sus pasiones fuertes e ingobernables.

Gozar era, por aquel tiempo al menos, la suprema ley de su alma. Y es que su madre, porque le quería demasiado, cualquiera creería que, lejos de regir sus desapoderados impulsos, parecía complacerse en darles rienda suelta. ¿Qué necesidades podía experimentar un mozo de sus años y ocupaciones? Libros, trajes, caballos, carruajes, criados, dinero, todo le sobraba; ni el trabajo de pedir casi nunca tenía, porque desde la cuna se había acostumbrado a ver satisfechos sus deseos y aún caprichos, apenas indicados. Con todo eso, no pasaba día sin que le hiciera la madre algún regalo costoso, teniendo además la costumbre de ponerle todas las tardes en la faltriquera del chaleco media onza de oro, a veces una onza. Naturalmente, como entraba ese dinero, así salía, sin conciencia de su valor, y era lo malo que jamás pasaba por la mente del hijo pródigo, que debía guardar para mañana lo que no fuese necesario para los gastos de hoy. ¿Cómo derramaba el oro nuestro imberbe estudiante? Adivinarlo puede el discreto lector, siendo como eran, el juego, las mujeres y las orgías con los amigos la vorágine que consumía el caudal de Gamboa y le agotaba el perfume del alma en la flor de su vida.

Estaba él, pues, sentado, luego que partieron las hermanas, en el puesto que dejó Adela, opuesto a su madre, a la que miraba de hito en hito, de codos en la mesa, con la cara entre las manos y le dijo de repente:

--¿Sabes una cosa, mamá?

--Si no me la dices... contestó ella como distraída.

--No creas que te voy a pedir. Yo no quiero nada.

--Ya, dijo doña Rosa; y se sonrió, pues que comprendió por el exordio que quería algo su hijo muy amado.

--¿Te ríes? Entonces me callo.

--No lo tomes a mal, hijo; me sonrío para que veas que te escucho con complacencia.

--Pues al pasar ayer tarde por la relojería de Dubois, en la calle del Teniente Rey, me llamó para enseñarme... ¿Te vuelves a sonreír? Vas a creer que te voy a pedir alguna cosa. Desde ahora te digo que te engañas.

--No hagas caso de mis sonrisas. Continúa. Deseo oír el fin; ¿qué te enseñó Dubois?

--Nada. Unos relojes de repetición que acababa de recibir de Suiza. Son los primeros que llegan a La Habana, según me dijo, directamente de Ginebra.

Callose en diciendo esto Leonardo y su madre imitó su ejemplo, aunque ésta, al parecer pensativa. Al fin ella fue la primera que rompió el silencio diciendo:

--¿Y qué tal los nuevos relojes de repetición? ¿Te gustaron, hijo mío?

Se le iluminó al joven el semblante, el cual exclamó:

--Muchísimo. Son magníficos, ginebrinos..., pero yo no quiero reloj nuevo, te lo advierto. Todavía sirve el inglés que tú me regalaste el año pasado, sólo que ya no es de moda. Yo no he visto nunca un reloj de repetición y mucho menos ginebrino, que no hay que abrirlo para saber la hora a cualesquiera del día o de la noche. Se empuja el botón de un resorte que tiene dentro de la argolla, y una campanilla interior da la hora y los cuartos. ¡Qué ventaja! ¿Eh, mamá?

--¿Por qué no me hablaste de eso antes de salir tus hermanas? Le habría encargado a Antonia que se pasara por la relojería.

--No me acordé ni tuve ocasión. Papá, además, estaba delante y luego entramos en una conversación... y me distraje. Bien que ellas no entienden de relojes.

Volvió a callar doña Rosa por corto rato, siempre con aire meditabundo, aunque sin manifestar enfado ni seriedad. Entretanto, Leonardo fingía no advertir la actitud abstraída de su madre, ni dar indicios de arrepentimiento por el embarazo en que la había puesto con sus antojadizas indicaciones. Por el contrario, mientras la pobre señora meditaba y echaba cálculos, él no cesaba de sobarse las mejillas con la punta de los dedos y de mirar al techo, cual si contara las vigas del colgadizo.

--¿Te dijo Dubois, continuó al cabo doña Rosa, el precio de sus nuevos relojes?

--Sí... No. ¿Para qué quieres saber el precio? ¿Para comprarme uno? Ya te he dicho que no lo necesito, que no lo quiero. ¿Para comprarles a mis hermanas? No los tiene Dubois de mujer, de hombre únicamente.

--Bien, pero ¿cuánto pide Dubois por sus relojes de repetición para hombre?

--Poca cosa, dieciocho onzas de oro. No pueden ser más baratos, porque son de oro, legítimos ginebrinos y de repetición.

--¿Tu reloj inglés no salió bueno?

--No tan bueno como creía al principio. Ese mismo Dubois te lo vendió, bien me acuerdo; pero es claro que se engañó o te engañó, porque se atrasa y se adelanta a cada rato, y ya le he llevado a la relojería más veces que onzas de oro pagaste por él. Y eso que te costó veinte, más de lo que piden por los ginebrinos. Dinero echado a la calle, mamá. Está visto, los relojes ingleses, aún los de Tobías, fallan a menudo; al contrario, los legítimos ginebrinos son otra cosa, casi todos salen buenos, exactos. Así al menos me dijo Dubois, que tú sabes entiende de relojes y es relojero de primera. Pero no hay que pensar más en eso, mamá; olvidémoslo, lo pasaré sin un reloj de confianza ¡cómo ha de ser!

--No te apures ni te aflijas, hijo, replicó Doña Rosa bastante alarmada. Ya veremos modo de que tengas el ginebrino si tan bueno es como dices y como cree Dubois. Yo siempre pensaba hacerte un regalo de pascuas, será el reloj ese que tanto te ha gustado, aunque de aquí a Navidad va todavía una pila de días. Pero se presenta una seria dificultad.

--¿Cuál? preguntó Leonardo asustado, por más que trató de dominarse.

--Sucede, continuó doña Rosa con suavidad, que en mi bolsa particular no creo que haya ahora todo el dinero requerido para la compra, y se me hace muy cuesta arriba acudir a la de tu padre.

--Pues si depende de papá, debo dar desde ahora por perdida la esperanza del reloj nuevo. El se ha vuelto más tacaño que un judío, al menos todo para mí le parece o caro o inútil; que lo que es para Antonia, ya sabemos que su bolsa siempre está abierta. Yo no sé para qué guarda él tanto dinero.

--Eres injusto con tu padre. ¿De quién es el dinero que tú derrochas? ¿Quién provee al lujo en que vives? ¿Quién trabaja para que tú goces y te diviertas?

--El trabaja, es verdad; él se industria y ahorra, no cabe duda ninguna, pero ¿tendría ahora tanto dinero si cuando se casó con contigo hubieras sido una mujer pobre? ¿A que no?

--Yo aporté al matrimonio unos doscientos mil pesos, que no es ni la cuarta parte de nuestro caudal hoy día. El aumento, ese gran aumento, se debe a los afanes y economías de tu padre, quien no era un pobrete tampoco cuando se casó conmigo; no, señor; tenía sus reales, y tú menos que nadie debías censurar su conducta, la cual, por otra parte, es hija de la tuya con él.

--En eso había de parar el sermón, en mi conducta con papá. El es seco y duro conmigo, ¿puedo yo ser cariñoso y blando con él? Vamos, di tú. Nunca me da tampoco ocasión de mostrarle mi cariño, aunque quisiera. Mas no hablemos del asunto, volvamos la hoja y tratemos de otra cosa, de lo otro. ¿Qué tenía papá cuando se casó contigo?

--Tenía algo, tenía bastante, sí, señor. Tenía un taller de maderas del Norte, tejamaní, ladrillos, cal..., allá en la Alameda o Paseo, cerca de la Punta. El terreno en que se hallaba también le pertenecía, si bien valía poco por ser muy pantanoso y bajo. Tenía asimismo por allí, donde ahora se ha fabricado la casa del colegio de Buena Vista, un barracón. Por cierto que de los últimos bozales que se marcaron en el hombro izquierdo con las letras _G_ y _B_ todavía quedan algunos en el ingenio _La Tinaja_, que heredé de mi padre. Cándido, en sociedad con don Pedro Blanco, suele traer todavía negros de África. Pero persiguen tanto los ingleses la trata, que se pierden muchas más expediciones que se salvan...

--Figúrate, mamá, dijo Leonardo con mucha risa, aunque bajando la voz, un plagiario de hombres convertido en Conde... del Barracón, por ejemplo. ¡Qué lindo título!--¿No te parece mamá?

--¿Qué quieres decir con esa salida de pie de banco? preguntó doña Rosa molesta no menos que sorprendida.

--¡Ay, mamá! ¿Tú no sabes que según las leyes romanas son plagiarios todos aquellos que roban hombres para venderlos?

--Ya. En ese caso tu padre no es el verdadero plagiario, como dices, sino don Pedro Blanco, quien es sabido, desde su factoría en Gallinas, en la costa de Guinea, (tantas veces he oído esos nombres que se me han quedado impresos) trata negros por baratijas y otras cosas y remite los cargamentos a esta Isla. Tu padre toma los que necesita para sus fincas y los demás los vende a los hacendados, porque él hasta hace poco ha estado actuando como consignatario y antes como socio de Blanco, cuando no se tenía por contrabando la trata de África, o se toleraba. Por su cuenta al menos, no ha despachado sino contadas expediciones. De un momento a otro espera la vuelta de su bergantín _Veloz_. ¡Dios quiera que no haya caído en las garras de los ingleses!

--Tú, sin querer, estás abogando en mi favor. Yo dije lo que dije en broma, pero es claro, mamá, que conforme a un principio de derecho tanto delito comete el que mata la vaca como el que le sujeta la pata.

--No me vengas con tus principios, tus fines ni tus leyes romanas. Digan ellas y ellos lo que gustes, la verdad es que existe mucha diferencia entre la conducta de tu padre y la de don Pedro Blanco. Este se halla allá, en la tierra de esos salvajes; él es quien los procura en trato, él es quien los apresa y remite para su venta en este país; de suerte que, si hay en ello algún delito o culpa, suyo será, en ningún caso de tu padre. Y, si bien se mira, lejos de hacer Gamboa nada malo o feo, hace un beneficio, una cosa digna de celebrarse, porque si recibe y vende, como consignatario, se entiende, hombres salvajes, es para bautizarlos y darles una religión que ciertamente no tienen en su tierra. Conque si lo dices por esto, ya sabes que, en caso de titular, en lo que por ahora no piensa, no le faltarían títulos bonitos y sobre todo, honrosos. Pues como te decía antes, esta vez no me será dado complacerte sin acudir a la bolsa de tu padre.

--¿Por qué no acudes?

--Porque tendría que decirle la verdad, esto es, que quería el dinero para hacerte un regalo.

--Bien, ¿y qué? El nunca te niega nada.

--Es cierto; pero como está tan enojado contigo, temo que me lo niegue.

--¿Cuándo no está él enojado conmigo, mamá? Esa es enfermedad endémica suya, crónica, mejor dicho. Si salgo, porque salgo; si no salgo, porque me estoy en casa. De todos modos, entra el año y sale el año y papá nunca está contento conmigo. Me ha cogido entre ojos, mamá, ésta es la verdad pura y dura. ¿Para qué andarnos con rodeos? El resultado es que no le pareces bien

nada de lo que yo hago o deshago.

--No es tu padre tan injusto, ni tan falto de amor paternal, que si te portaras bien, creería que te portabas mal. Mira, sin ir más lejos, anoche estuviste de correntón en Regla. ¿A qué hora volviste?

--¿Por quién lo ha sabido él?

--Importa poco el conducto, pero sabe que se lo dijeron esta mañana en el muelle de Caballería.

--¡Vamos! Esa no cuela. Al muelle no acuden temprano sino los _tasajeros_ y husmeadores de noticias, porque ése es su mentidero, pasándose la mañana esperando que el Morro señale el Correo de España, barco de Santander o de Montevideo, con harina o con tasajo. Semejantes nenes no frecuentan los bailes del Palacio de Regla. El cuentista ya caigo en quién fue, no pudo ser otro que Aponte. Te aseguro que ya me la pagará el muy perro conversador.

--No fue ese el soplón. Sin embargo, aunque lo hubiese sido, harías mal en pegarle por eso, pues si tu padre le preguntó, no sé yo cómo pudo ocultarle la verdad.

--Pudo decir que no sabía, que no oyó la campana del reloj del Espíritu Santo, que... cualquier cosa, menos que yo vine a tal o cuál hora, ni que estuve acá ni allá. Tiene muy floja la lengua el taita Aponte y papá le dio por la vena del gusto preguntándole. Milagro que no le contó... Pero, en resumidas cuentas, ¿qué estuve yo haciendo en Regla anoche?

--No me lo digas, no quiero saberlo, supongo que no hacías nada malo. El resultado es, Leonardito, que tú no te aplicas a los estudios, que no adelantas en nada bueno ni útil, y que el tiempo que debías dedicar a la lectura y a la meditación, lo desperdicias en fiestas frívolas y en correrías tan dañinas como peligrosas. Eso no puede gustarle a él, ni... a mí tampoco, por lo mismo que te quiero entrañablemente. Quiere tu padre y quiero yo que estudies más y que pasees menos, que te diviertas, pero que no te entregues a la disipación, que no pases malas noches, que te moderes, que..., en una palabra, te portes bien.

La emoción que experimentó doña Rosa la privó del uso de la palabra, arrasándose de lágrimas sus hermosos ojos.

--Tú no sirves para predicador, le dijo Leonardo, tal vez con ánimo de distraer su atención, porque te posesionas demasiado del asunto.

--Por lo que toca a Aponte, continuó doña Rosa luego que se hubo serenado, ya sé que es un conversador, mas, en honor de la verdad, debo decir que tu padre supo la hora a que volviste por el ruido que se hizo en el zaguán con la apertura de la puerta, la entrada del carruaje y las pisadas de los caballos. Con el silencio de la noche, todo ruido es un trueno. El despertó, encendió un tabaco con el yesquero, consultó el reloj e hizo una exclamación de enojo. Yo me hice la dormida. Eran las dos y media de la madrugada... Aún se te conoce en la cara la mala noche.

Hubo otro breve intervalo de silencio entre aquellos dos interlocutores, durante el cual Leonardo bostezó y se esperezó diferentes veces, hasta que, puesto en pie, dijo:

--Me voy a dormir... Si me compras el reloj, bueno; si no, poco importa.

Dio media vuelta y emprendió la subida de la escalera de su dormitorio, paso ante paso, cual si contara los escalones o le costara un grande esfuerzo. La madre, entre tanto, le siguió con los ojos, sin decirle otra palabra ni moverse de la silla; pero así que le perdió de vista en los altos de la escalera, se agitó con viveza y llamó en voz fuerte:--¡Reventos!

A una llamada tan apremiante, no tardó en responder en propia persona el mayordomo mencionado en el anterior capítulo. Era un hombre bajo de cuerpo, rechoncho, trigueño, con la cara redonda y el pelo muy crespo, que así en su aspecto como en sus maneras manifestaba resolución y agilidad. Aunque vestido de limpio, venía en chaleco, trasluciéndose a leguas que procedía de Asturias, tipo no muy común del español entonces en La Habana. Hacía de mayordomo en casa de don Cándido Gamboa, y si llevaba ciertos libros, no se ocupaba tanto en el escritorio, como en otras comisiones más en consonancia con su empleo. Cuando se presentó delante de doña Rosa, tenía la pluma detrás de la oreja, y ella le dijo en tono de mando:

--Reventos, diga a Gamboa que me mande con Vd. veinte onzas.

Fue el hombre y volvió sin demora con el dinero pedido, el cual sacó de la caja de hierro pequeña, debajo de la carpeta, en que había varios sacos atestados de monedas de oro y plata.

--Póngase la chaqueta, añadió doña Rosa derramando las onzas sobre la mesa para contarlas, y vaya ahora mismo a la calle del Teniente Rey, a la otra puerta de la botica de San Agustín, relojería de Dubois, y se compra Vd. el mejor reloj de repetición que haya recibido últimamente de Ginebra. Diga Vd. que es para mí. ¿Se ha enterado Vd.?

--Sí, señora.

--Supongo que Vd. no entiende de relojes.

--No se me alcanza mucho, que digamos, pero en Gijón, donde yo nací y me crié, hay más de una relojería; y un tío mío, hermano de mi madre, que en paz descanse, tenía en la uña, como quien dice, el mecanismo de los relojes.

--No lo decía por tanto, don Melitón, lo decía para prevenirle contra cualesquier engaño que pudieran practicar con Vd., si se creyese que el reloj era para Vd. u otra persona así... ¿Vd. me entiende?

--Ya, ya, estoy enterado.

--Oiga. Recalque Vd. a Dubois que el reloj es para mí. El me conoce y debe saber que le costaría caro...

--Dar a Vd. gato por liebre, interrumpió el mayordomo. Por sentado que le costaría un ojo de la cara, si tal hiciera el muy bellaco. Demasiado lo sé y lo sabe él.

--Yo no le tengo por bellaco, como Vd. dice; sin embargo, bueno es estar prevenido...

--Porque el soldado prevenido nunca fue vencido, volvió a interrumpir el mayordomo, interpretando a su modo el pensamiento del ama.

--¡Ah! Haga que le pongan en una caja fina, como para un regalo. ¿Entiende Vd.?

--¡Toma que si lo entiendo! Perfectamente.

--Bien. Vaya Vd.

--Volando.

--¿Se acordará Vd.? Reloj de oro, de repetición, suizo; quiero decir, ginebrino, de los últimamente recibidos de Ginebra por el relojero Dubois, que vive en la calle del Teniente Rey, a la otra puerta de la botica de San Agustín.

--Sí, sí, señora doña Rosa. Todo eso lo recuerdo y lo tendré presente. Y en un salto...

--¡Oiga! No me limito a 18 onzas. Se quiere el mejor reloj de repetición, ginebrino legítimo, cueste lo que cueste. Si más dinero se necesita, venga Vd. por él.

--Será servida la señora doña Rosa al pie de la letra.

--¡Ah! ¡Reventos! ¡Reventos! Venga acá. Lo principal se me olvidaba. Haga que le pongan por dentro de la tapa esta marca: L. G. S. oct. 24, 1830. No se olvide.

En efecto, en poco más de una hora el Mayordomo estuvo de vuelta y puso en manos de doña Rosa un estuche pequeño, cuadrado, de tafilete, con filetes de oro. Sin duda dicha señora le aguardaba impaciente, porque tomarle, abrirle, contemplarle por breve rato con una especie de alegría infantil, levantarse y meterse en su aposento, sin hacer más caso del Mayordomo, fue todo uno.

No pasó más tiempo que el que acabamos de emplear en la relación de la cómica escena.

Leonardo por su parte, tan seguro estaba de que no se pondría el sol de aquel día, sin que un nuevo reloj viniese a adornar su traje en el bolsillo de sus pantalones, que habiendo tendido éstos en el sofá, enfrente de su cama, se acostó tranquilo, resuelto a dormir y reparar las fuerzas quebrantadas por la fatiga y la falta de sueño de la noche anterior. Dormitaba solamente cuando el ruido de menudos pasos y de las ropas de una mujer, vino a confirmarle en su esperanza. Era su madre. Fingió que dormía y la vio acercarse quedito al sofá, levantar en alto los pantalones, meter en el bolsillo delantero algo redondo que relumbraba mucho, pendiente de una cinta de seda rosada y azul, formando aguas, de más de una pulgada de ancho y seis de largo, sujetas las puntas por una hebilla de oro. Sonriose de placer, y cerró los ojos, a fin de que su madre se retirase en la persuasión que le había

preparado una sorpresa.

Al volver doña Rosa los pantalones al sofá, cuidando de que la cinta del reloj quedase visible y deslizar en la faltriquera del chaleco las dos onzas que sobraron de la compra de aquél, le pareció que su hijo se había movido en la cama. Se sobresaltó cual si hubiera estado cometiendo un delito, y entonces, en efecto, entró un rayo de luz en su conciencia de madre, recordó vivamente las palabras de su marido en la conversación de por la mañana temprano, y sintió una especie de arrepentimiento. Algo en su interior la dijo que si no hacía actualmente mal, no resultaría tampoco un bien conocido y sólido de sus demostraciones tiernas y cariñosas con Leonardo, cuando no nacían de méritos contraídos por él, sino de la efusión espontánea e indiscreta de su corazón de madre.

Perpleja, entre recoger la prenda, cosa de guardarla para ocasión más oportuna, y arrostrar por ende la aflicción y el desagrado del hijo, se quedó inmóvil, como transfigurada. Aquél, aunque brevísimo, fue un momento supremo para la triste madre. Al fin echó una mirada furtiva hacia el lecho, vio a Leonardo desnudo de medio cuerpo arriba, con los brazos en la almohada y la hermosa cabeza apoyada en las palmas, el pecho abierto y levantado, subiendo en la aspiración y bajando en la respiración, cual la ola que no llega a romper, la nariz dilatada, la boca entreabierta para dar franco paso a la entrada y salida del aire, pálido el semblante por el sueño y la agitación del día, aunque lleno de salud y de fuerza, un sentimiento de orgullo se apoderó de todo su ser, cambiando de golpe y por completo el orden de sus pensamientos.

--¡Pobrecito! exclamó en tono casi audible. ¿Por qué había yo de privarle de nada, cuando está en la edad de gozar y de divertirse? Goza y diviértete, pues, mientras te duran la salud y la mocedad, que ya vendrán para ti, como han venido para todos nosotros, los días de los disgustos y de los pesares. La Virgen Santísima, en quien tanto fío y pongo toda mi esperanza, no dejará de oír mis ruegos. Ella te proteja y saque en bien de los peligros del mundo. Dios te haga un santo, hijo de mi corazón.

Movió los labios juntos, en señal de lanzar un beso, y fuese tan callandito como vino.

SEGUNDA PARTE

CAPÍTULO I

Tarde venientibus ossa. (Los que llegan tarde al banquete roen los huesos.)

Tenemos que dejar por breve tiempo estos personajes, para ocuparnos de otros que no por ser de inferior estofa, representan en nuestra verídica historia papel menos importante. Nos referimos ahora al célebre tocador de clarinete, José Dolores Pimienta.

Para verle con la aguja en la mano sentado a la turca junto con otros oficiales de sastre en una tarima baja, hilvanando una casaca de paño verde oscuro, todavía sin mangas ni faldones, fuerza es que pasemos a la sastrería del maestro Uribe, en la calle de la Muralla, puerta inmediata a la esquina de la de Villegas, donde hubo una tienda de mercerías llamada del Sol.

El primero de estos establecimientos se componía de una sala cuadrilonga con tres entradas: la de la primitiva puerta ancha y alta y las de las dos ventanas, cuyas rejas habían arrancado. Frente a ellas, en sentido longitudinal, había una mesa larga y angosta en que se veían varias piezas de dril, de piqué, de arabia, de un género de algodón que llamaban coquillo, de raso y de paño fino, todas arrolladas y apiladas en un extremo. Y hacia el opuesto, tendidos dos pedazos de tela de Mahón, en que ya se había trazado un par de pantalones de hombre con una astilla de jabón cenizoso.

Detrás de la mesa o mostrador, de pie, en mangas de camisa, con delantal blanco atado a la cintura, la tijera en la mano derecha, y echada en torno de los hombros, por medida, una cinta de papel doblada por medio en toda su longitud, con piquetes de trecho en trecho, se hallaba el maestro sastre Uribe, favorito en aquella época de la juventud elegante de La Habana. Aunque quisiera, no hubiera podido negar la raza negra, mezclada con la blanca a que debía su origen. Era de elevada talla, enjuto de carnes, carilargo, los brazos tenía desproporcionados, la nariz achatada, los ojos saltones, o a flor del rostro, la boca chica, y tanto que apenas cabían en ella dos sartas de dientes ralos, anchos y belfos; los labios renegridos, muy gruesos y el color cobrizo pálido. Usaba patilla corta, a la clérigo, rala y crespa, lo mismo que el cabello, si bien éste más espeso y en mechones erectos que daban a su cabeza la misma apariencia atribuida por la fábula a la de Medusa.[29]

Como sastre que debía dar el tono en la moda, vestía Uribe pantalones de mahón ajustados a las piernas, de tapa angosta, figurando una _M_ cursiva, sin los finales de enlace, y las indispensables trabillas de cuero. En vez del zapato de escarpín, entonces de uso general, llevaba chancletas de cordobán, dejando al descubierto unos pies que no tenían nada de chicos, ni bien

conformados, porque sobre mostrar demasiado los juanetes, apenas formaban puente. Por poco que previniese en su favor el aspecto de Uribe, no cabe duda que era el más amable de los sastres, muy ceremonioso y un si es no es pagado de la habilidad de sus tijeras. Estaba casado con una mulata como él, alta, gruesa, desenvuelta, quien en casa al menos, gustaba tanto de ir en piernas, arrastrando la chancleta de raso, como de enseñar más de lo que convenía a la decencia, las espaldas y los hombros rollizos y relucientes.

Comenzaba la tarde de uno de los últimos días del mes de octubre. Subían y bajaban muchos carruajes, carretones y carretas la angosta calle de la Muralla, tal vez la de más tráfico de la ciudad, por ser la más central y estar toda poblada de tiendas de varias clases. El ruido de las ruedas y de las patas de los caballos en las piedras, resonaba como un trueno continuado en el interior de las casas abiertas a todos los vientos. No pocas veces chocaban unos contra otros, y obstruían el paso por largo rato. En semejante caso, al trueno de los carruajes sucedían las voces y los ternos de los carreteros y caleseros, sin consideración ni respeto a las señoras. El transeúnte a pie, si no quería ser atropellado por los caballos o estrujado contra las paredes de las casas con los bocines salientes de los cubos de las ruedas, tenía que refugiarse en las tiendas hasta que se despejara la vía.

En la tarde de que hablamos ahora, ocurrió una de esas frecuentes colisiones entre un quitrín ocupado por tres señoritas, que bajaba, y un carretón cargado con dos cajas de azúcar, que subía. Chocaron con fuerza los cubos opuestos de ambos vehículos, de cuyas resultas el del segundo levantó la rueda del primero y se entró por sus rayos, rindiendo uno. Del choque los dos carruajes quedaron casi de través en la calle, el quitrín con la zaga hacia la puerta de la sastrería de Uribe, donde penetró la cabeza de la mula del carretón. El carretonero, que venía sentado a la mujeriega en una de las cajas de azúcar, con un zurriago en la mano derecha, perdió el equilibrio y dio en el lodo y piedras de la calle un terrible costalazo.

Y este hombre, africano de nacimiento, lo mismo que el otro, mulato de La Habana, en vez de acudir cada cual a su vehículo respectivo, a fin de deshacer el enredo y facilitar el pasaje, con atroces maldiciones y denuestos se embistieron mutuamente, ciegos de furor salvaje. No era que se conocían, estaban reñidos o tenían anteriores agravios que vengar; sino que siendo los dos esclavos, oprimidos y maltratados siempre por sus amos, sin tiempo ni medio de satisfacer sus pasiones, se odiaban a muerte por instinto y meramente desfogaban la ira de que estaban poseídos, en la primera ocasión que se les presentaba. En vano las señoritas del quitrín, muy sobresaltadas, pusieron el grito en el cielo, y la mayor de ellas amenazó repetidas veces al calesero con un fuerte castigo si no desistía de la riña y atendía a los inquietos caballos. Pero los combatientes, en su furor y en la lluvia de zurriagazos que se descargaban, no oían palabra. Luego los españoles de las tiendas, los oficiales de la sastrería, todos asomados a las puertas en mangas de camisa, aumentaban el ruido y la confusión con su vocería y sus risotadas, señales ciertas del júbilo con que presenciaban el combate.

En esto, un hombre de mala catadura entró por una puerta de la sastrería, como para evitar las ruedas del carruaje, y al salir por la otra extendió el brazo por encima del fuelle caído y le desprendió la peineta de teja de la cabeza de la más joven de las señoritas; con lo cual la larga y abundosa trenza de sus cabellos se desarrolló y desmadejó toda, cubriéndole la espalda con sus ondas sedosas y brillantes cual las alas del totí. Dio ella un grito y se llevó ambas manos a la cabeza; en cuyo momento, José Dolores Pimienta, mero espectador hasta entonces como los demás, hizo una exclamación de asombro, murmuró el nombre de la «Virgencita de bronce» y se lanzó sobre el ratero, o más bien sobre la presa, que se la llevaba en triunfo. Logró echarle garra; mas como era de quebradizo carey y estaba, además, primorosamente calada, se le quedó hecha pedazos en la mano: única cosa que pudo devolver a su afligida y asustada dueña. A favor de la confusión logró escapar el ratero, bien que ningún otro que el oficial de sastre había parado mientes en aquella ocurrencia. Sin embargo, la exclamación de éste, su acción generosa cuando la generalidad de los espectadores sólo pensaba en divertirse, llamó la atención de Uribe, que volviéndose de repente para él, le dijo:

--¿Estás loco? ¿Te figuraste que esa también era Cecilia Valdés? Si digo yo que tú ves visiones.

--No, contestó secamente José Dolores. Yo sé lo que me digo. Esas niñas son hermanas del caballero Gamboa.

--¡Acabáramos! exclamó a su vez Uribe. Yo bien quería conocerlas. Se parecen mucho. No pueden negar que son hermanos. Pues es preciso ampararlas. ¡Las hermanas de uno de mis rumbosos _clientes_! No faltaba más...

En efecto, entre el maestro sastre, sus oficiales y otros, consiguieron separar a los combatientes y desenredar las ruedas de los vehículos, tras lo cual uno y otro pudieron seguir su camino, llevando el carretonero las manchas de sangre de la _cuarta_ del calesero en la camisa de listado azul. Protegió quizás las espaldas de este último la chaqueta de paño de su librea; a lo menos no se le veían en ella las señales de la refriega.

Y una vez despejado aquel campo de Agramonte y vueltos, el maestro sastre a la mesa de cortar, los oficiales a su tarima, el primero sacó de pronto el reloj del bolsillo del pantalón y, con aire sorprendido, dijo:--¡Las tres! añadiendo enseguida más alto:--¡José Dolores!

No tardó éste en aparecer ante la presencia del maestro Uribe. Traía al hombro dos madejas trenzadas, una de hilo blanco de lino, otra de seda negra; clavadas en los tirantes de los pantalones varias agujas cortas, no muy finas, y en el dedo del medio de la mano derecha un dedal de acero, sin fondo.

Al nacimiento de José Dolores Pimienta y de Francisco de Paula Uribe concurrieron, sin duda, por igual las razas blanca y negra, con esta esencial diferencia: que aquél sacó más sangre de la primera que de la segunda, circunstancia a que deben atribuirse el color menos bilioso de su rostro, aunque pálido, la regularidad de sus facciones, la amplitud de su frente, la casi perfección de las manos y la pequeñez de los pies, que así en la forma como en el arco del puente podían competir con los de dama de raza caucásica. Ni con ser de constitución delicada sobresalían mucho los pómulos de su rostro ovalado, ni tenía el cabello tan lanudo como el de Uribe. En sus maneras, lo mismo que en la mirada, y a veces hasta en el tono de la voz, había aire marcado de timidez o melancolía, pues no siempre es fácil discernir entre ambas, que revelaba, o mucha modestia o mucha ternura de afectos.

De organización musical tenía que hacerse gran violencia, cosa que no podía echar a puerta ajena, para trocar el clarinete, su instrumento favorito, por el dedal o la aguja del sastre, una de las artes bellas por un oficio mecánico y sedentario. Pero la necesidad tiene cara de hereje, según reza el característico adagio español, y José Dolores Pimienta, aunque director de orquesta, ocupado a menudo en el coro de las iglesias por el día y en los bailes de las ferias por la noche, no le bastaba eso a cubrir sus propias necesidades y las de su hermana Nemesia, desahogadamente. La música en Cuba, como las demás bellas artes, no hacía ricos, ni siquiera proporcionaba comodidades a sus adeptos. El célebre Brindis, Ulpiano, Vuelta y Flores y otros se hallaban poco más o menos en este caso.

--¿Qué tal la casaca verde indivisible? le preguntó Uribe. ¿Se halla en estado de prueba? Son las tres y dentro de poco tendremos aquí al caballero Gamboa, como el reloj.

--Para el tiempo que hace que Vd. me la entregó, _señó_ Uribe, repuso Pimienta, la tengo bastante adelantada.

--¿Cómo es eso? ¿Pues no te la di desde tras de antier?

--Perdone Vd., _señó_ Uribe, yo no vine a recibir esa prenda, si hemos de hablar claro, hasta ayer por la mañana. Antier toqué la misa mayor del Santo Ángel Custodio, a prima toqué la salve y luego en el baile de Farruco hasta más de media noche. Conque no sé...

--Bien, bien, replicó Uribe serio interrumpiéndole: ¿Se halla o no en estado de prueba? Eso es lo esencial.

--Diré a Vd., lo que es probarse, puede ahora mismo. Las solapas están basteadas, lo propio que el cuello. Iba ahora a hilvanarle los forros de seda, para abrirle los ojales. Los hombros se hilvanarán cuando venga el caballero que Vd. dice, y las espaldas idem per idem. Las mangas las está cerrando _seña_ Clara, su mujer de Vd., aunque con probar una basta. De manera que a las ocho de la noche, cuando más tarde, estará concluida la casaca y lista para el baile, que no principiará hasta las nueve.

--El caso es que se quiere para mucho antes y no se dirá nunca que Pancho de Paula Uribe y Robirosa no cumple su palabra una vez empeñada.

--Entonces tendrá Vd. que poner otro oficial que me ayude; mejor dicho, que la concluya, porque a las seis debo tocar en la salve del Santo Ángel Custodio y luego después en el baile de Brito. Farruco abre sus bailes esta noche en la casa de Soto y yo no he querido llevar mi orquesta hasta allá. En la Filarmónica dirige Ulpiano con su violín y Brindis está comprometido a tocar el contrabajo. Conque considere Vd.

--Pues lo siento en el alma, José Dolores, y si hubiera sabido que tú no ibas a rematar esa pieza, no te la hubiera dado. Yo me estoy mirando en ella. Temo que si otro oficial la coge ahora en sus manos, le echa a perder el estilo. El caballerito Leonardo es el más quisquilloso de todos mis clientes. ¿No ve Vd. que nada en riqueza? ¿No ve cómo derrama la plata? ¡Para lo que le cuesta! Y vea Vd. su padre don Cándido, el otro día como quien dice, andaba con la pata en el suelo. Me parece que lo veo cuando llegó de su tierra: traía zapatos de empleita (quiso decir _pleita_, mejor, _alpargatas_), chaqueta y calzones de bayeta y gorro de paño. A poco más puso taller de maderas y tejas, después trajo negros de África a montones, después se casó con una niña que tenía ingenio, después le entró dinero por todos cuatro costados y hoy es un caballerazo de primera, sus hijas ruedan quitrín de pareja y

su hijo bota las onzas de oro como quien bota agua. _E intertanto_ aquella pobre muchacha... Mas, cállate lengua. Pues, según te decía, José Dolores, el caballerito Leonardo vino aquí la semana pasada y me dijo:--Maestro Uribe, tenga Vd. este paño verde indivisible que he hecho traer de París expresamente para que Vd. me haga una casaca como se debe. Pero déjese Vd. de vejeces, de talle encaramado en el cogote, ni de colas de golondrinas. Yo no soy ningún zacateca, Juanito Junco, ni Pepe Montalvo. Hágame una casaca como la gente, a la _dernier_, que yo sé que Vd. sabe pintarlas en el cuerpo, cuando le da la gana. Ese mozo tiene tanto dinero, que es preciso darle gusto o reventar. Además, como es tan elegante y bien parecido, da el tono en la moda, y si acierto a hacerle una cosa buena, me pongo las botas. Aunque a decir verdad, ya no tengo manos para todo el trabajo que me ha caído. Por donde se ve claro que la competencia del inglés Federico, lejos de dañificarme, me ha favorecido. Conque, mi querido José Dolores, al avío.

--Ya le he dicho, _señó_ Uribe, haré lo que pueda; pero sépalo, no tendré tiempo para darle la última mano. Lo principal, sin embargo, está hecho, esto es, las solapas y el cuello. La montura de los faldones y la espalda Vd. puede dirigirla, y los ojales nadie los hace mejor que _seña_ Clara.

--Trae acá la casaca.

Trájola el oficial, y con ella en la mano, para suspenderla a la altura de sus ojos, Uribe se encaminó a un espejo que había en la pared medianera de la primera ventana y la puerta. Allí le siguió maquinalmente José Dolores. Cuando los dos estuvieron delante del espejo, dijo el maestro a su oficial:

--Vamos, José Dolores, sirve tú de modelo... Apuradamente, tienes el mismo cuerpo que el caballerito Leonardo.

--Está bien, _señó_ Uribe, contestó Pimienta de malísimo humor. Pero sin ejemplar ¿eh?

--Compadre, tienes hoy palabras de poco vivir. ¿Qué te está labrando allá dentro? Antes tomaste una de las niñas Gamboa por Cecilia Valdés; ahora te pones bravo porque, para ganar tiempo, pruebo la casaca del hermano en tu cuerpo. Si lo haces porque ese blanco le pisa la sombra, lo peor que puedes hacer es tomarlo tan a pecho. ¿Qué remedio, José Dolores? Disimula, aguanta. Haz como el perro con las avispas, enseñar los dientes para que crean que te ríes. ¿No ves que _ellos_ son el martillo y nosotros el yunque? Los blancos vinieron primero y se comen las mejores tajadas; nosotros los de color vinimos después y gracias que roemos los huesos. Deja correr, chinito, que alguna vez nos ha de tocar a nosotros. Esto no puede durar siempre así. Haz lo que yo. ¿Tú no me ves besar muchas manos que deseo ver cortadas? Te figurarás que me sale de adentro. Ni lo pienses, porque lo cierto y verídico es que, en verbo de blanco, no quiero ni el papel.

--¡Qué ley tan brava, _señó_ Uribe! No pudo menos de exclamar por lo bajo el oficial, sorprendido más bien que alarmado de que abrigara principios tan severos.

--Pues qué, continuó el maestro sastre, ¿te figurabas que porque le hago el _rande vú_ a todos cuantos entran en esta casa, es que no sé distinguir y que no tengo orgullo? Te equivocas; en verbo de hombre, nadie creo mejor que yo. ¿Me estimaría en menos porque soy de color? Disparate. ¿Cuántos condes, abogados y médicos andan por ahí, que se avergonzarían de que su padre o su madre se les sentara al lado en el quitrín, o los acompañara a los besamanos del Capitán General en los días del rey o de la reina Cristina? Quizás tú no estás tan enterado como yo, porque no te rozas con la grandeza. Pero recapacita un poco y recuerda. ¿Tú conoces el padre del conde...? Pues fue el mayordomo de su abuela. ¿Y el padre de la marquesa...? Un talabartero de Matanzas, más sucio que el cerote que usaba para untarle a la pita con que cosía los arneses. ¿A que el marqués de... no enseña su madre a los que van a visitarlo en su palacio de la Catedral? Y ¿qué me dices del padre del doctor de tantas campanillas...? Es un carnicero de ahí al doblar. (Tuvo Uribe la discreción de pronunciar los nombres de las personas aludidas a la oreja del oficial, como para que los demás no le oyeran.) Pues yo no tengo por qué esconder mis progenitores. Mi padre fue un brigadier español. A mucha honra lo tengo, y mi madre no fue ninguna esclavona, ni ninguna mujer de nación. Si los padres de esos señorones hubieran sido siquiera sastres, pase, porque es notorio que S. M. el Rey ha declarado noble nuestro arte, lo mismo que el oficio de los tabaqueros, y podemos usar don. Tondá, con ser moreno, tiene don por el rey.

--Yo no me ocupo de eso, ni a derechas sé quién es mi padre, sólo sé que no fue negro, volvió Pimienta a interrumpir el torrente impetuoso del maestro sastre. Lo que yo sostengo es, que ni a Vd., ni a mí, ni... a nuestros hijos, según van las cosas, nos tocará ser martillo. Y es muy duro, durísimo, insufrible, _señó_ Uribe, agregó José Dolores, y se le nubló la vista y le temblaron los labios, que _ellos_ nos arrebaten las de color, y nosotros no podamos ni mirar para las mujeres blancas.

--¿Y quién tiene la culpa de eso? continuó Uribe hablando otra vez al oído del oficial, como para que no le oyera su mujer: la culpa la tienen _ellas_, no _ellos_. No te quepa género de duda, porque es claro, José Dolores, que si a las pardas no les gustaran los blancos, a buen seguro que los blancos no miraban para las pardas.

--Puede ser, _señó_ Uribe; pero, digo yo: ¿no tienen los blancos bastante con las suyas? ¿Por qué han de venir a quitarnos las nuestras? ¿Con qué derecho hacen ellos eso? ¿Con el derecho de blancos? ¿Quién les ha dado semejante derecho? Nadie. Desengáñese, _señó_ Uribe, si los blancos se contentaran con las blancas, las pardas no mirarían para los blancos.

--Hablas como un Salomón, chinito, sólo que eso no es lo que sucede, y es preciso atenerse a cómo son las cosas y no como queremos que sean. Yo me hago este cargo: ¿qué vale quejarse ni esperar que todo ha de salir a medida del deseo de uno? Ni ¿qué puedo yo solo, qué puedes tú, ni qué puede el otro contra el torrente del mundo? Nada, nada. Pues deja ir. Cuando son muchos contra uno, no hay remedio sino hacer que no se ve, ni se oye, ni se entiende, y aguardar hasta que le llegue a uno su turno. Que ya llegará, yo te lo aseguro. No todo ha de ser rigor, ni siempre ha de rasgar el paño a lo largo. _Intertanto_ aprende de mí, recibo las cosas como vienen y no pretendo enderezar el mundo. Podría salir crucificado. Tú todavía vas a tragar mucha sangre, lo estoy mirando.

--¿Qué importa? dijo el oficial con calor. Con tal que otros la traguen al mismo tiempo que yo...

--Ese es el caso, que si tú te calientas y tomas las cosas por donde más queman, no logras que otros traguen sangre, sino que la tragas tú a borbollones. Y eso es lo que pretenden los pícaros de los blanquitos. Bien, no te digo que te dejes sopetear de nadie, pues yo tampoco me he dejado pasar la mota. Lo que te digo es que no pierdas los estribos y aguardes la ocasión. ¿Ves ahí a Clara, tan formalota, tan seria? Ella cuando moza tuvo también más de un blanco tentador, y logré espantarlo sin mucho trabajo ni quebradero de cabeza. Así te digo, José Dolores, no te apures, ni te pongas bravo, porque llevas la de perder: te comes los hígados y sacas... lo que somos. Deja correr y aprenderás a vivir.

Durante esta larga y animada conversación, no cesó un punto la probadura de la casaca. Ya cogía Uribe una solapa con la mano derecha, la sacudía y atraía a sí, a tiempo que con la izquierda abierta comprimía los pliegues de la camisa del oficial por el pecho y el costado; ya mataba las ondas de la espalda, de los hombros para el centro; ya con el jabón de piedra trazaba crucetas a lo largo de las costuras de los costados; ya, en fin, metía las tijeras por la orilla del cuello y de las boca-mangas y sisaba el paño adherido por los hilvanes de hilo blanco a las entretelas de cañamazo. Así el embrión de frac tomaba poco a poco la forma del cuerpo del oficial bajo la tijera y la astilla de jabón de Uribe, sin que a todas éstas tuviese él la certidumbre de que le viniese bien a su legítimo dueño; pero fiaba el maestro mucho en su experiencia y conocida habilidad. Siempre que se le ofrecía alguna duda respecto al tamaño, ocurría a la tira de papel doblada en dos con piquetes en ambas orillas, que le servía de medida y rectificaba las dimensiones.

Media hora larga se había pasado en esta faena del maestro con su oficial, cuando paró una volante de alquiler a la puerta de la sastrería y se apeó de ella, de un salto, el intrépido joven que había servido de asunto, por la mayor parte, de su sazonada conversación.

CAPÍTULO II

No es caballero el que nace, sino el que lo sabe ser.

La llegada repentina del joven mencionado al final del capítulo anterior, esperada y todo, sorprendió al maestro sastre, con tanto más motivo que su oficial aguardaba precisamente aquel momento para echar atrás los brazos y soltarle en las manos la pieza de ropa en estado de prueba.

Esto, sin embargo, no fue parte para que él dejase de salir al encuentro de Leonardo Gamboa y recibirle con muchas sonrisas y zalamerías.

Si el joven recién llegado observó o no la retirada precipitada de Pimienta, o si adivinó el motivo, es más de lo que puede afirmarse con probabilidad de acierto. Fuerza es decir, no obstante, que hasta allí Leonardo ignoraba que tuviese un enemigo acérrimo en el músico; y que, además, se creía superior para ocuparse de las simpatías o antipatías de un hombre de baja esfera, mulato por añadidura. Lo seguro es que ni siquiera sospechó que había acabado de ser el objeto casi exclusivo de la conversación del maestro sastre y de su oficial. Venía, además, allí a hora fija y por cita expresa, sólo se demoraría el tiempo necesario. No había, por tanto, ocasión ni motivo de dar su atención y pensamientos a cosas ajenas al traje que hacía el maestro Uribe. Tampoco éste

le dio lugar a divagaciones.

Como tenía por costumbre Leonardo, al apearse sacó una peseta del bolsillo del chaleco y se la arrojó al calesero, el cual la recibió en el aire. Luego, sin más demora, se encaminó derecho al sastre, cortándole, en medio de sus obsequiosas demostraciones, con la pregunta:

--¿Qué hay de mi ropa? ¿Lista?

--Casi concluida, señor don Leonardito.

--Lo temía, lo esperaba, replicó éste impaciente. Un zapatero remendón tiene más palabra que tú, Uribe.

--Pues ¿qué hora es, caballero Gamboa?

--Son las cuatro y más de la tarde; y me prometiste la ropa para ayer tarde.

--Perdone el caballero, se la prometí para hoy a las siete de la noche. Es decir, concluida y planchada de un todo. Porque el caballero debe estar enterado que de mi taller no sale pieza sin todos sus periquitos y ringo rangos. Cuente el caballero que este pobre sastre no posee otra cosa que su reputación, como que viste, hace más de diez años, a la grandeza de La Habana, y nadie podría decir en justicia que Francisco de Paula Uribe y Robirosa...

--¡Ah! ¡Maestro Uribe! ¡Maestro Uribe! volvió a interrumpirle el joven con mayor impaciencia. El que no te conozca que te compre. Dale con la palabra y vuelta con su reputación y pocas veces, si alguna, cumpliendo con exactitud. Dejemos toda esta palabrería para otra ocasión y vamos a los hechos. Al fin ¿tendré la ropa esta noche, en tiempo para el baile o no? He aquí lo que importa saber.

--La tendrá el caballerito o pierdo el nombre que llevo. Por lo que toca al chaleco, que es lo único que se hace fuera de casa, lo espero por momentos. Apuradamente, está en manos de una pardita que se pinta sola para chalecos y es como el reloj. Ya que el caballero ha tenido la bondad de honrar mi taller con su presencia, probaremos la casaca, aunque estoy cierto y seguro que el caballero va a confesar que tengo buen ojo, si no otra cosa. Le ruego que no repare en su estado presente, porque sé que para las personas que no son del arte aquí hay trabajo de dos días, cuando para un oficial experto sólo hay trabajo de dos horas. Si alguna vez se me atrasa la obra, no es por culpa mía, ni por falta de oficiales, sino porque me cae mucha de golpe. En el taller sólo tengo cinco oficiales, fuera, en sus casas, cuantos quiero, aunque yo prefiero tener mi gente siempre a la vista.

Por entonces, plantado Leonardo delante del espejo, se había despojado del frac con la ayuda del sastre, y mientras le probaban el nuevo, creyó ver reflejada en aquél la imagen de alguien que le miraba a hurtadillas desde atrás de la puerta del comedor. Aunque le pasó por la mente que había visto aquella cara en alguna parte, de pronto no pudo recordar dónde ni cuándo. En este esfuerzo de imaginación se quedó un rato pensativo, completamente abstraído. Por supuesto, durante ese tiempo no vio lo que pasaba, no oyó ni entendió la charla del maestro Uribe.

Acertó a entrar en aquella sazón en la sastrería una muchacha de color, medio cubierta la cabeza en la _manta_ de burato pardo oscuro, a la usanza persa. Dio las buenas tardes, y como si no hubiese reparado en lo que allí se hacía, pasó de largo hacia el aposento, por detrás de la mesa de cortar. Pero Uribe la esperaba impaciente y la detuvo antes de alcanzar la puerta, preguntándole:

--¿Traes el chaleco, Nene?

--Sí, señor; contestó ella con voz muy suave y musical, deteniéndose a la cabeza de la mesa, en la cual depositó un lío pequeño que sacó de debajo de la manta.

El nombre, lo mismo que la voz de la muchacha, sacaron a Leonardo de su abstracción; volvió a ella el rostro y le clavó la vista. Ambos se reconocieron desde luego, y cambiaron una mirada de inteligencia y una sonrisa de cariño, señales que por cierto no se escaparon a la penetración de Uribe.--Aquí hay gato encerrado, pensó él. ¡Pobre muchacha! ¡la compadezco! ¡En qué garras has caído! Cuando menos ésta es la causa de las quemazones de sangre de Pimienta... Tiene razón,...Pero no, debe ser por algo más de eso.

Después sacó el chaleco del pañuelo de seda en que estaba envuelto, y dándole éste a su dueño, añadió hablando con Gamboa.

--¿No se lo dije al caballero? Aquí tiene la prenda. La costurera vale un Potosí.

Era el chaleco de raso negro, sembrado de abejas color verde brillante, entretejidas en la tela. No se lo probó Leonardo, ni lo juzgó necesario el sastre. Tampoco hubo desde allí tiempo para mucho, porque, cual por cita, acudió la mayor parte de los parroquianos de Uribe. Entre ellos, Fernando O'Reilly, hermano menor del conde de este nombre; el primogénito de Filomeno, después Marqués de Aguas Claras; el secretario o confidente del Conde de Peñalver; el joven Marqués de Villalta; el Mayordomo del Conde de Lombillo; y uno que le decían Seiso Ferino, protegido por la opulenta familia de Valdés Herrera. Casi todos éstos habían ordenado piezas de ropa para sí o para sus amos en la sastrería del maestro Uribe, y, ya de paso para el Paseo de extramuros en sus carruajes, ya ex profeso, entraban en ella y se detenían el tiempo necesario para esa averiguación.

Al entrar el primero de los personajes arriba nombrados, le puso familiarmente la mano en el hombro a Leonardo, le llamó por este nombre, y le trató de tú por tú. Habían sido condiscípulos de Filosofía en el Colegio de San Carlos desde 1827 a 1828, en cuya última fecha O'Reilly se había separado para ir a España y proseguir sus estudios hasta recibirse de abogado, como se recibió, tornando a los patrios lares sólo unos pocos meses antes del día de que aquí hablamos, con el empleo de Alcalde Mayor. Después de dos años de ausencia, aquélla era la primera vez que se veían, no habiendo tenido Leonardo ocasión ni humor de ir a saludarlo, quizás porque, si bien antiguos condiscípulos, no había dejado él de ser miembro de una familia la más orgullosa de La Habana, de la primera grandeza de España. Por otra parte, partió soltero y volvió casado con una madrileña, motivo de más para que sus gustos y aficiones ahora fuesen muy distintos de lo que fueron cuando juntos concurrían a oír las elocuentes lecciones del amable filósofo Francisco Javier de la Cruz.

La ocasión de aquella afluencia de señores y sus criados no era otra que el baile de tabla que se celebraba por la noche del mismo día, en los altos del palacio situado en la calle de San Ignacio esquina a la del Teniente Rey, alquilado para sus funciones por la Sociedad Filarmónica, en 1828. Desde los días del carnaval, a fines de febrero, en que coincidieron los festejos públicos por el casamiento de la princesa de Nápoles, doña María Cristina con Fernando VII de España, la Sociedad antes dicha no había vuelto a abrir sus salones. Ahora lo hacía como para despedir el año de 1830, pues es sabido que la gente principal de La Habana, única con derecho a concurrir a sus funciones, se marchaba al campo desde principios de diciembre y no volvía a la ciudad sino hasta mucho después de Reyes. En vísperas del sarao, la juventud de ambos sexos acudía en tropel a los establecimientos de modas y novedades para hacerse de trajes nuevos, de adornos, joyas y guantes. Las sastrerías como la de Federico, Turla y Uribe, que eran las favoritas; los almacenes como los del «Palo Gordo» y de «Maravillas»; las joyerías como las de Rozan y «La Llave de Oro»; las tiendas de modistas como la de madama Pitaux; las zapaterías como la de Baró, en la calle de O'Reilly y la de «Las Damas» en la calle de la Salud esquina a la de Manrique, extramuros de la ciudad, varios días anteriores al señalado para el baile se veían asediados a mañana y tarde, por las señoritas y jóvenes más distinguidos por su elegancia y el lujo de sus trajes. Las primeras por esa época empezaban a usar los zapatos o escarpines de raso blanco a la China, con cintas para atarlos a la garganta del pie y mostrar las medias de seda caladas, siendo así que el vestido se llevaba sobre lo corto. Los hombres usaban también escarpines de becerro con hebillita de oro al lado de fuera y calcetas de seda color de carne.

Con los caballeros, Uribe echó el resto de la cortesía y de la amabilidad, de que sabía revestirse cada vez que le convenía; con los criados, aunque acudían en nombre de personas de elevada posición, fue seco y parco en demostraciones civiles. Pero tuvo habilidad bastante para dejarlos a todos contentos y satisfechos, como que nada le costaba prodigar promesas a diestro y a siniestro, que es moneda imaginaria con que se pagan la mayor parte de las deudas en sociedad. De esta manera cumplió exactamente con los que le hablaron gordo desde el principio; a los restantes dio un solemne chasco, sin perder por eso su patrocinio. E idos todos, porque ninguno calentó asiento, se puso desde luego a habilitar las piezas que se proponía concluir para aquella noche. No descuidó, por supuesto, la casaca verde invisible de Gamboa; quien, satisfecho de que no sería chasqueado de nuevo, cedió a las vivas instancias de su amigo Fernando O'Reilly y le acompañó en el quitrín al paseo, llamado por imitación del famoso de Madrid, el Prado.

Ocupaba éste, y ocupa en el día, el espacio de terreno que se dilata desde la calzada del Monte hasta el arrecife de la Punta al Norte, al morir el glacis de los fosos de la ciudad por el lado del oeste. Cienfuegos extendió el paseo de la calzada del Monte hasta el Arsenal hacia el sur; pero jamás se ha usado como tal esa parte sino como calle Ancha, cuyo nombre lleva. Entre las obras de adorno que tuvieron origen en el gobierno de don Luis de las Casas, se cuenta el _nuevo Prado_ (el de que hablamos ahora). El Conde de Santa Clara concluyó la primera fuente que dejó en proyecto las Casas, y construyó otra más al norte; nos referimos a la de Neptuno en el promedio del Prado, y la de los Leones al extremo. Ambas se surtían de agua de la Zanja real, que atravesaba el paseo (y aún le atraviesa) por el frente del Jardín Botánico, hoy estación principal del ferrocarril de La Habana a Güines, y por la orilla del foso iba a verter sus turbias aguas en el fondo del puerto, al costado del Arsenal. Mucho después, al extremo meridional del Prado, donde estuvo originalmente la estatua en mármol de Carlos III, que don Miguel Tacón trasladó en 1835 a su paseo

Militar, hizo construir a su costa en 1837 el Conde de Villanueva la bella fuente de la India o de La Habana.

El nuevo Prado constaba de una milla de extensión, poco más o menos, formando un ángulo casi imperceptible de 80 grados, frente a la plazoleta donde se elevaba la fuente rústica de Neptuno. Le constituían cuatro hileras de árboles comunes del bosque de Cuba, algunos con la edad muy corpulentos, e impropios todos de alamedas. Por la calle del centro, la más ancha, podían correr cuatro carruajes apareados; las dos laterales, más angostas, con unos pocos asientos de piedra, servían para la gente de a pie, hombres solamente, quienes en los días de gala o fiesta se formaban en filas interminables a lo largo del paseo. La mayor parte de éstos, especialmente los domingos, se componían de mozos españoles empleados en el comercio de pormenor de la ciudad, en las oficinas del gobierno, en la marina de guerra y en el ejército, pues por su calidad de solteros y por sus ocupaciones, no podían usar carruaje y visitar el Prado en días comunes. Es de advertirse además, que a la hora del paseo, estaba prohibido atravesar siquiera el Prado en vehículo de alquiler; y si algún extranjero lo hacía por ignorancia de la regla o consentimiento del sargento del piquete de dragones que daba allí la guardia, llamaba la atención y excitaba la risa general del público.

La juventud cubana o criolla tenía a menos concurrir al Prado a pie; sobre todo el confundirse con los españoles en las filas de espectadores domingueros. De suerte que allí tomaba parte activa en el paseo sólo la gente principal: las mujeres invariablemente en quitrín, algunas personas de edad en volante y ciertos jóvenes de familias ricas, a caballo. Ninguna otra especie de carruaje se usaba entonces en La Habana, a excepción del Obispo y del Capitán General que usaban coche. El recreo se reducía a girar en torno de la estatua de Carlos III y la fuente de Neptuno cuando la concurrencia era corta, que cuando era mucha, se extendía hasta la de los Leones u otro cualquier punto intermedio, donde el sargento del piquete calculaba que debía plantar uno de sus dragones, a fin de mantener el orden y de que se guardase la debida distancia entre carruaje y carruaje. Mientras mayor era la afluencia de éstos, menor era el paso a que se les permitía moverse; de que resultaba a menudo un ejercicio muy monótono, no desaprovechado en verdad por las señoritas, cuya diversión principal consistía en ir reconociendo a sus amigos y conocidos, entre los espectadores de las calles laterales, y saludarlos con el abanico entreabierto, de la manera graciosa y elegante que sólo es dado a las habaneras.

Por fortuna la monotonía y la funérea gravedad de tan inocente recreo, a que las autoridades españolas daban el nombre arbitrario de orden, duraban lo que la presencia de los dragones del piquete en la avenida central del Prado, es decir, de las cinco a las seis de la tarde. Porque es cosa sabida que, unas veces con la punta de la lanza, otras a varazos, hacían que los caleseros guardasen el paso y la fila. Pero después de saludar el pabellón español en las fortalezas del contorno, ceremonia previa para arriarlo, lo mismo que las señales del Morro, desfilaba el piquete por la orilla de la Zanja, en dirección de la calle y cuartel de su nombre, y al punto empezaban las carreras, el verdadero ejercicio, la belleza y novedad de la diversión. Espectáculo digno de contemplarse era, en efecto, entonces, el paseo en carruaje y a caballo, del nuevo Prado de La Habana, iluminado a medias por los últimos rayos de oro del sol poniente, que en las tardes de otoño o de invierno se degradan en manojos de plata, antes de confundirse con el azul purísimo de la bóveda celeste. Los caleseros expertos se aprovechaban con ganas de la ocasión que se les presentaba para hacer alarde de su habilidad y destreza, no ya sólo en el regir de los caballos, en el girar violento y caprichoso de los quitrines, sino en el tino con que los metían por las estrechuras y la confusión, y los sacaban sin choque ni roce siquiera de unas ruedas con otras. Aún las tímidas señoritas, en el colmo del entusiasmo por el torbellino de las carreras y giros, arrebatadas en sus conchas aéreas, con la acción y a veces con la palabra, animaban a los jinetes; con que unos y otros contribuían hasta donde más al peligro y grandeza del espectáculo. Poco a poco desaparecía la vaporosa luz crepuscular; una polvareda sutil y cenicienta se elevaba remolinando hasta las primeras ramas de los copudos árboles y cubría todo el paseo; de manera que, cuando uno tras otro los quitrines, con su carga de mujeres jóvenes y bellas, dejaban el estadio en vuelta de la ciudad o de los barrios extramuros, no creía menos el desapercibido espectador sino que salían de las nubes, cual otras Venus, de la espuma de la mar.

En aquellos tiempos en que la Metrópolis creía que la ciencia de gobernar las colonias se encerraba en plantar unos cuantos cañones de batería, se ideó la construcción de las murallas de La Habana, obra que se comenzó a principios del décimo séptimo siglo y se terminó casi al finalizar el décimo octavo. Las tales murallas eran parte de una fortificación vasta y completa, así por el lado de tierra como por el del mar o el puerto; no faltándole cuatro puertas hacia el campo, poternas hacia el agua, puentes levadizos, foso ancho y hondo, terraplenes, almacenes, estacadas, aspilleras, y baluartes almenados; de modo que la ciudad más populosa de la Isla quedaba de hecho convertida en una inmensa ciudadela. Así existieron las cosas hasta la venida del memorable don Miguel Tacón, quien abrió tres puertas más y sustituyó los puentes levadizos con puentes fijos de piedra. Pero en la época de la historia que vamos refiriendo, esto es, cuando sólo existían las cinco puertas originales, las tres del centro llamadas de Monserrate, de la Muralla y de Tierra, eran para el uso del público en carruaje, a caballo y a pie, y las de los extremos, denominadas de la Punta y de la Tenaza estaban destinadas especialmente al tráfico. Por ellas, pues, se acarreaba el azúcar, el

café y otros efectos pesados en el único medio de trasporte de entonces, a saber, las enormes primitivas carretas, tiradas por cachazudos bueyes. La guarnición de la plaza, numerosa en los últimos tiempos, daba la guardia en las puertas y en las poternas, juntamente con el resguardo, constituido en todas ellas; pues nadie ni nada entraba ni salía sin estar sujeto a un doble registro, todo según se acostumbra en las plazas sitiadas.

Después de entrado el carruaje en que iban O'Reilly y Gamboa, en el rastrillo interior, donde se hallaba la garita del resguardo, asomó, por la parte opuesta del puente levadizo, un caballo tan cargado de forraje verde de maíz, a que llaman vulgarmente _maloja_, que no se veían más que los pies y la cabeza, la cual procuraba alzar cuanto podía, a causa sin duda del demasiado peso. Sobre aquella montaña de hierba venía montado a la mujeriega, mejor dicho, recostado a la grupa el conductor o malojero, mozo natural de Islas Canarias, vestido a la usanza de los campesinos cubanos. El centinela español, que se paseaba entre las dos puertas con el fusil al brazo, miró primero hacia el puente, luego hacia el rastrillo, y se plantó en medio de la vía en señal de que ambos debían pararse, hasta que se resolviera cuál de los dos tenía que ciar o desviarse. Pararse el caballo del forraje equivaldría a obstruir el paso; volverse en el estrecho puente era imposible sin exponerse a una caída; en tanto que al carruaje le era fácil arrendar los caballos sobre el cuartel del cuerpo de guardia y dejar expedito el camino. A pesar de su natural torpeza, esto lo vio claro, desde luego, el centinela; así que ordenó con la mano al malojero que se parase y avanzó a paso de carga al carruaje y gritó:--¡Atrás!

Pero orgulloso el calesero de la nobleza y autoridad de su amo, envanecido de los escudos de arma bordados en su librea, lo mismo que de sus espuelas de plata, metal de que estaban sobrecargadas las guarniciones, aún el mismo carruaje, en vez de obedecer la orden del centinela, plantó los caballos delante de la puerta interior, y miró de medio lado a su amo. Venía éste muy embebecido contándole a Gamboa los peligros que había corrido en su ascención al monte Etna en Sicilia, y hasta la parada repentina del carruaje no echó de ver que se había presentado un obstáculo. Naturalmente los ojos del amo se encontraron con los del esclavo que le pedía órdenes:--¡Arrea! le dijo, y como si nada ocurriese, continuó la íntima conversación que traía con su condiscípulo y amigo.

Moviéronse los caballos y entonces el centinela repitió la voz de:--¡Atrás! presentando la bayoneta a sus pechos; a cuya vista O'Reilly, que era soberbio, se puso rojo de la indignación. Medio se incorporó en el asiento, como para mostrar mejor la cruz roja de Calatrava que llevaba bordada en la solapa de la casaca, y gritó:--¡Cabo de guardia! Y luego que éste se le presentó con la mano derecha abierta sobre la frente, agregó:--¡Haga Vd. despejar el paso!

Informose el cabo en un instante de lo que pasaba, y aunque no conocía el sujeto que le había hablado, por el tono imperioso que usó y por la cruz roja, supuso que era un señor principal, jefe, o cosa parecida, y le contestó, siempre con la mano abierta, a la altura de la frente:--El malojero no puede retroceder.

--¿Cómo es eso? exclamó Fernando en el colmo de la cólera. ¿Sabe Vd. con quien habla? Llame al oficial de guardia.

--No hay para qué, repuso el cabo. Ya veremos modo de arreglarlo. No se incomode V. E.

--Haga ciar ese caballo de la maloja... Pronto.

A las voces, acudieron el oficial de guardia, que se entretenía en jugar a los naipes con unos cuantos amigos, y los soldados de facción, los cuales esperaban órdenes sentados en un banco sin respaldo a la puerta del cuartel, mientras los demás dormían a pierna suelta en las tarimas fijas del interior. Aquel militar, que debíamos suponer más enterado que el cabo de la noción de lo justo y de lo injusto, no vio más sino que un caballero cruzado no podía proseguir su paseo porque se lo impedía un paisano con su caballo cargado de forraje. Así que dio la orden perentoria de despejar el puente. Ejecutada en un dos por tres, el monte de forraje verde quedó montado en la barandilla del puente levadizo, única cosa que ocurrió a los soldados hacederos en aquella circunstancias. En efecto, así pudo pasar el carruaje, aunque llevándose en el bocín del cubo parte de la maloja. Todo aquello sucedió tan repentina como inesperadamente para el mozo conductor, que sólo tuvo tiempo de echarse al suelo, no para resistir el atropello, sino para no ser lanzado al foso. Expresó su sorpresa con algunos juramentos, y su enojo con mudas demostraciones; mas nadie le hizo caso. Por el contrario, temeroso de mayor violencia, se apresuró a descargar parte de la hierba, a fin de que el caballo pudiera enderezarse y seguir camino a la ciudad.

En saliendo de la cabeza del puente para coger el estrecho rastrillo de la estacada, había que orillar el foso por corto trecho, pasar por encima de la esclusa de la Zanja, parte de cuyas aguas se vertía en aquél, formando un charco de regulares dimensiones. Pues en el borde del alto terraplén, en el instante en que hablamos, había un grupo de hombres y muchachos en observación de

algo que ocurría abajo, en el charco.

--¿Qué es ello? preguntó O'Reilly.

--No sé, contestó su amigo; supongo que gentes que se bañan.

Preguntado el calesero, informó a su amo sin titubear, que eran el mulato Polanco y el negro Tondá, célebres nadadores, riñendo a zapatazos. En efecto, desnudos completamente, cual salvajes del África, zambullían, giraban bajo del agua, y luego procuraban hacerse daño, descargándose tremendos golpes con las piernas, al modo como dicen que hace el cocodrilo cuando ataca la presa. Esto llamaban en Cuba tirar zapatazos. Parece que el inmoral espectáculo se repetía a menudo, supuesto que el calesero de O'Reilly desde luego dijo los nombres de los bañistas y lo que hacían en el agua. El primero más de una vez había acometido a un tiburón en el puerto y le había rendido a puñaladas; además de excelente nadador el segundo, era bien conocido en toda la ciudad por su valor heroico y actividad desplegada en la persecución de los malhechores de su propia raza, con autoridad especial del mismo capitán general don Francisco Dionisio Vives.

El fácil triunfo obtenido sobre el mozo del forraje en la puerta de la Muralla, había envalentonado al calesero, el cual quiso entrar en el paseo por la orilla de la Zanja; pero se lo impidió el dragón con lanza en ristre. A pesar de las protestas de O'Reilly, quien invocó su carácter de Alcalde Mayor, hubo que dar la vuelta a la estatua de Carlos III y esperar allí un claro para incorporarse en la fila. Este fue el primer motivo de mortificación para tan orgulloso joven; el segundo le aguardaba en el punto donde la calle de San Rafael corta el Prado. Desembocaban por ella el coche del general Vives con su escolta de a caballo, todos a galope tendido; y mientras, para abrir campo, los dragones del piquete interrumpían el movimiento de los quitrines de ambas filas, en el paseo, entre los cuales se hallaba el de O'Reilly; dos flanqueadores con sable desnudo detenían y arrollaban a los que pretendían entrar o salir por la puerta del Monserrate, antes que su excelencia el Capitán General.

Probaba esto que había en La Habana alguien superior y más privilegiado que un segundo génito de conde, aunque Grande de España de primera clase. En la acepción recta de la palabra, no era demócrata Leonardo, mas le disgustó mucho el atropello del malojero y casi se alegró de las mortificaciones que experimentó su amigo en el paseo, cual si hubiesen querido humillarle el orgullo. Evidente, pues, aparecía que las distinciones sociales del país, sólo aprovechaban en todas circunstancias a la autoridad militar, ante la cual nobles y plebeyos debían doblar la cerviz.

CAPÍTULO III

Y al compás se agitaban mil bellezas Que ropajes fantásticos vestían, Y a mí cual las visiones se ofrecían De un poeta oriental.

R. PALMA

Aquella noche[30] el teatro de la elegancia habanera sentó sus reales en la Sociedad Filarmónica. Brillaron allí con todo su esplendor el gusto y la finura de las señoras, lo mismo que el porte decente de los caballeros. Además de los socios y convidados de costumbre, asistieron los señores cónsules de las naciones extranjeras, los oficiales de la guarnición y de la real Marina, los ayudantes del Capitán General y algunos otros personajes notables por su carácter y circunstancias, como fueron el hijo del célebre Mariscal Ney, que estaba viajando, y el cónsul de Holanda en Nueva York.

Hiciéronse notables los vestidos de tul bordados de plata y oro sobre fondo de raso blanco, por ser de última moda e iguales al que Mme. Minette hizo en París para la actual soberana de España. Las mangas de este traje conocidas con el nombre de a la _Cristina_, eran cortas, abobadas y guarnecidas su parte inferior con encaje muy ancho. También se vieron otros de tul bordados con muchísima delicadeza, sobre fondo celeste. Llamaron así mismo la atención general los vestidos de tul sobre raso blanco con guarnición en puntas encontradas, adornadas éstas de encaje estrecho y mangas a la _Cristina_. Otros iguales a estos últimos, pero con diferentes guarniciones, pudieron señalarse, sin que dejase de haber muchos más cuya elegancia y gusto en nada desmerecían de los ya descritos.

Los peinados armonizaban con los vestidos. Llevaban unas turbantes egipcios, otras plumas blancas puestas con mucho donaire; las más, jirafas de todos tamaños, adornadas con flores azules o blancas, guardando unión con el color del traje, y algunas tenían lazos de oro graciosamente colocados. Era grandioso y bello el efecto que producía la reunión de tantas y tan hermosas lechuguinas. Animaba la concurrencia una completa alegría, y rebosaba la sonrisa en los labios de todos. La etiqueta, que generalmente caracteriza a los bailes de la Sociedad, no se vio más que en los vestidos de las señoras y en los trajes de los hombres, los cuales lucieron a porfía sus recamados uniformes de gentiles-hombres, de generales, de brigadieres, de coroneles,

de altos empleados, Cadaval y Lemaur sus fajas rojas de seda, al paso que los que no poseían título ni condecoraciones se contentaron con la última moda de París en semejantes reuniones.

Adornaba la testera principal de la sala el magnífico dosel, cuyo centro ocupaba el retrato del rey Fernando VII. Los paños de la pared sostenían cuadros históricos y de las cornisas pendía una colgadura de damasco azul con pabellones blancos guarnecidos de vistosos flecos de seda, sostenida por adornos dorados y clavos romanos, de los cuales caían con gracia cordones y borlones de seda. El cielo raso de la sala estaba vestido de damasco del mismo color de la colgadura.

Cosa de las diez empezó el baile y a las once el salón principal estaba completamente lleno. En los intermedios servían sorbetes y refrescos de todas clases en grandes bandejas de plata sostenidas por lacayos. Las señoras que preferían tomarlos fuera del salón tenían preparada para este efecto una sala alumbrada perfectamente, en donde estaba la repostería y criados prontos para servirlas; pero la política y la urbanidad de los socios y convidados les ahorró un trabajo que para los caballeros se convierte en placer cuando se emplea en servicio de las damas.

La cena se principió entre doce y una de la madrugada, y consistía en pavo fiambre, jamón de Westfalia, queso, gigote excelente, ropa-vieja, dulces secos, conservas, vinos generosos de España y extranjeros, chocolate suculento, café y frutas de todos los países en comercio con la isla de Cuba. Y fue lo más notable que, compitiendo la esplendidez de la mesa con su pródiga abundancia, los manjares no costaban sino el trabajo de pedirlos.

Puede afirmarse sin temor de ser desmentidos que la elegancia y la belleza de La Habana se habían dado cita aquella noche en la Sociedad Filarmónica. Porque allí estaba la marquesa de Arcos, hija del famoso marqués Pedro Calvo, con Luisa, su hija mayor, entonces de quince años de edad. Por ésta había improvisado Plácido aquellos versos que dicen:

Andaba revoloteando _En el ambiente exquisito,_ _Muerto de sed un mosquito,_ _Jugo de flores buscando;_ _Llegó a tu boca, y pensando_ _Que era una rosa o clavel,_ _Introduciéndose en él,_ _Porque allí el placer le encanta_ _Murió en tu dulce garganta,_ _Como en un vaso de miel._

Allí las hermanas Chacón, que merecieron por su hermosura figurar en el gran lienzo pintado por Vermay[31] para perpetuar la memoria de la misa que se celebró en la inauguración del Templete de la Plaza de Armas. Allí las Montalvo, de tipo teutónico, una de las cuales fue declarada reina de la belleza, cuando la corrida de cañas el año anterior, en la antigua plaza de Toros del Campo de Marte; allí la Arango, célebre por haber contribuido a la evasión del poeta Heredia, y que después se casó con un Ayudante de campo del Capitán General Ricafort; allí las hermanas Aceval, Venus de Milo en las formas, tan distinguidas por su talento como desdichadas por sus pasiones; allí las hermanas Alcázar, modelos de perfección, así por la simetría de sus menudas facciones, como por las rosas de sus mejillas y el color negro de sus cabellos; allí las Junco y las Lamar, de Matanzas, conocidas bajo el poético vocativo de las Ninfas del Yumurí; allí las tres hermanas de Gamboa, las cuales ya hemos tenido ocasión de describir; allí la Topete, hija del Comandante general del Apostadero de La Habana, que más adelante inspiró a Palma su inmortal «_Quince de Agosto_», allí la menor de las Gámez, Venus de Belvedere, cuyo cabello castaño, ondulante y copioso, llevaba suelto sembrado de estrellas de oro; allí, en fin, entre otras muchas que sería prolijo enumerar, Isabel Ilincheta, hija del que había sido asesor del Capitán General Someruelos, quien poseía los rasgos principales del tipo severo y modesto celtíbero, a que debía su origen.

Como modelos de varonil belleza, entre los jóvenes concurrentes al baile de la Sociedad aquella noche, pudiera hacerse mención del Teniente coronel de Lanceros del Rey, Rafael de la Torre, quien unos días después murió estrellado contra las ruedas de los quitrines en el Paseo, junto a la estatua de Carlos III, víctima de la fogosidad de su caballo; Bernardo Echeverría y O'Gabán, que en los días de gala gustaba vestir el uniforme de gentil-hombre de Cámara con entrada, por cuanto podía lucir las bien hechas y rollizas piernas; Ramón Montalvo, en la flor de su edad, bello como un inglés de la más pura sangre; José Gastón, el verdadero Apolo de Cuba; Dionisio Mantilla, recién llegado de Francia, que venía hecho un cumplido parisiense; Diego Duarte, el feliz campeón de las corridas de cañas celebradas el año anterior, con motivo de las nupcias de Fernando VII con María Cristina de Nápoles; varios oficiales de la marina y del ejército español en sus vistosos uniformes, más propios de una parada que de un baile particular.

También contribuyó al lustre de la fiesta la presencia de algunos jóvenes que empezaban a distinguirse en el cultivo de las letras, a saber: Palma, que había sido uno de los competidores en la corrida de cañas; Echeverría empleado en la Hacienda, que el año siguiente alcanzó el premio en el concurso poético abierto por la Comisión de Literatura, con objeto de celebrar el nacimiento de la Infanta de Castilla, Isabel de Borbón; Valdés Machuca, conocido por _Desval_ en la república de las letras; Policarpo Valdés, que se firmaba _Polidoro_; Anacleto Bermúdez, que solía publicar versos bajo el nombre de _Delicio_; Manuel Garay y Heredia, que

imprimía sus versos en _La Aurora_ de Matanzas; Vélez Herrera, el autor del romance cubano _Elvira de Oquendo; Delio_, el cantor de las ruinas del Alhambra; Domingo André, joven abogado, elocuente y amable; Domingo del Monte, que introdujo el romance cubano, de variados conocimientos y muy distinguido porte.

Diego Meneses, Francisco Solfa, Leonardo Gamboa y otros varios, que también se hallaban en el baile, si se exceptúan el segundo que era dado a los estudios filosóficos, y el tercero que entraba ya en la clase rica, no se hacían notables por su talento, aunque los tres solían escribir en los periódicos literarios; y el último pasaba, además, por mozo de buen parecer y varoniles formas. Los literatos, mejor dicho, los aficionados a las letras, sobre todo los que cultivaban la poesía, empezaban a tener entrada con la gente que podía tenerse por noble en Cuba, o que aspiraba, por su caudal, a la nobleza y alternaba con ella. Mostraban al menos distinción por ellos algunas familias tituladas de La Habana y los atraían a sus fiestas y reuniones, entre otras, por ejemplo, los condes de Fernandina, los de Casa Bayona, los de Casa Peñalver, los marqueses de Montehermoso y los de Arco. Dichas fiestas y reuniones en los días de pascuas de navidad se trasladaban a los lindísimos cafetales de San Antonio, de Alquízar, de San Andrés y de la Artemisa, que pertenecían a la gente rica.

No se presentaron en los salones de la Sociedad nuestros amigos Gamboa, Meneses y Solfa, sino hasta cerca de las once de la noche. Durante las primeras horas habían estado visitando los bailes de la feria del Ángel, el de Farruco y el de Brito, sin olvidar la _cuna_ de la gente de color, en la calle del Empedrado, entre Compostela y Aguacate. En ninguno de esos sitios habían tomado ellos parte activa, si se exceptúa el primero, quien al juego del monte perdió en un instante las dos onzas de oro que aquella misma tarde le había metido su madre en el bolsillo del chaleco. No conocía el valor del dinero, ni jugaba por amor a la ganancia, sino por el placer de la excitación del momento; pero sucedió que los bailes no le prestaron atractivo ninguno, desertados de las muchachas bonitas; que no logró ver a Cecilia Valdés en la ventana de la casa, ni en la _cuna_, cosas todas que se conspiraron para ponerle de malísimo humor. Para remate de desdichas, cuando perdidoso y disgustado volvía con sus amigos en busca del quitrín, que había dejado apostado en la calle del Aguacate al abrigo de las altas paredes del convento de Santa Catalina, descubrió que no estaba allí, ni fue posible encontrarle sino media hora después y en punto opuesto y distante.

Por otra parte, preguntado el calesero sobre el motivo que le indujo a desobedecer una orden terminante de su joven amo, dio al principio respuestas evasivas, y al fin, apretado, dijo que un desconocido, medio cubierto el rostro con un pañuelo, le había forzado a abandonar el puesto y fingir que se volvía a casa, valiéndose de amenazas terribles. No parecía creíble el cuento: hubo empero que aceptarlo como bueno y verídico; lo que, si cabe, aumentó el mal humor de Leonardo, porque en caso de ser cierta la relación del calesero, ¿quién podía ser ese sujeto, ni qué interés tener en que el carruaje aguardase en una u otra esquina de la calle? ¿Por qué emplear amenazas? ¿Qué autoridad tenía para ello? Aponte no pudo decir si el desconocido era militar o paisano, comisario de barrio o magistrado, hombre blanco o de color. Tal vez era un inesperado y desconocido rival que de aquel modo se preparaba a disputarle el cariño de Cecilia Valdés.

Corroboraba tan desagradable sospecha, el hecho de que ni ella, ni su amiga Nemesia se habían presentado en parte alguna de la feria del Ángel. Además de eso, la circunstancia de no haber abierto la ventana, aún cuando Gamboa hizo la señal convenida pasando la punta del bastón por los pocos balaustres que aún le quedaban, casi no dejaba duda de que algo extraordinario había ocurrido en el humilde y oscuro hogar.

Mas sea de esto lo que se fuere, que no hay tiempo de verificarlo ahora, Leonardo Gamboa entró en el baile de la Filarmónica preocupado y de muy mal talante. Armada sin embargo la danza, en la sala principal y el aposento del palacio, bastante espaciosos por cierto, según dice el poeta:

Una noche por fin: entre cristales _La luz reverberaba en los salones;_ _Y la sangre inflamaba con sus sones,_ _La danza tropical;_

no pudo nuestro héroe sustraerse a su arrobadora influencia. La orquesta, que dirigía el célebre violinista Ulpiano, ocupaba el anchísimo corredor sobre la mano izquierda, como se sube de la regia escalera de piedra oscura. Luego, a la derecha, estaba la puerta del salón, enfrente de otra que daba sobre los más amplios balcones, que formaban los portales llamados del Rosario. Dejados los sombreros y los bastones en manos de un lacayo negro, a la puerta de un cuarto entresuelo que abría al descanso de la escalera de doble tramo, y tendiendo la vista por el soberbio salón, que podía tener «la carrera de un caballo», si se nos permite la exageración, descubrieron los estudiantes que las animadas parejas le llenaban de extremo a extremo. Recibían los hombres de espalda, y las mujeres de frente, mientras esperaban su turno para hacer cedazo, el aire fresco de la media noche, que entraba por las puertas y ventanas abiertas de par en par.

Como hemos dicho antes, allí se hallaba reunido lo más granado y florido de la juventud cubana de ambos sexos, entregada, por el momento al menos, con alma y cuerpo a su diversión favorita. Y a la luz deslumbrante de las arañas de cristal, en olas de una música tan plañidera como voluptuosa, pues que procede del corazón de un pueblo esclavizado, al través de la nube sutil de polvo que levantaban los bailarines con los pies, las mujeres parecían más hermosas, los hombres más bizarros. ¿Podía, pues, entregarse el ánimo de la juventud a otros pensamientos que los que le sugerían los halagadores objetos que tenía delante? No es posible.

Gamboa se ocupó, desde luego, en buscar compañera para tomar parte en el baile, aunque no le gustaba mucho; pero Meneses, que rara vez bailaba, y Solfa, que no bailaba nunca, se quedaron de espectadores en el medio del salón, observando el último, con sonrisa amarga, que mientras aquella loca juventud gozaba a sus anchas de los placeres del momento, el más estúpido y brutal de los reyes de España parecía contemplarla con aire de profundo desprecio desde el dorado dosel donde se veía pintada su imagen odiosa.

Andando con algún trabajo entre las apiñadas filas de espectadores y bailarines, tropezó Gamboa con la más joven de las señoritas Gámez, cuyo retrato hemos hecho arriba a vuela pluma, en lo más empeñado de la danza. Por todo saludo, sin dejar de girar, como una sílfide, en brazos de su pareja, le dijo ella antes con los ojos que con la lengua:--Ahí está Isabel.

--¿Bailando? preguntó el joven.

--¡Qué bailar! Esperando por Vd.

--¿Por mí? Qué descanso el suyo. Pues por un tris no vengo al baile esta noche.

En efecto, aquella señorita se hallaba a la sazón en toda apariencia comiendo pavo, según reza la frase vulgar en Cuba, es decir, sentada a la izquierda, cerca de la puerta del aposento entre una señora de mediana edad y el culto abogado Domingo André, con quien sostenía animada conversación. No obstante su natural despreocupación, sintió Gamboa un arranque de celos que le fue imposible reprimir, no ya porque estuviese de veras enamorado, sino porque el caballero en cuya compañía la encontraba, era asaz galán y sabía insinuarse en el ánimo de las mujeres discretas. De paso debemos decir, sin embargo, que el norte de las galanterías de André por aquella época, se dirigían a otra beldad muy distinta de Isabel Ilincheta, la misma que perdió por tímido y que ganó por osado el literato dominicano Domingo del Monte, si no estamos muy equivocados, en la noche de que estamos hablando. Por lo que hace a Isabel, recibió a Leonardo con una sonrisa adorable, lo cual, lejos de tranquilizarle, fue parte a causarle mayor desazón. Cambiados los saludos de costumbre, pues la compañera de Isabel, madre de las Gámez, era amiga del joven estudiante, lo mismo que André, en prueba de que no tenía nada de coqueta, tampoco de vengativa, dijo muy risueña:

--Decía a este caballero poco hace, que tenía comprometida esta danza, y no me quiere creer.

--Es que Vd. no ha bailado ninguna todavía, que yo sepa, repuso André.

--Cierto que dos se han bailado solamente, replicó Isabel sin cortarse, pero hasta ahora que se baila la tercera, no ha venido Vd. a invitarme.

--Lo que quiere decir en sustancia, continuó André, que he llegado en hora menguada. ¡Cómo ha de ser!

--Esta señorita tiene razón, interpuso Leonardo repuesto de su embarazo. Por compromiso anterior, en cualquier baile donde nos encontremos, me reserva ella la tercera danza. No he podido llegar, pues, a mejor hora según veo. Por eso se dice que más vale llegar a tiempo que rondar un año.

--Ya, exclamó el galante abogado, el caso es que con las buenas mozas pocos somos los que llegamos a tiempo.

André saludó y fue a formar coro a las dos hijas del potentado Aldama, de las cuales la menor, de nombre Lola, cedía a muy pocas aquella noche la palma codiciada de la belleza. Entretanto Leonardo e Isabel, cogidos por la mano, se metieron en las filas de la danza, no distante de la cabecera, mediante el favor de amigos mutuos, que, aunque llegaron tarde, no les dejaron incorporarse a la cola, como era de rigor. La cubana danza sin duda que se inventó para hacerse la corte los enamorados. En sí el baile es muy sencillo, los movimientos cómodos y fáciles, siendo su objeto primordial la aproximación de los sexos, en un país donde las costumbres moriscas tienden a su separación; en una palabra, la comunión de las almas. Porque el caballero lleva a la dama casi siempre como en vilo, pues que mientras con el brazo derecho la rodea el talle, con la mano izquierda la comprime la suya blandamente. No es aquello bailar, puesto que el cuerpo sigue meramente los compases; es mecerse como en sueños, al son de

una música gemidora y voluptuosa, es conversar íntimamente dos personas queridas, es acariciarse dos seres que se atraen mutuamente, y que el tiempo, el espacio, el estado, la costumbre ha mantenido alejados. El estilo es el hombre, ha dicho alguien oportunamente; el baile es un pueblo, decimos nosotros, y no hay ninguno como la danza que pinte más al vivo el carácter, los hábitos, el estado social y político de los cubanos, ni que esté en más armonía con el clima de la Isla.

La noche en cuestión lucía Isabel Ilincheta a maravilla las gracias naturales de que la había dotado el cielo. Era alta, bien formada, esbelta, y vestía elegantemente, conque siendo muy discreta y amable, está dicho que debía llamar la atención de la gente culta. Hasta la suave palidez de su rostro, la expresión lánguida de sus claros ojos y finos labios, contribuía a hacer atractiva a una joven que, por otra parte, no tenía nada de hermosa. Su encanto consistía en su palabra y en sus modos. Entraba en la pubertad cuando perdió a su madre, y para educarla, lo mismo que para libertarla de los peligros del mundo, su padre la puso al cuidado de las religiosas Ursulinas, venidas de Nueva Orleans y establecidas en su convento de puerta de Tierra desde principios de este siglo. Después de un pupilaje de más de cuatro años, en que recibió una educación antes religiosa que erudita y completa, se retiró al campo, en el cafetal de su padre, cerca de la población de Alquízar, junto con su hermana menor, Rosa y una tía, viuda de un cirujano de marina, de nombre Bohorques. Este individuo había hecho varios viajes a la costa de África en las expediciones despachadas por cuenta de la sociedad de Gamboa y Blanco. Contrajo de esas resultas una enfermedad terrible, murió en la travesía y le arrojaron al agua, cual otros muchos de los infelices salvajes a quienes había ayudado a plagiar de su nativo suelo. En más de una ocasión fue la viuda, con tal motivo, el objeto de la munificencia de don Cándido Gamboa. Leonardo la visitó en el cafetal de Alquízar, y no pudo menos de enamorarse de la sobrina, cuya modestia y gracias realzaban su clara inteligencia y fina discreción.

No había nada de redondez femenil, y, por supuesto, ni de voluptuosidad, ya lo hemos indicado, en las formas de Isabel. Y la razón era obvia: el ejercicio a caballo, su diversión favorita en el campo; el nadar frecuentemente en el río de San Andrés y en el de San Juan de Contreras, donde todos los años pasaba la temporada de baños; las caminatas casi diarias en el cafetal de su padre y en los de los vecinos, su exposición frecuente a las intemperies por gusto y por razón de su vida activa, habían robustecido y desarrollado su constitución física al punto de hacerle perder las formas suaves y redondas de las jóvenes de su edad y estado. Para que nada faltase al aire varonil y resuelto de su persona, debe añadirse que sombreaba su boca expresiva un bozo oscuro y sedoso, al cual sólo faltaba una tonsura frecuente para convertirse en bigote negro y poblado. Tras ese bozo asomaban a veces unos dientes blancos, chicos y parejos, y he aquí lo que constituía la magia de la sonrisa de Isabel.

No debe extrañarse que, siendo Leonardo un tanto descreído y despegado, sintiese pasión por una joven tal como la que acaba de describirse. Entraba él por las puertas doradas de la vida. A pesar de sus connotaciones y de su riqueza, no había tenido aún trato con las mujeres de su esfera y educación, ni había empezado a buscar en ellas tampoco la compañera futura de su vida. La aspereza suya no era sino externa, estaba en sus maneras bruscas, porque allá en el fondo de su pecho, como habrá ocasión de observarlo, había raudal inagotable de generosidad, ternura de sentimientos. Dios, por dicha, no le había negado la capacidad de amar, sólo que las mujeres con quienes hasta allí había tropezado, o habían cedido a la fogosidad de sus afectos, a la intrepidez de sus pocos años, o a la influencia de su _lluvia de oro_. Ninguno de estos móviles podía tener ascendiente en el ánimo de una joven rica, bien educada, modesta y virtuosa como Isabel Ilincheta. Atraído Leonardo primero por sus prendas físicas, seducido después por sus relevantes dotes morales, comprendió desde luego que para ganar su afecto fuerza era tocar su corazón, hablar a su entendimiento. Por otra parte, aquella mujer que se presentaba a los ojos de Leonardo bajo un nuevo aspecto, habitaba el trasunto del paraíso terrenal cuando la vio por la primera vez.

Si podemos prescindir del esclavo y de sus padecimientos, que son, sin embargo, más llevaderos en los cafetales, se convendrá en que Isabel, su hermana Rosa, su tía doña Juana, su padre y criados, llevaban una vida de paz y quietud, lejos del bullicio de la ciudad, rodeados de olorosas flores, de los cafetos y naranjos siempre verdes, de las airosas palmas, del clásico plátano, embebecidos con el canto perenne de las aves y el susurro melancólico de la brisa en los campos de Cuba. Hasta la estación de los aguinaldos y de los azahares, en que Leonardo conoció a Isabel, contribuyó a rodearla de encanto a sus ojos y a despertar en su pecho algo que no había sentido nunca a los 21 años de su vida: el amor.

CAPÍTULO IV

Princesa.--Su nombre al menos, _Rey.--Nunca, nunca, nunca._

Sueños de amor y ambición.

El callejón de la Bomba, como el de San Juan de Dios, que parece ser su continuación, se compone de dos cuadras. Es, si cabe, más estrecho, hondo y húmedo, aún cuando sus casas son en general más amplias. En una de éstas, inmediato a la calle del Aguacate, vivía Nemesia Pimienta con su hermano José Dolores, ocupando dos cuartos seguidos, cuyo mueblaje se reducía a un par de sillas, un columpio, una mesita de pino y un catre de viento, que se abría de noche y se cerraba de día, a fin de despejar el campo.

Anochecido ya, Nemesia salió de la sastrería de Uribe y se encaminó a paso menudo hacia el barrio del Ángel. Prefirió para ello la calle del Aguacate, que si bien más solitaria y oscura, por la ausencia de establecimientos públicos, conducía derecho a dos puntos en donde de paso quería detenerse. Cuando llegó a las cuatro esquinas formadas por la calle de O'Reilly y la traviesa que llevaba, se detuvo un breve rato, pensativa e indecisa. Miró primero atrás, luego a su derecha, después adelante, fijando la mirada en la ventanilla de la casucha inmediata a la taberna de la izquierda, aunque por estar en línea paralela a la observadora, sólo se distinguían las molduras de los balaustres que sobresalían un poco del plano de la pared. Difícil era, pues, saber si había o no persona asomada allí o a la puerta. En consecuencia, la mulata se trasladó a la esquina de abajo y dio un silbido peculiar muy agudo, haciendo pasar el viento con fuerza por entre los dientes del medio de la mandíbula superior.

Algunos segundos después vio asomar por los balaustres de la ventana un canto de la cortina blanca; pero al acudir al reclamo, notó que descendía del terraplén del convento un caballero a paso largo, que se dirigía derecho al punto objetivo de sus miradas. Estúvose a observar lo que pasaba. ¿Quién sería ese sujeto? ¿Quién le aguardaba en aquella casa? Vestía de frac oscuro, pantalón claro y sombrero de ala angosta y copa desproporcionadamente ancha, sobresaliéndole por detrás el cuello blanco y recto de la camisa. No era joven, ni anciano, sino de mediana edad. A pesar de la oscuridad, todo eso lo pudo notar Nemesia a la corta distancia a que se encontraba, que no excedía de treinta pasos. Su porte, sus movimientos acompasados y firmes, no podían confundirse con los de un mozalbete ni de un viejo.

Se dirigió, sin embargo, con aparente cautela al punto donde se veía el canto de la cortina blanca, sostuvo un breve diálogo con la persona que se hallaba oculta detrás de sus pliegues, y entonces, a paso largo siguió al abrigo de las altas paredes del convento, la vuelta de la Punta. Nemesia le perdió bien pronto de vista en la oscuridad; pero no le quedó duda de que le esperaba un carruaje a mediados de la cuadra, porque oyó distintamente el ruido de las ruedas en las piedras de la calle, corriendo en sentido opuesto a aquél en que ella estaba, y favorable al que seguía el desconocido.

Aguijada por la curiosidad, volvió la muchacha a silbar como lo había hecho antes; le contestaron desde la ventanilla moviendo la cortina blanca, y acudió al punto; pero en vez de su querida amiga Cecilia, sólo encontró a la abuela. ¿Cuál de las dos mujeres había recibido y hablado con el caballero del frac oscuro y el sombrero de copa abultada? Nuevo motivo de curiosidad y de mayor confusión.

--¡Ah! ¿Era Vd., Chepilla? exclamó Nemesia.

--Entra, le dijo ésta, pasando a la puerta y quitando con la punta del pie la media bala que la aseguraba.

No se hizo de rogar la muchacha. Parecía seria y desazonada la abuela; y la nieta, sentada en un rincón, con el traje flojo, el aspecto desaliñado, la cabeza doblada sobre el pecho, los brazos extendidos y los dedos cruzados en la falda, era viva imagen del abatimiento y de la desesperación.

--Entra, hija mía. Seas bienvenida, repitió Chepilla. Entra y siéntate; hazme el favor de sentarte, añadió notando que la moza se mantenía en pie, como azorada y confusa.

--Ya es tarde y estoy de prisa, repuso ésta dejándose caer maquinalmente en la butaca de cuero delante del nicho en que se veneraba la imagen de la Dolorosa.

Iba Chepilla a repetir la instancia, pero visto que la recién llegada se sentaba sin más demora, se quedó parada entre ella y su nieta.

--Decía, agregó Nemesia a poco rato, que es tarde y venía de prisa. Fui a llevar unas costuras al taller de _señó_ Uribe, y _me se_ ha hecho de noche. Porque resulta que Clarita su mujer es muy conservadora, y después quiso que la ayudara a cerrar la saya de un túnico que está haciendo para la Nochebuena chiquita.[32] José Dolores debe de estar esperándome. El salió del taller mucho antes que yo, pues tenía que tocar en la salve del Santo Ángel Custodio. Por cierto que ha habido mucha gente de fuste esta tarde en la sastrería, todos a buscar ropa para un baile en la Filarmónica, y para las Pascuas de Navidad. A _señó_ Uribe hay que

hacerle el encargo con tiempo. Bien que el trabajo le llueve. Todos dicen que está haciendo mucho dinero, pero es más gastador... Mas ahora que me acuerdo, ¿qué sucede por acá? Parecen Vds., muy atribuladas, dijo Nemesia notando que ninguna de las dos mujeres le prestaba atención.

Suspiró Cecilia únicamente y la abuela dijo:

--No es cosa lo que sucede; sólo que esta muchacha (señalando para la nieta con un movimiento de los labios) parece poseída... ¡Dios nos asista! (y se persignó). Iba a decir un disparate. Quiero que seas el juez y la consejera en este caso, aunque tú puedes ser dos veces mi hija. Por eso te he hecho entrar. Vamos, dime, hija mía, ¿qué harías tú si tu protector, tu amigo constante, tu único apoyo en el mundo, como si dijéramos, tu mismo padre, que es verdaderamente un padre para nosotras pobres, desvalidas mujeres, sin otro amparo bajo el cielo, ¿qué harías tú si te aconsejaba, vamos, si te prohibía el que hicieras una cosa? Di, ¿tú lo harías? ¿Tú le desobedecerías?

--Mamita, saltó y dijo Cecilia sin poder contenerse; su merced no ha pintado el caso como es.

--Cállate, replicó la abuela con imperio. Deja que Nemesia conteste.

--Pero su merced parte de un principio equivocado, y Nene no puede contestar derecho, aunque quiera. Su merced dice que nuestro amigo, nuestro protector, nuestro apoyo y qué sé yo qué más, ha rogado y ha prohibido que hagan y deshagan. Y en primer lugar, la persona a que su merced se refiere, no creo que es nada de lo que su merced dice para nosotras, al menos para mí. En segundo lugar, por más que me devano los sesos, no veo la razón ni el derecho que tenga para meterse en mis cosas y ver si salgo, o si entro, si me río o si lloro... Voy a acabar, agregó Cecilia de pronto, advirtiendo que la abuela iba a cortarle la palabra. Sobre todo, su merced no tenía para qué haberme _rompido_ el túnico de punto de ilusión y la peineta de teja, sólo por darle gusto a un viejo que me tiene ojeriza, y está celoso porque yo no lo quiero ni lo querré nunca, así...

--No creas nada de lo que dice esa chica, la interrumpió la anciana.

--¿Pues no me rompió su merced el túnico y la peineta? ¿Por culpa de quién fue? ¿No fue por culpa de ese viejo narizón que Dios...?

--Calla, calla, le atajó la abuela. No blasfemes después de haber rabiado, porque creeré que estás en pecado mortal. Si se rompió el vuelo del vestido ¿no fue porque te propusiste ponértelo contra mi expresa voluntad? ¿Quién tuvo la culpa de que se cayera y se quebrara la peineta? Tú, nadie más que tú, porque si no tuvieras esos actos de soberbia, nada de eso hubiera sucedido. Sí, sí, es preciso que te confieses, es preciso que hagas penitencia, que te arrepientas de tus pecados y que te enmiendes. Estás en pecado mortal, y si sigues así vas a parar en mal. Hay que poner remedio a esto en tiempo.

--¡Esa sí que está mejor! continuó Cecilia a pesar de los ojos que le echaba la abuela. Nunca había oído decir que era pecado no querer a quien no le gusta a uno.

--¿Y quién te dice que le quieras, espiritada? exclamó la Chepilla con vehemencia. ¿El te enamora acaso? El pecado consiste en no agradecer los favores que nos hacen y en morder la mano que nos acaricia.

--Vamos a ver, ¿cuáles son los favores de que habla su merced? ¿La mesada que nos pasa? ¿Los regalos que me hace de Corpus a San Juan? Dios y él sólo saben el motivo que le guía. ¿No es extraño, muy extraño, que sea tan generoso con nosotras, pobres mujeres de color, un hombre blanco y rico que no es nada de su merced, ni mío tampoco?

--¿Y vuelta, Cecilia? No prosigas ni ensartes más disparates. El enemigo malo únicamente pudiera inspirarte unas ideas tan contrarias a la humildad y a la caridad cristianas. ¿Cómo puede ser buena hija, buena esposa, buena madre, ni buena amiga, la mujer que no agradece favores ni paga beneficios? Por pequeños que sean (que no lo son) los favores que nos hace el caballero dicho, nuestro deber es agradecérselos, ya que no podemos otra cosa. Es grave pecado pagar bien con mal. Tus murmuraciones y tu ingratitud nos van a costar muy caro.

--No sé cómo su merced entiende mi conducta con él. Apenas le conozco. Ni le doy ni le quito; lo que no quiero es que me mande y se meta en mis cosas.

--Es que tú tampoco parece que lo entiendes a él. Si desea que no hagas esto o aquello, ¿es por su bien o por tu bien? Si aprueba o desaprueba algo de lo que tú dices o haces, ¿qué mejor prueba puede darse de su cariño para contigo, y de su buen corazón? Figúrate, Nemesia, que el individuo de que hablamos (bueno es que tú lo sepas) es una dama en su trato, y su generosidad para

nosotras tan grande como desinteresada, y debe dolerle muchísimo...

--¿Desinteresada? repitió Cecilia. He ahí lo que no puedo...

--No me interrumpas, niña; estoy hablando con Nemesia. Nos da cuanto necesitamos y muchas cosas que apetecemos. Apenas le indico un deseo de esta niña, cuando se apresura a complacerla. Di que no. Preciso es que no tengas conciencia si lo niegas.

--Y no lo niego. Todo eso es muy cierto, pero ¿por qué lo hace?

--Lo mejor de todo, prosiguió la Chepilla, es que de mí no exige nada, y de ti no espera otra cosa que cariño, gratitud, y... respeto.

--Hete aquí la que me mata, saltó otra vez Cecilia con vehemencia. ¿Sabes tú, Nene, de alguna persona que dé palos de balde? Yo no la conozco. Que no exija nada de mamita, se comprende; pero que espere de mí sólo cariño, gratitud y respeto, como dice ella, eso que lo crean los tontos. Tú sabes de quién hablamos. ¿No es así? Pues bien, el tal no se puede tener en rigor por viejo. Le sobra el dinero y ha sido toda su vida, según dice mamita, un correntón y enamorado como hay pocos. Hasta ayer, como quien dice, según me ha contado mamita, a pesar de ser casado y con hijos, mantenía mujeres, con preferencia las de color. Ha perdido más muchachas que pelos tiene en su cabeza; y mamita parece empeñada en hacerme creer que su generosidad conmigo es inocente y desinteresada. Quien no lo conozca que lo compre.

--Hablas por hablar, niña, dijo la abuela al cabo de un largo espacio de meditación y de silencio. Nada de lo que has dicho viene al caso, ni se trata de eso tampoco. Se trata de que tú no le complaces, ni le tienes voluntad a una persona que es tan buena contigo y sólo le lleva el bien que te puede resultar de que hagas o no hagas ciertas cosas. _Verbi gratia_: ¿por qué habías de salir esta noche si él no quería que salieras? Cuando él se oponía, algún motivo tenía. Ese motivo no puede ser otro que tu bien. Considera, Nene, agregó la anciana en tono más blando, que poco antes de llegar tú estuvo aquí el buen señor... No entró. ¡Qué! El nunca entra. Lo primero que hizo fue preguntar por Cecilia. Siempre pregunta y se ocupa mucho de ella, por supuesto desinteresadamente; quiero decir, sin otra mira que la de saber cómo va de salud. Tú lo sabes, Nemesia; al menos me lo has oído decir muchas veces... Estuvo por la ventana... Sólo un momento. Luego que preguntó por la salud de Cecilia, como te he dicho, con mucho interés, con el interés de un... Así que le dije que ella se preparaba para ir a la _cuna_ del Ángel, me dijo muy agitado, sí, muy agitado, se le conocía, porque hasta le temblaba la voz:--No la deje ir, _seña_ Chepa, no la deje ir, deténgala; esa chica busca su perdición... (Ese es su modo de hablar). No la deje ir, deténgala, en otra ocasión le explicaré lo que pasa. Luego se fue, arrimadito a la pared como si temiera de que lo viesen. Al irse me puso una onza de oro en la mano para zapatos para Cecilia. ¿Puede darse mayor generosidad ni nobleza de alma? ¿Estará enamorada una persona que siempre obra así? Vamos. Di. ¿Ves en esto interés malicioso, celos mundanos, amor? ¿De esa manera enamoran los hombres de su edad hoy en día? Bien, ¿qué te parece, Nemesia? ¿Qué opinas?

--Yo, en verdad, contestó Nemesia, consultando con la vista el semblante de su amiga, no sé qué decir, ni me atrevo a dar una opinión franca. Sin embargo, añadió luego más animada: yo que Cecilia me reía de todo eso, en vez de ponerme brava. Si el hombre estaba enamorado de veras, porque lo estaba, y si no para burlarse de él y que me pagase por todo lo malo que me hicieran los demás. A mí no me importaría un comino que uno como ése me hiciera la rueda y me celara a todas horas; mientras me daba dinero, le pagaba con sonrisas. Y no se diga que yo procedía mal, ni cometía un pecado, porque los hombres son todos falsos, fingen amor cuando no lo sienten, y tienen tantas tretas que es difícil conocer cuando quieren de verdad y cuando se proponen engañar a las pobres mujeres. Piensa mal y acertarás, dice el proverbio. ¿Qué daño te puede resultar tampoco, Celia, de no ir esta noche a la _cuna_?

--Daño ni bien no me podía resultar de ir o no ir esta noche, claro está, replicó Cecilia. El caso es que el hombre de que habla mamita se ha propuesto meterse en mis negocios y gobernarme, por puro capricho o por gana de moler la paciencia, y eso es lo que hallo intolerable.

--Está bien, mujer, observó Nemesia blandamente; mas no veo que te cause ninguna extorsión con meterse.

--¿Cómo que no? repuso Cecilia prontamente. Mamita toma su parte desde luego, y me regaña, y me pelea, y me rompe el túnico para que me quede en casa y le dé gusto al viejo majadero. ¿Te parece poco?

--Ya, a mí tampoco me gusta que se meta _naiden_ en mis negocios. Con todo, a veces tiene una que hacerse la boba, a fin de sacar mejor partido de ciertos hombres. A ése se le ha metido en la cabeza mandarte y celarte; déjale seguir su capricho, mujer; haz que le das gusto; no le deseches de una vez; sonríete con él, por lo menos mientras se muestra dadivoso, y gozarás y vivirás

hasta ponerte vieja.

Por entonces la conversación se concretaba a Nemesia y su amiga, porque la anciana había vuelto a su butaca y a sus cavilaciones.

--Mira, prosiguió aquélla, que el que se apura se muere. Por otra parte, ten por seguro que ningún viejo por marrullero que sea es peligroso para una muchacha como tú.

--No, yo no lo creo peligroso, no le temo ni un tantico, dijo Cecilia. Yo soy muy independiente y no consentiré jamás que nadie me gobierne, mucho menos un extraño.

--¡Extraño! repitió la abuela para sí, con voz ronca y profunda.

Las dos muchachas se miraron como azoradas, así por el tono como porque ambas la creyeron absorbida completamente en sus tristes pensamientos.

--Su hijo, prosiguió Nemesia en baja voz. Tú me entiendes... Ese sí que es de temer... Joven, bien plantado, rebosándole la gracia por todas partes, con mucha labia y dinero para derramarlo como quien derrama agua... No hay mujer de corazón que se resista. ¿Es verdad, china? No es posible verlo y oírlo sin quererlo. Yo me guardaría de un hombre como él como del diablo. Ya le ha dado quebraderos de cabeza a más de una muchacha. Tiene a quien salir.

Continuaba la Chepilla en su abstracción, sin oír ni entender, en la apariencia, las palabras de Nemesia. Cecilia al contrario, desde que su amiga mencionó a su amante, se volvió toda oídos, comprendiendo que ella se proponía comunicarle alguna noticia importante.

--Pues como te iba diciendo, añadió Nemesia, cuando salí de la sastrería de _señó_ Uribe, tomé por la calle del Aguacate, y al enfrentar con la casa de las Gámez, que sabes tú está detrás del convento de las monjas Teresas, oí música y voces de hombres y mujeres. Me arrimé a una de las ventanas que tiene el poyo alto. Estaban abiertas las hojas y las cortinas echadas. Había en la sala una gran reunión: tocaban, cantaban y bailaban. ¿Qué día es hoy? ¡Ah! El 27 de Octubre. ¡Toma! ¡Si es el santo de la más chica de las Gámez, Florencia! Por eso estaba vestida de blanco y tenía el cabello suelto, y muy crespo para ser de mujer blanca. Cuando menos... Eso sí hermosísimo, porque es largo y abundante, aunque me gustaría de color más oscuro.

Cecilia dio un suspiro y Nemesia continuó ya sin más rodeos:

--Decía que rodeaban a Florencia delante del piano varias señoritas y caballeros. ¿Sabes quién estaba allí también? Sí, no me cabe duda, era ella. ¿Te acuerdas de la muchacha alta, pálida, buena moza, que te dije pasó por la Loma del Ángel en el quitrín de las Gámez, la mañana de San Rafael? La misma. Conversaba con Meneses, el amigo de... tú sabes. Por allí estaba el otro también, que siempre anda junto con los dos individuos... ¿Cómo se llama? Sola, Sofa. ¡Ah! Ya, Solfa. Pero el individuo no estaba, mencionaron su nombre únicamente. Estoy cierta que lo mencionaron...

--¿Quién lo mencionó? preguntó Cecilia con ansiedad.

--No te pudiera decir lo cierto; mas si no me engaño, entre Meneses y la muchacha pálida. Ellos hablaban de él. Según entendí, todos iban al gran baile que se da esta noche en la Filarmónica.

--Lo temía, dijo Cecilia.

--¡Ay! exclamó Nemesia. Ahora caigo para quién era el chaleco de seda que tuve que hacer con tanta premura. ¡Oh! Si lo averiguo antes no me apuro para acabarlo en tiempo. Cosí hasta bien tarde de la noche, porque me lo dieron ayer tardecita y se quería para hoy a las tres. ¡Quién lo hubiera adivinado! Al menos no hubiera ido él al baile de la gente blanca con un chaleco hecho por mí. Para lucírselo a Dios sabe quién. Nadie sabe para quién trabaja. Digo esto por ti, chinita, porque a mí no me va ni me viene. El no me pertenece; sólo me intereso por ti, que has puesto tu cariño... ¡Cuidado que los hombres son ingratos! Pero más vale callar y no ponerle más leña al fuego.

Bastaba, en efecto, y sobraba lo dicho para poner en ascuas a una joven menos fogosa que Cecilia. A medida que la amiga fue desarrollando su pensamiento, pues lo había de seguro en las noticias que comunicó y aún en el modo de comunicarlas, fue creciendo su cólera y desazón. ¿Qué hacer en aquellas circunstancias a fin de impedir, si era tiempo, que el individuo, según Nemesia, se viese en la Filarmónica con la señorita desconocida? Eran celos, rabia, desesperación lo que sentía. No cabía en la

silla, cerca de la ventana. Se levantó varias veces en ademán de entrar en el aposento, sin duda para mudarse de traje y salir a la calle, y otras tantas volvió al asiento. La sangre estaba a punto de ahogarla.

La abuela entre tanto seguía como absorbida en devotas oraciones, sobando, al parecer, con el pulgar e índice de la mano derecha, una tras otra, las cuentas negras del rosario que tenía en el regazo, y con los ojos cerrados. Nemesia miraba de soslayo a su amiga, leía, como al través de un cristal purísimo, la fiera batalla que se libraba en su pecho, y de cuando en cuando se sonreía ligeramente, cual si hubiera previsto todo aquello, o no temiese que tuviera un resultado desagradable. Al cabo Cecilia se desplomó en la silla, exhaló un suspiro profundo y murmuró:

--Más vale que no; yo sé lo que he de hacer. De mí no se burla nadie... Casi me alegro... No salgo a ninguna parte.

Chepilla alzó entonces la vista y miró a la nieta con cierta alegría mezclada de compasión. Por su parte Nemesia, en toda apariencia satisfecha, más diremos, orgullosa de que su venida hubiese surtido todo el efecto deseado, se marchó, despidiéndose cariñosamente de sus amigas.

CAPÍTULO V

Aún pienso estaros mirando... _La faz terrible y airada,_ _La vista desencajada,_ _El látigo vil sonando._

J. PADRÍÑEZ

Llegaba Nemesia a la puerta de su casa, a tiempo que salía de ella su querido hermano José Dolores con el clarinete en la funda debajo del brazo y un rollo de papeles de música en la mano. Según costumbre, caminaba cabizbajo y meditabundo. Por esta razón y por estar muy oscura la calle, no habiendo tampoco luz en la casa, por poco se cruzan los hermanos sin reconocerse, a pesar de la proximidad. Así como así, ella le reconoció primero, se le atravesó en el camino y le preguntó repitiendo dos versos de una canción tan popular entonces como llena de malicia:

«--¿A dónde vas con ese gato y la noche tan oscura?»

--¡Qué! dijo José Dolores sorprendido. ¡Ah! ¿Eres tú? Me cansé de esperarte.

--¿Tan temprano para el baile?

--Pues, ¿qué hora es?

--Tocaban a vísperas ahorita mismo en Santa _Catarina_, cuando pasé por el costado del convento.

--Te equivocas; debe ser más tarde de lo que tú te figuras.

--Puede ser, porque traigo la cabeza como un güiro, y no sé lo que me pasa.

--¿Pues qué sucede, hermana? Despacha que estoy de prisa.

--Bien. No quiero detenerte mucho. Sin embargo, creo que tenías tiempo de tomar un bocado... Una taza de café.

--Ya anduve yo ese camino. Tomé café con leche, pan y queso, y esto me basta hasta media noche en que haré por tomar gigote o cosa así. Di.

--En la casita a la otra puerta de la taberna de la esquina de la calle de O'Reilly, tú me entiendes, ha habido una _San Francia_ esta noche.

--¿Cómo así? Y tú parece que te alegras.

--Hay de todo. Te diré. Pasaba yo por allá... _Seña_ Clara me detuvo más de lo regular en la sastrería. Pues pasaba por allá, aunque era bastante tarde, porque había quedado con Cecilia en que daríamos una vuelta por el Ángel después de la salve. Ella sospechaba que el individuo que estuvo esta tarde en la sastrería a buscar su ropa nueva iba al baile de Farruco para verse con la muchacha del campo del día de San Rafael, y se proponía pillarlo _en fragante_. Cálculos de mujer celosa. Apenas llegué a la esquina vi acercarse un hombre a la ventana de la casita y hablar con una persona que estaba detrás de la cortina. Aquello picó más mi curiosidad, y así que se separó el hombre me acerqué yo... Y ¿con quién te figuras tú que me topé? Con Chepilla. Me hizo entrar. Acababa de haber allí una de mar y morena. Parece que Cecilia se había vestido para salir conmigo; y la abuela, en la

brega de impedírselo, le rompió el túnico y la peineta de teja. Todo eso sucedió en un momento.

--¡Pobre muchacha! exclamó el músico compadecido.

--Cecilia es muy cabezadura. Cuando se le pone una cosa, eso ha de ser; de manera que la abuela vio los cielos abiertos luego que yo me aparecí. Ya ella no puede con la nieta. Pues bien, me hizo entrar para ver si entre las dos lográbamos que Cecilia no saliera.

--¿Lo lograron? preguntó José Dolores con muestras de interés.

--Por supuesto, dijo Nemesia con intención. Yo sabía por donde atacarla y no erre el golpe. La abuela no quería que la nieta saliera; yo tampoco quería, y sucedió que el hombre del barrio de San Francisco que las mantiene, lo había prohibido. Ese fue, como luego supe, el que estuvo por la ventana hablando con Chepilla antes que yo.

--¿Qué es _él_ de _ella_? Quisiera saberlo.

--Yo, verdaderamente, no lo sé. A veces _me se_ figura que es mucho cuidado el suyo para mero enamorado...

--¡Si será su padre! _Señó_ Uribe cree a puño cerrado que lo es y sostiene que la madre vive. ¿Pero dónde está la madre? ¿Quién la conoce? ¿Quién la ha visto?

--Eso es lo que yo digo.

--Ahí tienes. Yo me tengo tragado que el padre y el hijo están enamorados de Cecilia hasta la punta del pelo.

--Puede ser, hermana, porque se han visto muchos de esos casos en el mundo. Ella preferirá al hijo...

--Se entiende, y ¿quién no preferiría el joven al viejo?

--La hermosura de Cecilia será al fin la causa de su perdición. ¿Qué puede esperar ella de esos dos blancos? ¿El viejo quizás le dé dinero, lujo y cuidados, mas el joven...? Este no es posible que se case con ella; gracias si la toma de querida por algún tiempo, se fastidia y la deja con dos o tres hijos el día menos pensado. Yo no sé qué será de mí si tal cosa sucede. No quiero pensar en eso.

--Ella te tiene voluntad, pero no amor. Bien claro que lo veo. Sin embargo, si yo pudiera hacer que olvidara a Leonardo, estaba vencida la principal dificultad.

--La que bien quiere, tarde o nunca olvida.

--Hay sus excepciones, y Celia, que es muy soberbia, no es imposible que por lo mismo que quiere mucho olvide pronto. Del amor al odio no hay más que el salto de una pulga.

--Esa, al fin, es una esperanza.

--Te juro que le ha de costar mucho trabajo engañarla y engañarme a mí. Yo conozco mejor que él el flaco de Celia y tengo esta ventaja. Ahora poco le dije a ella una cosa que la puso como candela. Está que trina contra el individuo. Ya se le pasará la rabieta, pero volveré a la carga y estoy segura que la haré saltar las trancas... Todo lo que sea alejarla de él, es acercarla a...

No le dejó concluir la frase José Dolores. Se sonrió tristemente, y diciendo a su hermana que no le esperase, se marchó en dirección de la calle del Aguacate. Nemesia entró en su cuarto repitiendo cual si hablara con otro:

--¡Cómo que yo me mamo el dedo! No siempre había de trabajar para el inglés. Si no ha de ser para mí, que no sea para ella tampoco. El es muy enamorado y le gustan mucho las pardas. No es tan difícil la cosa como parece. Veamos si de una vía hago dos mandados. Ella para José Dolores y _él_ para mí. Se puede, se puede...

Ahora corresponde que volvamos al sarao en la Filarmónica donde hemos dejado a Leonardo Gamboa en las filas de la danza con Isabel Ilincheta. Comprendiendo bien ella el carácter de su pareja, no le dio queja ninguna sobre su falta de puntualidad en escribir, ni de su aparente desvío; le habló, al contrario, de asuntos indiferentes: de los amigos mutuos en el campo; de las ocurrencias en el partido de Alquízar; del rosal rojo que él había injertado en el rosal blanco del jardín fronterizo del cafetal; del naranjo a cuya sombra, las pascuas pasadas, habían comido tantas veces las naranjas más dulces que producía la finca; de la

hija mayor del mayoral de su padre, que, para casarse, como se casó, en la Ceiba del Agua, se había fugado con un joven guajiro del pueblo.

--Tía Juana, añadió Isabel, se empeñó con el padre y lo hizo reconciliarse con la hija. Así es que los novios hoy día están hechos cargo del sitio de papá, en que sabe Vd. se crían gallinas y se ceban algunos animales. La muchacha se quedó con su marido, y su padre, nuestro mayoral, tuvo que salir. Yo lo sentí por su esposa, porque era una buena mujer y nos acompañaba bastante; pero, desde que se casó la hija, se le puso el humor atroz: no dejaba resollar a los negros, los castigaba por cualquier falta, siempre con verdadera sevicia, hasta que papá le despidió. Al presente pasamos algunas soledades, y nuestras salidas en el cafetal se reducen a ir al sitio todas las tardes y volver a las puestas del sol. Cuando hace luna...

--Te acuerdas de mí, ¿no es eso? la interrumpió Leonardo, con indiscreto despecho, al ver su glacial indiferencia.

--Naturalmente, contestó ella, al parecer sin notar lo que pasaba por su compañero. No puedo olvidar que en tardes divinas, como son todas las de invierno en el campo, más de una vez hemos hecho juntos ese paseo en compañía de Rosa y de tía Juana.

--Te encuentro algo cambiada, observó el joven después de breve rato de silencio.

--¿Yo cambiada? Pues está buena. Vamos, Vd. se chancea.

--Hasta me tratas de Vd.

--Creo que siempre le he tratado del mismo modo.

--No al pie del naranjo dulce.

Isabel se puso colorada, y luego dijo:

--Es ya una costumbre en mí el tratar de Vd. a todo el mundo. Aún con mis propios esclavos, si son viejos sobre todo, se me escapa el decir Vd. A papá le sucede lo mismo frecuentemente.

--El _tú_ es más cariñoso.

--¿Lo cree Vd. así? El _Vd._ es más modesto.

Cortábase a cada paso este chispeante diálogo, es decir, tantas veces cuantas la pareja que bajaba hacía figura con la pareja que subía la danza. Al fin, hubo de cambiarse del todo el tema de la conversación cuando Meneses y Solfa, que habían venido saludando a las amigas, llegaron al puesto ocupado por Isabel y Leonardo. Ambos habían visto a la joven aquella misma tarde en casa de las Gámez. Poco tenían que decirse que de nuevo fuera; Isabel, sin embargo, distinguía a Meneses, y se alegró de volver a verle.

--¿Qué es eso? ¿No baila Vd? le preguntó con interés.

--Casi nunca bailo por mera cortesía.

--¡Ay! Si le oyese Florencia se ofendería.

--Me cae en gracia Florencia, me parece bonita, la quiero, pero si bailase con ella ahora sería por mera galantería. Mi amiga del alma está lejos de aquí, Vd. lo sabe, y es mucha crueldad en Vd. atribuirme intenciones de galantear a otra.

--Sobre que le voy cogiendo miedo al amigo Solfa, dijo ella volviéndose de repente para éste, con el doble objeto de atender a todos y de no seguir la broma con Meneses.

--¿Qué he hecho para inspirar temor a la impávida Isabelita?

--¿No ve Vd.? Esa es una sátira.

--Lo sería, señorita, repitió Solfa prontamente, si la mía fuese una opinión aislada, pero no lo es. De ella participan, estoy seguro, Leonardo y Diego, juntamente con cuantos conocen a Vd. ¿Cómo pues, puedo inspirarle temor?

--Porque voy viendo que es Vd. implacable, que no perdona enemigos ni amigos.

--¿Esa más? Me aturde Vd. señorita.

--Sí, hágase Vd. ahora el inocentico, el que no quiebra un plato. ¡Cómo que desde que asomó Vd. a la puerta del salón no noto que ha venido hasta mí cortando cada traje que es un primor! Apelo al amigo Meneses; él dirá si me he equivocado o no.

Solfa y Meneses cambiaron una mirada y una sonrisa, con que corroboraron implícitamente la observación aguda de Isabel, y el primero dijo:

--Ya eso es distinto, lo declaro, me gusta la tijera; mas se me ha hecho pedazos entre las manos al llegar a Vd.

En esto cesó la danza, y las diferentes parejas de bailarines, deshaciendo la formación, corrieron las unas a ocupar sus asientos en la sala y cuartos, las otras a respirar el aire libre de los corredores. Los hombres, por la mayor parte, se dividieron en grupos para hablar de las conquistas amorosas de la noche, y casi todos para fumar un cigarro puro o de papel. Leonardo dio un paseo por los corredores con su amable compañera de baile, la cual, si hemos de juzgar por la frecuencia de sus sonrisas, no tuvo a mal que se prolongara la entrevista, aunque había terminado el encanto de la música.

Continuando, entretanto, por su parte la revista de la fiesta que se habían propuesto pasar Meneses y Solfa, se detuvieron por breve rato ante la madre y hermanas de su amigo y condiscípulo Leonardo Gamboa. Hallábanse ellas sentadas en el lado norte del salón, debajo del dosel donde dijimos que se ostentaba el retrato colosal al óleo de Fernando VII de Borbón. Antonia, la mayor, tenía a su derecha a un capitán del ejército en completo uniforme, con quien cambiaba en tono bajo frases breves de inteligencia; después seguía su madre, y a la izquierda de ésta, las dos hermanas Carmen y Adela. Con la primera de estas tres hablaba el Mariscal de campo don José Cadaval; con las dos últimas los currutacos más célebres que conocía La Habana entonces: Juanito Junco y Pepe Montalvo, cadete del regimiento Fijo. Asomó a poco Leonardo Gamboa, y como por magia desapareció el capitán español del lado de Antonia, a una insinuación suya con el codo; Cadaval siguió adelante, y el lechuguino y el cadete hicieron lo mismo con un profundo saludo.

Al descubrir de lejos Leonardo al militar español mano a mano con su hermana, se renovó en su mente la memoria de las escenas de por la mañana, primero al postigo de la ventana y después en la mesa del almuerzo, sintiendo el mismo rapto de celos y de odio que ya había experimentado. Todo el deseo que tenía de ver y hablar un rato con su madre y hermanas en el baile, se enfrió y apagó en el instante, y sólo por respeto y cariño a aquélla no les volvió la espalda. A un gesto suyo, Antonia ocupó el asiento que dejó vacante el capitán, y así pudo sentarse Leonardo y decir al oído de doña Rosa:

--¿Es posible, mamá, que tú consientas que ese soldado pele la pava con Antonia en tu presencia?

--¡Cállate! replicó doña Rosa seria. Ese caballero ha venido a traernos un recado de tu padre, el cual no puede venir por nosotras hasta la una y creo que tú tendrás que acompañarnos. De la ocurrencia me alegro con doble motivo; lo uno porque ya podré irme cuando quiera o me dé sueño; lo otro porque no te quedarás tú por detrás, ni me harás pasar otra mala noche.

--Debo acompañar a Isabel Ilincheta y a las Gámez a su casa, pues su carruaje ha sufrido una avería y no pueden usarlo esta noche.

--¡Cómo! ¿Isabel está aquí y no ha venido a saludarnos?

--No lo extrañes, porque sin duda ella ignoraba que Vds. hubiesen venido al baile, y luego ha habido una concurrencia extraordinaria.

--Bien, manda en tu quitrín a tus amigas a su casa.

--Antes, sin embargo, es preciso que Vds. vean a Isabel, o que Isabel salude a Vds.

--¿Ya te has enamorado de ella? Eres un veleta. No pienses en burlarte de esa muchacha también. Tráela aquí y la veremos.

--No. He pensado que debemos tomar algo y en la mesa nos reuniremos todos. El ambigú dicen que no es menos abundante que exquisito. ¿Qué te parece, Adela?

--Aprobado, contestó ésta alegre.

--Pero es el caso, dijo Leonardo, que si alguna de Vds. no me saca de apuros, no tendré con qué cubrir el gasto.

--Pues, ¿y las dos onzas de oro que te puse en el chaleco por la tarde cuando dormías la siesta? preguntó doña Rosa con seriedad.

--No he visto semejante dinero, mamá. Bien que si lo pusiste en la faltriquera del chaleco de esta mañana, allá en mi cuarto se quedó. Apenas tengo tres o cuatro pesos en este chaleco que me puse a la vuelta del paseo para venir al baile.

No hizo Leonardo esta explicación con la franqueza que solía; se puso colorado y titubeó varias veces. Lo advirtió su madre y le preguntó:

--¿Por qué te has aparecido en el baile tan tarde? Creí que ya no venías, y eso que tú saliste de casa antes que nosotras. Quién sabe por donde has andado.

--Había reunión y piano en casa de las Gámez con motivo de ser el santo de Florencia...

--Ellas no vinieron contigo, que yo sepa. Tú no dices la verdad, Leonardo, lo conozco y de veras te digo que haces mal, muy mal. Yo soy tu mejor amiga, hijo, y tengo el desconsuelo de ver que cada día eres menos franco conmigo. Vamos al ambigú, añadió no poco desazonada; yo pago los costos y aquí tienes mi bolsa, que contiene unas seis onzas de oro.

Era de punto de seda roja, formando dos senos separados por un nudo o lazada en el medio, para dividir el oro entero del menudo y la plata. Se la sacó del seno, porque las señoras en esa época no usaban bolsillos en las faldas como al presente, sino que se colgaban la bolsa del cinto o cordón del traje casero. Leonardo recibió el dinero con las mejillas encendidas de la vergüenza, porque a la humillación de recibir dos veces la suma que había perdido al juego, se agregaban las mentiras conque había pretendido encubrir su falta. La madre, tal vez sin quererlo ni saberlo tampoco, había leído en el fondo de su alma como a través de un cristal. ¿Le servió eso de correctivo? No es tiempo todavía de examinarlo. Pero aquel incidente había pasado para el hijo y la madre no más, para la última ciertamente no en toda su genuina deformidad, pues puede decirse que sin conciencia de ello había puesto el dedo en la llaga. Del choque recibido trabajo le costó reponerse a Leonardo, quien dijo a su madre luego que se puso en pie y le tomó el brazo para conducirla a la sala del ambigú:

--¿Y dónde quedaba papá?

--Quedaba en casa de don Joaquín Gómez, a donde han concurrido varios otros hacendados; entre ellos Samá, Martiartu, Mañero, Suárez Argudín, Lombillo, Laza...

--¿No se sabe cuál es el objeto de semejante junta?

--El capitán Miranda no ha podido explicarlo, sin duda porque él mismo lo ignora; pero por lo poco que me dijo tu padre cuando salió de casa, saco en consecuencia que va a tratarse de las expediciones a la costa de África. Vives está ya cansado de las quejas de Tolmé y de las impertinencias de los jueces de la maldita comisión mixta, y ha hecho decir a Gómez por trasmano que procuren que las expediciones de bozales no desembarquen por los alrededores de La Habana. También llegó un expreso del Mariel, participando que se ha presentado un bergantín parecido al _Veloz_, que se esperaba con un buen cargamento, perseguido por un buque inglés.

--Tal vez lo ha apresado.

--¿A la vista del torreón del Mariel? Sería demasiado atrevimiento. Con todo, esos ingleses protestantes se figuran que el mundo entero les pertenece, y no lo extrañaría. Si la expedición se pierde, tu padre pierde un pico regular. Es la primera que él emprende en sociedad con sus amigos de aquí por ser muy costosa. Cuando menos trae quinientos negros.

--¿Quién mete a papá en tales trotes, al cabo de sus años?

--¡Ay, hijo! ¿Echarías tú tanto lujo, ni gozarías de tantas comodidades, si tu padre dejase de trabajar? Las tablas y las tejas no hacían rico a nadie. ¿Qué negocio deja más ganancias que el de la trata? Di tú que si los egoístas ingleses no dieran en perseguirla como la persiguen en el día, por pura maldad, se entiende, pues ellos tienen muy pocos esclavos y cada vez tendrán menos, no había negocio mejor ni más bonito en qué emprender.

--Convenido, mas son tantos los riesgos, que quitan las ganas de emprender.

--¿Los riesgos? No son muchos comparados con las ganancias que se obtienen. El costo total de la expedición del bergantín _Veloz_, por ejemplo, según me dijo tu padre, no ha pasado de 30,000 pesos, y como la empresa es de varios, su cuota fue de algunos miles de pesos solamente. Ahora bien, si se salva la expedición, ¿cuánto no le tocará?... Saca la cuenta. Pero aquí está Isabel.

Doña Rosa la recibió con los brazos abiertos; excepto Antonia, las hermanas de Leonardo con sinceras demostraciones de cariño; sobre todas. Adela la abrazó y besó repetidas veces. Era ésta la más joven, entusiasta y franca e Isabel la preferida de su hermano querido. Después de los saludos de costumbre y las quejas mutuas, juntas todas con las Gámez, llevando Leonardo, Meneses y Solfa cada uno dos mujeres del brazo, pasaron a la sala del ambigú, espléndidamente iluminada, al fondo del palacio. Eran muchos y no cabían en una sola mesa, por cuya razón ocuparon dos, aunque inmediata una de otra.

Señoras y caballeros tomaron gigote de pechuga de pavo, fiambre de esta ave, con rico jamón de Westfalia, algunos arroz y frijoles negros, ninguno vinos ni espíritus, todos café con leche para terminación de cena. Esta, conforme al precio usual de los platos pedidos en funciones semejantes, calculó Leonardo que no bajaría el costo de onza y media de oro, o veinticinco y medio duros, cuando menos. Deseoso de hacer alarde del dinero, sacando la bolsa de seda roja, preguntó al mozo blanco, que servía ambas mesas con destreza imponderable:

--¿Cuánto es?

--Nada, contestó el hombre con la misma brevedad, a tiempo que formaba en el brazo izquierdo una _torre de porcelana_ con los platos y tazas.

--¿Cómo se entiende? repuso el joven asombrado. Pues ¿quién ha pagado por mí?

--Se conoce que Vd. no pertenece a la junta directiva, dijo el mozo con cierta impertinencia. La sociedad costea el ambigú de esta noche, y si yo fuese uno como hay muchos le hacía pasar a Vd. plaza de primo.

--¡Ah! exclamó Leonardo, corrido como una mona y no poco mortificado.

Se puso en pie murmurando:

--Estos mozos españoles son a veces demasiado impertinentes.

Si él oyó o no, es cosa que no se sabe, aunque por la mirada de través que le echó al joven, parece que resonó en sus oídos lo de español e impertinente. Bien quisieran Adela y Florencia Gámez tomar parte en la siguiente danza, la primera hasta se lo indicó a su hermano; mas él se sonrió distraídamente y no contestó palabra.

Entre tanto doña Rosa dispuso que las _niñas_, según se expresó, pasaran al camarín a recoger sus _mantas_ de seda. Al mismo tiempo los tres jóvenes bajaron al entresuelo a reclamar sus sombreros y bastones respectivos; pero tanto aquí como en el camarín, ya se habían adelantado otras muchas personas en demanda de sus prendas; de suerte que antes que obtuvieran las suyas nuestros conocidos, se pasó algún tiempo. Después bajó Leonardo al portal para prevenir a su calesero que estuviese listo.

De este intervalo se aprovecharon las más jóvenes de las señoritas para acercarse a los sitios en que se había armado la danza última, que dicen es la que mejor acompañan los músicos. No faltó quien las invitara, y ellas, en son de marcha, se pusieron a bailar con más gusto que nunca. Doña Rosa, Isabel, Antonia, la señora de Gámez y la mayor de sus hijas se sentaron en grupo a esperar la hora de la partida.

Pasada era la una de la madrugada. Cuando Leonardo descendía las escaleras de piedra del palacio de la Filarmónica, lo primero que hirió sus oídos fue el repiqueteo de las espuelas de plata de los caleseros en las sonoras piedras del portal, bailando el zapateo al son del tiple cubano. Tocaba uno, bailaban dos, haciendo uno de ellos de mujer; y de los demás, quiénes batían las palmas de las manos, quiénes golpeaban la dura losa con los puños de plata de los látigos, sin perder el compás ni cometer la más mínima disonancia. Algunos de ellos cantaban las décimas de los campesinos, anunciando por esto, por el baile y por el tiple que todos ellos eran criollos.

Aún aquí se habían adelantado muchas familias que se retiraban del baile lo más temprano posible; y eran de oírse los apellidos de las más distinguidas de La Habana repetidos de boca en boca, como ecos en escala, por todos los caleseros:--¡Montalvo! gritaba una voz y Montalvo repetían veinte sucesivamente, hasta que se perdía a lo lejos o contestaba el llamado acercando el carruaje; en cuyo acto ocurrían algunos choques, no pocas peloteras entre los esclavos, más de un varapalo asestado por el dragón que mantenía el orden en la calle, todo esto acompañado del estallido de los látigos, del ruido de las ruedas, cual truenos lejanos, y de las patadas de los caballos en las chinas pelonas del pavimento. En medio de toda aquella batahola, no cesaba el clamor de los caleseros por el nombre de las familias a que pertenecían. A saber: ¡Peñalver! ¡Cárdenas! ¡O'Farril! ¡Fernandina! ¡Arcos! ¡Chacón! ¡Calvo! ¡Herrera! ¡Cadaval! repetido tantas veces cuantas era necesario para que llegara la palabra al calesero

que se quería; el cual, después de todo, si no estaba a la cabeza de la fila que rodeaba la manzana, tenía que esperar a que le tocara su turno para mover el carruaje si no quería que el dragón de guardia le midiera las costillas con la vara de su lanza.

Apenas se pronunció el apellido de Gamboa, cesó el baile del zapateo, porque el tocador del agudo tiple no era otro que nuestro antiguo conocido Aponte. El triste esclavo se divertía al parecer con todas veras, o punteaba el instrumento primorosamente para distracción suya y de sus compañeros, porque pesaban sobre su espíritu, nada obtuso por cierto, dos amenazas terribles, la de su señorita por la tarde y la de su joven amo a las diez y media de la noche; y sabía, bien a su pesar, que ellos no olvidaban ni perdonaban faltas de sus esclavos. Pero si aquella era su suerte y no había remedio, ¿a qué apurarse ni afligirse anticipadamente? Así reflexionaba él, y así poco más o menos reflexionanban todos sus compañeros, a quienes Dios, en su santa merced, no había negado un alma pensante.

Acabada la junta de hacendados, don Joaquín Gómez puso su carruaje a la disposición de don Cándido Gamboa, para retirarse a su casa, como lo hizo, poco después de la media noche; con lo que éste pudo despachar el suyo a la familia en la Filarmónica, para que hiciera lo mismo cuando lo tuviera por conveniente. Mediante aquel refuerzo inesperado, las Gámez y su amiga Isabel pudieron trasladarse de una sola vez desde el baile a su morada a espaldas del convento de Santa Teresa, y enseguida la familia de Gamboa.

Metieron los caleseros sus respectivos quitrines en el zaguán, llevaron los caballos a la caballeriza en el traspatio, pusieron las monturas en sus burros, colgaron los arreos, libreas y sombreros en clavos fijos en la pared de un cuartucho; y por lo que hace a Aponte, acabado el trabajo, con la tarima a la espalda, cual Cristo con la cruz, volvía al zaguán para ver de descansar de las fatigas del día, durmiendo las pocas horas de la madrugada. Por entonces habían sonado las dos hacía rato en el reloj de la parroquia del Espíritu Santo. La luna menguante trasponía el tejado de la casa por el lado de la calle, cuya sombra ganaba la altura de la tapia divisoria entre ambos patios, de modo que reinaba oscuridad en el primero, aunque no tanta que no se viesen los bultos ni se reconociesen los rostros. De repente un hombre interceptó el paso de Aponte, quien levantó los ojos y vio que agitaba el látigo en la mano derecha. Se paró al instante, porque reconoció a su amo, el joven Gamboa.

--Suelta la tarima, le ordenó éste con voz bronca por la cólera; arrodíllate y quítate la camisa.

--Niño, ¿su merced me va a castigar? dijo el atribulado esclavo, ejecutando por parte lo que se le había ordenado.

--Vamos, despacha, agregó el amo acompañando a la vez el golpe, por la vía de apremio.

--Espere su merced, niño. ¿En qué le he faltado yo?

--¡Ah! ¡Perro! ¿Y me lo preguntas? ¿No te dije que te iba a castigar porque no me esperaste como te mandé, en la esquina del convento?

--Sí, señor, niño; pero yo no tuve la culpa.

--¿Pues quién la tuvo? Yo le probaré que cuando te mando una cosa la has de hacer o reventar.

Y sin más ni más empezaron a llover zurriagazos en las espaldas desnudas del infeliz esclavo. Se retorcía, porque los golpes los descargaba un brazo vigoroso, y decía:--Bueno está, mi amo (por basta). Por la niña Adela, mi amo. Por Señorita (como llamaban los criados a doña Rosa Sandoval de Gamboa), mi amito. Si yo pudiera decir la verdad, niño, su merced vería que no tuve yo la culpa. ¡Bueno está ya, niño Leonardito!

Pero aquella boca había callado, embargada por la cólera; aquel corazón se había vuelto de piedra; aquella alma había perdido el sentimiento; aquel brazo sólo parecía animado, de hierro, no se cansaba de descargar golpes. ¡Qué cansarse! los menudeaba cada vez con más furor, si no con más fuerza. Dormía ya don Cándido, cuando le despertaron asustados los estallidos del látigo y los lamentos del calesero.

--¿Qué es eso? preguntó a su esposa.

--Nada, Leonardo que castiga a Aponte.

--Pero ¡qué escándalo! ¿Qué horas son éstas de castigar a los criados? Di a ese muchacho de Barrabás que pare la mano, o por Dios bendito...

--Acuéstate y duerme, repitió la mujer. Aponte está muy perro y necesita un buen castigo.

--Sí, mas estoy seguro que esta vez no ha cometido falta. Véase qué pasada le han jugado a tu hijo y ahora se la paga el pobre mulato.

--Tú no sabes lo que hizo por la tarde a las muchachas en la calle de la Muralla.

--Será así, pero que pare el muchacho la mano o me levanto y le rompo una costilla como me llamo Cándido. ¿Hase visto mayor desvergüenza?

Claro vio doña Rosa que por poco que continuasen el vapuleo, los clamores y las protestas de inocencia del calesero, se levantaba don Cándido y hacía una de las suyas, pues a la natural rudeza de quien no había recibido educación, agregaba un carácter violento, se asomó al postigo de la ventana de su alcoba y dijo:--Leonardo, basta.

Esto fue lo suficiente. Bien que ya era tiempo de que el joven hubiese desfogado la cólera que le dominaba, o de que se le desmayase el vigor.

Después de eso, ¿cuál de los dos, la víctima o el verdugo, encontró primero reposo en la cama? Mejor dicho ¿qué pasaba por el alma del amo cuando se echó en la suya? ¿Qué por el alma del esclavo cuando se desplomó en la rígida tarima? Difícil es que lo expliquen los que no han sido una ni otra cosa, e imposible que lo entiendan en toda su fuerza, aquéllos que no han vivido jamás en un país de esclavos.

CAPÍTULO VI

¡Hola! del bergantín. _--¿Qué dirá?--¿Cómo se llama?_ _--El Condenado.--¿De dónde procede?_ _--De Sarrapatán.--¿Qué carga trae?_ _--Sacos vacíos.--¿Cómo se llama el capitán?_ _--Don Guindo Cerezo._

Escenas a la vista del Morro de la Habana.

Como es de suponer, a las nueve de la mañana del día después del baile en la Filarmónica, con dos excepciones, todo el mundo dormía en casa de Gamboa. Hablamos aquí del mundo de los amos, en cuyo número no entraban los ocho o nueve criados de la familia, porque éstos desde el amanecer debían estar en pie, desempeñando las obligaciones cotidianas, no embargante el cómo habían pasado la noche.

Don Cándido, a pesar del poco dormir y de los graves pensamientos que le ocupaban a consecuencia de lo ocurrido en la junta en casa de don Joaquín Gómez, se levantó temprano y salió a la calle a pie, por pura impaciencia de carácter.

Su esposa, algo más tarde, tomaba café con leche muellemente arrellanada en uno de los sillones del comedor.

No carecía de objeto el sentarse doña Rosa todas las mañanas en ese sitio. Registrábase desde allí el interior de la casa, y se veía si las lavanderas preparaban la lejía para el lavado de la ropa, o el brasero con carbón vegetal para el aplanchado desde temprano; si las costureras, en vez de ponerse a coser las _esquifaciones_, perdían el tiempo en conversaciones con los otros siervos; si los caleseros lavaban los carruajes, daban sebo y limpiaban las correas de las monturas; si Aponte volvía temprano o tarde de bañar los caballos, lo que probaba que había ido al muelle de Luz o a la Punta, más distante; si Pío, el anciano calesero de Gamboa, hacía zapatos de mujer en el zaguán para uso de las criadas de la casa y a veces hasta para las amas, al mismo tiempo que desempeñaba el oficio de portero, cuando no tenía que ponerle el carruaje a su amo; por último, si el cocinero, negro de aire aristocrático, bien hablado y racional, según dicen los esclavistas, había ido o no de madrugada al mercado inmediato de la Plaza Vieja, en busca de las vituallas y hortalizas que se le habían encargado la noche anterior.

Era éste el que más madrugaba en la casa. Debía hacer el fuego y preparar el café con leche, a fin de que Tirso y Dolores pudieran servirlo tan luego como despertaran los amos. No siempre despachaba el cocinero el mercado a la misma hora, ni en breve tiempo, aun cuando la Plaza Vieja distaba poco de la casa de Gamboa. En la madrugada de que hablamos ahora, por ejemplo, salió para allá demasiado temprano. Pero andando en esa dirección con el farolito en una mano, según estaba mandado por las Ordenanzas municipales desde los tiempos de Someruelos, y un canasto en la otra, sonó el cañonazo de las cuatro, el capitán de llaves abrió las puertas de la muralla y al silencio mortal de la ciudad se sucedieron el tumulto y toda clase de ruidos tan disonantes como desapacibles.

A la vuelta del mercado había siempre ajuste de cuentas del cocinero con su ama, regaños y amenazas de castigo por el precio de las carnes, por su calidad y aun peso; porque en vez de pollos trajo gallinas, por la hortaliza, pues en vez de habichuelas trajo

guisantes, y berros por lechuga, o viceversa. Porque es condición del esclavo no acertar nunca a complacer a sus amos. Para doña Rosa, en suma, siempre había motivo de queja; su cocinero pecaba a menudo por torpe, por malicia o por descuido.

--Dionisio, ¿no te encargué pollos tiernos? decía ella levantando del canasto el par de aves atadas fuertemente por los pies, ¿por qué me has traído gallinas? Tu amo no come sino pollos.

--Son pollonas, señorita, contestaba el cocinero; lo que tiene es que están gordas y parecen gallinas hechas. También no se encuentran pollos en la plaza.

--No me vengas con esas, Dionisio, que no soy boba ni nací ayer. Si tú sabes mucho, yo sé más. Vamos, ¿cuánto te costaron?

--Dos pesos, señorita. Las aves están caras ahora.

--¡Ave María Purísima! ¿A que se las compraste a tu _carabela_, la negra lucumí más carera de la plaza?

--No, señorita, se las compré a un placero del campo. Mírelas su merced bien, todavía tienen las plumas sucias de tierra colorada.

--Esa no es prueba, Dionisio, porque bien pudo tu comadre dejarles la tierra para hacer creer que eran frescas del campo, y no de segunda mano.

--Señorita, la morena de los pollos no es mi comadre ni mi _carabela_ tampoco. Ella es de nación.

--Yo sé lo que me digo, Dionisio, y no vengas tú a corregirme la plana. Si tú tienes leyes, yo sé a dónde se enderezan a los doctores como tú. Ahí está la maestranza de artillería[33] ahí está el Vedado.[34] No cuesta nada un curso de derecho en esos lugares. ¡Eh! Conque ande Vd. listo, taita Dionisio. Lo que no quiero es que Vd. se festeje ni festeje a sus comadres con mi dinero.

Al buen callar llaman Sancho, y por dolorosa experiencia de largos treinta años de esclavitud, sabía bien Dionisio que debía guardar silencio desde el punto en que sus amos empezaban a tratarle de Vd. Aquella era señal segura de que subía la marea de la cólera. Se aproximaba la tempestad y en breve estallaría el rayo. En tal virtud, el cocinero recogió a toda prisa los avíos de la comida y se refugió en su cocina, como buen piloto que busca abrigo temporal en el primer puerto que le depara el cielo.

Este esclavo había nacido y se había criado en Jaruco, en el palacio de los condes de ese título. Sabía leer y escribir casi por intuición, dones adquiridos que le revestían de mérito extraordinario a los ojos de sus compañeros de esclavitud, mucho más ignorantes que él, en general, bajo esos respectos. Era aficionadísimo al baile, gran bailador de minué, que aprendió en las suntuosas fiestas de sus amos, pues en su calidad de paje, que fue su empleo primitivo, siempre estaba en contacto con ellos; y allí conoció a la después Condesa de Merlín, a varios Capitanes Generales, al primer conde de Barreto y a otras notabilidades de Cuba, de España y del extranjero, por ejemplo, a Luis Felipe de Orleans, después rey de los franceses.

A poder de tiempo, de industria y de economía, viviendo entre gente rica y rumbosa, que visitaban personajes notables, logró Dionisio reunir dinero suficiente para _coartarse_, quiere decir, para fijar el precio en que se le vendería, si lo vendían, dando a su amo diez y ocho onzas de oro, o 306 duros. Sacáronle, sin embargo, a remate junto con otros varios esclavos, por ante el Escribano público don José Salinas, a la muerte del Conde, para cubrir las grandes costas que ocasionaron su testamentaría y división de bienes. La habilidad de Dionisio en la cocina y la repostería, a que le aplicaron apenas llegó a la virilidad, le daba más valor en el mercado que a los otros esclavos sin oficio; de consiguiente, la _coartación_ sólo le sirvió para que le vendieran en 500 pesos, en vez de los 800 en que le estimó el amo cuando le aceptó la suma arriba mencionada. En el _lote_, don Cándido le obtuvo por menos de los 500 pesos en que quedó coartado, aunque él no fue el mejor postor; pero supo untarle en tiempo la mano al oficial de causas, y no aparecieron las otras pujas. De dos graves faltas adolecía Dionisio, graves por su triste condición: era la una su afición a las mujeres; la otra ya se ha dicho, su afición al baile propio de los blancos.

Dadas las 9 de la mañana, entró don Cándido Gamboa por el zaguán de su casa. Parecía cariacontecido, cansado y sudoso, no ya por el calor, que no dejaba de sentirse, aunque estábamos a fines de octubre, sino por la agitación de las primeras horas del día y los pensamientos que ocupaban su espíritu. Sin reparar en su esposa, que inquieta le aguardaba junto a la mesa del comedor, puesta ya para el almuerzo por el ágil Tirso, de la calle pasó derecho al escritorio, donde estaba el Mayordomo don Melitón Reventos encaramado en el banquillo, con la pluma detrás de la oreja y de codos en la carpeta, meditando sobre un pliego de papel español, escrito en renglones desiguales, a manera de versos de arte mayor, que tenía delante.

--¿Qué hace? le preguntó entrando don Cándido, sin darle los buenos días, acaso porque aquél era uno de los peores de su vida.

--Hacía el apunte de los efectos que ordena el Mayordomo de _La Tinaja_ para la próxima molienda, y miraba si se me había escapado algo. El patrón Sierra estuvo aquí y dijo que salía...

--Deje Vd. eso de la mano, que no precisa, y vamos a lo que importa. Reventos, ahora mismo se pone Vd. la chaqueta y se va corriendito al baratillo de Suárez Argudín en el portal del Rosario, y recoge Vd. cuantas camisas de listado y pantalones de rusia tenga hechos, y le dice Vd. que los cargue en cuenta. Probable es que no tenga cuanto se necesita, 400 mudas; pero él puede completar el número en los otros baratillos de los paisanos. Mas en caso que ni así se consigan todas, 300, 250, 200, las que se puedan... ¿Qué remedio? Si no salvamos tantos, salvamos cuantos.

--¿Cuántos qué? preguntó Reventos, demasiado curioso para dejarlo para luego.

--Bultos, hombre, bultos, repuso brevente don Cándido. ¿No sabe Vd. que ha llegado el _Veloz_?

--¿Sí? A fe que no lo sabía.

--Pues ha llegado, mejor dicho, lo han traído al puerto. El número fijo a bordo no se sabe todavía. Las escotillas están clavadas, y dice el Capitán Carricarte que, aunque embarcó sobre 500, con el largo viaje y la atroz caza que le han dado los ingleses, se le han muerto algunos y tenido que echar al agua... muchos, vamos, la broza por fortuna. ¿Está Vd.? Ahora bien, tome las mudas de ropa, forme tres o cuatro líos, según; los conduce Vd. en un carretón al muelle de Caballería, frente a Casa Blanca, y se los entrega al patrón del guadaño _Flor de Regla_. Vd. le conoce. Bien, le entrega Vd. todo, que él está ya avisado y sabe a dónde ha de llevarse eso. Vd. le acompaña, pues que conoce al contador. ¡Eh! conque al avío. Se le guardará a Vd. el almuerzo si no da la vuelta en tiempo. De cualquier modo, la ropa debe estar a bordo antes de las once. ¿Lo oye Vd.?

El Mayodomo ido, de seguidas entró doña Rosa en el escritorio. Se paseaba su marido arriba y abajo agitado; mas al verla se detuvo por un instante esperando la pregunta, que, en efecto, no tardó ella en dirigirle:--¿Qué ocurre, Gamboa? Ahí va Reventos que se desnuca y tú aquí inquieto. Di, por caridad, ¿qué pasa?

--Lo de siempre, hija; que si seguimos como vamos, todavía los pícaros de los ingleses han de causar la ruina de este hermoso florón de S. M. C. el rey, que Dios guarde.

--No me digas.

--Como lo oyes, porque si los ingleses no nos dejan importar los brazos que nos hacen tan suma falta, no sé con qué ni cómo vamos a elaborar el azúcar. Sí, esto se lo lleva Barrabás, no me canso de decirlo.

--Tal es mi tema, Cándido; pero al grano.

--Al grano. Esta mañana a las siete señaló el Morro buque inglés de guerra a sotavento. Nos hallábamos en el muelle varios: Gómez, Azopardo, Samá, en fin, casi todos los de la junta de anoche. A poco el Morro señaló presa y media hora después se presentó en la boca del puerto la corbeta inglesa _Perla_, su comandante el Lord Pege o Pegete, según nos dijeron después los que desde la Punta oyeron la contestación que dio el práctico al vigía de señales.[35] ¿Cuál te figuras que era la presa?

--¿El bergantín _Veloz_?

--El mismo, Rosa; con casi todo el cargamento a bordo.

--Luego se ha salvado el cargamento. ¡Qué bueno!

--¿Salvado? repitió don Cándido con amargo acento. Pluguiera a Dios. Desde el punto que nuestro bello bergantín entra aquí como presa...

--Están perdido barco y cargamento, ¿no? ¡Sería una gran desgracia!

--Lo que es perderse todo no será si los que estamos interesados en la salvación de una cosa y otra no nos dormimos en las pajas. Por lo pronto, los pasos que se han dado y que se darán más adelante nos hacen abrigar la esperanza de que cuando no todos los bultos, al menos las dos terceras partes lograremos arrancarlos de las garras de los ingleses. ¿Has de creer, Rosa, que a veces se me figura que más dolor me causaría la pérdida del bergantín que la del cargamento, aunque es el más valioso de cuantos ha traído del África, según la factura del Capitán Carricarte? Pues no te quepa duda ninguna. Con mi bergantín se pueden traer con seguridad y en corto tiempo no uno, sino varios cargamentos, y no hay muchos como él. Habrá tres años que se lo

compré a Didier, de Baltimore, y ya ha dado cuatro viajes felices al África. Este era el quinto viaje y ya me he reembolsado tres veces de su costo. Admírate, Rosa, salió de Casa Blanca... ¿te acuerdas? a mediados de julio y a los cuatro meses no cabales ha dado la vuelta. Eso se llama andar. ¿Quién negará ahora que es el más velero de cuantos se emplean en la carrera al presente? Ahí están el _Feliz_, de Zuaznávar; la _Vencedora_, de Abarzusa; la _Venus_, de Martínez; la _Nueva Amable Salomé_ de Carballo; el _Veterano_ de Gómez, y muchos otros de fama. ¿Qué son en comparación de mi _Veloz_? Potalas, urcas. Sí, sentiría mucho perderlo; no por el dinero, aunque no son un grano de anís los diez mil pesos que di por él, sino porque difícilmente se construye buque de más pies.

--¡Ah! Cándido, no te hagas ilusiones. Tú y tus amigos abrigan esperanzas, yo no. Cuando los ingleses agarran, no sueltan, tenlo por seguro. Cada vez me parecen más odiosos esos judíos protestantes. Vea Vd. ¿quién los mete en lo que no les va ni les viene? Yo me hago los sesos agua y no atino a comprender por qué se ha de oponer Inglaterra a que nosotros traigamos salvajes de Guinea. ¿Por qué no se opone también a que se traiga de España aceite, pasas y vinos? Pues hallo más humanitario traer salvajes para convertirlos en cristianos y hombres que vinos y esas cosas que sólo sirven para satisfacer la gula y los vicios.

--Rosa, los enemigos de nuestra prosperidad, quiero decir, los ingleses, no entienden esa filosofía, no la quieren entender tampoco; de otra manera tendrían más miramientos con nosotros los vasallos de una nación amiga y en otro tiempo aliada de la suya. Pero yo no les echo toda la culpa a ellos, a quienes culpo principalmente es a los que aconsejaron a nuestro augusto soberano don Fernando VII celebrar el tratado de 1817 con Inglaterra. Aquí está el mal. Por la miserable suma de 500,000 libras esterlinas los indiscretos consejeros del mejor de los monarcas concedieron a la pérfida Albión el derecho de visita de nuestros buques mercantes y de insultar, como insulta un día con otro, impunemente, el sagrado pabellón de la que no ha mucho fue señora de los mares y dueña de dos mundos. ¡Qué vergüenza! No sé cómo toleramos... Mas al caso, Rosa. Como te decía, la llamada repentina de Gómez ayer tardecita tuvo por objeto oír la historia de lo ocurrido con el _Veloz_, de boca del capitán Carricarte, que llegó a revienta cinchas del Mariel, y ver lo que se hacía por si era posible jugarle una buena a los ingleses; porque tú sabes que, hecha la ley, hecha la trampa. Cuando llegué a casa de Gómez, que serían cerca de las ocho...

--¿Cómo así? le interrumpió su mujer. Tú saliste de acá antes de las siete. ¿En qué te demoraste? ¿Cómo echaste más de una hora en ir a casa de Gómez?

--No me demoré en ninguna parte, no; repuso el marido, visiblemente embarazado. ¿Dije que serían cerca de las ocho? Pues cuenta que quise decir poco después de las siete, a las siete y cuarto, a las siete y media... La hora precisa no importa.

Parecía que no importaba; pero no dejó de llamar la atención de doña Rosa, que, yendo en carruaje su marido, para trasladarse de la esquina de la calle de San Ignacio y Luz, donde vivía, al extremo de la de Cuba, hacia el norte, donde se celebró la reunión, echase una hora, cuando esta distancia puede recorrerse a pie en la mitad de ese tiempo descansadamente. Natural fue que Doña Rosa, que parece no las tenía todas consigo, en tratándose de la lealtad conyugal de su marido, se callase, es cierto, mas a todas luces perdió el entusiasmo, y con éste el interés en lo que pensaba hacerse para salvar la presa y su cargamento. Advirtiéndolo don Cándido, pues harto conocía a su mujer, diose una palmada en la frente y dijo:

--¡Tate! me dilaté porque tuve que ver si Madrazo, el cual vive frente a Santa Catalina, era o no de la junta o le habían avisado. El Capitán Miranda puede decir la hora a que llegué a casa de Gómez. Esa fue la única parada que hice en el camino. Pío también es testigo. Vamos ahora al caso. Como te decía, cuando llegué a casa de Gómez, que tú sabes está allá lejos, frente a la muralla, encontré toda la gente reunida. Madrazo fue conmigo, Mañero entró después. Samá, Martiartu, Abrisqueta, Suárez Argudín y La Hera, sobrino de Lombillo, porque el tío había ido de carrera a su cafetal _La Tentativa_ en la Puerta de la Güira; Martínez, Carballo, Azopardo y otros varios que, si bien no inmediatamente interesados en el cargamento del _Veloz_, como principales importadores que son de esclavos, deseaban informarse a fondo de lo ocurrido en el Mariel y de cómo nosotros pensábamos sacar el caballo del atolladero. Carricarte se mudaba de ropa en los entresuelos de la casa de Gómez, y bajó así que todos estábamos reunidos. Formábamos una corte regular en la sala baja. Depositó el Capitán unos papeles en la mesa del centro, y luego, sin más ceremonia, comenzó la relación de lo que le había pasado desde las costas de África hasta las de nuestra Isla. Dice que desde que salió de Gallinas, a fines de setiembre, navegó de bolina y mar bonancible hasta reconocer a Puerto Rico. Allí, sin embargo, una vela sospechosa por sotavento le hizo variar de rumbo. Durante la noche, siempre con viento fresco, volvió a su derrota, esperando avistar el _Pan de Matanzas_ el día siguiente por la tarde. Hacia el oscurecer, en efecto, le avistó; pero la misma vela de antes se le presentó en lo más estrecho del canal de Bahama, empezando desde luego la caza. Dice Carricarte que su primera intención fue entrar en Arcos de Canasí. No fue posible: el crucero inglés, porque resultó serlo, como que llevaba la línea recta y más inmediata a la costa de Cuba, a pesar de los buenos pies del bergantín, siempre se presentaba a su costado,

mayormente a la altura de las _Tetas de Camarioca_. Cerró la noche de nuevo, el _Veloz_ se hizo mar a fuera y luego viró con ánimo de meterse en Cojímar, en Jaimanitas, en Banes, en el Mariel, en Cabañas, en el primer puerto sobre el cual le amaneciese. Aflojó el viento, por desgracia el terral le fue contrario, así que, cuando tornó a dar vista a la tierra, ya asomaba el sol y el crucero amagaba ganarle el barlovento. Vio entonces Carricarte que no podía escapar sino a milagros, por lo que resolvió jugar el todo por el todo. Dio orden, pues, de despejar el puente, a fin de facilitar la maniobra y aligerar el buque lo que se pudiese, y como lo dijo lo hizo. En un santiamén fueron al mar los cascos del agua de repuesto, no poca jarcia y los fardos que había sobre cubierta...

--¿Los bozales quieres decir? ¡Qué horror! exclamó doña Rosa, llevándose ambas manos a la cabeza.

--Pues es claro, continuó Gamboa imperturbable. ¿Tú no ves que por salvar 80 ó 100 fardos iba a exponer su libertad el Capitán, la de la marinería y la del resto del cargamento, que era triple mayor en número? El obró arreglado a sus instrucciones: salvar el barco y los papeles a toda costa. Además, había que despejar el puente y aligerar, como te he dicho. No había tiempo que perder. ¡Pues no faltaba otra cosa! Eso sí, dice Carricarte, y yo lo creo, porque él es mozo honrado y a carta cabal, que en la hora del mayor peligro sólo tenía sobre cubierta los muy enfermos, los enclenques, aquéllos que de todos modos morirían, mucho más pronto si los volvían al sollado donde estaban como sardinas, porque fue preciso clavar las escotillas.

--¡Las escotillas! repitió doña Rosa. Es decir, las tapas de la bodega del buque. De manera que los de abajo a estas horas han muerto sofocados. ¡Pobrecitos!

--¡Ca! dijo don Cándido con el más exquisito desprecio. Nada de eso, mujer. Sobre que voy creyendo que tú te has figurado que los sacos de carbón sienten y padecen como nosotros. No hay tal. Vamos, dime, ¿cómo viven allá en su tierra? En cuevas o pantanos. Y ¿qué aire respiran en esos lugares? Ninguno, o aire mefítico. ¿Y sabes cómo vienen? Barajados, quiere decir, sentados uno dentro de las piernas de otro, en dos hileras sucesivas, cosa de dejar calle en el medio y poder pasarles el alimento y el agua. Y no se mueren por eso. A casi todos hay que ponerles grillos, y a no pocos es fuerza meterlos en barras.

--¿Qué son barras, Cándido?

--¡Toma! ¿Ahora te desayunas? El cepo, mujer.

--No me quedaba que oír.

--A todo esto y mucho más da lugar la persecución arbitraria de los ingleses. El único sentimiento de Carricarte ahora es que con el afán y la precipitación de limpiar el puente, echaron al agua los marineros una muleque de 12 años, muy graciosa, que ya repetía palabras en español y que le dio el rey de Gotto a cambio de un cuñete de salchichas de Vich y dos muleques de 7 a 8 años que le regaló la reina del propio lugar por un pan de azúcar y una caja de té para su mesa privada.

--¡Ángeles de Dios! volvió a exclamar doña Rosa sin poder contenerse. Y reflexionando que acaso no estaban bautizados, añadió: de todos modos, esas almas...

--Y dale con creer que los fardos de África tienen alma y que son ángeles. Esas son blasfemias, Rosa; la interrumpió el marido con brusquedad. Pues de ahí nace el error de ciertas gentes... Cuando el mundo se persuada que los negros son animales y no hombres, entonces acabará uno de los motivos que alegan los ingleses para perseguir la trata de África. Cosa semejante ocurre en España con el tabaco: prohíben su tráfico, y los que viven de eso, cuando se ven apurados por los carabineros, sueltan la carga y escapan con el pellejo y el caballo. ¿Crees tú que el tabaco tiene alma? Hazte cuenta que no hay diferencia entre un tercio y un negro, al menos en cuanto a sentir.

No había similitud ninguna en el ejemplo aducido, tampoco tiempo para discutir, porque en aquella sazón se presentó Tirso en la puerta del escritorio y dijo que el almuerzo estaba listo. Eran las diez y media de la mañana; por donde se ve claro que la conversación de don Cándido con su mujer había durado largo tiempo; y, sin embargo, no le había dicho los medios de que pensaba valerse para arrancar el _Veloz_ y la mayor parte de la carga, compuesta de seres humanos, diga él lo que quiera, de las garras de los testarudos ingleses.

CAPÍTULO VII

_"Por lo cual deberían poner tasa los magistrados, a quien toca, a la codicia de los mercaderes, que ha introducido en Europa, y no menos en estas Indias, caudalosísimos empleos de esclavos, en tanto grado, que se sustentan de irlos a traer de sus tierras,

ya por engaño, ya por fuerza, como quien va a caza de conejos o perdices, y los trajinan de unos puertos a otros como holandas o cariseas."_

FR. ALONSO DE SANDOVAL

Paseábase don Cándido Gamboa largo rato hacía en su escritorio, después de levantado el mantel del almuerzo, cuando entró su Mayordomo don Melitón Reventos. Venía con la cara hecha un ascua por el calor del día, las carreras desde temprano, y la satisfacción que experimentaba y que se le conocía por encima del pelo de la ropa. De modo que, advirtiéndolo el amo, paró los paseos, se quitó el tabaco de la boca y se apoyó de espaldas contra la carpeta, a fin de escuchar a sus anchas la relación de las diligencias practicadas en los baratillos y el puerto. Hasta doña Rosa, cuyo interés en el asunto cedía tan sólo ante el de su marido, acudió ganosa al escritorio; y entre los tres personajes tuvo lugar la siguiente escena.

No venía, sin embargo, dispuesto don Melitón a satisfacer de plano la ansiedad de sus señores. Creía, por el contrario, que acababa de vencer una gran dificultad, mas que había alcanzado una hazaña; y, como hombre de poco seso, se daba importancia inmerecida. Después de ir y venir arriba y abajo del escritorio recogiendo papeles, arreglando las plumas de ave en el tintero, abriendo y cerrando gavetas, se volvió para don Cándido y su esposa, que seguían sus movimientos, no poco disgustados, y dijo:

--¡Qué calor! ¿eh?

Ninguno de sus oyentes le replicó palabra, y él continuó muy satisfecho:

--Vea Vd. en Gijón. Por este mismo tiempo empieza a soplar un airecillo, que ya... Es preciso abrigarse, so pena de coger un _costipado_...pero esta Isla se ha hecho para los negros. Bien pudo el señor don Cristóbal haberla descubierto en otra parte, donde no hubiese tanto calor. Porque, pongo por caso, llega aquí un mozo de Castilla, o de Santander, llega robusto, con unos cachetes que parecen dos cerezas, vamos, rozagante, fuerte como un toro, y en menos de seis meses, si escapa con vida del vómito,[36] se queda escueto y desmazalado por el resto de su vida. ¡Qué tierra ésta! Sí, ¡digo a Vd. que es ésta mucha tierra!

En estos momentos sus ojos tropezaron con los de don Cándido y doña Rosa que le miraban de hito en hito, y, cual si volviera en su acuerdo, agregó en diferente tono:

--Pues, señor, me parece, sí, me parece que todo ha salido a pedir de boca.

--¡Acabáramos! dijo don Cándido respirando fuerte.

--Allá iba, prosiguió don Melitón, respondiendo antes a la intención que a la palabra de Gamboa. Allá iba, pero Vd. me conoce, señor don Cándido, y sabe que yo no soy escopeta catalana.

--No tiene Vd. que repetirlo, replicó don Cándido con énfasis.

--Al caso, terció doña Rosa en tono blando, pues conoció que iba a armarse una disputa interminable.

--Al caso, repitió el Mayordomo, entonces más en caja. Pues como decía, ha salido la cosa mejor de lo que esperábamos. Marché, ¿qué digo? partí como una saeta para el portal del Rosario y me entré de rondón en el baratillo de don José a pesar que el mozo de las vidrieras, en el portal, lo mismo que los otros dos detrás de los mostradores dentro, creyendo que iba a comprarles la tienda en peso, me tira éste del brazo, aquél de la chaqueta... Vd. sabe que ellos son bromistas y más pillos, que ya...

--Lo que sé, repuso don Cándido molesto, es que Vd. gasta una pachorra...

--Pues decía, continuó como si no hubiese oído a su amo, que me costó algún trabajillo deshacerme de esos bellacos. ¿Dónde está don José? pregunté a don Liberato. Quiero ver a don José. Traigo un recado urgente para él. ¡Chite! me dijo el mozo; ahora está muy entretenido para que Vd. le vea. Venga acá, y me llevó por la mano a la puerta del patio, y agregó:--Véale. En efecto, muy acicalado estaba y arrimadito a la pared, en interesante conversación por señas y medias palabras, con la sombra de una mujer que se entreveía a través de las persianas del balcón en el principal de la casa. Sólo vi dos ojazos como dos carbones encendidos y la punta de unos deditos de rosa asomándose de cuando en cuando por entre los listoncillos verdes. ¿Qué significa eso? pregunté a don Liberato. ¿No lo entiende Vd.? me contestó. Nuestro don José que se aprovecha de la ausencia del paisano y amigo en el campo para camelarle la hermosa dama.

Don Cándido y doña Rosa cambiaron una mirada de inteligencia y de asombro, y el primero dijo:

--Don Melitón de mis culpas ¿qué tenemos que hacer nosotros con un cuento con todos los visos de calumnia?

--¡Calumnia! repitió el Mayordomo serio. Pluguiera al cielo. Nada de eso; ya verá Vd. mis trabajos, ya. No se puede negar que es el más buen mozo que ha salido de Asturias. Y su pico de oro, porque sabe hablar, que ya... Es cosa notoria que ahora años, cuando el sistema constitucional, le comparaban con el divino Argüelles, y una vez le pasearon en triunfo en esos mismos portales de la Plaza Vieja. Y, con perdón de la señora doña Rosa, todo eso le peta mucho a las mujeres, y la Gabriela que es joven y bella... ya, ya. La intención, las ausencias del marido, las galanterías, el diablo que nunca duerme...

--Don Melitón, saltó otra vez Gamboa muy molesto, ¿de quién nos habla Vd.?

--¡Toma! Pues creía que me estaba Vd. atento. Le hablo de don José, mi paisano, y de la Gabriela Arenas. No parece hija del país por lo blanca y rosada.

Doña Rosa, que era criolla y que no lo tenía a menos, se sonrió al oír la grosería de su Mayordomo, el cual prosiguió:

--Pues el señor don José ni me hizo caso, sino que le dijo de muy mal humor a don Liberato:--despache Vd. a ese mozo y no permita que me molesten. Al punto nos pusimos a revolver los entrepaños y las cajas, y con mucho trabajo conseguimos tres líos de mudas de ropa, de 50 pares cada uno. No era bastante. Corrí al baratillo de Mañero, donde sólo había 30 mudas. Sabe Vd. que por esta época empiezan las _refacciones_ de los ingenios, según se dice aquí. Los que se proveen por tierra, se adelantan hasta dos meses. Las carretas echan semanas en andar cualquier distancia, con que escasea la ropa hecha de los esclavos. Pues como decía, del baratillo de Mañero pasé al del vizcaíno ese... Martiartu, donde Aldama estuvo de mozo. Ahí conseguí 60 mudas más, y por no perder tiempo y porque juzgué que serían suficientes, llamé a un carretonero, cargué con todos los bultos y andando, andando para el muelle de Caballería, hice cinco líos, los até con unos cordeles, y al avío... Pero cate Vd. que al pasar por delante de la casilla del resguardo, sale el hombre y detiene la mula por la brida.--¿Cómo se entiende? ¿Qué hace Vd.? le grité encolerizado.--Se entiende, me dijo él con mucha sorna, que si Vd. no trae guía, para embarcar estos efectos, yo no los dejo pasar.--Guía, guía, le dije. ¿Para qué diablos ese requisito? Estos líos no son para embarcar a ninguna parte. Son _esquifaciones_.--Sean lo que fueren, prosiguió el hombre sin soltar la presa. La guía al canto o no hay paso.--¿Qué quería Vd. que hiciera en semejante aprieto? Eran pasadas las once. Ya había oído yo el reloj de la Aduana. Me registré los bolsillos, encontré un dobloncejo de a dos, le saqué, se lo puse en la mano al carabinero, diciéndole: Vaya la guía, hombre; y sin más ni más soltó las bridas y dio paso franco. La cara del rey posee magia.

--Eso es, dijo don Cándido en tono de aprobación.

--Pues es claro, añadió el Mayordomo satisfecho. Para ciertas gentes no hay mejor lenguaje. Mas aquí no pararon mis trabajos. Llegados al muelle, allí estaba el botero. ¿Sabe Vd. que el hombre es listo? En un santiamén descargamos el carretón y luego dimos con los líos en el bote. Tomé el timón bajo la carroza, y a viaje. Viramos, y en poco más que lo cuento nos pusimos en Casa Blanca, a vela y remo. Opuesto estaba el famoso bergantín sobre las anclas y con la proa para Regla, tan ufano y orgulloso cual si libre cortara las aguas del océano y no se hallara cautivo de los perros ingleses. En la cubierta se paseaban varios soldados de marina; algunos de los cuales me pareció que no era de los nuestros; pero alcancé a ver el cocinero Felipillo hacia popa, quien no tardó en conocerme y hacerme señas de que no atracara por el costado de estribor, sino por el de babor, hacia la parte de tierra. Así se hizo, corriendo a un largo la vuelta de Triscornia y luego virando por redondo a ganar la popa del bergantín, bajo la cual nos acoramos, y como quien no quiere la cosa, bonitamente fuimos metiendo lío tras lío por un ventanillo, donde el cocinero los recibía con toda seguridad.

--¡Vamos! exclamó don Cándido en un arranque de entusiasmo, rarísimo en sujeto tan grave. Esa sí que estuvo buena. ¡Magnífico!, don Melitón. Ya se puede dar por seguro que al menos se salvará una buena parte del cargamento y habrá para cubrir los gastos. No todo se ha perdido. Hecho, hecho.

Bien quisiera doña Rosa participar de la alegría y entusiasmo de su marido; pero sucedía que ella no entendía jota del bien que pudiera traer a la salvación del cargamento del bergantín _Veloz_, el hecho de haber introducido a hurtadillas por un ventanillo de popa, las mudas de ropa nueva compradas por don Melitón en los baratillos de los portales de la Plaza Vieja. Así es que se contentó con mirar primero a uno y luego al otro de sus interlocutores, como si les pidiera una explicación. Entendiolo así Gamboa, porque continuó con la misma animación:

--Ciego el que no ve en día tan claro. Rosa, ¿no comprendes que si vestimos de limpio los bultos pueden pasar por ladinos, venidos de... de Puerto Rico, de cualquier parte, menos de África? ¿Estás? No todo se ha de decir. Estos son secretos... porque...

hecha la ley, hecha la trampa. Reventos, agregó con volubilidad, que le den de almorzar. Rosa, a Tirso que le sirva el almuerzo... Debe traer hambre canina, y además, quizás tenga que volver a salir. Por lo que a mí toca, a la una debo estar en casa de Gómez, quien me espera en compañía de Madrazo, de Mañero... Vaya (empujando suavemente por el hombro a su Mayordomo), despache.

--Corriendito, contestó él. No necesito que me rueguen. Apuradamente, tengo un hambre que ya... ¿Pues no ando de ceca en meca desde las nueve de la mañana? Ya, ya... Se la doy al más pintado. Lo extraño sería que no sintiese una gazuza, que ya...

Hacia el medio día don Cándido, que había hecho venir al barbero para que le afeitase, estaba listo para salir, y el quitrín le esperaba a la puerta. Antonia, su hija mayor, le puso la corbata blanca con puntas bordadas y colgantes, untándole aceite de Macastar, de olor fuerte, especie de esencia de clavo, muy generalizado entonces, y peinándole a la Napoleón, es decir, con la punta del pelo traída sobre la frente hasta tocar casi la unión de las cejas y la nariz. Adela le trajo la caña de Indias con puño de oro y regatón de plata, y Tirso, que andaba por allí, viéndole desdoblar la gran vejiga de los cigarros, le acercó el braserillo. De seguidas, medio envuelto en la nube azulosa de su exquisito habano, sin sonreírse ni decir palabra a ninguno de su familia, salió con aire majestuoso por el zaguán a la calle y se metió en el carruaje.

--¡A la Punta! fue lo único que dijo en su voz bronca al viejo calesero Pío.

No era un enigma este brevísimo lenguaje para el anciano calesero. Significaba que debía dirigirse al trote a casa de don Joaquín Gómez, que entonces vivía en aquel pedazo de calle frente a una cortina de la muralla que da hacia la entrada del puerto.

Allí esperaban el amo de la casa, el hacendado Madrazo y el comerciante Mañero. Este último era el más inteligente de los cuatro; se ocupaba en importar géneros y quincalla de Europa, que vendía a plazos a mercaderes de la plaza. Aquel era un medio muy tardío de hacer fortuna, fuera de que los vendedores no siempre cumplían exactamente con sus compromisos, de que resultaban pérdidas en vez de ganancias. Mañero, por esto, como otros muchos paisanos suyos, había emprendido en las expediciones a la costa de África, hasta allí con mejor suerte que en el comercio de géneros.

Al salir, como salieron a poco para el palacio del Capitán General, Gómez dijo a Mañero que llevara la palabra, cosa que aprobaron de la mejor gana Madrazo y Gamboa, reconociéndose incapaces para desempeñar el papel de orador siquiera con mediano lucimiento. Las dos de la tarde serían cuando entraban ellos por el ancho y elevadísimo pórtico de ese edificio que, según se sabe, ocupa todo el frente de la Plaza de Armas. A aquella hora estaba lleno de gente no por cierto del mejor pelaje, aunque no podía calificársele, en general, como de la clase del pueblo bajo de Cuba. El movimiento era incesante y activo. El rumor de pasos y de voces ruidoso y aún chillón. Unos iban, otros venían, observándose que los que más agilidad mostraban, mozos en su mayoría y nada atildados en su porte ni en su traje, llevaban debajo del brazo izquierdo, doblados por la mitad en sentido longitudinal, unos legajos de papeles del folio español. Por lo común entraban en o salían de los cuartos o covachuelas, que dicen en Cuba accesorias, cuya única puerta y acaso ventana daban al pórtico, al ras del piso de chinas pelonas de que estaba formado. A la primera ojeada, era de advertirse que esa multitud de gente no acudía a solazarse ni por mera curiosidad; porque se distribuía en grupos y corrillos más o menos numerosos, en los cuales se hablaba a voz en cuello, mejor, a veces se gritaba, acompañando siempre la acción a la palabra como si se discutieran asuntos de gran importancia, o que mucho interesaban a los principales actores. Desde luego, puede asegurarse que no se trataba de política; estaba absolutamente prohibido, y el derecho de reunión no se practicaba en Cuba desde al año de 1824 en que acabó el segundo período del sistema constitucional. Y sin embargo, aquel era un Congreso en toda forma.

Mientras esto pasaba en medio del pórtico, arrimado a una de las macizas y gruesas columnas, se veía un grupo compuesto de una negra y cuatro niños de color, el mayor de doce años de edad, la menor una mulatica de 7, todos cosidos a la falda de la primera, la cual tenía la cabeza doblada sobre el pecho y cubierto con una _manta_ de algodón. Enfrente de este melancólico grupo se hallaba un negro en mangas de camisa, y a su lado un hombre blanco, vestido decentemente, quien leía en voz baja de un legajo de papeles abiertos, que a guisa de libro sostenía en ambas manos, y el primero repetía en voz alta, concluyendo siempre con la fórmula:

--Se han de rematar: éste es el último pregón. ¿No hay quien dé más?

Cada una de estas palabras parecía herir, como con un cuchillo, el corazón de la pobre mujer, porque procuraba ocultar la cabeza más y más bajo los pliegues del pañolón, temblaba toda y se le cosían a la falda los hermosos niños. Llamó el grupo o la escena aquella la atención de Mañero, se la indicó con el dedo a Gómez, y le dijo al paño:--¿Ves? Farsa, farsa. El remate ya está hecho

aquí (señalando entonces para una de las covachuelas a su derecha). Pero, tate, agregó dándose una palmada en la frente y tocándole después en el hombro a Madrazo, que iba por delante al par de Gamboa, ¿pues no es esa negra la María de la O de Marzán que tú tenías hace tiempo en depósito judicialmente? Yo que tú la remataba con sus cuatro hijos. Dentro de unos pocos años valen ellos cuatro tantos lo que te cuesten con la madre ahora.

--¿Qué sabes tú si no la ha rematado ya? observó Gómez con naturalidad.

--¿Interesa a ustedes el asunto? dijo Madrazo desazonado, contestando a Gómez y a Mañero.

--Me intereso por ti y por la mulatica, repuso este último con malicia, dándole un buen codazo a su compañero. La madre de los chicos es excelente cocinera, lo sé por experiencia propia, y luego la chica... Sobre que se me figura mucho a su padre.

--A Marzán querrás decir, dijo Madrazo.

--¡Ba! No. ¿Cuánto tiempo hace del pleito de Marzán con don Diego del Revollar y del depósito de los negros del primero en tu ingenio de Manimán? preguntó Mañero con aparente sencillez.

--Cerca de ocho años, dijo Gómez. Marzán es curro y del Revollar montañés como nosotros, y siempre han vivido como perro y gato en sus cafetales del Cuzco.

--No creo que hace tanto tiempo, interpuso Madrazo.

--Sea como fuere, continuó Mañero, el caso es que la chicuela esa de padre blanco y madre negra no tiene arriba de siete años de edad y...

No continuó Mañero, porque en aquel instante se acercó a Madrazo un hombre sin sombrero, le tocó en el brazo, le llamó por su nombre y le atrajo a una de las covachuelas de que antes hemos hablado. Madrazo con la mano abierta indicó a sus amigos que le esperaran, y desapareció entre la multitud de gente, casi toda a pie, que llenaba la pieza.

--¿No se los decía? añadió Mañero hablando con Gómez y Gamboa. Madrazo ha hecho el remate de María de la O con sus cuatro hijos, uno de los cuales, o el diablo me lleve o es la mismísima efigie del rematador, y el pregón no ha sido una farsa para guardar las apariencias y mostrar imparcialidad con el amigo Marzán. Al fin tiene entrañas de padre y se porta como buen amo: no habrá extrañamiento ni dispersión de la familia.

Según debe haberlo comprendido el lector avisado, aquellas eran las escribanías públicas de la jurisdicción judicial de La Habana. Componíanse de un saloncito cuadrilongo con puerta al pórtico y ventana de rejas de hierro al patio del palacio de la Capitanía General de Cuba. Eran unas diez o doce al frente, unas tres más había en el costado del norte o calle de O'Reilly y otras tantas o más en la de Mercaderes, entre éstas la de hipotecas. De medio día a las tres bajaba la audiencia, como se decía allí, y los oficiales de causa, junto con los procuradores, que venían a tomar nota de los autos en los pleitos a su cargo, los escribanos que daban fe, uno u otro abogado de poca clientela y aún bachilleres en derecho que comenzaban la práctica de los juicios por su propia cuenta, llenaban las escribanías hasta el exceso. Fuera de esto, el cuarto no era nada amplio y estaba flanqueado de mesas cargadas de tinta y de papeles o procesos, y detrás de ellas, arrimados a las paredes, había anchos y altos armarios, con redes de alambre o cuerda por puertas para que se viesen entre sus entrepaños los numerosos protocolos forrados de pergamino cual códices de antiguas bibliotecas.

El hombre sin sombrero llevó a Madrazo a la derecha de la escribanía, ante la primera mesa, algo más grande y decente que las demás, pues tenía barandilla, y el tintero se conocía que era de plomo, es decir, que no estaba tan cargado de tinta. El individuo que ocupaba una silla de vaqueta detrás de dicha mesa, se puso en pie lleno de respeto luego que vio al hacendado, le saludó con amabilidad y en voz alta pidió los autos de Revollar contra Marzán. Traídos por el hombre del pregón y abiertos por una hoja que estaba doblada longitudinalmente, apuntó con el índice de la mano izquierda para una providencia compuesta de unos pocos renglones manuscritos, y dijo a Madrazo que pusiera debajo su firma. Hízolo así éste, con una pluma de ganso que le alcanzó el escribano, y saludando, fuese enseguida a reunirse con sus compañeros.

CAPÍTULO VIII

Hecha la ley, hecha la trampa.

Proverbio castellano.

Mira, como se sabe, hacia la Plaza de Armas o el Este el frontispicio del palacio de la Capitanía General de Cuba. La entrada es amplia, especie de zaguán, con cuartos a ambos lados, cuyas puertas abren al mismo, y sirven, el de la izquierda para el oficial de guardia, el de la derecha para cuartel del piquete. Los fusiles de los soldados descansaban en su astillero, mientras la centinela, con el arma al brazo, se paseaba por delante de la puerta.

Tenía Mañero formas varoniles, maneras distinguidas y vestía traje de etiqueta, como que debía presentarse con decencia ante la primera autoridad de la Isla. No era, pues, mucho tomarle, a primera vista, por un gran personaje. Además, habiendo servido en la milicia nacional durante el sitio de Cádiz por el ejército francés en 1823, había adquirido aire militar, al que daba mayor realce el cabo de una cinta roja con crucecita de oro, que solía llevar en el segundo ojal del frac negro. Luego que Madrazo se reunió con sus amigos, Mañero se volvió de pronto y a su cabeza marchó derecho a la entrada del palacio.

Reparó entonces en él la centinela, cuadróse, presentó el arma y gritó:

--¡La guardia! El Excelentísimo Señor Intendente.

Armáronse en un instante los soldados de facción con su caña hueca, púsose a su cabeza el oficial con la espada desnuda, y la caja empezó a tocar llamada. El grito de la centinela y el movimiento de los soldados llamaron la atención de Mañero y de sus amigos, los cuales, a fin de despejar el campo, apresuraron el paso; pero como les presentasen armas y el oficial hiciese el saludo de ordenanza, comprendieron que uno de ellos, el que marchaba delante, había sido tomado por el Superintendente de Hacienda, don Claudio Martínez de Pinillos, con quien, en efecto, tenía alguna semejanza. No tardó, sin embargo, en reconocer el error el oficial de guardia, y en su enojo mandó relevar la centinela y que guardara arresto en el cuartel, por el resto del día.

Los cuatro amigos entonces, reprimiendo la risa para no excitar más la cólera del teniente de facción, emprendieron la subida de la ancha escalera del palacio. Una vez en los espaciosos corredores, a la desfilada y con sombrero en mano, se dirigieron a la puerta del salón llamado de los Gobernadores. En ella estaba constituido un negro de aspecto respetable, quien a la vista de los extraños que se acercaban, se puso en pie y se les atravesó en el camino, como para pedirles el santo y seña.

En pocas palabras le manifestó Mañero el objeto de la embajada; pero antes que el negro replicase, se presentó un ayudante del Capitán General, e informó que S. E. no se hallaba en el palacio sino en el patio de la Fuerza, probando la calidad de un par de gallos finos o ingleses que había recibido de regalo de la Vuelta-Abajo recientemente.

--No tengan Vds. reparo en ir a verle allá, si urge el asunto que les trae a su presencia, añadió el ayudante notando la incertidumbre de los recienvenidos; porque S. E. suele dar audiencia en medio de sus gallos de pelea, hasta al general de marina, a los cónsules extranjeros...

Aunque la cosa urgía sin duda, pues iba a reunirse pronto la comisión mixta para dar un fallo decisivo sobre si eran buena presa el bergantín _Veloz_ y su cargamento, o no, gran alivio experimentaron Gómez Madrazo y Gamboa especialmente, así que se convencieron de que podía verificarse la entrevista con el Capitán General algo después y en sitio menos aristocrático e imponente que su palacio. Entre la Fuerza y la Intendencia de Hacienda, detrás de los pabellones en que más adelante se estableció la escribanía de la misma, había y hay un patio o plaza, dependencia del primero de estos edificios, donde el Capitán General don Francisco Dionisio Vives había hecho construir en toda forma una _valla_ o reñidero de gallos con su piso de serrín, galería de bancos para los espectadores, en suma, una verdadera _gallería_. Allí se cuidaban y se adestraban hasta dos docenas de gallos ingleses, que son los más pugnaces, producto de crías famosas de la Isla y regalos todos que de tiempo en tiempo habían hecho al general Vives individuos particulares, bien conocida como era de todos su afición a las riñas de esa especie. Y allí tenían efecto también éstas de cuando en cuando, sobre todo, siempre que se le antojaba a S. E. obsequiar a sus amigos y subalternos con uno de esos espectáculos que, si no bárbaro como el de las corridas de toros, no dejan de ser crueles y sangrientos.

El individuo a cuyo cargo corría el cuidado y doctrina de los gallos del Capitán General de Cuba, era hombre de historia, como suele decirse. Le llamaban Padrón. Había cometido un homicidio alevoso, según decían unos; en defensa propia según otros; lo cierto es que, preso, encausado y condenado a presidio en La Habana, mediante los ruegos y representaciones de una hermana suya, joven y no mal parecida, y la influencia del Marqués don Pedro Calvo, que le abrigaba y protegía, vista su habilidad en el manejo de los gallos finos, Vives le hizo quitar los grillos y le llevó al patio de la Fuerza donde, a tiempo que cuidaba de la gallería de S. E., podía cumplir el término de su condena, sin el mal ejemplo ni los trabajos del presidio. Quieren decir que Padrón había cometido otras picardihuelas además del homicidio dicho y que los parientes del muerto habían jurado eterna venganza contra el

matador. Pero ¿quién se atrevía a sacarle del patio de la Fuerza, ni del amparo del Capitán General de la Isla? Padrón, pues, el penado Padrón, sin hipérbole, se hallaba allí protegido por una doble fuerza.

En el patio de aquélla de que ahora hablamos, se presentaron sin anunciarse, con sombrero en mano y el cuerpo arqueado, en señal de profundo respeto, nuestros conocidos, los asendereados tratantes en esclavos, Mañero y amigos. Ya los habían precedido en el mismo sitio varios personajes de cuenta, entre otros el comandante de marina Laborde, el mayor de plaza Zurita, el teniente de rey Cadaval, el coronel del regimiento Fijo de La Habana Córdoba, el castellano del Morro Molina, el célebre médico Montes de Oca, y otros de menor cuantía. Con excepción de Laborde, Cadaval, Molina y un negro joven que ceñía sable y lucía dos charreteras doradas en los hombros de su chaqueta de paño, los demás se mantenían a respetable distancia del Capitán General Vives, quien a la sazón se hallaba arrimado a un pilar de madera que sostenía el techo de la valla por la parte de fuera de las graderías.

La atención de este personaje estaba toda concentrada en las carreras y revuelos de un gallo cobrizo y muy arriscado, al cual Padrón provocaba hasta el furor, dejando que otro gallo que tenía por los encuentros en la mano izquierda le pegara de cuando en cuando un picotazo en la cabeza rapada y roja como sangre. Vestía Padrón a la usanza guajira, quiere decirse: de camisa blanca y pantalón de listas azules ceñido a la cintura por detrás con una hebilla de plata, que recogía las dos tiras en que remataba la pretina. No sabemos si por dolencia, por abrigo o por costumbre, tenía la cabeza envuelta en un pañuelo de hilo a cuadros, cuyas puntas formaban una lazada sobre la nuca. Los zapatos de vaqueta apenas le cubrían los pies pequeños y el empeine arqueado como de mujer, y sin calcetines. Por respeto sin duda al Capitán General, sujetaba el sombrero de paja con la mano derecha, apoyada por el dorso en la espalda. Era de talla mediana, enjuto, musculoso, fuerte, pálido, de facciones menudas, y podía contar 34 años de edad.

No era mucho más aventajada la talla del Capitán General don Francisco Dionisio Vives, el cual vestía frac negro de paño, sobre chaleco blanco de piqué, pantalones de mahón o nankín y sombrero redondo de castor, siendo el único distintivo del rango que ocupaba en el ejército español y en la gobernación político-militar de la colonia, la ancha y pesada faja de seda roja con que se ceñía el abdomen por encima del chaleco. Ni en su aspecto ni en su porte había nada que revelara al militar. En la época de que hablamos podía tener él cincuenta años de edad. Era de mediana estatura, como ya se ha indicado, bastante enjuto de carnes, aunque de formas redondeadas, como de persona que no había llevado una vida muy activa. Tenía el rostro más largo que ancho, casi cuadrado; las facciones regulares, los ojos claros, el cutis fino y blanco, el cabello crespo y negro todavía, y no llevaba bigote, ni más pie de barba a la clérigo. Sí, aquel hombre no tenía nada de guerrero, y, sin embargo, su rey le había confiado el mando en jefe de la mayor de sus colonias insulares en América, precisamente cuando parecían más próximos a romperse los tenues y anómalos lazos que aún la tenían sujeta al trono de su metrópolis.

Aunque la traición de don Agustín Ferrety había puesto en manos de Vives sin mayor dificultad los principales caudillos de la conspiración conocida por los _Soles de Bolívar_ en 1826, muchos afiliados de menos metas, si bien no menos audaces, pudieron escapar al Continente y desde allá, por medio de emisarios celosos, mantenían viva la esperanza de los partidarios de la independencia en la Isla y llevaban la zozobra al ánimo de las autoridades de la misma.

La prensa había enmudecido desde 1824, no existía la milicia ciudadana, los ayuntamientos habían dejado de ser cuerpos populares, y no quedaba ni la sombra de libertad, pues por decreto de 1825 se declaró el país en estado de sitio, instituyéndose la Comisión Militar permanente. El paso repentino de las más amplias franquicias a la más opresiva de las tiranías, fue harto rudo para no engendrar, como engendró, un profundo descontento y un malestar general, con tanto más motivo cuanto que en los dos cortos períodos constitucionales el pueblo se había acostumbrado a las luchas de la vida política. Privado de esa atmósfera acudió con más ahinco que antes a las reuniones de las sociedades secretas, muchas de las cuales aún existían a fines del año de 1830, no habiéndolas podido suprimir el gobierno con la misma facilidad que había suprimido las garantías constitucionales. La conspiración fue desde allí un estado normal y permanente de una buena parte de la juventud cubana. Tomaba creces y se extendía a casi todas las clases sociales la agitación más intensa en las grandes poblaciones, tales como La Habana, Matanzas, Puerto Príncipe, Bayamo y Santiago de Cuba.

En todas ellas hubo más o menos alborotos y demostraciones de resistencia, porque tardó algún tiempo antes que el pueblo doblara la cerviz y se sometiera al yugo de la tiranía colonial. Numerosas prisiones se habían efectuado en todas partes de la Isla, saliendo de ellas para el extranjero cuantos pudieron eludir la vigilancia de la policía, muy obtusa y de organización deficiente entonces.

A todas éstas la metrópolis no tenía marina de guerra digna de este nombre; se reducía a unos pocos buques de vela viejos, pesados y casi podridos. Con excepción de La Habana, no había verdaderas plazas fortificadas. Muy escasa era la guarnición veterana, y sobre escasa había cundido en sus filas la insubordinación. Componíase de cumplidos y de capitulados de México y Costa-Firme, y ni todos sus jefes generales eran españoles; los había también naturales del país o criollos en las tres armas, y éstos nunca podían inspirar confianza al más suspicaz de los gobiernos que ha tenido España, si se exceptúa el de Felipe II.

Por otra parte, el desorden de la administración de la colonia, la penuria del erario, la venalidad y la corrupción de los jueces y de los empleados, la desmoralización de las costumbres y el atraso general, se combinaban para amenazar de muerte aquella sociedad que ya venía trabajada por toda suerte de males de muchos años de desgobierno. Durante los seis que duró el mando de Vives, ni la vida, ni la propiedad estaban seguras, así en las poblaciones como en los campos. De éstos se enseñoreaban cuadrillas de bandoleros feroces que todo lo ponían a sangre y fuego. En los mares circunvecinos cruzaban triunfantes los corsarios de las colonias que acababan de emanciparse y destruían el mezquino comercio de Cuba. En las islitas adyacentes se abrigaban piratas que para ejercer el contrabando apresaban los buques escapados de los corsarios y, después de robarles, mataban a los tripulantes y hacían desaparecer toda huella del crimen con el fuego.

Tal era, en resumen, el estado de cosas en la isla de Cuba hasta bien entrado el año de 1828. Y es perfectamente claro que, sin la oficiosa intervención de los Estados Unidos en 1826, se habría llevado a efecto la invasión de las dos Antillas españolas por las fuerzas combinadas de México y de Colombia, de acuerdo con los planes de Bolívar y los deseos de los cubanos, una diputación de los cuales fue a encontrarle con ese objeto cuando volvía vencedor de los famosos campos de Ayacucho. Suceso éste que, realizado, infaliblemente hubiera sido el golpe de gracia al dominio español en el Nuevo Mundo. En tan críticas circunstancias, al menos para neutralizar las maquinaciones de los enemigos de España en el interior de la colonia, se requerían las artimañas de un diplomático más bien que la espada de un guerrero; un hombre de astucia y de doblez, más bien que de acción; un hombre de intriga, más bien que de violencia; un gobernante humano por política, más bien que severo por índole; un Maquiavelo, más bien que un duque de Alba, y Vives fue ese hombre: escogido con grande acierto por el más despótico de los gobiernos que ha tenido España en lo que va del presente siglo, para la gobernación de Cuba.

Mucho se alegró don Cándido Gamboa de encontrarse un conocido en el grupo de los cortesanos que venían a saludar al Capitán General en su gallería del patio de la Fuerza. El aspecto de ese sujeto no prevenía nada en su favor, porque sobre ser de baja estatura y raquítico, llevaba la cabeza metida entre los hombros, tenía la cara larga y el color aceitunado, como la persona muy biliosa, siendo su desaliño general, casi repugnante. En sus ojos chicos y de hondas cuencas había, sin embargo, bastante para redimir las faltas y las sobras del cuerpo y del semblante, había fuego e inteligencia. Al saludarle don Cándido, le dio el título de Doctor.

--¿Cómo está Vd.? contestó él en voz chillona y risa que bien pudiera llamarse fría.

Para ello tuvo que levantar la cabeza, porque su interlocutor le sacaba dos palmos, por lo menos, de altura.

--Bien, si no fueran los trotes en que sin quererlo me veo ahora metido.

--Y ¿qué troles son esos? preguntó el Doctor como por mero cumplimiento.

--¡Toma! ¿Pues no sabe Vd. que los perros de los ingleses _nos_ acaban de apresar un bergantín bajo los fuegos del torreón del Mariel, como quien dice en nuestras barbas, so pretexto de que era un buque negrero, procedente de Guinea? Pero esta vez se han llevado solemne chasco: el bergantín no venía de África, sino de Puerto Rico, y no con negros bozales, sino ladinos.

--¡Qué me dice Vd.! Nada sabía. Bien que con los enfermos, no tengo tiempo aun para rascarme la cabeza, cuánto más para averiguar noticias que no me tocan de cerca. Aunque si he de decir a Vd. la verdad, si a alguno le causa perjuicio el celo exagerado de los ingleses es a mí, pues harta falta me hacen brazos para mi cafetal del Aguacate.

--¿Y a quién no le hacen falta? Eso es lo que todos los hacendados necesitamos como el pan. Sin brazos se arruinan nuestros ingenios y cafetales. Y tal parece que es lo que buscan esos judíos ingleses, que Dios confunda. ¿No le parece a Vd., Doctor, que el Capitán General, sobre este punto es de la misma opinión que nosotros?

--¡Hombre! Acerca de este particular no le he oído expresarse.

--Ya, pero pudiera ser que Vd. le hubiese oído declamar...

--¿Contra los ingleses? interpuso el Doctor. Mucho que sí. Por cierto que Tolmé le carga y a duras penas le sufre sus impertinencias y desmanes.

--Eso, eso, repitió Gamboa alegre. No en vano se dice que Vd. tiene vara alta con S. E.

--¿Sí? ¿Tal se corre? dijo el Doctor con muestras de que la especie halagaba no poco su vanidad. Es cierto que le merezco a S. E. una buena voluntad y aun distinción; pero nada de extraño tiene porque yo soy el médico de él y de su familia desde que vinieron de España, y por otra parte, es cosa sabida su llaneza. Me distingue bastante, mucho.

--Lo sé, lo oigo repetir a distintas personas y por lo mismo, estaba pensando, me ocurre, mejor dicho, que, como Vd. se prestase a ejercer su influjo todavía podríamos jugarle una buena pasada a los ingleses y dejarlos con tamaño palmo de narices. Estoy seguro que tampoco le pesaría a Vd., amigo Doctor, el darnos la mano en este aprieto.

--No lo entiendo. Explíquese Vd., don Cándido.

--Hágase Vd. el cargo, Doctor, que la expedición apresada por los ingleses, salvada íntegra, nos vale a nosotros los dueños de ella, por lo bajo dieciocho mil onzas de oro, libres de polvo y paja. En caso de perderse la mitad, todavía nos deja una ganancia líquida de nueve mil, que no es ningún grano de anís. Con que vea Vd. si podemos ser liberales con el que nos ayude. Escogería Vd. mismo media docena de mulecones entre la partida, que es de lo mejor que viene de la costa de Gallinas, y no le costaría sino el trabajo de...

--Aún no entiendo jota, señor don Cándido.

--Pues me explicaré más. La expedición consta de unos 500 bultos, 300 de los cuales es posible hacerlos pasar por ladinos importados de Puerto Rico, habiéndose remitido a bordo, desde esta mañana, sobre 400 mudas de ropa de cañamazo. Ahora bien, si S. E. es de parecer que tenemos necesidad de brazos para cultivar los campos, y que no debe permitirse que los ingleses destruyan nuestra riqueza agrícola, es claro que, como haya quien le hable y le pinte bien el caso, no podrá menos de ponerse de nuestra parte. Una palabra suya al señor don Juan Montalvo, de la comisión mixta, bastaría a decidir el pleito en favor nuestro; y ya ve Vd. si nos sería fácil ser liberales con... Además, cinco o seis bozales no van a ninguna banda, ni nos harían más ricos ni más pobres a nosotros los armadores, que por todos somos ocho... ¿Comprende Vd. ahora mi idea?

--Claro que sí. Cuente Vd. con que pondré de mi parte cuanto esté en mi mano, aunque no me estimula tanto la oferta de Vd. como el deseo de servirle y de contribuir al castigo de la ambición y malas intenciones de los ingleses. Supongo que Vd. viene a hablar con S. E. sobre el asunto.

--Si, vengo a eso con mis amigos Gómez, Mañero y Madrazo. Creo que Vd. los conoce.

--Conozco de oídas a Madrazo, cuyo ingenio de _Manimán_ está en la misma jurisdicción de Bahía Honda que mi cafetal del Aguacate.

--Pues bien, ellos y los otros interesados estarán y pasarán por todo lo que yo acuerde con Vd. Si Vd. cree que S. E. acepte un regalito de unos cuantos centenares de onzas...

--Deje Vd. eso a mi cargo. Yo sé como entrarle a S. E. Le hablaré esta noche misma. Véanle Vds. primero. Y ahora que me acuerdo, ¿qué se hizo de la chica aquélla?...

--¿Cuál? No atino, dijo Gamboa poniéndose colorado.

--Pobre memoria tiene Vd., según parece. Bien que de eso hace ya algún tiempo, pero Vd. estaba muy interesado, pues me recomendó mucho la asistencia de la chica.

--Ya ése es otro cantar... En Paula...

--¿Cómo en Paula? ¿Enferma?

--Peor que eso, Doctor. Creo que ha perdido el juicio sin remedio.

--¡Qué me cuenta Vd.! ¿Tan joven?

--No tanto.

--Jovencita, digo. Veamos, ¿qué tiempo hace? Dieciséis o diecisiete años. Fue en 1812 ó 1813. Sí, estoy seguro. No puede ser más joven.

--¿Pues no se refería Vd. a la madre?

--Pregunto por la chica, la que conocí en la Real Casa Cuna. Prometía ser un pimpollo cuando grande.

--Ya, acabáramos para mañana. El enredo nace de que tengo por chica cualquier moza, como sea de pocos años, y la madre, en rigor, no pertenece a esa categoría.

--Recordará Vd., dijo el Doctor, que yo no curaba a la mujer que Vd. dice, sino Rosaín, aunque me consultó varias veces el caso. No tenía idea de que la enferma del callejón de San Juan de Dios tuviese nada que ver con la chica de la Real Casa Cuna. Ahora me desengaño. Padecía de fiebre puerperal en combinación con una meningitis aguda...

En este punto Gamboa cortó bruscamente la conversación y volvió a reunirse con sus amigos, y Mañero le preguntó:

--¿Qué ha sido ello? ¿Gato encerrado?

--No, gata, replicó Gamboa prontamente.

--Lo presumía, dijo Mañero con naturalidad. Tú fuiste siempre aficionado a las empresas gatunas. Pero ¿quién es con mil de a caballo ese hombrecito que llamas _Doctor_?

--Pues qué, ¿no le conoces, hombre?... El Doctor don Tomás de Montes de Oca.

--Le había oído mentar. No le había visto la facha, sin embargo. Figura asaz ridícula, y _ainda mais_...[37]

--Buen medido y diestra cuchilla.

--Dios me libre de sus manos.

--Es el que cura a la familia del Capitán General.

En este punto se notó un movimiento en el grupo de las personas que rodeaban a ese personaje más de cerca, cesando desde luego los diálogos en voz baja de las más distantes. Padrón había llevado los gallos a sus respectivas casillas, y Vives saludaba afectuosamente a Laborde, a Cadaval, a Zurita, a Molina y a Córdoba, pasando de uno a otro hasta que llegó al joven negro, arriba mencionado, a quien dijo, sin darle la mano ni más saludarle:

--Tondá, preséntate en Secretaría a recibir órdenes.

Tenemos que hacer un paréntesis en este punto, para decir dos palabras acerca de Tondá. Era el protegido del Capitán General Vives, quien le sacó de la milicia de color donde tenía el grado de teniente, y después de ascenderle a capitán, previa la venia de S. E. el rey, de facultarle para usar el don y ceñir sable, le dio comisión para perseguir criminales de color en las afueras de la ciudad, sin duda por aquello de que no hay peor cuña que la del mismo palo.

Y en este caso, como en otros muchos que pudieran citarse, se echaron bien de ver el tacto y tino con que solía Vives escoger sus hombres. Parece ocioso agregar que el protegido llegó en breve a distinguirse por su actividad, celo y astucia en la averiguación de los crímenes, la persecución y captura de los criminales. En estas empresas difíciles cuanto riesgosas, le ayudaron mucho su juventud y robustez, su presencia, que era gallarda, su educación regular, sus finas maneras y modesto porte, en fin, su valor sereno, que a veces llevaba hasta la temeridad; prendas éstas que al paso que le ganaron la admiración de las mujeres, le dieron ascendencia mágica en el ánimo fantasioso de las gentes de su raza. Y como a menudo acontece con los personajes novelescos, el pueblo le compuso y dedicó canciones y danzas alusivas a sus hechos más notables, y le dio un apodo que de tal modo ha oscurecido, apagado su nombre patronímico, que hoy, al cabo de cuarenta años, sólo podemos decir que le llamaban Tondá.

Empleado activo y leal, tardó en cumplir la orden recibida lo que tardó en pasar del patio de la Fuerza a los entresuelos del palacio de la Capitanía General. Desempeñaba entonces la secretaría política don José M. de la Torre y Cárdenas. Este, aunque recibió a Tondá con semblante risueño, no le brindó asiento, ni a derechas contestó a su respetuoso saludo; sólo se ocupó de decirle que en la noche anterior, por parte del Comisario del barrio de Guadalupe, Barredo, se sabía que se había cometido un crimen atroz en la calle de Manrique esquina a la de la Estrella, y que S. E. deseaba se hiciese la pronta averiguación del hecho, a fin de

descubrir el autor o autores, y se pudiera perseguirlos sin descanso hasta capturarlos y entregarlos a los tribunales; porque estaba empeñado en hacer un señalado escarmiento.

Enseguida le llegó su turno a los de la comisión, y Mañero expresó su embajada lisa y llanamente, reducida a decir que no procedía en ley ni en justicia se declarase buena presa, si se declaraba por la comisión mixta, la del bergantín _Veloz_, ahora mismo en el puerto de La Habana, aunque traía un cargamento de negros, pues como atestaban sus papeles, despachados en toda forma, venía de Puerto Rico y no de las costas de África directamente; y aun cuando se considerase contrabando el tráfico en esclavos con esta última, no lo era respecto de la primera, que por fortuna aún pertenecía, al par de Cuba, a la corona de S. M. el rey de España e Indias, don Fernando VII, Q. D. G.

Sonriose el General Vives y dijo al postulante que le presentara un memorial expresivo de todas las razones y hechos alegados, que él lo pasaría a la comisión mixta con los papeles del buque; que ya tenía noticias de lo ocurrido, por boca del mismo cónsul inglés, el cual se le había presentado antes de la hora de audiencia en compañía del comandante del apresador, el Lord Clarence Paget, y añadió con cierta severidad de tono y de semblante:

--Reconozco, señores, la injusticia y los daños que nos ocasiona un tratado por el cual se concede a Inglaterra, la enemiga natural de nuestras colonias, el derecho de visita sobre nuestros buques mercantes; pero los ministros de S. M. en su alta sabiduría tuvieron a bien aprobarlo, y a nosotros, leales súbditos, sólo nos toca acatar y obedecer el mandato del augusto monarca Q. D. G. Y se me figura, señores, que si Vds., están dispuestos a respetar el tratado, no lo están ni poco ni mucho a cumplirlo. En vano me hago de la vista gorda respecto de lo que Vds. hacen día tras día (señores, cuando hablo así no me refiero a Vds., personalmente, sino a todos los que se ocupan en la trata de África), que según va la cosa, no pararán hasta meter sus expediciones en Banes, en Cojímar, en los Arcos de Canasí y aun en este mismo puerto. En vano he hecho cerrar y derribar los barracones del Paseo, que Vds. no escarmientan y siguen introduciendo sus bozales en esta plaza, persuadidos, sin duda, que no hay mejor mercado para esa mercancía. En tal momento no se acuerdan Vds., del pobre Capitán General, contra quien el cónsul inglés endereza sus tiros, porque no bien entra aquí un saco de carbón, como Vds. dicen, cuando él lo huele y viene hecho un energúmeno a desahogar conmigo su mal humor.

--¡Ea! Vayan Vds., con Dios y otra vez sean más prudentes. Y a propósito de prudencia: ayer tarde vino a mí un joven dependiente de una casa de comercio para quejarse de que a la luz del día, en la plaza de San Francisco, le habían arrebatado un saco de dinero de su principal. ¿Cabe mayor imprudencia que la de ir por la calle enseñando el dinero a todo el mundo y tentando a la gente de mala índole? También se me quejó de que al oscurecer del día de ayer, dos negros con puñal en mano le pararon cerca de la estatua de Carlos III y le desvalijaron de cuanto llevaba encima de valor, el reloj, etcétera. Si Vd. hubiera tenido un tantico de prudencia, le dije, no se habría expuesto a perder la vida atravesando sitio tan solitario como ese del Paseo, a la entrada de la noche, hora que escoge la gente mala para cometer sus fechorías. Aprenda de mí que no salgo de noche a la calle. Lo mismo digo a Vds.: no se metan en las garras de los ingleses y salvarán sus expediciones, ni comprometan la honra del Capitán General. La prudencia es la primera de las virtudes en el mundo.

CAPÍTULO IX

En ti pensaba y en aquel instante Me mandaba llorar naturaleza.

JOSÉ MARÍA HEREDIA

Personaje de más cuenta de lo que nadie puede imaginarse era en casa de Gamboa su Mayordomo don Melitón Reventos. Tenía en el manejo general económico más voz que su amo, y a las veces se hombreaba en ese terreno con doña Rosa.

Pero donde ejercía un poderoso imperio era entre los esclavos. Corría con su provisión de vestuario y de alimentos, tanto de los del servicio doméstico en La Habana, como de los de las fincas rurales. Para con los primeros, sobre todo, se daba los aires de señor; más que eso, de déspota. Hacía, sin embargo, respecto de éstos, dos excepciones el feroz Mayordomo. En primer lugar, no gustaba de estrechar lance con el calesero Aponte. No ya sólo era hombre serio y temible sino que pertenecía al hijo mimado de la casa, el cual no quería delegar en nadie el derecho de castigarle.

Tampoco tenía don Melitón malas obras ni malas palabras para Dolores. Lejos de eso, para ella reservaba sus sonrisas, sus agasajos y atenciones. De cuando en cuando la hacía regalos de pañuelos y dijes, que la muchacha aceptaba sin reparo, aunque para usarlos tuviese que mentir a sus señoritas; porque, después de todo, no halagaba poco su vanidad el que un hombre blanco

emplease con ella tales galanterías.

No tenían origen estas distinciones del Mayordomo en favor de Dolores en la circunstancia de que era la doncella de las señoritas de la casa, tratada por ello con ciertas consideraciones por toda la familia, no; tenían diverso origen, procedían de los méritos de la moza como mujer: joven, bien formada y bonita para negra.

Aquel día en que por llegar tarde de su comisión al bergantín _Veloz_, almorzaba don Melitón a la cabecera de la mesa en el comedor, con todos los aires de amo, servido atentamente por Tirso, acertó a pasar Dolores y tropezar con su codo en los momentos en que se llevaba un vaso de vino a la boca. Fuese aquello por casualidad o de hecho pensado, el Mayordomo se aprovechó de la ocasión para pegarle un pellizco en el desnudo y bien torneado brazo.

--¡Ay, don Melitón! exclamó ella sin alzar la voz, aunque llevándose la mano al punto dolorido.

--¡Ay, Dolores! remedó él lleno de risa.

--Eso duele, agregó la muchacha.

--¡Ca! No hagas caso. Si todavía te he de libertar.

Dolores hizo con la boca el ruido onomatopéyico que llaman freír un huevo, cual si no creyera ni jota en la sinceridad de las últimas palabras del Mayordomo. No obstante, harto dulce es el nombre de la libertad para que la joven esclava cerrase el oído a la promesa y el corazón a la esperanza de verla realizada, fuera el que fuese el sacrificio que la exigiese el donante. De cualquier modo, siguiola él con la vista hasta que traspasó el arco del patio, y entonces murmuró:

--Esta todavía se casa con el bribón de Aponte. ¡Sería una lástima!

María de Regla, mencionada al principio de esta historia, tuvo Dolores de su unión legítima con Dionisio el cocinero, quince años antes de la época actual. Contemporáneamente tuvo doña Rosa a Adela, su hija menor, la cual entregó a María de Regla para que se la lactase, por no sentirse ella en condiciones para desempeñar por entonces aquél, el más dulce de los deberes de madre. Por supuesto, para llenar encargo tan delicado, necesario se hizo destetar a Dolores y criarla con leche de cabra o de vaca, aparte enteramente de la hija de su señora y ama.

Prohibiósele explícitamente a María de Regla el dividir sus caricias y el tesoro de su seno entre las dos niñas, siquiera el tomarlas juntas en brazos. Pero aunque esclava, temerosa del castigo con que la habían amenazado, era madre, quería a su propia hija entrañablemente, quizás más por lo mismo que no la permitían criarla; así que siempre que las otras esclavas le proporcionaban la ocasión, tarde de la noche y fuera del alcance de la vista de los amos, se ponía ambas niñas a los pechos y las amamantaba con imponderable delicia. La robustez de la nodriza, al parecer sin detrimento ni desmedro, proveía ampliamente a aquella doble lactancia. Criábanse las dos hermanas de leche sanas y fuertes. María de Regla no hacía diferencia entre ellas, y así en la mayor armonía habría corrido su infancia si tan luego como empezó a disminuir el sustento no trataran de disputárselo y armar llanto, en especial la blanca, no acostumbrada a semejante división.

Al cabo, atraída una noche doña Rosa por el llanto de su hija, sorprendió a la nodriza dormida entre las dos niñas, que, con ambos brazos extendidos, se impedían el mutuo goce del delicioso líquido. ¿Qué hacer en aquellas circunstancias? ¿Castigar a la esclava en el acto por su desobediencia? ¿Cambiar de nodriza? Tan malo sería lo uno como lo otro, pensó doña Rosa. Lo primero, porque el castigo envenenaría la leche de la esclava; y lo segundo, porque en el octavo mes de la lactancia, el cambio repentino produciría resultados no menos fatales a la salud y tal vez a la existencia de Adela. Tan perpleja estaba que consultó a su marido, quien, hombre violento si los hay, aconsejó la prudencia y el disimulo hasta ocasión más oportuna. Descubierta su primera falta, dijo él, no es probable que María de Regla reincida. De cualquier modo, así continuaron las cosas por un año y medio más, al cabo de cuyo tiempo, el día menos pensado, se le ordenó al Mayordomo echara por delante a la _criandera_ y la embarcara a bordo de una goleta que hacía viajes de La Habana al Mariel, dejándola en el ingenio de _La Tinaja_, bien recomendada al Mayoral. Allí se hallaba de enfermera el año de 1830, es decir, purgando la culpa de ser madre amorosa, cometida trece años antes de esa fecha.

Que la esclavitud tiene fuerza de trastornar la noción de lo justo y de lo injusto en el espíritu del amo; que embota la sensibilidad humana; que afloja los lazos sociales más estrechos; que debilita el sentimiento de la propia dignidad y aun oscurece las ideas del honor, se comprende; pero que cierre el corazón al amor de padres o de hermanos a la simpatía espontánea de las almas tiernas, he aquí lo que no se ve a menudo. No es, pues, extraño que María de Regla sintiese en lo profundo del pecho su separación a un

tiempo de la hija, del padre de ésta y de Adela misma, para pasar el resto de sus días en el destierro del ingenio _La Tinaja_.

En el código no escrito de los amos de esclavos no se reconoce proporción ni medida entre los delitos y las penas. Es que no se castiga por corregir, sino por desfogar la pasión del momento; de que resulta que casi siempre se le apliquen al esclavo varias penas por un solo delito. Luego, llovía sobre mojado, como vulgarmente se dice, en el caso de María de Regla. Su destierro de La Habana, la separación de la hija y del marido, quizás para no verlos más en la vida, el cambio de ocupación de ama de leche en la ciudad por el de enfermera en el campo, el traspaso de dependencia bajo el capricho del Mayordomo en aquélla, al del Mayoral en el ingenio, en concepto de doña Rosa no bastaban a purgar la culpa de su triste esclava.

No había logrado averiguar esa señora a ciencia cierta de quién era la niña que había estado lactando María de Regla, cosa de año y medio antes de haber dado a luz a Dolores. Lo único que pudo sacar de don Cándido fue que el médico Montes de Oca la había contratado para lactar a la hija ilegítima de un amigo, cuyo nombre no debía revelarse. El precio del alquiler, dos onzas de oro, las recibió doña Rosa mes tras mes, con la mayor puntualidad mientras duró la lactancia, por mano de don Cándido. Esto poco no pudo bastar a satisfacer sus celos, antes fue a sembrar fuertes sospechas en su ánimo, siendo el misterio motivo constante de quejas y disgustos entre ella y su marido, y, por rechazo, de gran preocupación, que a veces rayaba en odio, contra María de Regla.

Por fortuna, tales ejemplos de injusticia y de crueldad ocurrieron cuando ambas niñas no tenían uso de razón, y como crecieran juntas, como en realidad mamaran una misma leche, no obstante su opuesta condición y raza, se amaron con amor de hermanas. Adela entró en años y concurrió a una escuela de niñas poco distante de su casa en compañía de su hermana Carmen, a donde Dolores les llevaba los libros junto con la fruta y el refresco a medio día, y a las tres de la tarde las acompañaba en su vuelta a la casa. Carmen y Adela alcanzaron la edad de la pubertad, Dolores antes que ellas, y en dejando la escuela no se les separaba ésta ni de día ni de noche. Las vestía, las peinaba, les lavaba los pies a la hora de acostarse; durante el día cosía al lado de sus señoritas, y de noche, bien dormía en el duro suelo al lado de la cama de Adela, bien en el cuarto inmediato sobre la rígida tarima, a la vista de otra criada, la más anciana de la servidumbre.

Dolores y Tirso eran hermanos uterinos. La primera, nacida en La Habana, salió negra, porque a esa raza pertenecía su padre; el segundo, nacido después en el ingenio La Tinaja, salió mulato, porque su padre, fuera el que fuese, era de la raza blanca. De aquí provenía el que ellos no se viesen como tales hermanos, y que María de Regla quisiese más a Tirso, que mejoraba la condición, que a Dolores, la cual perpetuaba el odioso color, causa aparente y principal, creía ella, de su inacabable esclavitud. Pero aun en este particular estaba María de Regla condenada a ver defraudadas sus más risueñas ilusiones de madre. Tirso, su preferido, no la quería, mas se avergonzaba de haber nacido de negra, enfermera del ingenio por añadidura. Al contrario, Dolores adoraba en su madre. Cada vez que llegaba a sus oídos la noticia del mal trato que le daban en _La Tinaja_, era motivo de amargo llanto para ella y para suplicar a Adela la hiciese venir a La Habana y la sacase de aquel purgatorio donde la tenían penando, hacía tanto tiempo, sólo por haber dado de mamar a la vez a su propia hija y a la hija de sus amos. Sentía Adela la fuerza de estas dolorosas quejas, y, no obstante sus pocos años y muchas distracciones, oyendo continuamente, en el silencio de la noche, ella acostada y Dolores de rodillas junto a su cama, la triste historia de los trabajos y padecimientos de María de Regla en el ingenio, se conmovía hasta verter lágrimas, y entre bostezo y bostezo la prometía que al día siguiente hablaría a doña Rosa sobre el asunto. Así se quedaban dormidas muchas veces aquellas hermanas de leche, casi siempre con las mejillas aún húmedas del llanto.

Mas sucedía que al día siguiente no encontraba Adela ocasión favorable para hablarle a su madre, señora algo seria con sus hijos, con la sola excepción de Leonardo, el niño mimado de la casa, y harto severa con los esclavos. De esta manera se pasaba el tiempo. Una tarde, al fin, mientras se hallaba Adela recostada en el sofá de la sala por un ligero dolor de cabeza, como se le acercase la madre, se le sentase al lado y empezase a pasarle la mano por la frente, en son de acariciarla o por mera distracción, cobró ánimo la joven, y agarró la ocasión por los cabellos, cual suele decirse:

--Quisiera pedirte un favor, mamá; dijo con voz trémula por la emoción o el temor.

Por breve rato no contestó palabra doña Rosa; sólo miró a su hija, entre sorprendida y pensativa. Esto aumentó la turbación de Adela, quien, no embargante, añadió a la carrera:

--Tú no me vas a decir que no.

--Estás enferma, niña, dijo doña Rosa secamente. Tranquilízate. Y se levantó para marcharse.

--Un favor, mamá. Escucha un momento, prosiguió Adela, ya con los ojos humedecidos, deteniendo a su madre por la falda.

Esta volvió a sentarse, tal vez porque le llamaron la atención las palabras, y más la actitud de su hija, indicativas todas de extraordinaria agitación y zozobra.

--Vamos, te escucho. Di.

--Pero tú no te negarás a mi ruego.

--No sé qué quieres de mí; mal puedo decir de antemano si me negaré o no. Supongo, sin embargo, que es una de tus boberías. Acaba.

--¿No crees tú, mamá, que ya María de Regla ha purgado la culpa?...

--¿No lo dije? la interrumpió doña Rosa enojada. ¿Y para esa necesidad me detienes y me ruegas que te oiga? ¿Ni quién te ha dicho que esa negra está purgando culpa alguna?

--¿Por qué la tienen tanto tiempo en el ingenio?

--¿Y dónde estaría mejor la muy perra?

--¡Jesús, mamá! Me duele que hables así de quien me crió.

--Ojalá que nunca te hubiera dado de mamar. No sabes tú cuánto me ha pesado la hora en que te puse en sus manos. Pero bien sabe Dios que lo hice a no poder más. No me hables de María de Regla, no quiero saber de ella.

--Creía que la habías perdonado.

--¡Perdonado! ¡perdonado! repitió doña Rosa alzando la voz. ¡Jamás! Para mí ya ella ha muerto.

--¿Qué te ha hecho para tanto rigor?

--¿Quién la trata con rigor?

--¿Te parecen pocos los trabajos del ingenio? ¿El maltrato que le dan?

--No sé yo que la maltraten más de lo que ella merece.

--Pues todos dicen que sí.

--¿Quiénes son esos todos?

--Uno de ellos creo que ha sido el patrón Sierra que estuvo aquí la semana pasada, cuando vino por las _esquifaciones_ para el ingenio.

--Lo que extraño es que el patrón hablase contigo.

--Yo no, mamá, sino otra persona, y como saben lo que quiero a María de Regla, me contaron lo que ella decía. Me han afligido mucho las cosas que allá le pasan, y quisiera, de veras, que tú hicieras algo por ella y por mí. Me ruega le sirva de madrina y haga que la saquen del ingenio...

--Adela, dijo doña Rosa afectada con el tono de ingenuidad y de exquisita ternura de su hija. Adela, tú no sabes el sacrificio que exiges de mí. Pero se acercan las Pascuas, toda la familia irá al ingenio y ya veremos lo que puede hacerse con esa negra de Barrabás. Debo advertirte, sin embargo, que no esperes me ablande de pronto y sin madura reflexión. Esa negra está perdida y muy sobre sí. Lejos de arrepentirse y enmendarse, como esperaba, para lavarse de la culpa de su desobediencia a mi expreso mandato, la ha hecho peor desde su llegada a _La Tinaja_. Va para doce años que la tengo allá, y cada vez me traen más quejas de ella y oigo cosas más escandalosas. El Administrador que teníamos allí trinaba con la negra. Yo no te había dicho nada, hija, porque no se había ofrecido la ocasión; pero me parece que ya María de Regla no puede vivir con nosotros. Sería un mal ejemplo para ti, para Carmen y aun para la misma Dolores. Desde que entró en el ingenio, entró allí la guerra civil; de cuyas resultas ha habido que cambiar a menudo de mayordomos, de mayorales, de maestros de azúcar, de carpinteros, en fin, de cuantos tienen la cara blanca, pues no parece sino que la maldita negra tiene un encanto para los hombres o que todos ellos son fáciles de infatuarse con cualquiera que lleva túnico. Tirso es una acusación viva contra la moralidad de María de Regla, pues su padre fue un carpintero vizcaíno que tuvimos hace tiempo en _La Tinaja_... Los _bocabajos_ que ha llevado no la han corregido...

Las últimas palabras de doña Rosa estremecieron a Adela de pies a cabeza, pues a pesar de los lamentos de Dolores, ignoraba que le hubiesen impuesto a su adorada ama de leche otro castigo que el durísimo del destierro de La Habana y de las personas que más quería en el mundo. Pareciole oír el chasquido del látigo, los gritos de la víctima y el crujido de las carnes; se llenó de horror, se cubrió la cara con ambas manos, y por entre sus dedos de rosa saltaron dos lágrimas como dos gotas de rocío, y fueron a estrellarse en su casto y agitado seno, exclamando solamente.

--¡Pobrecita!

Conoció entonces doña Rosa que había ido muy lejos, y apresuradamente añadió:

--¿Lo ves? Tú también estás infatuada con la negra. Por desgracia te dio de mamar, debes de tenerle algún cariño, lo comprendo; no obstante, es preciso que reconozcas que es muy mal empleado y ya te convencerás que ella no merece tu compasión. Espera: de aquí a Navidad no va mucho. Ya veremos el medio de arreglar lo que haya de hacerse.

De todos modos aquella era una esperanza, que Adela tardó en impartirle a su hermana de leche lo que tardó la madre en alejarse de su lado. Dolores no sabía más que amar a su joven señorita, siendo todavía muy joven para amar a otra persona de contrario sexo, y hacía esfuerzos constantes para identificarse con ella, imitar el tono de su voz, sus modos, su aire de andar y de llevar el traje, sus coqueterías; de manera que los compañeros de esclavitud, cuando querían decirle algo que la complaciera mucho, la llamaban allá entre ellos: Niña Adela.

CAPÍTULO X

--Ya sé lo que me pides, Llévate en él mi corazón y... toma.

RAMÓN MAYORGA

Promediaba el mes de noviembre de 1830. Los vientos del norte ya habían arrojado sobre las playas cubanas las primeras aves de paso de la Florida, probando así que se había adelantado el invierno en el opuesto continente. El mar a menudo se hinchaba y con bramidos atronadores rompía contra los arrecifes de las costas que sembraba por largo trecho de blanca espuma, de conchuelas y sedimentos salinos.

A las cuatro de la mañana no había bastante claridad en las calles de La Habana, ni a cierta distancia se reconocían las personas, excepto aquéllas, pocas en verdad, que llevaban un farolito encendido balanceándose en la mano, mientras a paso acelerado se dirigían, bien a los mercados, bien a los templos; en algunos de los cuales se oía a medias el órgano con que las monjas o los frailes acompañaban el canto de los maitines.

Hacía aún noche, decimos, y ya don Cándido Gamboa, en su bata de zaraza y gorro de dormir, se hallaba asomado al postigo de la ventana de la calle, abrigado tras de la cortina de muselina blanca, en espera de _El Diario de la Habana_, o para respirar aire más libre que el pesado de la alcoba.

A poco más empezó a oírse el ruido, al principio sordo, después más vivo, de los pasos de alguien que se acercaba de la parte de la Plaza Vieja. Hacia allá tornó los ojos don Cándido; mas no vino a salir de dudas hasta que tuvo delante la persona en cuestión. Vestía traje de cañamazo, compuesto de una especie de chal para cubrirse la cabeza y de la falda corta que ceñía a la cintura con una correa de cuero larga y negra. Contribuía además a disfrazarla, el color cobrizo mate del rostro, propio de los mulatos, mayormente cuando van para viejos, que le daba la apariencia de mujer de la raza india.

--Buenos días, señor don Cándido, le dijo en tono gangoso.

--Téngalos muy buenos la _seña_ Josefa, contestó él procurando bajar la voz. Temprano ha madrugado.

--¿Qué quiere el señor? Quien tiene cuidados no duerme.

--Pues, ¿qué se ofrece de nuevo? Al grano.

--Se ofrece mucho y me pareció que si me dilataba hasta la venida del día, la cosa no tenía remedio.

--Entiendo. La orden que se ha dado el otro día por la Capitanía General sobre pordioseros y locos trae aquí a _seña_ Josefa. La esperaba.

--Lo acertó el señor. No sé como tengo vida, ni cuando acabarán mis tribulaciones. Se creía al principio que sólo iban a recoger a los pobres y los locos que andan por las calles. Pero ayer por la tarde me dijo la madre de Paula que hasta los locos en las casas privadas y en los hospitales van a ser trasladados a San Dionisio o a una casa que han fabricado en el patio de la Beneficencia. El señor podrá calcular cómo estará mi espíritu con tal noticia. No he cerrado los ojos en toda la noche. _Dende_ que se publicó la orden el corazón me anunció una desgracia.

--Tal vez haya tiempo todavía de remediarla.

--Quiéralo Dios, mi señor, porque si en el hospital la muchacha sufre, ¿qué no será cuando la lleven a San Dionisio, o a la casa nueva, allá por San Lázaro? Ahí no hay quien la cuide ni haga por ella. La tratarán a palos. ¡Y yo que no había perdido la esperanza de verla en su sano juicio y cabal salud! Ahora mi pobre Charito irá por delante, yo por detrás. Acabaremos de pena... Hágase la voluntad de la Virgen Santísima.

--¿Cree la _seña_ Josefa que se podrá hacer algo de provecho en este caso?

--Creo, mejor dicho, _seña_ Soledad, la madre del hospital, cree que si hay una persona de influjo que le hable al _Contralor_, sujeto muy caritativo y temeroso de Dios, se hará de la vista gorda y no se cumplirá la orden por lo tocante a Charito. Todo depende de él. Tal vez _haiga_ que buscar un médico que dé una certificación. El _Contralor_ es bueno como el pan, y quiere servir, lo _mesmo_ seña Soledad. Conque, para que vea el señor...

--Entiendo, entiendo, repitió don Cándido pensativo. Digo a Vd., por lo tanto, que he consultado a Montes de Oca, quien es de opinión lleven al campo a la enferma y la hagan tomar baños de agua salada. Veremos lo que puede hacerse...

Pero como sintiera pasos en el zaguán, se interrumpió e hizo señas a la anciana mulata para que se alejara a toda prisa.

El toque de diana primero y de seguidas el disparo de cañón a bordo del navío _Soberano_ anclado junto al muelle de la Machina, estremeciendo las ventanas del cuarto, hicieron despertar sobresaltado a Leonardo Gamboa. Sacó lumbre en el mechón de escarzo, y abriendo el reloj, vio que eran las cuatro de la madrugada.--A tiempo, dijo entre sí, y se apresuró a salir de la cama y vestirse. Para esto encendió una vela de esperma, valiéndose de una pajuela, pues aún no se conocían los cerillos en La Habana.

Mientras se peinaba delante del tocador, soltó de repente el peine de carey, volvió a requerir el reloj, y murmuró:

--¡Las cuatro y cuarto! Muy temprano todavía y de aquí allá no podré echar arriba de quince minutos andando despacio. Ella me dijo que cerca de las cinco... ¿No sería mejor aguardar en la esquina? Sí, concluyó diciendo con resolución. Y vestido y perfumado y con la caña de Indias, salió de su cuarto y empezó a bajar la escalera de piedra.

Apoyábase con la mano izquierda en el barandal de cedro, cosa de no dar pisadas recias; mas así que descendió al zaguán, donde no había tal apoyo, antes reinaba gran oscuridad, por más cuidado que puso, aunque no tuviesen tacones sus zapatos de escarpín, hizo demasiado ruido, aquel ruido sordo que se oye cuando uno camina por encima de un suelo hueco, abovedado. No parece sino que se habían despertado de improviso todos los ecos del zaguán y de la sala vecina, donde él sospechaba que podía estar su padre, madrugador por excelencia. Andando a tienta paredes, tropezó con el viejo calesero, quien, acostumbrado a la oscuridad, vio venir desde luego al joven y le salió al encuentro para servirle de guía y evitar que se diera de narices contra la llanta férrea de uno de los carruajes.

--¡Pío! ¿Eres tú? dijo él en voz muy baja. Abre.

--El amo está _asomao_ en la ventana de la calle, contestó el negro.

--¡Diablos! ¿Tiene cerrojo el postigo de la puerta?

--No, señor. _Dende_ que salió Dionisio _pa_ la plaza quité el _serojo_.

--Abre poco a poco.

No crujieron los goznes; pero ya don Cándido había oído los pasos en el zaguán, y arrimado a la reja tronaba:

--Pío, ¿quién va?

--El niño _Lionar_, mi amo.

--Sal. Llámale. Detenle. Dile que yo le llamo. Corre, patas de plomo.

Entre tanto volvía el esclavo no cesó don Cándido de ir y venir, muy desazonado, de la ventana de la calle a la reja del zaguán y vice versa, murmurando:

--¿A dónde irá el muy bribón a estas horas? A nada bueno por cierto. Allá ha ido. Claro que sí, por decontado. Le estoy mirando. ¿Y no habrá dejado aquella santa mujer nadie al cuidado?... Tal vez no, lo más probable es que no. A ciertas gentes se les pasea el alma por el cuerpo, se descuidan mucho, no toman precauciones y de aquí provienen las desgracias... El demonio no más podría imaginar un cúmulo de circunstancias... La ocasión, la edad, la tentación, el enemigo malo que no duerme... Yo también me he descuidado. Debí preverlo, evitarlo, sí, impedirlo... Pero ¿cómo? ¡Si yo pudiera dar la cara! Veremos. Le desnuco, le meto en un buque de guerra como me llamo Cándido, y hago que le den chicote a ver si suelta alguna de la sangre criolla que tiene en las venas. No es hijo mío, no. Todo esto se hubiera evitado si le mando a España como tenía pensado hace más de cuatro años. Su madre tiene la culpa. Casi, casi me alegraría de que no le encontrase Pío, porque podría matarle. Tal me siento contra él.

En esto volvió Pío fatigado, sin aliento y dijo:

--Na, lamo, el niño no parece po ningún parte.

--¡Bruto! tronó don Cándido. ¿Por dónde fuiste a buscarle?

--Po la mano e larienda, lamo.

--¿Por la izquierda, quieres decir? ¡Animal en dos pies! Si marchó por la derecha ¿cómo habías de dar con él, pedazo de bestia? Vete. Quítate de mi presencia, porque si Dios no me tiene de su mano, me parece que te destripo de una patada.

A las voces destempladas de don Cándido se asomó doña Rosa a la puerta del aposento que daba a la sala, y asustada preguntó:

--¿Qué ha sucedido, Gamboa? ¿Por qué gritas?

--Pregúntale a tu hijo que acaba de salir por ahí hecho un facineroso.

--¿Un facineroso? No lo entiendo. ¿Ha hecho algo malo? ¿Va a hacerlo?

--No sé mucho más que tú; sin embargo, sospecho, temo, se me ha puesto que el muy bribón va a hacer una de las suyas. Se necesita ser ganso para no sospechar que ese muchacho no ha podido salir a la calle a estas horas en que no se ven ni las manos, y recatándose de mí, para oír misa ni confesarse.

--Quizás ha ido a tomar el fresco, quizás ha querido darte gusto levantándose de madrugada. No hay razón para sospechar nada malo. Tú, al menos, no estás seguro, no lo sabes. ¿Por qué has de pensar siempre mal de tu hijo?

--Porque dice el refrán español: piensa mal y acertarás.

--Te repito, él no ha ido a nada bueno. Le conozco mejor que tú que le pariste. Yo sé lo que he de hacer con él.

--El pobre muchacho no acierta nunca a complacerte. Ni que fuera tu hijastro. Si lo fuera, tal vez serías más indulgente...

--Compadécele. Dios quiera que no tengas que llorarle antes de mucho.

Luego que salió Leonardo a la calle notó que, arrimado a la acera de la izquierda caminaba en la dirección de Paula un bulto oscuro como de mujer. Entre seguirlo hasta cerciorarse de quién podía ser y alejarse de su destino, estuvo un momento titubeando, pero la voz de su padre, que llamaba a Pío, le decidió a marchar la vuelta contraria, a fin de ganar lo más pronto posible la esquina de la calle de Santa Clara. Así lo hizo en segundos de tiempo. Por esta casualidad no le dio alcance el esclavo. En poco más se puso en la calle de O'Reilly, y subió al alto terraplén o terrado del convento de Santa Catalina, lo atravesó de este a oeste y descendió a la calle del Aguacate por la escalera de tres o cuatro escalones mencionada al principio de esta historia, yendo derecho a la casita enfrente de ella.

Pareciéndole que la puerta no estaba cerrada con llave ni tranca, empujó una hoja con la punta de los dedos. Cedió algo, en efecto; por lo cual hizo mayor esfuerzo, rodó la silla en que se apoyaba y se abrió lo bastante para que el joven se deslizara por entre las dos hojas y quedase dentro, sin más ni más. De pronto no vio nada. Allí eran las tinieblas tan espesas como el aire húmedo que llenaba la estrecha pieza. Sin embargo, a favor de la lámpara que ardía aún en el poyo del nicho sobre la izquierda,

pudo al fin distinguir al alcance de su mano un par de palomas caseras dormidas en el respaldo de una silla, un gato enroscado en el fondo de un sillón de vaqueta, y una gallina bajo una mesa protegiendo con sus amorosas alas varios pollitos, que asomaban los picos por entre las plumas y empezaron a piar del modo suave y repetido que suelen siempre que sienten temor o frío.

Gradualmente sus miradas fueron elevándose del suelo hasta la altura de la puerta del cuarto del fondo, donde vio algo que le pareció una mujer o visión, de pie, escasamente vestida con un ropaje blanco, y el copioso cabello suelto hecho mil anillos y revueltas ondas, desparramadas por el seno y los hombros sin alcanzar a ocultarlos, con ser tan abundoso y largo. Reconocerse, correr el uno hacia la otra y abrazarse estrechamente en medio de los besos ardientes y sonoros, fue todo uno.

El hospital de Paula no es más que la continuación de la iglesia del mismo nombre, inmediato al ángulo de la muralla, por la parte que da al sudeste de la bahía. Tiene la entrada al norte, abierta en una alterosa tapia de una galería que sirve de pasaje entre la iglesia y el hospital. Precede a la entrada un vestíbulo con tejadillo, que más parece mampara de convento que otra cosa. Allí se estaciona un centinela para impedir el escape de los presos o dementes que reciben asistencia médica en el hospital. Generalmente sólo se admiten mujeres en uno u otro estado, cuando ni el delito es grave, ni la demencia de carácter furioso.

La mujer que había visto Leonardo caminando a paso vivo en la dirección del sur de la ciudad, por la calle de San Ignacio abajo, no paró hasta llegar al vestíbulo de que antes hemos hablado. Empezaba a clarear el horizonte entonces por el lado de oriente. Era su ánimo entrarse de rondón, pero ya la centinela con el sable desnudo se paseaba de un extremo al otro del tejadillo, y se le encaró cerrandole el paso:

--Buenos días tenga Vd., señor militar, dijo la anciana tratando de congraciarse con la centinela.

--Buenos o malos, contestó con rudeza el soldado, hace ratos que acá los tenemos.

--El señor militar parece que no me conoce, agregó ella en tono y actitud suplicatorios.

--No tiene nada de extraño, porque el diablo me lleve si he tenido tratos con brujas.

Se persignó la mujer y añadió que deseaba hablar con _seña_ Soledad, la madre del hospital.

--Tampoco conozco a esa tía, repuso la centinela reasumiendo sus paseos. Por allá dentro nadie se menea. Entrar, entrar y despejar el campo.

En traspasando el umbral del vestíbulo, se está en un gran patio cuadrangular que lo forman, por la derecha el costado de la iglesia y por los otros tres lados unos anchos pasadizos, de los cuales el de la izquierda, por tres anchas puertas conduce a la sala de la enfermería. Varias columnas cuadradas de fábrica de mampostería dividen ésta en dos naves longitudinales, llenas de camas, cuyas cabeceras se apoyan en las paredes maestras del edificio, con lo que queda despejado el centro. No había allí mamparas ni compartimientos, de manera que el observador situado en cualquiera de las puertas, podía registrar con la vista todas las camas. Hacia la bahía o el este, lo mismo que hacia el sur y el norte, había ventanas altas que daban claridad y saludable ventilación a la espaciosa sala.

Apenas la mujer con el cilicio de cañamazo puso el pie en el patio, vio asomar por el lado de la iglesia a la madre _seña_ Soledad, con un farolito, y detrás de ella un clérigo en sotana negra de sarga, sin bonete, llevando en ambas manos, a la altura de su pecho, un copón de plata con tapadera de lo mismo. Ambos caminaban a paso largo y murmuraban ciertos rezos que en el silencio del patio resonaban con los zumbidos de muchos moscones. Se encaminaron derecho a la enfermería y atravesaron la sala de un lado a otro. Al pasar los dos por junto a la anciana, conoció ésta de lo que se trataba y cayó de rodillas exclamando:

--¡Los óleos! Dios reciba en su seno el alma del moribundo.

Rezado el credo con mucho fervor, recogió todas sus fuerzas hecha casi un arco con su cuerpo y dando traspieses, continuó hasta la puerta del medio de la sala y volvió a caer de rodillas. Era que acababa de notar que el clérigo de pie al lado de una cama enfrente, administraba la extrema unción a una de las enfermas, mientras la madre de rodillas en el lado opuesto suspendía cuanto podía el farolito para alumbrar aquella triste y desolada escena.

De vuelta de la iglesia a donde había acompañado al clérigo, la madre tornó a la sala y encontró todavía de rodillas a la mujer del cilicio, con la cabeza doblada sobre el pecho, absorbida en sus oraciones. Tocole en el hombro _seña_ Soledad y le dio los buenos días, en cuyo momento la mujer, en tono de voz casi ahogado por la angustia:

--¿Conque ha muerto? preguntó.

--Ya descansa en paz, contestó la madre brevemente.

--¡Ah! dijo la anciana y cayó desplomada en el suelo.

--¡Jesús! ¡_Seña_ Josefa! repitió la madre haciendo esfuerzos por levantarla. ¿Qué le pasa? ¡Va que Vd., no me ha entendido! Mire que todo ha sido una equivocación de las dos. No comprendí su pregunta de Vd., ni Vd., tampoco comprendió mi _contesta_. La muerta no ha sido Charo. No, señor, no ha sido ella, sino una pobre morena que hacía pocos días había entrado en el hospital. Charo va mejor, está más aliviada del pecho. Sí, no cabe duda. Así lo dice el médico y yo lo veo. Vamos, venga, quiero que Vd. se desengañe por sus mismos ojos.

Poco a poco, con tales seguridades, empezó a volver en sí _seña_ Josefa. Después de derramar un mar de lágrimas en silencio, se sintió en actitud de seguir a la madre hasta la cama de la enferma por la cual se interesaba tanto. Hallábase la tal a la sazón sentada, sin más abrigo que la sábana que le cubría las piernas encogidas, las cuales sujetaba con ambos brazos desnudos, apoyando la frente en las rodillas. Tenía cortado el cabello casi de raíz, como se hace generalmente con los locos, y bajo la piel floja, descolorida y seca mostraba la armazón de huesos, tanto más cuanto que la camisa, sola pieza interior que llevaba, no le cubría sino parte de la espalda. Por su posición en la cama y por una tos hueca y débil que a veces le acometía, se conocía que estaba viva.

--Charo, Charito, le dijo la madre con amabilidad. Mira quién está aquí. Levanta la cabeza, niña. Anímate.

--¡Hija mía! se atrevió a decir _seña_ Josefa. Mírame. ¿Me oyes? ¿Me conoces, mi vida? Soy tu madre, quiero verte la cara. Respóndeme siquiera. Te traigo buenas noticias; pronto vamos a sacarte de aquí. Te llevaremos al campo para que te cures y tengas el gusto de conocer y abrazar a tu hija. ¡Ah! ¡Si la vieras! Está lindísima. Es tu retrato cuando eras de su edad.

--Véala Vd. tan callada, dijo _seña_ Soledad. Cuando está así no habla, no se mueve y cuesta Dios y ayuda que pase un bocado. Otras veces la coge por gritar, como si la estuvieran matando, por llorar o por reírse a carcajadas.

Pero en vano empleó _seña_ Josefa los medios que juzgó más eficaces para moverla. En vano acudió a los ruegos, a las caricias, a las lágrimas; la enferma se mostró insensible a todo, no contestó palabra, no alzó la cabeza, no cambió la posición acurrucada. Claro era que no había tenido conciencia de la escena de muerte que acababa de verificarse en una cama opuesta a la suya, y, por supuesto, no dio señal alguna de haber reconocido la voz familiar de _seña_ Soledad, ni la angustiosa de su desconsolada madre.

En fin, se adelantaba el día y era preciso que _seña_ Josefa se apresurase a volver a su casa, donde había dejado sola a la nieta. Dijo, pues, a la carrera a _seña_ Soledad que el caballero que las protegía a ellas se proponía hacer el último esfuerzo para curar a Charo, si es que aún tenía remedio, y que para ello la llevaría al campo, cerca del mar, en donde respirase otro aire y se bañase a menudo, bajo la vigilancia de un médico.

--Pues a ello, _seña_ Josefa, y que para bien sea, dijo alegre la madre. Lo que es aquí, está visto que esa pobre muchacha no tiene cura. Además, es preciso sacarla o no hay modo de impedir que se la lleven para la nueva casa en la Beneficencia. Todos estos días atrás han andado recogiendo pobres y locos por las calles. Ayer se llevaron a Dolores Santa Cruz, tan alborotosa. Y el Comisario Cantalapiedra ya me ha notificado la orden de traslación de todas las locas en disposición de moverse.

Figurarse puede cualquiera cómo llevaría el corazón _seña_ Josefa después de lo que había visto, escuchado y sentido en el hospital de San Francisco de Paula.

CAPÍTULO XI

...Pero si el vicio mancha su limpieza Vertiendo en ella su funesto hielo, Levanta el ángel de su guarda el vuelo, Y Dios torna a otro lado la cabeza.

LUISA PÉREZ DE MONTES DE OCA

Era el día claro y calentaba bastante el sol cuando _seña_ Josefa volvió a su casita de la calle del Aguacate. Al parecer nadie allí se había movido, excepto la gallina con sus polluelos, que buscaban la salida al patio por entre el cabio y el quicio de la puerta. El

primer cuidado de la anciana fue ver si la nieta reposaba en el alteroso lecho; y satisfecha de que dormía tranquila, se quitó el chal de cañamazo, se desciñó la correa y se dejó caer en la butaca, desalojando para ello al gato, que al ruido de la entrada de su ama entonces se esperezaba, abría tamaña boca y mostraba la roja lengua con los afilados dientes.

En desplomándose dio un profundo suspiro. Apuraba ahora el cáliz más amargo que jamás apuraron labios humanos. Su única hija languidecía en un hospital, privada de los cuidados maternales, falta de juicio y devorada por la consunción, si que ella pudiera valerle en nada. Que no tendría remedio ni alivio mientras continuara en ese lugar, plenamente convencida quedó en aquella mañana _seña_ Josefa, si era que antes abrigaba dudas.

¿Por qué estaba la madre afligida separada hacía tanto tiempo, de la hija doliente y moribunda? Esta separación tenía dieciséis años de fecha, porque, según recordará el lector, María del Rosario Alarcón había perdido el juicio a consecuencia del sentimiento y sorpresa que le produjo el secuestro de su hija recién nacida, para pasarla por la Casa Cuna. Cuando se la devolvieron, bien amamantada y rolliza, ya era demasiado tarde, ya se había apagado en su mente el último rayo de la divina luz. Todavía si su demencia hubiese tomado un carácter manso y tranquilo, habría sido posible dejarla pasar el resto de su vida al lado de la madre y de la hija; pero a veces le entraban accesos de furor, en cuya disposición era difícil sujetarla e impedir que se hiciera daño o le hiciera a los suyos.

Además, aun cuando por no haber casa de dementes en La Habana, admitían en los hospitales, por ejemplo, en el de Paula, algunas mujeres en ese estado, aquéllos cuyas familias no podían guardarlos en sus casas que eran los más, andaban sueltos por las calles, hechos el hazmerreír de los muchachos y el escándalo de las gentes timoratas. Tal, entre otros, Dolores Santa Cruz, a que hizo referencia la madre del hospital de Paula.

Esta negra había sido esclava de la familia distinguida de Jaruco cuyo apellido llevaba. Con su industria y economías había logrado libertarse y reunir un capital. Compró casa y esclavos, dedicándose a la reventa de carnes y frutas, que entonces era negocio bastante lucrativo.

Sin que sepamos el motivo, alguien le disputó en juicio el dominio directo a su pequeña hacienda. Esto la enredó en un pleito largo y costoso, que si bien ganó con costas, en honorarios, sobornos, propinas, entre abogados, procuradores, escribanos, oficiales de causa, jueces y asesores, se consumió el valor de la casita, juntamente con el de las dos esclavas. El resultado fue, que el día menos pensado la pobre mujer se quedó literal, no figuradamente, por puertas.

Golpe rudo debió de haber sido éste para quien amaba mucho el dinero y las satisfacciones que procura. La que siendo esclava fue libre, dueña de esclavos y de fincas, y de nuevo se vio atada al poste de otra esclavitud: la miseria; no era posible sobrellevar el cambio sin que su razón perdiese el equilibrio. Se le desvaneció en efecto, y desde entonces, vestida de harapos, y adornada la cabeza con flores artificiales y pajas, a la Hamlet,[38] recorría día y noche las calles apoyada en un palo largo, de que pendía una jaba, gritando desaforadamente por las esquinas: _¡Po! ¡po! Aquí va Dolores Santa Cruz. Yo no tiene dinero, no come, no duerme. Los ladrones me quitan cuanto tiene. ¡Po! ¡po! ¡Poó!_

Figúrese el lector la hija de _seña_ Josefa, madre a su vez desgraciada, revelando al pueblo en sus arrebatos de locura los pasos, los medios y el nombre, quizás, de la persona o personas por cuya agencia se veía en aquel tristísimo estado. No debía darse, y no se dio semejante espectáculo; antes por doloroso que fuese el sacrificio hubo que hacerlo todo entero, como que de ello dependían hasta cierto punto la salud y la felicidad de la inocente niña que había sido la causa indirecta de la desgracia de su madre. Tampoco debía crecer y desarrollar su razón viendo que ésta la había perdido y era el ludibrio de los extraños. Ni había llegado el tiempo, creía la abuela, de que la hija y la madre se conociesen. La separación, pues, podía ser eterna.

Tales pensamientos ocupaban el ánimo de la anciana con más fijeza que nunca en los momentos que llamaron a la puerta de la calle. Cual si despertara de un sueño pesado, levantose a abrir y se encontró con el lechero, isleño de Canarias que en el traje usual de los campesinos, con una botija debajo del brazo y un jarrito de lata en la mano, la saludó en el tono peculiar de su país, con las palabras:

--Pues abriera para mañana la casera. _Verídicamente_ ésta es la tercera vez que le traigo la leche.

--Yo estaba en misa, contestó _seña_ Josefa trayendo la cazuela para recibir la poción láctea.

--Como que iba creyendo que se habían muerto toditos en esta casa.

--Acabo de entrar de la calle.

Después de mirar a la vieja con aire peculiar, añadió:

--Andese con cuatro ojos la casera, continuó el lechero; porque enseña el refrán que el que tiene enemigos no duerme.

--Yo no tengo enemigos, a Dios gracias.

--Parécele a la casera. Toditos tenemos enemigos ocultos en este mundo. ¿No tiene la casera una hija bonita?

--¿Hija? No, señor, nieta.

--Es lo _mesmo_. Pues en el palmito de esta nieta está el enemigo del reposo de la casera. No hay mozo que no se perezca por los buenos palmitos. El _demongo_ me lleve si esta madrugada mesma no _vide_ por aquí un lindo don Diego. Ahora no me atrevo a decir si estaba juntito a la puerta o a la ventana... Pero _de que lo vide lo vide_.

--El casero se engaña, observó la anciana desazonada y temblorosa. No estuve fuera sino por corto tiempo, y mi nieta no tiene mozo que le persiga el lindo palmito como dice el casero.

--Dígole a la casera lo que le digo, ándese con cuatro ojos, y no se duerma en las pajas, porque _de que lo vide lo vide_.

Nuevo motivo de inquietud y de tormento para la desventurada abuela. Sabía que un joven blanco, de familia rica, seguía a su nieta como la sombra al cuerpo, que la hacía regalos costosos, que la facilitaba su carruaje para concurrir a los bailes de las ferias, que ella decididamente se pagaba de esas atenciones y obsequios; pero estaba muy distante de creer, siquiera de sospechar, que él se aprovechase de su ausencia en la iglesia o el hospital para soplarle la nieta, corromperla y malograr su porvenir.

Entonces pensó que la había dejado sola, encomendada a la vecina de la casa inmediata, y bien pudieron los dos amantes ponerse de acuerdo, darse cita de antemano y reunídose allí mismo, mientras ella se andaba por Paula. De cualquier modo, afirmaba el lechero haber visto temprano a la puerta de su ventana o casita a un lindo don Diego.--¿Quién sabe si estuvo dentro? ¿Cúya era la falta si ocurría una desgracia? ¿Sería posible que la nieta siguiese el mismo camino y casi por los mismos medios se perdiese como su desventurada madre?

--¡Ah! exclamó _seña_ Josefa cayendo de rodillas al pie del nicho donde se veneraba la imagen de la Dolorosa. ¡Virgen Santísima! ¿Qué he hecho yo para este duro castigo? ¿Cuál ha sido mi grave culpa? ¿Habré estado toda la vida en pecado mortal sin saberlo? Tú sabes que he sido buena hija, buena hermana y cariñosa madre. Yo he procurado criar mis hijos en el santo temor de Dios. Yo me he desvelado por infundirles sanos principios de moral, de virtud y de religión. Yo cumplo estrictamente con lo que manda la santa madre Iglesia. ¿Por qué consientes, Virgen purísima, amparo de los débiles, madre de misericordia, por qué permites que el Tentador en figura humana aleje a mi nieta, niña inocente, tierna oveja del señor, del camino de la virtud, la empuje al pecado y la haga caer de la gracia divina como a su infeliz madre? ¿Me abandonarás tú también, piadosísima Señora, en éste el más duro trance de mi vida?

Aunque _seña_ Josefa había tomado casi al pie de la letra las ideas y hasta las palabras de los libros de devoción, únicos que leía, no cabe duda ninguna sino que el fervor de su fe religiosa, la consideración de la nueva desgracia que le venía encima, la conciencia de la tremenda responsabilidad que le cabía en caso de salir ciertas sus sospechas, en medio de su poca cultura, la habían inspirado, al punto de improvisar una oración elocuente, por cuanto expresaba con verdad los sentimientos que la dominaban en aquellas circunstancias. Poco fue, no obstante, el alivio que proporcionó a su desgarrado corazón el ferviente desfogue. Porque el aviso del canario, por oportuno y certero, hacía en su pecho el mismo efecto del cuchillo, hincado en las carnes, que si se mueve lascera, si se clava, mata. Tampoco era fácil olvidar las últimas sentenciosas palabras de aquél, no pensar en ellas; antes continuamente resonaban en sus oídos: _De que lo vide lo vide._

También resonaron en los oídos de Cecilia, la cual no dormía desde mucho antes que volviese su abuela de la iglesia; sólo que le causaron impresión muy distinta. Encendiéronle el pecho en cólera e indignación. Porque, pensaba ella, ¿quién mete al hombre a dar semejante aviso? ¿Qué le iba ni le venía conque ella tuviese o no tuviese un amante, en que se viese con él o no por la puerta o por la ventana? ¿Por qué insistir en haberle visto? ¡Maldito hombre! ¡No se le hubiera secado la lengua antes de decir lo que dijo! Seguramente también vio al joven entrar o salir, y si no lo afirmó con la misma pertinacia, fue porque la abuela no le dio tiempo ni ocasión.

Pero fuerza era atender a las demostraciones de dolor y sentimiento de la abuela, que parecían extraordinarias y debían tener causa poderosa y legítima. ¿Cuál podía ser ésta? Ignoraba Cecilia lo ocurrido en Paula. Su conciencia alarmada vino a descifrarle

el enigma. Había cometido una grave falta admitiendo en su casa, a ocultas de la abuela y contra su expresa orden, al joven blanco con quien cultivaba relaciones amorosas.

Desde ese punto, la soberbia e independiente Cecilia experimentó algo que no había experimentado nunca, algo que no atinaba a explicarse ella misma, una revolución en todo su ser. Es que ante la culpa empezaba a verse débil, temerosa, irresoluta, y tener vergüenza de sí, de su abuela y de sus amigas. ¿Con qué cara se les presentaría ella? El hombre de la leche iba a publicar su falta por todas partes aquella misma mañana. Cuando menos el vecindario ya estaba impuesto de todo, y en cuanto saliera a la calle la señalarían con el dedo y dirían de manera que lo oyese:--Ahí va la muchacha que se aprovecha de la ausencia de su abuela en la iglesia para admitir en su casa al hombre que públicamente la corteja.

Pero en medio de aquella confusión de ideas, comprendió Cecilia sin mayor esfuerzo dos cosas importantes: la una, que tal vez la abuela no estaba aún convencida de su culpa; la otra, que a la tranquilidad de las dos, pues que ya no había remedio, convenía disimular lo más posible hasta averiguar la verdad de lo que pasaba y tomar un partido. En esta disposición, se levantó con tiento, se echó por encima de la camisa un traje y se asomó a la puerta de la alcoba. Aún se hallaba la anciana de rodillas y concluía la improvisada plegaria. Corrió a arrodillarse a su lado, le pasó un brazo por la cintura y, dándole un beso en la mejilla, le preguntó con exquisita ternura:--Mamita, ¿qué tiene su merced? ¿Por qué está tan afligida?

No le respondió palabra la anciana, volvió a la butaca y rompió a llorar en silencio. No hay cosa más pegadiza que el llanto, y Cecilia estaba predispuesta a contraer el mal. Se arrojó en brazos de la abuela y confundió sus lágrimas con las de ella; desahogo necesario de dolores que, sin embargo, tenían contrapuesto origen. Tal vez habrían aprovechado aquella coyuntura para tener una explicación que no podía menos de ser satisfactoria para entrambas, porque así lo predisponía el estado de sus ánimos; pero llamaron de nuevo a la puerta y _seña_ Josefa se apresuró a abrir, enjugándose de camino las mejillas empapadas. Era la vendedora de carne, manteca y huevos, negra de África, con tablero cuadrilongo equilibrado en la cabeza sobre un rodete, y un espanta-moscas, hecho de varetas de palma de coco, en la mano derecha.

Bien por cierta tendencia a la obesidad, por el calor, o por el desaliño natural de la gente de color, el traje de la vendedora consistía de falda de listadillo y camisolín, que cuando limpio debía de ser blanco, y apenas le llegaba a los hombros, quedándose más corto por las espaldas, cuyas partes, junto con los brazos desnudos a la griega o romana y las mejillas redondas y rollizas, le brillaban cual si, a la usanza de su tierra, se las hubiese untado con grasa. Por supuesto, no calzaba zapatos, sino que al caminar arrastraba un par de chancletas con la punta de los dedos. Luego que abrió _seña_ Josefa, depuso el tablero en el quicio de la puerta, y en tono de voz chillona, cuyo volumen no correspondía con el de su cuerpo, dijo:

--_Güenos días, caserite. ¿No me toma naa hoy? Entoavía no ha hecho la cru._

Contestado brevemente el saludo por la anciana, ayudó a deponer el tablero en el suelo, agregando de prisa que le diera un real de carne de puerco, medio real de huevos y medio de manteca. La vendedora cortó la carne a ojo de buen cubero, y con los demás artículos pedidos la puso en un plato que trajo Cecilia; y no bien la vio, parece que la entraron ganas de hablar hasta por los codos.

--Labana etá perdía, niña. Toos son mataos y ladronisio. Ahora mismito han desplumao un cristián alantre de mi sojo. Uno niño blanca, muy bonite. Lo abayunca entre un pardo con jierre po atrá y un moreno po alantre, arrimao al cañón delasquina de Sant Terese. De día crara, niño, lo quitan la reló y la dinere. Yo no queriba mirá. Pasa batante gente. Yo conose le moreno; e le sijo de mi marío. ¡Ah! Me da mieo. Entoavía me tiembla la pecho.

Con semejante descuadernado e ininteligible relato, se asustó mucho Cecilia, porque le pasó por la mente que el robado podía ser su amante; pero disimuló cuanto pudo y la carnicera prosiguió:

--Allá por los Sitios ha habio la mar y la morene lotra noche. Tondá quiee prendré los mataores del bodeguer de la calle Manrico y la Estreya. Elle estaba en un mortorio. El gobernaó manda prendeslo. Dentra Tondá, elle solito con su espá, coge dos; Malanga, lo sijo de mi marío juye po patio y toavía anda escondió. Ese, ese, ma malo que toos. Conque pa que vea la caserite. No se pue un fía de naide. ¡Adiós, caserite! Mucha salú.

Ida la carnicera vino el panadero con la cesta de pan a la cabeza de un negro que le seguía los pasos, como la sombra verdadera de su cuerpo. Entonces _seña_ Josefa se acordó que debía preparar el almuerzo. Según dijimos al principio de esta historia, el fogón se hallaba en el patio, debajo de un alero de mesilla, sin chimenea ni cosa que lo valga. Allí la anciana hizo lumbre valiéndose del eslabón, el pedernal, el azufre, el cabo de vela y unos cuantos carbones vegetales, y en poco más el almuerzo

quedó listo. Entretanto Cecilia puso la mesa y ambas mujeres se sentaron a ella. Por largo rato estuvieron sin probar bocado, levantar los ojos del plato, ni hablar palabra. Es que a cada rato esperaba la nieta que la abuela le leyese la culpa en el semblante, y no se atrevía a mirarla de frente; al paso que ésta parecía muy nerviosa y desazonada. Varias veces intentó decir algo; harto se le conoció por el movimiento de los labios, y otras tantas la voz se le atravesó en la garganta, porque en vez de sonidos articulados sólo se le escaparon sollozos. Por último, hizo un esfuerzo y dijo:

--Yo debía morirme ahora mismo.

--¡Jesús, mamita! No diga eso, exclamó Cecilia sin alzar la cabeza.

--¿Por qué no, si tal es lo que siento? ¿Qué hago yo en el mundo? ¿De qué sirvo? De estorbo, nada más que de estorbo.

--Nunca había hablado así su merced.

--Puede ser, pero mis penas, aunque grandes, he podido sobrellevarlas hasta ahora. Ya estoy vieja; sin embargo, me faltan las fuerzas, no puedo más. Estaba pensando que sería mejor echarme a morir.

--¿No dice su merced que es pecado murmurar de los trabajos y penas que Dios nos manda? Acuérdese que Jesucristo llevó la cruz hasta el calvario.

--¡Pobre de mí! Mucho tiempo hace que he andado la _vía crucis_, y que estoy en el calvario. Sólo falta mi crucificación, y tal parece que me la tienen decretada aquellos mismos que más quiero en este mundo.

--Si mamita lo dice por mí, mire su merced que comete una verdadera injusticia. Bien sabe Dios que por aliviarle los pesares, de buena gana daría la sangre de mis venas.

--No lo demuestras, no se te conoce. Al contrario, parece que te complaces en hacer siempre lo que yo no quiero que hagas, lo mismo que te prohíbo. Si tú me quisieras como dices no harías ciertas cosas...

--¡Eh! Ya veo por donde va su merced.

--Voy por donde debo ir, por donde va toda madre que estima en algo el porvenir de sus hijos y su propio decoro.

--Si su merced no diera oídos a chismosos, lengua largas, se ahorraría más de un disgusto.

--Sucede, niña, que esta vez el chisme viene bien con lo que yo vi con estos ojos y oí con estas orejas que se han de comer la tierra.

En el calor de la discusión la muchacha había cobrado aliento y dijo:

--¿Qué ha podido ver ni oír su merced que no sea un chisme? Vamos, dígalo.

--Cecilia, lo que yo veo claro como la luz del día es que a pesar de mis amonestaciones y de mis consejos, tú buscas tu perdición como la mariposa la luz de la vela.

--Y si cierta persona, que es a quien su merced se refiere, se casa conmigo, me colma de riquezas y me da muchos túnicos de seda, y me hace una señora y me lleva a otra tierra donde nadie me conoce, ¿qué diría su merced?

--Diría que ese es un sueño irrealizable, un disparate, una locura. En primer lugar él es blanco y tú de color, por más que lo disimule tu cutis de nácar y tus cabellos negros y sedosos. En segundo lugar, él es de familia rica y conocida de La Habana, y tú pobre y de origen oscuro... En tercer lugar... Pero, ¿a qué cansarme? Hay otro inconveniente todavía mayor, más grande, insuperable... Tú eres una chicuela casquivana... Mujer perdida, sin remedio. ¡Dios mío! ¿qué he hecho yo para que me castiguen así?

La última exclamación la hizo _seña_ Josefa, ya en pie y con las manos en los oídos, como para no oír por boca de la nieta la confirmación del mal juicio que se había formado acerca de sus opiniones sobre el matrimonio. Cecilia se puso también en pie y quiso seguir a la abuela, sea con la intención de calmarla, sea con la de justificarse, explicando o ampliando su idea; pero se detuvo de repente porque en aquel momento asomó por la entreabierta puerta de la calle el bien conocido rostro de Nemesia.

CAPÍTULO XII

...Pero ponme _esa mano en este pecho._ _¿No sientes en él, Matilde,_ _Un volcán? ¡Pues son mis celos!_

J. J. MILANÉS

--Santos días por acá, entró diciendo muy risueña Nemesia sin llamar a la puerta.

Pero se quedó callada e inmóvil no bien echó de ver la cara y actitud de sus dos amigas. La abuela había vuelto a desplomarse en la butaca, su sitio favorito; la nieta se mantenía de pie, junto a la mesa, en la cual apoyaba una mano, fluctuando visiblemente entre el dolor y la desesperación.

No pudo ser más oportuna la aparición de la amiga en aquellas circunstancias. La anciana había dicho más de lo que la prudencia aconsejaba, y la joven temía averiguar el sentido íntimo de las últimas palabras de la abuela. ¿Qué sabía ella? ¿Por qué usar un lenguaje tan embozado? ¿Abrigaba fundadas sospechas o sólo pretendía intimidar?

La verdad es que en la disputa, con la conciencia alarmada, si no en posesión de hechos, ambas habían avanzado a un terreno resbaladizo, hasta allí vedado para ellas, donde la primera que entrase había de recoger larga cosecha de pesares y remordimientos. Por su parte, no creía _seña_ Josefa llegado el momento de enterar a Cecilia de su verdadera posición en el mundo. Tal vez el lechero se había equivocado respecto de la identidad del joven; tal vez éste meramente pasaba por la puerta de la casa. Si usted quiere conservar la inocencia de una doncella, no la acuse, sin pruebas de haber pecado. Por estas razones _seña_ Josefa, aunque desazonada, y llena de profundo pesar, desde lo íntimo del pecho saludó con alegría la venida inesperada de Nemesia.

Por fortuna también, para sacar a las tres mujeres de su embarazosa situación, llamaron entonces a la puerta de la calle con un fuerte golpe de aldaba, modo desusado de llamar. _Seña_ Josefa, siempre lista para estos casos, corrió a abrir, recibiendo, junto con un saludo profundo, un papel que le alargó un negro ya canoso, vestido decentemente de limpio. Tenía todo el aire de calesero de casa principal. Dada la carta, se marchó diciendo:--No contesta.

No tenía, en efecto, contestación, ni venía dirigida a _seña_ Josefa, sino al «Dr. Don Tomás de Montes de Oca. En mano propia». Llegaba a tiempo de calmar la ansiedad mayor de su espíritu atribulado. Con el auxilio de las gafas, que le alcanzó Cecilia, pudo ella mascullar para sí:

«Muy señor mío: De conformidad con lo que hemos hablado, doy la presente a la portadora, que se le presentará hoy mismo, a fin de que Vd. la explique lo que haya de hacerse en el asunto consabido. Está de más repetirle que responde a todo y que le vivirá eternamente reconocido S. S. S. y amigo Q. B. S. M.[39]

C. de Gamboa y Ruiz.»

Leída una y otra vez la carta para enterarse mejor del contenido, miró por encima de las gafas, primero a la nieta, luego a Nemesia, que se estaba callada a esperar el resultado de aquella escena muda, conocidamente absorbida, y como dudosa del partido que debía tomar. Pero el «hoy mismo» de la carta la obligó a formar una resolución preguntando:

--¿Qué hora es?

--Son las ocho, contestó Nemesia prontamente. Acaban de mudar las guardias de la _suidad_. Como que oigo los tambores _entodavía_.

--¡Qué me alegro! repuso _seña_ Josefa. ¿Estás tú hoy muy de prisa, hija mía? añadió hablando con Nemesia.

--No, señora, ni un tantico. Iba a la sastrería de Uribe en busca de costura. Pero si la vida dura, el tiempo es largo. Iré más tarde. Lo mismo da.

--Ahora bien, hija, tú me vas a hacer un favor: te quedas aquí en la compaña de Cecilia, intertanto doy un saltico a la Merced y vuelvo en un santiamén. ¿Te quedarás?

Sin aguardar respuesta se ciñó de nuevo la correa, se echó el chal de cañamazo por la cabeza y salió a la calle. Y no bien lo hizo cuando Nemesia se volvió de improviso para Cecilia, la cogió por ambas manos y le dijo:

--¿Qué te cuento, china? Acabo de toparme con él.

--¿Con quién? preguntó Cecilia.

--Con tu adorado tormento.

--¿Y qué bienes nos vienen con esa gracia?

--¿Es posible, mujer? Lo dices como si no te importara. Cuando digo que me he topado con él es porque creo que te interesa saber cómo, cuándo y dónde lo he visto. Vengo a buscarte.

--Yo no puedo salir.

--Para estos casos siempre hacen un poder las mujeres de pelo en pecho como tú.

--Mamita puede volver pronto y yo no quiero que me encuentre fuera.

--¿Qué importa? ¿Quién dijo miedo? No es lejos tampoco. Detrás de Santa Teresa.

--No sé qué sacaré yo con ir hasta allá.

--Tal vez un desengaño.

--Pues para eso no voy. No quiero desengaños tan temprano.

--Es preciso que vengas, mujer. Te interesa, te lo repito. Pronto.

--No estoy vestida ni peinada.

--No le hace. En un momento te pones el túnico, te alisas el pelo, te echas la manta por la cabeza y _naide_ te conoce. Yo te ayudaré.

--Nene, ¿cómo dejamos la casa?

--Le echamos la llave a la puerta, y ojos que te vieron ir, paloma torcaza. Vamos, anda. No hay tiempo que perder. Podemos llegar tarde, cuando _haygan_ volado los pájaros.

--Me da vergüenza salir a la calle de trapillos.

--_Naide_ te verá. ¡Hombre! Ni que fueras a perder por eso el casamiento. ¿Vienes? Sería una lástima llevarnos chasco.

--¿Qué será? pensó Cecilia entrando en el cuarto para prepararse, como lo hizo, en un dos por tres.

Había logrado Nemesia despertar la curiosidad y aún la alarma en el ánimo de la amiga, y de antemano saboreaba el placer de verla morir de celos.

Bastante trabajo costó a las dos muchachas el cerrar la puerta con llave. La oxidada cerradura estaba fija en el ángulo del marco y la traviesa a un lado, el picolete adherido a su armella en la hoja macho al otro, mal ajustado en la alcayata que le servía de apoyo, y de consiguiente no entraba el cerradero en la hembrilla para que hiciera presa el pestillo. Al fin, lograron su objeto, haciendo uso Cecilia de más maña que fuerza; y echaron a andar a paso menudo, bajo la sombra de los tejados, en dirección del sur de la ciudad.

Detrás de las tapias del convento de Santa Teresa, opuesto a una casa de ventanas de poyo alto y rejas voladizas, había parado un carruaje, al cual se veían enganchados tres caballos apareados, de frente para la calle de la Muralla. El calesero montaba el de la izquierda, armado de machete largo y demás adminículos del oficio, en son de marcha. Al estribo inmediato a la acera había un joven dando los últimos adioses a una señorita en traje de viaje, que se hallaba sentada a la derecha de un caballero entrado en años y de aire respetable.

Ocupaba el poyo de la ventana mencionada un grupo compuesto de varias señoras y caballeros, todos conocidos nuestros; es decir, la familia Gámez, Diego Meneses y Francisco Solfa, despidiéndose de Isabel Ilincheta que, en unión de su padre, se volvía para Alquízar. Casi a un tiempo todos aquéllos le dirigían la palabra desde la ventana y ella les contestaba, asomando a veces la cabeza por debajo del capacete, sin desatender el joven al estribo, que apoyaba en él un pie mientras asía con la mano izquierda la abrazadera del quitrín.

En esto llegaban las dos muchachas por la parte del norte de la calle. Desde lejos reconoció Cecilia al joven que hacía de lacayo, Leonardo Gamboa. Y aunque no había visto todavía a la dama del carruaje, ni a derechas la conocía tampoco, adivinó quién podía ser. Andando, andando, formó la resolución de dar un buen susto a los dos, tal que les sirviera de castigo, si no de saludable escarmiento. Para ello, adelantose a su compañera, le pegó un fuerte empellón a Leonardo, que, por no estar prevenido, perdió el equilibrio, resbaló y dio de costado en la concha del quitrín, a los pies de la sorprendida dama. Esta, ignorante de lo que pasaba, o juzgando que aquello no era más que una broma, aunque pesada, sacó la cabeza por debajo de la cortina para ver a la agresora, en cuyo momento, creyendo reconocerla, entre asustada y reída, exclamo:--¡Adela!

En efecto, Cecilia, sin el disfraz, pues se le había rodado el embozo a los hombros, la negra cabellera flotando, sólo sujeta a la altura de la frente por una cinta roja, con las mejillas encendidas y los ojos chispeantes de la cólera, era el trasunto de la hermana menor de Leonardo Gamboa, aunque de facciones más pronunciadas y duras. Mas ¡ay! reconoció ella pronto su error. Apenas se cruzaron sus miradas, aquel prototipo de la dulce y tierna amiga se transformó en una verdadera arpía, lanzándole una palabra, un solo epíteto, pero tan indecente y sucio que la hirió como una saeta y la obligó a esconder la cara en el rincón del carruaje. El epíteto constaba de dos sílabas únicamente. Cecilia lo pronunció a media voz, despacio, sin abrir casi los labios:--¡Pu...!

Nemesia se llevó por fuerza a Cecilia, Leonardo se incorporó como pudo, el señor Ilincheta dio la orden de marcha, el calesero pegó con el pie en los ijares del caballo de varas, dejando caer al mismo tiempo la punta del látigo en las espaldas del de fuera y el carruaje partió a buen paso, con lo que a poco más se perdió de vista en la esquina de la calle inmediata, por donde torció a la derecha en dirección de la puerta de las murallas de la ciudad, llamada _de Tierra_. En vano las señoras y caballeros en el poyo de la ventana esperaron ver alzarse la cortina del postigo posterior del quitrín y asomar el pañuelo blanco para decir el último adiós. Ni aquélla se movió, ni apareció éste tampoco, pregonando el hecho, desde luego, la desagradable impresión que había producido el lance en el ánimo de los desapercibidos viajeros. Mas todavía cuando recapacitaron en lo que acababa de suceder, ya no estaban allí las mulatas, ya había desaparecido Leonardo juntamente con el carruaje.

En la calle de la Merced, cerca del convento de este nombre, como quien va para la alameda de Paula, sobre la mano derecha, hay una casa de azotea, la única de la cuadra. La entrada, aunque amplia, pues admitía hasta dos carruajes en fila, no era de las llamadas propiamente de zaguán. Delante de la puerta había estacionada una mala volante a la que se hallaba enganchado entre varas, un caballo que para no desdecir de aquélla tenía más de Rocinante que de Bucéfalo. Encaramado allá en la alterosa silla, hecha así por la multitud de sudaderos para mejor resguardo de los lomos de la bestia, descansaba a horcajadas el calesero negro, cuyo traje y aspecto no desdecían un punto del resto del equipaje. Mientras esperaba por el dueño, o dormía, o tenía en la mollera más aguardiente del necesario, porque le costaba trabajo mantener la cabeza erecta y alta, antes daba a veces con la frente en el pescuezo del caballo, que por su inmovilidad parecía de piedra.

Se le acercó _seña_ Josefa por el lado de dentro y le dirigió la palabra repetidas veces, sin lograr que despertara o diera señales de vida. Bien es que ella, por respeto o por natural timidez, ni alzaba bastante la voz, ni osaba tocarle. No sabía su nombre tampoco, pero sospechando que se llamaba José, le dijo éste repetidas veces en tono cariñoso:--José, José, Joseíto, ¿está ahí el Doctor?

Medio se incorporó el negro en la silla, e hizo muecas horribles en el afán de abrir los ojos, casi cegados por el polvo blanco de la calle, y dijo al fin:--_Yo no me ñama José, me ñama Ciliro, y mi amo el Dotor está ahí aentro, si no ha salío. Dentre, dentre._

Después de darle las gracias al amable calesero, entró, en efecto, la anciana. Había en la sala varias personas de aspecto pobre y ambos sexos esperando por el médico, el cual en aquel momento no se hallaba presente. _Seña_ Josefa le conocía, y desde luego le buscó por todas partes con cierta inquietud, pues tal vez había salido; aunque el hecho de la volante a la puerta y la presencia de los pacientes en la sala, indicaban que si estaba fuera de casa, no era para la visita ordinaria de enfermos que giraba todos los días después de almuerzo. Al fin alcanzó a verle en el patio, inclinado sobre un hombre que, sentado en una silla, emitía de cuando en cuando quejidos apagados, más dolorosos, por donde se conocía que el Doctor ejecutaba una operación quirúrgica difícil. Era Montes de Oca cirujano hábil, no cabe duda, al menos atrevidísimo en el manejo de la cuchilla, tajando carne humana como quien taja hogazas de pan, siempre, es verdad, con acierto, tal vez por la misma sangre fría con que ejecutaba esas operaciones carniceras. Cuéntase, en efecto que en cierta ocasión le abrió el vientre a un individuo para extirparle un absceso que se le había formado en el hígado, y que lo ejecutó con la mayor fortuna, pues no se le murió el paciente entre las manos, sino que sanó, al menos de aquella dolencia. Eso sí, era tan hábil como interesado y codicioso de dinero. A nadie curaba de balde; ni se movía de su casa sino para hacer visitas de paga al contado violento, o con promesa explícita de que se le pagaría bien su habilidad, reconocida generalmente, tarde que temprano.

Conoció luego _seña_ Josefa que había terminado la operación, así porque había cesado de quejarse el paciente, como porque el Doctor, alzando el instrumento con que la había ejecutado, dijo:

--¡Ea! ya está Vd., despachado. Vea lo que tenía en el oído: un frijol, como un garbanzo, pues con la humedad de esa parte creció dos tantos de su natural tamaño.

--Gracias, Doctor, mil gracias. Dios se lo pague y le dé mucha salud. No sabe Vd. cuánto me ha atormentado ese frijol en el oído. Hacía más de diez días que no dormía, no comía ni...

--Lo creo, le interrumpió el Doctor con aire triunfante y no poco receloso. Buen trabajo me ha costado extraerle el cuerpo extraño. Luego, la parte esa es tan delicada, que por poco que me fallase el pulso podían resbalarse las pinzas y dañarle el tímpano del oído y dejarle sordo por el resto de sus días. Bien. Ahora me paga Vd. mi trabajo, se marcha a casa y se da unos bañitos de cocimiento de malvas con unas gotas de láudano para calmar la irritación...

--¿Cuánto le debo Doctor? preguntó el hombre temblando, no ya del dolor, sino del recelo de que le pidiesen mucho dinero por una operación ejecutada, y eso brevemente.

--Media onza de oro, contestó Montes de Oca con sequedad e impaciencia.

No tuvo el hombre más remedio que meterse la mano en el pantalón y sacar un pañuelo nada limpio, en una de cuyas puntas tenía atadas varias monedas, que ciertamente no hacían mucha mayor suma de la que había exigido el cirujano por la curación. Volvía éste para la sala, como acostumbraba con la cabeza baja y el hombro derecho derribado, cuando se encontró de manos a boca, cual se dice, con _seña_ Josefa, a la que preguntó con su voz gangosa:

--¿Qué quiere Vd. buena mujer?

Por toda respuesta _seña_ Josefa le alargó la carta de recomendación.

--¡Ah! agregó el cirujano después de haberla leído. Tenía ya noticias de esto. El mismo señor don Cándido estuvo aquí bien temprano y me habló del asunto. Pero debo decirle a Vd. lo que a él le dije, a saber: que no he visto aún a la enferma, que no conozco el caso y que sin conocerlo tendría que ser adivino para decidir lo que deba hacerse.

--¿No le contó el señor don Cándido, se atrevió a observar la anciana, toda temblorosa, que el caso es desesperado, digo, que no da espera, porque depende la vida o la muerte...?

--Sí, sí, la interrumpió el cirujano. Algo me dijo sobre eso el señor don Cándido. El caso es que no puedo atender a todo. Si me dividiese en diez me parece que no daba avío. ¿Ve Vd. los que aquí aguardan por mi? Pues fuera me esperan muchos más, y todos con premura. Estimo al señor don Cándido, sé que es generoso, desprendido y que sabe agradecer los favores que se le hacen. Deseo, puedo y está en mi mano servirle; creo que si le sirvo esta vez, ha de pagármelo bien. Mas Vd. es mujer racional, conocerá que necesito tiempo, que debo examinar por mí mismo el caso antes de aventurar un diagnóstico. Tal vez no tenga cura, tal vez sea peor el remedio que la enfermedad. No soy el médico brujo que a ciegas decidía y así salía ello. Sin embargo, quizás Vd. pueda darme mejores informes de lo que ha podido el señor don Cándido, que, por lo que entiendo, conoce el caso de oídas. ¿Quién es la enferma?

--¡Mi hija!, señor don Tomás.

--¿Hija de Vd. eh? ¿Qué edad tendrá ahora?

--Va en los treinta y siete.

--Vamos, no es vieja. Hay ahí cuerpo todavía, y habrá resistencia. ¿Qué tiempo hace que enfermó?

--¡Ay, señor! Mucho tiempo, la vida de un cristiano, hará ahora dieciocho años más bien más que menos.

--No, no quiero decir eso. ¿Desde cuándo entró en el hospital de Paula?

--Poco después de haber enfermado. Hace ahora algo menos de diecisiete años, porque la niña tendría unos dos meses de nacida cuando, por no poderla sujetar en casa, me vi obligada a ponerla en el hospital de Paula, según me aconsejó el médico Rosaín. Ya puede imaginar el señor Doctor lo que me costaría esta separación. Se me arrancó el alma...

--De suerte, añadió pensativo Montes de Oca, de suerte que la niña...

--¿Mi nieta? dijo _seña_ Josefa.

--Sí, su nieta de Vd., hija de la enferma, ¿tendrá...?

--Va en los dieciocho años de edad.

--¿Y qué tal?

--A Dios gracias, buena y sana.

--No, no es eso. Pregunto que qué figura tiene, qué tal parece la muchacha.

--¡Ay, señor Doctor! su figura y su parecer son los que van a acabar conmigo antes de mucho tiempo. Aunque me esté a mal el decirlo, es lo más lindo en verbo de mujer que se ha visto en el mundo. Nadie diría que tiene de color ni un tantico. Parece blanca. Su lindura me tiene loca y fuera de mí. No vivo ni duermo por guardarla de los caballeritos blancos que la persiguen como moscas a la miel. Me tiene sin sombra.

--¿Y esa muchacha encantadora acompañaría a la enferma si la sacamos del hospital?

--Si el señor Doctor lo cree conveniente, me parece que sí la acompañaría.

--De convenir, creo que convendría y mucho; pero se ofrece una dificultad. Veamos. ¿Qué tiempo hace que no se ven la madre y la hija?

--¡Qué! Hace una pila de tiempo. Más de diecisiete años.

--¿Tanto? Malo. ¿Pero Vd. u otro le habrá hablado a menudo a la madre de la hija y a la hija de la madre?

--A la madre sí le he hablado frecuentemente de la hija, cada vez que he ido a verla; a la hija nunca de su madre. Estoy por creer que no sabe que existe.

--¿Conque no se ha intentado nunca el que se vean la madre y la hija?

--Nunca.

--Mal hecho.

--Así creí yo, pero el señor Doctor Rosaín, que fue quien la asistió en el parto y después del parto, me aconsejó que las separase, y después que a la madre se le remató el juicio, me repitió que no le hablase de eso a la hija, porque querría verla y era fácil que la loca en uno de sus arrebatos la ahogase con sus propias manos. Pues es preciso que sepa el señor Doctor don Tomás, que tomó la locura con la hija, diciendo que como había nacido blanca tenía a menos el tener madre de color.

--Vaya, pues. Se equivocó Rosaín. Es un buen médico, no se puede negar, sólo que en este caso me parece que perdió los papeles o que se le fue el santo al cielo. Si la madre y la hija se ven de repente, después de una larga separación, tal vez se efectúe una reacción, y las enfermedades se curan con reacciones o revulsiones, no con medicinas, particularmente aquéllas en que aparece afectado el sistema nervioso. Somos todo nervio, nada más que nervio. Irritados los nervios cate Vd. la locura. Estaba pensando... Se había pensado llevar la enferma al campo, a una finca que poseo cerca del puerto de Jaimanitas, a fin de ver si cambiando el aire y dándose unos baños de agua salada, se lograba la revulsión que se busca. Pero es que la hija no puede ir allá con la madre. Figúrese Vd. que en esa finca, en el ingenio de Jaimanitas, digo, tengo sociedad con los Padres Belenitas. Lo administran y muchos de ellos se pasan en él buenas temporadas, en particular durante la molienda. ¿Qué escándalo no se armaría con la aparición de una joven tan linda, como Vd. dice, en medio de aquellos benditos Padres? ¡La tentación! Dios nos libre. Más de uno de ellos perdería el juicio y se diría que yo tenía la culpa... Mas ya veremos modo de arreglar eso. Vuélvase Vd. por acá pasado mañana, que yo veré a la enferma entre tanto y diré a Vd. lo que haya de hacerse. Quiero servir al señor don Cándido, puedo servirle, y me parece que será con beneficio de todos los interesados.

CAPÍTULO XIII

La alegría del corazón conserva la edad florida, la tristeza seca los huesos.

Parábolas de Salomón.

En la época de que venimos hablando, eran _rara avis_ los dentistas de profesión en La Habana. Siguiendo aquel refrán castellano que enseña: al que le duele la muela que se la saque, el oficio o arte dental lo ejercían, por la mayor parte, en las poblaciones, los barberos; en los campos los cirujanos, quiénes armados con el potente gatillo de acero, no dejaban diente ni muela con vida.

Había también sacamuelas intrusos o aficionados. Entre éstos, uno de nombre Fiayo se había hecho célebre por la destreza y habilidad con que ponía las raíces al aire y sin dolores de esos apéndices de la masticación. Su fama y popularidad, sin embargo, provenían del hecho, primero, de no emplear instrumento quirúrgico de ninguna clase; segundo, de no llevar dinero por sus mágicas operaciones dentarias.

La hija mayor de los señores Gamboa, Antonia, hacía tiempo venía padeciendo de una neurosis de carácter agudo a la cara, cuyo asiento en la mandíbula superior daba lugar a presumir tenía por causa la carie de un molar. Los médicos consultados, después de probar la aplicación de apósitos, sanguijuelas, enjuagues y cabezales, sin fruto aparente, decidieron se hiciera la extracción. Pero la idea no más de que para llevarse a efecto había de emplearse el temible gatillo, ocasionaba sudores y desmayos en la dolorida joven.

Por aquellos días llegó a La Habana, desde el campo, el mágico dentista Fiayo, y, como de costumbre se hospedó[40] en casa del Doctor Montes de Oca. No bien llegó a oídos de doña Rosa la noticia, cuando dispuso la engancharan el quitrín, y sola, con la hija doliente, se dirigió a la calle de la Merced. Llena estaba la sala de pacientes, unos en solicitud de los consejos o remedios del médico, otros de los servicios del famoso sacamuelas. Este ocupaba el segundo cuarto, cuya puerta y ventana daban al patio, y era por eso el más claro y a propósito para las operaciones de la boca. Allí tenía una silla común de madera, en que hacía sentar al paciente con la cara para el este, y en un dos por tres ponía al aire las raíces de la muela o el diente que le indicaba el interesado. Sucedía a veces que encontraba mayor resistencia de la que podía vencer con la fuerza del pulgar y del índice de la mano derecha; en cuyo caso, disimuladamente metía ésta en la faltriquera del chaleco, cual si pretendiera enjugársela, se armaba de una llavecita de hierro, convertía el paletón en gatillo, el tronco en palanca, y el éxito era instantáneo y seguro.

La entrada de doña Rosa Sandoval de Gamboa con su hermosa hija Antonia no causó poca sorpresa en las personas presentes en la sala, principalmente en Montes de Oca, que si bien era el médico de palacio y gozaba de extensa y merecida fama, no estaba acostumbrado a que le consultasen en su propia casa, señoras tan distinguidas y en la apariencia ricas. Tamaña condescendencia y amabilidad no podían menos de obligar a un médico de las condiciones y calidades del que tratamos ahora; así fue que, abandonando desde luego a sus pacientes, salió a recibir y atender a las recién llegadas. No conocía él sino de nombre y de vista a doña Rosa, a pesar de la estrecha y antigua amistad que le ligaba con su marido. Pero a tiempo de acercársele y hacérsela presente, le pasó por la mente que tal vez la inesperada venida de aquella respetable señora tenía que ver algo con la enferma del hospital de Paula, de la cual hablaba precisamente con la anciana _seña_ Josefa, en los momentos en que entró en la sala. Y una vez metido este extraño pensamiento en su cabeza, ya no hubo forma de sacarle de ahí.

--La señora esposa de mi caro amigo el señor don Cándido Gamboa y Ruiz, si no estoy equivocado, dijo Montes de Oca.

--Servidora de Vd., contestó secamente doña Rosa.

--Yo lo soy de Vd. muy atento. ¿Y ésta es su señorita hija de Vd.?

--Sí, señor.

--Bien se conoce. Hermosa niña. Dios se la guarde. Tengan la bondad de pasar adelante y sentarse.

--No hay necesidad, dijo doña Rosa. Vd. es persona muy ocupada, y luego venía solamente...

--Lo adivino, lo sé, mejor dicho, y perdone que la interrumpa, dijo Montes de Oca con desusada oficiosidad. Me complace el ver que Vd., también se interesa por la salud de la enferma en el hospital de Paula. Tanta bondad y nobleza de alma son mucho de celebrarse. Lo veo, lo comprendo perfectamente, desea Vd., conocer cuanto antes cuál es mi diagnóstico acerca del estado de la pobre muchacha. Es de celebrarse.

No teniendo noticias de semejante enferma, la madre y la hija se miraron azoradas, azoramiento que el médico no sólo no entendió, sino que lo interpretó por uno de aquellos sentimientos de admiración mezclados de gratitud que sienten las personas

bien criadas cuando les adivinan sus pensamientos y se anticipan a sus caros deseos. Halagada de este modo su vanidad, continuó diciendo, cada vez más satisfecho de su penetración:

--Diré a Vd., señora mía, con gran sentimiento, lo mismo que acabo de decirle a la anciana madre de la enferma, con quien me ha visto Vd., hablando hace poco. No es nada favorable mi diagnóstico. Con Vd. aun puedo ser más franco que con la madre. Ahí no hay ya fuerzas, sujeto, como decimos; quedan sólo alma en boca y huesos en costal, según se dice de los bozales recién llegados de Guinea. Su mal trae origen de una meningitis aguda, superveniente de un susto, que bajo el influjo de una fiebre puerperal, la privó del juicio y produjo un desorden general del sistema nervioso, cuyo estado ha pasado a crónico, para el que hasta ahora no se conoce remedio en la ciencia médica. En el día los síntomas más marcados son los de una consunción lenta, ya en el último período, cuyo término puede ser más o menos cercano, pero cierto y fatal que, o mucho me engaño, o no podría alargar una hora, un minuto el mismo Galeno[41] si para ello solamente volviese al mundo. Esta clase de enfermos acaban como las velas así que se evapora el sebo de que están hechas. Se apagará su vida el día y a la hora menos pensada. Lo peor de todo, _misea_[42] Rosa, es que ya es demasiado tarde para sacarla del hospital. Corremos riesgo de que se nos quede muerta entre las manos, que se apague la vela en cuanto le dé el aire libre del campo. Siento mucho no poder llenar los deseos del señor don Cándido...

En este punto hizo Rosa un movimiento de sorpresa que llamó la atención aun del embebecido médico, obligándole a dejar trunca la frase. No era para menos la especie. Mujer más joven, menos precavida que ella, habría hecho una exclamación demostrando mayor desazón y cólera. De tal naturaleza fue, sin embargo, la impresión que le causaron las últimas palabras de Montes de Oca, que cambió de color, poniéndosele rojo en el primer instante el rostro, y luego pálido, y desapareció, por supuesto, la plácida expresión con que había estado escuchando el ininteligible diagnóstico. Aunque de origen bien diverso, la misma sensación de extrañeza experimentó Antonia. No comprendía ésta, es cierto, por su juventud y ninguna experiencia, toda la malicia que podía encerrar el hecho de que su padre desease sacar del hospital de Paula a una muchacha enferma y desconocida para toda la familia, con el objeto de que se curase en alguna otra parte. Pero no se hallaba doña Rosa en el mismo caso. Lo que era oscuro e insignificante para la hija, era un mar de luz para la madre, la verificación de continuas sospechas, el aguijón de celos antiguos y siempre vivos. ¿Quién podía ser aquella moza, ni qué clase de relaciones tenía o había tenido con ella su esposo, que estaba empeñado en sacarla del hospital de Paula por medio del médico Montes de Oca? Debía de ser una mulata, pues que su madre era casi negra. Se hallaba gravemente enferma, el médico la había desahuciado, estaría hecho un esqueleto, fea, asquerosa, moriría ciertamente en breve; pero había sido su rival, había gozado a la par con ella del amor y de las caricias de Gamboa.

¿Por qué disposición del cielo averiguaba en la hora postrera un secreto tras el cual venía corriendo hacía más de una década? Ya era poco menos que inútil la venganza. La muerte se interpondría en breve entre la esposa y la manceba. ¡Qué desesperación! ¡Qué tumulto de pasiones! ¡Qué atar y desatar de cabos sueltos, ocultos mas no olvidados en los rincones del pensamiento! Quería hablar, gritar, desahogar de alguna manera su corazón oprimido. ¡Cuánto alivio no la habrían proporcionado las lágrimas! Cristiana y discreta como era doña Rosa, sin duda hubiera dado en aquel instante la mitad de su vida por retrotraer los sucesos al año 13 ó 14, en que, joven todavía, llena de fuerza y de encantos personales, con menos cordura y calma, la hubiera sido fácil, plausible, hacer valer sus derechos de esposa, de madre y de señora.

Mientras revolvía todas estas cuestiones en la cabeza, obra que no le costó muchos minutos, sino segundos de tiempo, y sentía que la sangre se asomaba toda a sus mejillas, pasole por la mente lo de la niña en la Casa Cuna y su lactancia por María de Regla, la esclava ahora de enfermera en el ingenio _La Tinaja_; y dedujo, por necesaria consecuencia, que esa historia se relacionaba estrechamente con la mujer enferma en el hospital de Paula. ¿Buscaba, pues, Gamboa salvarle la vida a la madre de su hija bastarda? ¿Quién sería ésta? ¿Vivía aún? ¿La reconocía como tal el padre? Fuerza era averiguarlo. Tal vez Montes de Oca estaba enterado. Haciendo un esfuerzo supremo, logró dominar la agitación ya a punto de embargarle los sentidos; y decidió apurar hasta las heces la copa de la curiosidad y de los celos. Así, tomando de nuevo el hilo de la conversación con Montes de Oca, que mostraba deseos de manifestar cuanto sabía, dijo:

--Yo también siento en el alma que no se pueda hacer nada de provecho con la pobre...

--Rosario Alarcón, sugirió el médico, viendo que doña Rosa titubeaba.

--Rosario Alarcón, repitió ésta. Lo más presente que yo tenía. Mi memoria es flaca en esto de recordar nombres. Se lo dije a Gamboa que ya era demasiado tarde y no dudo que el desengaño le causará un verdadero pesar. Luego la hija, así que lo sepa...

--En cuanto a eso, repuso prontamente Montes de Oca, pierda Vd. cuidado, _misea_ Rosa. La abuela ha tenido la habilidad de ocultarle a la hija hasta la existencia de la madre enferma.

--¡Es posible! exclamó doña Rosa. Parece increíble...

--Nada más fácil, continuó el médico. Esto es, repito lo que me ha contado la anciana que acaba de salir de aquí y que yo no hallo absurdo. Supongo que Vd. no ignora que cuando pusieron en Paula a la Rosario Alarcón, la hija era una chiquilla, sin uso de razón para echar de menos a una madre a quien después no ha visto.

--Con que la hija, una mujer hecha y derecha...

--Y muy linda, sin desdoro de los presentes, dijo Montes de Oca, cortando otra vez la palabra a su interlocutora para interpretar a su manera un pensamiento no más que indicado.

--Quiere decir, dijo doña Rosa, que Vd. conoce a la mozuela. Estaría aquí con la abuela.

--No, señora, no la he visto nunca. Hablo por boca de ganso, repito lo que me ha contado la abuela. Mejor dicho, no la veo desde el primero o segundo mes de nacida, cuando la Real Casa Cuna o de Maternidad estaba situada en la calle de San Luis Gonzaga, cerca de la esquina de la del Campanario Viejo.

--Luego tal es la niña para cuya crianza se tomó en alquiler a mi esclava María de Regla.

--Puede ser, yo no sé de eso jota.

--¿Cómo que no, si por orden de Vd. se me pagaron las dos onzas mensuales del alquiler mientras duró la lactancia de la susodicha niña?

--¿Por orden mía? Perdone Vd. _misea_ Rosa. No tengo idea de semejante inquilinato, y, por supuesto, de la tal mensualidad. ¿No estará Vd. equivocada?

--Vaya, señor Doctor, repuso doña Rosa. ¿Es olvido o pura modestia de Vd.?

--Ni lo uno ni lo otro, mi señora. Positivamente no tengo noticias de lo que Vd. dice.

--Así será, dijo al fin doña Rosa advirtiendo que el médico se ponía en guardia. Comprendo lo que pasa por Vd.: no quiere que se hable más de este asunto. No añadiré palabra. Eso no obsta para que yo le manifieste mi complacencia por el uso que hizo Vd. de los servicios de mi esclava, cuando se le ofreció sacar de apuros a un amigo. Permítame le agregue, ya que se presenta la ocasión, que me negué a tomar un peso por el alquiler de la criatura, y que si al fin recibí el dinero fue porque se me dijo que de otro modo Vd. no la aceptaba.

Guardó silencio Montes de Oca. Únicamente inclinó respetuoso la cabeza como hombre que, cogido en un fallo, y sin salida plausible ni medios de defensa, se resigna y aguarda la sentencia. Pero lo poco que negó fue precisamente aquello de que debía estar más convencida doña Rosa, es a saber, del inquilinato de la nodriza y del salario que por ello la abonaron mes a mes, durante cierto tiempo. En lo que sí se equivocaba lastimosamente era en dar por hecho que Montes de Oca había sido el contratante y pagado el dinero del supuesto alquiler. Sobre este particular importante había sufrido dicha señora un engaño: ¡su marido no le había dicho la verdad!

Ahora bien: a la vista de la persistente negativa del médico, ¿salió doña Rosa de su error? Difícil es la comprobación en tales casos, y por lo mismo nos limitamos a decir que, aclarados ciertos particulares oscuros sobre la mujer enferma y las relaciones que con ella y con la hija tenía su marido, lo demás se caía de su peso, se infería sin esfuerzo, y no era digno de una señora el informar a una persona extraña de secretos de familia que quizás realmente ignoraba. Desistió, pues, del ataque y concluyó pidiendo al médico que la perdonase las molestias que le había ocasionado, sirviéndose decirla si Fiayo se hallaba dispuesto a examinarle la boca a su hija Antonia. Por sentado que lo estaba, y se ejecutó la operación con toda felicidad. Después, don Tomás Montes de Oca tuvo la cortesía de acompañar a las dos señoras hasta el estribo del carruaje y de ayudarlas a montar en él. Y una vez sentada y emprendida la marcha en vuelta de la casa, doña Rosa se cubrió la cara con las manos y dio a llorar y sollozar sin medida ni consuelo; todo esto con extrañeza grande de la hija, quien, ocupada de su propio dolor físico, no había echado de ver la transformación del semblante de su madre así que se alejó de la presencia del médico.

Conviene advertir aquí que a consecuencia de un disgusto con su padre por la salida a la calle tan de madrugada, según hemos referido ya, Leonardo hacía tres o cuatro días que no paraba en su casa, sino en la de una tía materna. Esto contribuyó a aumentar el pesar de doña Rosa. No sólo se negó a sentarse a la mesa, lista para el almuerzo, sino a darle explicación alguna a

don Cándido sobre los motivos de su sentimiento. En medio del llanto y de los suspiros, pronunció varias veces el nombre del hijo favorito, razón por qué las hijas, suponiendo que la ausencia de éste era la causa original de sus lamentos, despacharon a Aponte en su busca con el carruaje. Vino el joven, y al punto doña Rosa, rodeándole con sus brazos, le cubrió la frente de besos y de lágrimas. Dábale entre tanto los epítetos más cariñosos y le decía:--Hijo del alma, ¿dónde estabas? ¿Por qué huías de las caricias de tu madre? Mi amor, mi consuelo, no te apartes de mi lado. ¿No sabes que tu triste madre no tiene otro apoyo que el tuyo? Tú no mientes, tú dices siempre verdad, tú eres el único en esta casa que conoce lo que vale una madre y esposa leal. Mi vida, mi corazón, mi fiel amigo, mi todo ya en el mundo, ¿qué, ni quién tendrá bastante poder ahora para arrancarte de mis brazos? Sólo la muerte.

Al fin esta señora, casada, madre de familia, halagada por los dones de la fortuna y de la naturaleza, al llegar a su casa se encontró rodeada de varias personas que le eran muy queridas, que la respetaban y que se apresuraron a enjugar sus lágrimas, a ofrecerle consuelos y distracciones. Al fin, aquella angustia suya, dado que legítima, nacía de un mero desengaño en su vida conyugal, que por la época en que le recibió, bien se conocía que el ángel de su guarda se le había apartado de los ojos hasta la hora en que su conocimiento la fuese menos doloroso. Hasta allí un golpe de celos era lo único que venía a turbar la serenidad de sus días, por otra parte siempre plácidos e iguales.

Pero ¿qué había de común entre el pesar, el desengaño ni los celos de doña Rosa Sandoval de Gamboa, y el pesar, el desengaño y la desolación de la pobre _seña_ Josefa, más desamparada y sola que antes desde el punto que se separó del médico Montes de Oca y volvió a cruzar el umbral de su casita en la calle del Aguacate? Con razón pudo entonces exclamar con el salmista:--Venid, cielos y tierras, aves que pobláis el aire, peces que llenáis las aguas, brutos que holláis los campos, y decidme: ¿Hay dolor comparable con el dolor mío?

Nadie le preguntó por qué lloraba y se mostraba tan afligida. Cecilia, a quien encontró allí de vuelta, estaba harto disgustada para pensar en los disgustos ajenos. Nemesia también guardó un profundo silencio, diciendo sólo al despedirse de las dos:--Hasta después. Aun la imagen de la Virgen en el nicho, frente a su butaca, parecía que no debía ofrecerla esta vez consuelo. Transida por el dolor de la espada que le atravesaba el pecho, dirigía hacia otra parte sus amorosos ojos.

Y tal fue, después de todo, la indicación oportuna que recibiera _seña_ Josefa en medio de su pavorosa soledad. La madre del Salvador del mundo, en los momentos de perderle enclavado en una cruz, claramente le enseñaba con su resignada, sublime actitud, que hay dolores tan grandes para los cuales no se encuentra consuelo aquí abajo, sino allá arriba, ¡en el cielo!

CAPÍTULO XIV

Meditando su pena _Dentro del pecho el corazón se abrasa:_ _El fuego desordena_ _Los límites y pasa:_ _Y suelta ya la lengua, hablé sin tasa._

GONZÁLEZ CARVAJAL

La extraña conducta y las frases irónicas de su cara esposa traían alarmado a don Cándido Gamboa. Nunca había usado ella un lenguaje tan sarcástico. Por el contrario, en sus arranques de celos siempre había pecado por franca y desembozada. ¿Qué había averiguado de nuevo? ¿Dónde había estado aquella mañana, que la produjo tal cambio?

No entraban en el carácter, ni en las ideas de honor y dignidad de don Cándido el pedir a su esposa la explicación del misterio, menos a los hijos con quienes pocas veces hablaba, mucho menos a los criados, alguno de los cuales sabía más secretos de la familia de lo que convenía a la paz y a la dicha del hogar. Hombre de mundo y astuto, creyó que podía dejar al tiempo y a la indiscreción de la mujer o de los hijos el salir de dudas más tarde o más temprano.

Adoptó, eso sí, mayor cautela, observó con doble atención; y he aquí la sola novedad que se operó en su conducta en adelante respecto de su familia. Ni tuvo que mantener larga espectativa tampoco, porque días después, en la mesa del almuerzo, se habló de la neurosis facial de Antonia y del alivio que sentía después de la extracción de la muela por Fiayo. No necesitó de más don Cándido: su mujer había estado en casa de Montes de Oca, donde era notorio que aquél paraba y ejecutaba sus operaciones dentarias.

Precioso dato éste; sólo que, en vez de ayudarle a resolver el enigma, contribuyó a desorientarle y hasta cierto punto a adormecer sus recelos. Porque no cabía en su cabeza que el médico hubiese hablado a su esposa de la moza enferma en el hospital de Paula. Por flojo de lengua que le supiese, no podía imaginar siquiera que llevase la candidez (malicia no era) al extremo de

comunicar a una persona extraña que veía por la primera vez, un asunto con el cual no tenía relación ni interés alguno. ¿Con qué motivo, tampoco, suscitar la conversación? Daba por hecho Gamboa, además, que él había hablado al médico sobre la enferma en confianza, y aunque no le había exigido el secreto, se entendía que debía observarse en todas circunstancias.

Ya se ha visto cuán falaces eran todos estos razonamientos de don Cándido. Del mismo erróneo tenor fue la reflexión de que _seña_ Josefa, encontrándose por casualidad con doña Rosa en casa de Montes de Oca, tuvo una explicación, o habló delante de ella de la enferma en el hospital de Paula. En esta persuasión la esperó varias mañanas seguidas al postigo de la ventana de su casa.

Inútilmente. El médico había sido todavía más franco, diríamos más rudo con la anciana que con doña Rosa. De una vez le quitó toda esperanza, cuando en el lenguaje vulgar, no en el de la ciencia, le desahució a la hija. Para una mujer de sus años, agobiada por los trabajos y los pesares, cada vez más descontenta de su nieta, que llevaba, al parecer, el mismo camino de la madre moribunda, era aquella noticia más de lo que su espíritu y su cuerpo podían sobrellevar. Para valernos de sus propias palabras, ya había ella andado la _via crucis_, se hallaba en la cima del calvario, sólo faltaba la _crucificación_, la muerte que compasiva, pondría fin a una existencia ya muy larga para lo que había sufrido, tela inacabable de privaciones y de sacrificios.

De este golpe no se repuso más. Tras el llanto y otras demostracciones de dolor, acudió con doble ahinco que antes, al rezo, a la oración, a la confesión y comunión casi diarias, a la penitencia continua, recayendo al cabo en aquel estado de indiferencia y apatía mental y corporal para los negocios del mundo, que tanto se asemeja a la fatuidad o a la demencia. No parece sino que de repente se le había apagado el fuego misterioso que desde los primeros años de su existencia venía comunicando calor a su sangre, actividad a su espíritu. Porque dejó de ser comunicativa, se encerró en sí misma, descuidó a la nieta, se ocupó solamente de los actos de devoción que eran en ella una segunda naturaleza, un movimiento automático, se echó a dormir, en una palabra, desde entonces, el sueño de la vida.

Tal y tan repentino cambio no pudo menos de llamar la atención de Cecilia, quien, si al principio se aprovechó de él para satisfacer sus pasiones y caprichos, sintió luego mayor compasión y ternura por su abuela. Conociendo que sin enfermedad aparente, el día menos pensado caería muerta, empezó a asustarse y ocuparse más de su propio porvenir. En breve se quedaría sola en el mundo, destituida de parientes, de amigos respetables, de amparo, y redobló sus cuidados con la abuela, fue con ella más amable y servicial de lo que jamás había sido en su vida. Pero sus caricias, sus palabras amorosas, sus asiduos oficios de hija sumisa y tierna no obtenían correspondencia digna de este nombre, no excitaban a veces más que una sonrisa fría y... pavorosa para la inexperta joven, que creía ver en eso un signo de anticipada decrepitud, si no de demencia. Ni era que la anciana había perdido ya la facultad de sentir, porque más de una vez la sorprendió la nieta con las mejillas húmedas de las lágrimas. Si éste fue el estado de _seña_ Josefa inmediatamente después de su última entrevista con Montes de Oca, mal pudo ella acercarse a don Cándido para hablarle de un asunto casi borrado de su memoria.

No era por cierto mucho más llevadera la situación de este caballero. Seguía guardando con él su esposa desusada reserva, tal que rayaba en despego; al paso que, como por pique, hacía con su hijo Leonardo dobles extremos de cariño y de ternura. Cada vez que salía a la calle, le acompañaba hasta el zaguán y allí le despedía con besos y abrazos repetidos. Si volvía tarde de la noche, cosa frecuente, le esperaba anhelosa a la reja de la ventana cual se espera a un amante, y lejos de reñirle cuando llegaba, le besaba y abrazaba de nuevo, como si hubiese durado largo tiempo su ausencia, o corrido un grave peligro fuera de casa. Todo le parecía poco a dicha señora para el hijo mimado. Ocioso es añadir que se anticipaba a sus gustos, que le adivinaba los pensamientos y que acudía a satisfacérselos, no como madre, sino como enamorada, con apresuramiento y afán de pródiga, sin pérdida de tiempo y costara lo que costase. Si al volver de una de sus correrías insinuaba siquiera que se sentía cansado o doliente, ¡santo Dios! ponía ella la casa toda en movimiento, haciendo que las hermanas, los criados, el Mayordomo, todos, no se ocupasen de otra cosa que del alivio y bienestar del enfermo.

Así tuviese don Cándido la calma del buey o la paciencia de Job, por fuerza que habían de cargarle estas cosas; más, hacerle hervir la sangre, no tanto porque la madre contribuía con sus halagos intempestivos a la perversión del hijo, cuanto porque así tiraba a mortificar al padre. Tan hostigado se vio, que la dijo un día:

--Si de propósito te pusieras, Rosa, a perder al muchacho, me parece que no lo harías mejor.

--No eres tú quien puede hacerme el cargo, contestó ella con mucho énfasis.

--No obstante, te lo hago.

--Lo veo, y lo atribuyo a que los hombres pierden a veces el... pudor.

--Dura es la palabra, mas la paso en obsequio de la paz.

--No la pases, si te parece. Lo mismo da.

--Es que se me figura que olvidas que yo estoy tan interesado en este asunto como tú.

--¡Tú interesado! ¡Tú interesado como yo en la buena o mala conducta del niño! Graciosa salida por cierto. Lo dudo, no lo creo, lo niego.

--En vano es negarlo, señora; no sería su padre si otra cosa dijese.

--Pues bien, yo que soy su madre, que le di el ser, que le crié en mis brazos, digo a Vd. que puede excusarse el trabajo de velar por la suerte del niño. El no tiene necesidad de los cuidados de padre, le bastan los de su madre.

--Eso no quita que yo mire con inquietud cómo la madre a posta echa a perder cada vez más al mozo.

--No creo que le importe mucho al padre que se pierda o se salve.

--Me importa más de lo que Vd. se figura, señora mía. Si no llevase mi nombre...

--¡Lindo nombre en verdad, donoso!

--Tan bueno es como el de otro cualquiera. Para mí vale mucho.

--Creería que eso era así si no hubiese visto que Vd. mismo le ha arrastrado por el suelo. Lindo nombre, digo. Esté Vd. seguro que si lo que he sabido ahora lo hubiese sabido hace veinticuatro años, mi hijo no llevaría el nombre que lleva. Pero yo tengo la culpa. No me sucedería esto si me hubiera llevado por los consejos de mi madre, que santa gloria haya.

--¿Y qué os aconsejó vuestra buena madre? ¿Se puede saber?

--No tengo embarazo en decirlo, pues me dijo: hija, no te cases con hombre de opuesta religión o naturaleza a la tuya.

--Lo que tanto vale como decir, me parece, agregó don Cándido bastante mortificado, que a Vd. la pesa ya haberse casado conmigo. ¿Hubiera Vd. preferido a un criollo jugador y botarate? Por supuesto.

Tal vez, repuso doña Rosa con mayor suavidad de tono mientras más punzantes eran sus palabras. Pero jugador o no, es probable que el criollo, el paisano mío, se hubiera portado conmigo con más lealtad y decencia. De seguro que el criollo no me hubiera engañado por el espacio de doce o trece años...

--¡Acabáramos! exclamó Gamboa respirando con más libertad. Protesto contra la acusación. Yo no la he engañado nunca.

--¿Y tiene Vd. valor de negarlo? ¿Quién sino Vd. me aseguró una y otra vez que María de Regla criaba a la hija bastarda de un amigo de Montes de Oca? ¿Quién inventó lo del alquiler de la negra? ¿Quién pagó las dos onzas de oro del supuesto inquilinato mientras duró la crianza de la chiquilla? No, no fue Vd. Fue otro, fue el amigo reservado de Montes de Oca. El dinero, sí, es verdad, no salió del bolsillo de Vd., salió del mío; por mejor decir, me lo quitó Vd., con una mano para devolvérmele con la otra.

--Ladrón, ladronazo; ni más claro ni más turbio, dijo don Cándido tratando de echar la cosa a broma.

--Lo ha dicho Vd. Y de que es exacta la calificación, se prueba con el hecho notorio de haber sido mi caudal mucho mayor y más saneado que el de Vd. cuando nos casamos.

--No tiene Vd., necesidad de recordármelo.

--¡Cómo que no! estalló doña Rosa con entereza. Aún tengo que recordarle otras cosas. Pues debo decirle que en caso igual mi marido el criollo quizás juega su dinero y el mío, pero de seguro que no hubiera gastado un peso en amoríos con mulatas. De seguro que no habría ido a Montes de Oca para que le sacara la manceba del hospital de Paula y se la curase en el campo. De seguro que no se desatinaría por una mozuela cuyo padre verdadero sabe Dios quién es.

--¿Conque todo eso me tenía reservado la señora doña Rosa Sandoval y Rojas?

--He aquí como me explico, continuó ésta sin hacer cuenta de la salida burlona de su marido, el odio, sí, el odio, ni más ni menos, que Vd. siempre le ha profesado a mi hijo. He aquí el verdadero motivo del empeño de Vd., en separarlo de mi lado y mandarlo a comer cebollas y garbanzos en España. Temía Vd. que descubriese lo que su madre acaba de descubrir por una rara casualidad. Temía que le despreciase y tuviese a menos el llevar el nombre de Vd., al ver con sus ojos los cenagales por donde Vd., ha venido arrastrándolo. Temía que se avergonzase e indignara de que su padre, no un criollo jugador y botarate, sino todo un hidalgo español, se la pegaba a su madre con una mulata sucia, que purga sus penas y pecados en un hospital de caridad.

--Espero que Vd. acabe para...

--¿Que yo acabe espera Vd.? le interrumpió doña Rosa sonriendo desdeñosamente. No tengo cuando acabar. ¿Para qué tampoco había de acabar? ¿Ni qué puede decir Vd., si yo lo oyera, en atenuación de su mala conducta con la más leal y consecuente de las esposas? ¿Podría, se atrevería Vd., a negar los hechos que le acusan?

--Negarlos a bulto no, explicarlos sí, y de manera que Vd. misma se convenciese que no soy el malvado que su imaginación la pinta.

--No quiero oír más explicaciones. Sobrado tiempo me ha tenido Vd., engañada con sus cuentos y enredos.

--Veo, pues, que Vd., lo que se propone es desfogar su cólera, no dar oídos a la razón y a la justicia.

--Lo que yo me propongo, señor don Cándido Gamboa y Ruiz, dijo su mujer alzando la voz y con ademán solemne, es que Vd. no continúe derrochando mi dinero ni el de mis hijos en _querindangos_ y en la familia de la querida. Sobre esto y sobre lo de maltratar a mi hijo para que le pague sus desengaños en amor, mi resolución está tomada: o Vd., se enmienda o yo me divorcio.

Con lo dicho don Cándido se retiró a su escritorio callado y serio. Y su retirada la saludó doña Rosa con sinceros aplausos desde el fondo de su pecho. Porque es bueno que se sepa, que mientras duró el vivo diálogo que acaba de leerse, estuvo ella haciendo un grande esfuerzo sobre sí misma, a fin de decir cuanto tenía encerrado en largos años de zozobras y sospechas, antes que sus más nobles sentimientos recobrasen el acostumbrado imperio y se echase a perder la lección que había pensado darle a su marido. Bueno es decir, además, que ella se había casado por amor, no obstante la oposición de su madre, y quizás por eso mismo; y no quería romper con el padre de sus hijos y constante compañero. Después, en los veinticuatro años de matrimonio, no había tenido ocasión plausible de arrepentirse, por mucho que no hubiese sido nunca ejemplar la fidelidad de don Cándido.

También se habrá echado de ver en el curso de la presente verídica historia, que don Cándido, antes y después de casado, como se dice vulgarmente, no había reservado pluma. Bastante galán y de apuesta persona, en su mocedad había sido muy enamorado o mujeriego; y tal era su falta mas de bulto. Pero a pesar de la rudeza de sus maneras y de su poca cultura, había bondad e hidalguía en el fondo de su corazón, prendas éstas que redimían en gran parte aquel defecto. Precisamente porque amaba mucho y bien y era hombre de conciencia, cuando contraía un compromiso, fuera de la naturaleza que fuese, hacía cuanto estaba en su mano por cumplirlo, arrostrando a veces para ello con frente serena las dificultades todas que se le presentaban.

Dieciocho o veinte años atrás, esto es, cuatro o cinco después de casado, va con dos hijos de su legítima mujer, tropezó con una mozuela de singular belleza. Sin saber cómo ni cuándo contrajo con ella relaciones clandestinas; lazo fácil de formar cuando el hombre es joven, rico y buen mozo y la mujer bella, en los quince y de la raza mezclada. De estos necios amoríos resultó una niña, la cual don Cándido se empeñó en salvar, primero de la muerte cuando infante, luego de la miseria, de la oscuridad y de la degradación cuando joven. Un compromiso le metió en otro y otro, no ya sólo respecto de esa niña, sino de su abuela, que pronto tuvo que ejercer con ella los oficios de madre; aunque ninguna de las tres estaba ya en aptitud ni situación de apreciar sus favores ni de reconocer sus costosos sacrificios.

Pasado el tiempo de la efervescencia, el más propicio para las locuras de la mocedad, empezó a turbarle no poco el ánimo el recuerdo de sus debilidades. De esa fecha datan sus luchas tremendas para llenar sus obligaciones de amante y padre adúltero, sin descuidar las sagradas de esposo y honrado padre de familia. Pero los celos de doña Rosa, excitados a lo sumo por el orgullo de raza y de señora casada, por sus ideas sobre la virtud de la mujer y los deberes de la madre de familia, la ocupaban de manera y ofuscaban hasta tal punto su razón, que no la permitían notar que su marido estaba plenamente arrepentido de sus anteriores faltas, y que para enmendarlas ponía todos los medios que estaban a su alcance. Mientras dicha señora, justamente ofendida, le echaba en cara sus extravíos de mozo, no veía que laceraba una a una toda las fibras de su corazón; no veía que ya no existían ni podían existir después los motivos de celos que tanto la habían desazonado; no veía, en fin, que deplorando el pasado desde el fondo de su alma, don Cándido de algún tiempo a esta parte sólo trataba de evitar un gran escándalo, una catástrofe en no lejano

porvenir.

CAPÍTULO XV

Perdí el desamor Con las libertades; Quísele bien luego, Bien le quise, madre. Empecé a quererle, Empezó a olvidarme: Rabia le dé, madre. Rabia que le mate.

L. DE GÓNGORA

Cursaban las horas, los días y las semanas y no llegaban a la ciudad letras ni noticias de Isabel Ilincheta, desde su partida para Alquízar. Cierto que eran entonces difíciles y raras las comunicaciones de la capital, aún con los pueblos de su misma jurisdicción. Pero no escaseaban los correos privados, trajinantes o buhoneros, que se prestaban a llevar y traer cartas y líos sin cargar porte. Y de éstos acostumbraba a valerse Isabel para mantener correspondencia con sus primas las Gámez y con Leonardo.

Salía éste bastante preocupado de casa de esas señoritas al oscurecer del 6 ó 7 de Diciembre, al propio tiempo que bajaba la calle en dirección de la de Teniente Rey una mujer, cubierta la cabeza con una manta oscura. Pareciéndole que la conocía, apresuró el paso, le ganó pronto la delantera, la observó de soslayo y la detuvo, visto que era Nemesia.

--¿Qué prisa es ésta? la preguntó Gamboa.

--¡Ay, Jesús! exclamó la muchacha. ¡Cuidado que el caballero me ha dado un buen susto!

--Como que te me querías escapar de rengue liso, dijo Leonardo haciendo uso del lenguaje de la gente de color.

--No es mi natural el escaparme de rengue liso ni labrado, y menos de las personas de mi estimación.

--De tu estimación. ¿Soy yo por ventura de ese número?

--El primerito.

--El que te crea que le compre.

--¿Lo duda el caballero?

--¿Cómo que si lo dudo? No lo creo, porque dice el refrán que obras son amores y no buenas razones.

--¿Qué pruebas tiene el señor para decir eso?

--Muchas. Te daré una, la más reciente. El día en que me despedía de una amiga a la puerta de la casa de donde acabo de salir, ¿quién trajo a Celia para que me viese y se encelara conmigo? Tú. Nadie más que tú.

--¿Quién se lo dijo?

--Nadie. Lo sospeché entonces y ahora estoy convencido de ello. Tú eres más mala que Aponte, como decía mi abuela.

--No lo crea el señor, dijo Nemesia retozándole la risa en los ángulos de la boca. Créame el caballero, todo fue una pura casualidad. Yo iba a buscar costura en la sastrería de _señó_ Uribe y Celia quiso acompañarme.

--Sí, hazte ahora la santica y la inocente. Sábete que cometes un pecado en declararme la guerra. Si lo haces porque te figuras que no hay en mi corazón amor más que para Celia, mira que te equivocas. Hay para ella, para la amiga en el campo y todavía queda para las malagradecidas como tú un mundo de cariño.

--Ahora sí que yo digo que el que crea al caballero que lo compre.

--Tienes que creerme, porque te lo digo y porque tú eres la mulata más salerosa que pisa la tierra.

--¡Lisonjero! ¡Veleidoso! exclamó Nemesia conocidamente pagada del requiebro. Cuidado que los hombres son malos. Sólo que a mí no me gusta partir con _naiden_ ni ser plato de segunda mesa.

--En siendo plato, mujer, no importa de qué mesa. ¡Ay de las que no son plato de ninguna! porque es la prueba de que se quedaron para tías y para vestir santos. Celebremos un trato: no me hagas la guerra.

--Dale con la tema: yo no le hago la guerra al caballero.

--Sí, sí, me la haces. Lo veo, lo conozco. Celia está _brava_ conmigo por ti. Pero has escogido un mal camino para alejarme de ella. No le eches leña al fuego. Aquí, aquí, añadió oprimiéndose el lado izquierdo del pecho con ambas manos, aquí hay lugar para Celia y para su más tierna amiga.

--No. Para que yo _dentrara_ ahí habría de ser sola, solita. No quiero compaña en el corazón del hombre que yo ame.

--¡Egoísta! la dijo Leonardo echándole una mirada amorosa. Y se separaron, tirando Nemesia hacia la calle de Villegas en dirección de su casa en el callejón de la Bomba, y Leonardo todo derecho a la calle de O'Reilly.

Había aquélla oído de los labios del joven, de quien estaba perdidamente enamorada, que cabía en su corazón juntamente con Cecilia. Tal vez la cosa no pasaba de una mera galantería. ¿Qué decimos? Leonardo sólo se propuso propiciarla, halagando de paso su vanidad femenil con la esperanza de que en cierta contingencia podría ver realizado su amoroso deseo. Mas ella reflexionó que si cabía, lo más difícil en su concepto, bien podría suceder que entrase acompañada y se quedase sola y dueña del campo. Así que el descubrimiento, además de causarla un regocijo indecible, la confirmó más en el plan sobre cuya ejecución venía trabajando hacía algún tiempo. Para llevarle a debido efecto, dos medios se ofrecían a su traviesa imaginación. Con el conocimiento que tenía de los rasgos más marcados del carácter de su amiga, una índole eminentemente celosa, unida a una soberbia desapoderada, juzgó Nemesia, y juzgó bien, que si excitaba a lo sumo ambas pasiones, aún cuando no lograse que rompiera con el amante, ni suplantarla en el amor de éste, haría al menos que él la abandonase.

En la escena debía jugar José Dolores su hermano un papel principal. Daba por hecho que Cecilia no le amaría nunca. Esto poco importaba, porque una vez torcidos los amantes, no sería difícil infundir celos a Gamboa, por lo mismo que en su pique con el blanco era natural que ella se prestase a coquetear con el mulato. Ya veremos el desenlace fatal de estas intrigas.

Sucedió que al desembocar Leonardo Gamboa en la calle de O'Reilly, se separaba de la ventanilla de la casa de Cecilia un hombre que tenía toda la traza del hermano de Nemesia. Picó aquello su curiosidad, por lo cual, sin previo aviso, se acercó a media carrera, y con la punta de los dedos levantó el canto de la cortina blanca. Detrás se hallaba Cecilia sentada en una silla, con el codo descansando en el poyo de la ventana y la barba en la palma de la mano. Al reconocer a su amante en la persona que había levantado la cortinilla, no manifestó sorpresa ni alegría.

--Sí, la dijo él, muy mortificado por lo que había visto y por la indiferencia con que ella le recibía. Sí, disimula ahora. ¿Quién no la ve ahí? Parece que no quiebra un plato. ¿Qué haces?

--Nada, contesto seca y lacónicamente.

--¿Está fuera tu abuela?

--Sí, señor. Ha ido a la salve, ahí enfrente.

--Abre pues. Déjame entrar.

--De ninguna manera.

--¿De cuándo acá tanto rigor? Quisiera saberlo.

--No sé. Vd. dirá.

--Lo que yo sé es que de aquí acaba de salir un hombre.

--No, señor. Aquí no ha estado nadie desde que salió Chepilla.

--Le he visto con mis ojos.

--Sus ojos le engañaron. Ha sido una ilusión.

--Qué ilusión ni que niño _muerto_. Le vi, le vi, no me queda género de duda.

--Entonces creeré que Vd. ve visiones.

--No me hables más con ese aire desdeñoso, despreciativo diría, que me parece intolerable y ajeno de ti y de mí. No disimules tampoco ni busques persuadirme que fue un duende y no un hombre de carne y hueso, el que acaba de alejarse de esta ventana, tras de la cual te encuentro sentada y al parecer muy tranquila.

--¡Ah! Ya eso es otro cantar. Puede Vd. haber visto un hombre parado donde está Vd., ahora. Lo que yo niego y negaré siempre es que Vd. le viera salir de aquí, porque él no puso los pies en esta casa.

--De todos modos salió de aquí, de este lugar, estuvo conversando contigo y necesito saber quién es y qué buscaba.

--«Necesito», repitió Cecilia con desdén. ¡Qué _guapo_! ¿Ha de ser a la fuerza? Pues no lo digo.

--Sea como fuere, tienes que decírmelo, o de lo contrario me peleo contigo y no me vuelves a ver la cara en la vida.

--Eso es lo que yo quisiera ver.

--Lo verás. En fin, ¿me dices quién es?

--No lo digo.

--Tú parece que quieres jugar conmigo.

--No juego, hablo de veras.

--Bien. Abre la puerta y déjame entrar, porque me da vergüenza que me vea la gente que pasa. Van a figurarse que estamos peleando.

--Y se figurarán lo cierto.

--Vamos. ¿Te dejas de retrecherías?

--Yo digo lo que siento.

Leonardo la miró un rato con fijeza, como para medir el alcance de sus palabras, y trató luego de cogerla la mano que ella retiró, y después la cara con igual resultado. Cecilia no parecía dispuesta a ceder un punto de la actitud tomada desde el principio. ¿Sería ella capaz de dejarle por otro hombre? ¿Era el preferido aquél que vio alejarse de la ventana? Tanteemos un poco más, se dijo para sí, y enseguida añadió alto:

--¿Qué tienes tú en realidad? ¿Se puede saber?

--¿Yo? Nada.

--Si te encierras en ese círculo vicioso de: no sé nada, no lo digo, creo que lo mejor será que yo me vaya con la música a otra parte.

--Como Vd. guste.

--Cada vez te entiendo menos, Celia. Sospecho, sin embargo, que no dices ahora lo que sientes, y que si diera ascenso a tus palabras de poco vivir y me marchase, habías de derramar lágrimas de sangre. ¡Cómo! ¿Te quedas callada? ¿Qué dices? Contesta.

Iba siendo demasiado larga y violenta la posición asumida por Cecilia para que durase mucho tiempo. Amaba de veras. Si persistía en su desacostumbrada severidad, tal vez ahuyentaba al amante; fuera de que no tenía prueba patente de su inconstancia. Por todas estas razones, cuando precisada a responder categóricamente, inclinó la cabeza y rompió a llorar con grandes sollozos.

--¿Lo ves? la dijo él bastante conmovido. Ya sabía yo que en esto vendrían a parar tus bravezas. Tu corazón me quiere cuando tus labios me desdeñan. ¡Bah! Se acabó todo. No llores más, mi vida, porque concluiré por llorar contigo. Ahora lo que corresponde es: pelillos a la mar y tan amigos como siempre.

--Sólo bajo una condición haría yo las paces contigo, acertó a decir Cecilia entre sollozo y sollozo.

--Admitido. Afuera con esa condición.

--No. Es preciso primero que prometas cumplirla.

--¡Hombre! Eso es mucho pedir. Tal vez no está en mis facultades. Pero, ¿quién dijo miedo? Sí, prometo.

--No vayas al campo en las próximas Pascuas...

--¡Celia, por Dios!... ¡qué caprichos tan extraños tienes tú! ¿De qué nace tamaña exigencia? Sin duda te figuras que me alejo para siempre o que te he de olvidar. Reflexiona y no me pidas imposibles.

--Lo tengo bien pensado. ¿Te vas o te quedas?

--No me voy, ni me quedo; porque una ausencia de quince días en el campo no va a ninguna banda, no es una ida ni una quedada formal.

--Está bien, dijo Cecilia con firmeza, enjugándose las lágrimas. Ve. Yo sé lo que he de hacer.

--No tomes resolución que luego te pese. Te ruego de nuevo que reflexiones y veas mi posición tal cual es. ¿Te parece fácil que yo permanezca en La Habana mientras toda mi familia está en el ingenio de _La Tinaja_ cerca del Mariel? Pues no lo es; en primer lugar no habrá en casa sino el mayordomo con algunos criados. En segundo lugar, aunque yo pretendiera quedarme, mi madre no lo consentiría, mucho menos mi padre. La marcha será del 20 al 22 para volver después del domingo de Niño Perdido. ¿Comprendes ahora?

--Lo que comprendo es que vas a divertirte en el campo con una mujer que detesto sin conocerla a derechas, y que no puedo, no debo, ni quiero consentirlo.

--Eres muy celosa, Celia. He aquí tu único defecto. Si yo te amo más que a mi vida, más que a todas las mujeres del mundo, ¿no te basta? ¿qué más quieres? Por otra parte, esta corta ausencia nos conviene a los dos, así nos querremos con mayor ternura a mi vuelta. Después, en Abril entrante me recibiré de Bachiller en derecho y entonces tendré más libertad para hacer lo que me dé la gana. Ya verás, ya verás cuanto vamos a gozar. Yo para ti, tú para mí.

Para este tiempo Cecilia se había puesto en pie, esperando quizás la retirada de su amante, callada y pensativa. Su hermoso busto, sus hombros y brazos torneados cual los de una estatua, el estrechísimo talle que casi se podía abarcar con ambas manos lucían a maravilla, alumbrados a medias por la bujía en el interior, en contraste con la oscuridad ya reinante en la calle. Más enamorado que nunca Leonardo de tanta belleza, añadió con la mayor ternura:

--Lo que falta ahora, cielo mío, es que me des un beso en señal de paz y de amor.

Cecilia no respondió palabra ni hizo el menor movimiento. Parecía transfigurada.

--¡Vaya con Dios!, dijo el joven desconsolado. ¿Tampoco me darás la mano?

El mismo silencio, igual inmutabilidad. La conversión no podía ser más completa, pues si respiraba, no daba señales el redondo y levantado seno, de agitación ni de perceptible movimiento.

--Tu abuela va a venir, agregó Gamboa. ¿Oyes? Se concluye la salve en Santa Catalina; yo no quiero que me vea. ¡Adiós, pues!... ¡Ah! ¿Me dirás el nombre de la persona que hablaba contigo cuando yo llegué?

--José Dolores Pimienta, contestó Cecilia en tono tan breve como solemne.

Sintió Leonardo que toda la sangre se le agolpaba al rostro y que le quemaba las mejillas; y como para mejor ocultar la impresión que le había causado aquel nombre en boca de Cecilia, se alejó de allí a toda prisa, a la sazón que los fieles salían del convento vecino.

Por su parte Cecilia se dejó caer en la silla y lloró amargamente.

CAPÍTULO XVI

¡Conciencia, nunca dormida, mudo y pertinaz testigo que no deja sin castigo ningún crimen en la vida! La ley calla, el mundo olvida; mas ¿quién sacude tu yugo? Al Sumo Hacedor le plugo que a solas con el pecado, fueses tú para el culpado delator, juez y verdugo.

NÚÑEZ DE ARCE

Llega una época en la vida de cada hombre culpable de falta grave, en que el arrepentimiento es el tributo forzoso que se paga a la conciencia alarmada; pero la enmienda, como sujeta a otras leyes y dependiente de circunstancias externas, no siempre está el cumplirla en la voluntad humana. Porque tiene eso de característico la culpa, que, cual ciertas manchas, mientras más se lavan, más clara presentan la haz.

Bien quisiera don Cándido romper de una vez con el pasado, borrar de su memoria hasta la huella de ciertos hechos. Pero sin saber cómo, sin poderlo evitar, cuando más libre se creía, sentía, puede decirse así, en sus carnes el peso de los grillos que le ataban al misterioso poste de su primitiva culpa. Mucha parte tenían en esto los testigos y cómplices de ella. Recordábansela sin cesar y se la ponían delante a doquiera que tornase los ojos.

Aquí tiene el lector algunas de las razones por qué, a raíz del serio altercado con doña Rosa, don Cándido se hizo el encontradizo con Montes de Oca. No le riñó por las indiscreciones que había tenido con su esposa. ¡Qué reñirle! Al contrario, nunca le apretó con más efusión la mano. Es que le necesitaba para el arreglo de un proyecto en que venía meditando de poco tiempo a esta parte. Quería que, como médico, certificase que sin riesgo de la vida no era posible la traslación de la enferma en el hospital de Paula, a la nueva casa de locos. Esto, en primer lugar. En segundo lugar, pretendía que se prestara a servir de conducto por medio del cual _seña_ Josefa, o en su defecto la nieta, recibiera una pensión mensual de veinte y cinco duros y medio por tiempo indefinido.

Estimulada la codicia de Montes de Oca con un espléndido regalo, no hubo dificultad en que despachara la certificación, ni en que aceptara el encargo de la mensualidad. Este era un modo, por parte de don Cándido, de hacer del ladrón fiel; fuera de que sería quizás más riesgoso probar la discreción de tercera persona en aquel asunto.

Así cortaba, creía Gamboa, toda directa relación futura con las tres cómplices de su grave culpa, sin fallar a los compromisos con ellas contraídos. Pero aún quedaba el rabo por desollar. ¿Cómo librar a Cecilia Valdés de los lazos que la tendía su hijo Leonardo? Ellos se amaban con delirio, se veían a menudo, no bastaban a separarlos los regaños a ella de la abuela, ni las amenazas a él, por medio de doña Rosa, de don Cándido. No había, pues, más remedio que embarcar al galán y echarlo del país, o que secuestrar a la dama y ponerla donde no se viese ni se comunicase con él. Lo primero no había que pensarlo siquiera: doña Rosa se opondría con todas sus fuerzas. Lo segundo, era riesgoso en alto grado y estaba l rodeado de dificultades casi insuperables. Tales eran los pensamientos que más preocupaban el ánimo de don Cándido y le hacían sufrir las torturas del infierno por la época que vamos historiando.

Ahora bien: ¿convenía proceder desde luego al secuestro de la muchacha? Convenía, mas no era de urgente necesidad en aquel momento, por dos razones principales, a saber: porque vivía la abuela, aunque achacosa y decadente; y porque dentro de dos semanas marcharía la familia a pasar las Pascuas en el ingenio de _La Tinaja_, y se había acordado que Leonardo fuese de la partida.

Efectivamente: una semana antes despachose al Mariel la goleta _Vencedora_: su patrón Francisco Sierra con las vituallas, conservas y vinos que no se encontraban por amor ni por dinero en aquellas partes, y con los criados del servicio particular de la familia de Gamboa, entre ellos Tirso y Dolores. También debían ser de la partida la señorita Ilincheta con su tía doña Juana; para lo cual Leonardo y Diego Meneses les darían escolta desde Alquízar.

El motivo de la próxima reunión de las dos familias en el ingenio de _La Tinaja_, tenía por objeto presenciar el estreno de una máquina de vapor para auxilio de la molienda de la caña miel, en vez de la potencia de sangre con que hasta allí se venía operando el primitivo pesado trapiche.

No quiso partir Leonardo sin tener una entrevista con Cecilia. Obtúvola fácilmente, así porque ambos la deseaban como porque a la fecha parecía que _seña_ Josefa había perdido todo dominio sobre la nieta. Pero de nada valieron ruegos, halagos, promesas de mayor ventura ni amenazas de rompimiento. Cecilia cerró los oídos a todo eso y se mantuvo firme, cual una roca, en negar su consentimiento a la partida del amante para el campo. El corazón leal la anunciaba que él corría a reunirse con su temible rival; lo que equivalía a perderle para siempre. Otro, que el atolondrado joven habría parado mientes en la actitud y firmeza de la muchacha, y le habría concedido admiración ya que no simpatía. Mas él, ligero de cascos y soberbio, principió por creer que vencería su resistencia y acabó por darse por ofendido y retirarse despechado.

Esta vez no lloró Cecilia. Con el corazón partido de dolor, en silencio vio alejarse a Leonardo. No abrió los labios para llamarle ni consintió que sus lágrimas, aun ido él, viniesen a revelar la angustia de su alma, dando así, a sus propios ojos, muestra indigna de flaqueza. Antes que rendirse al rigor de la suelte, creyó la soberbia muchacha que debía armarse de valor a fin de tomar señalada venganza de su ingrato amante. Dicho y hecho, apenas se alejó de su lado, se vistió ella a la carrera, dio un beso a la abuela, que, como solía, se hallaba hundida en el fondo de enana butaca de Campeche y salió a la calle. Mas yendo en la dirección de la casa de Nemesia, en el callejón de la Bomba, se encontró en la esquina con Cantalapiedra, a quien no veía desde la noche del 24 de Setiembre. No le valió inclinar la cabeza, ni estrechar en torno del rostro los pliegues de la manta de burato. El Comisario la reconoció al punto, y, quiera que no, la detuvo en medio de la calle diciéndola:

--Alto a la justicia. Date o te va la vida.

--Con su licencia, replicó Cecilia seria, en ademán de seguir camino.

--Date presa, digo, o de lo contrario haré uso de la autoridad que me concede la ley. Respeta estas borlas (enseñándole las del bastón que llevaba bajo el brazo izquierdo) o le ordeno a Bonora (su esbirro, el de las grandes patillas, que se mantenía a respetable distancia) que proceda a prenderte.

--Como no he cometido ningún delito, contestó Cecilia muy tranquila, es inútil que me enseñe las borlas y me amenace con su teniente. Déjeme pasar, que no estoy para bromas.

--Sin ver antes esa carita fuera de la manta, no esperes que te deje dar un paso más.

--¿Tengo acaso monos pintados en la cara?

--¡Muchachita! Juégate conmigo y todavía te dan las doce sin campana.

--Yo no me juego, no estoy para juegos. Déjeme ir.

--¿A dónde vas?

--A una parte.

--¿Es cosa de cita?

--Yo no tengo citas con nadie, ni dejaría mi casa por ver al rey de los hombres.

--Quien te oye, segurito que se traga que hablas de veras.

--¿Sabe Vd., que yo haya hablado de mentira sobre estas cosas?

--Bien, veremos si eso que dices es verdad.

--¿De qué manera?

--Fácilmente, siguiéndote las aguas.

--¿Está Vd. loco, Capitán?

--No, sino muy cuerdo. Soy el Comisario del barrio y ¿qué se diría de mí si por descuido dejaba que una muchacha tan linda como tú daba un mal paso y luego andábamos de tribunales y pleitos?

--No me doy por ofendida de sus palabras, porque sé que Vd. es muy _jaranero_.

--Es que no jaraneo ahora. No deseo ofenderte ni en el negro de una uña; pero, repito, que ni como Comisario, ni como hombre, debo consentir que andes a estas horas por las calles sin galán que te guíe y te defienda.

--No me sucederá nada. Esté Vd. seguro. Voy aquí cerquita.

--Está bien, quiero creerte. Ve con Dios y la Virgen. ¿Mas no me dejarás verte la carita?

--¿No la está Vd. viendo?

--Así no me gusta verla. Echa hacia atrás los malditos pliegues de esa manta.

Hizo Cecilia lo que la dijeron, quizás para verse libre de aquel impertinente, descubriendo casi todo el busto con sólo dejar caer la manta sobre los hombros. En ese tiempo Cantalapiedra atizó el cigarro puro que fumaba, y produjo mayor claridad de la que reinaba en torno, puesto que no había faroles por allí, y las estrellas no alumbraban bastante.

--¡Ah! exclamó el Comisario lleno de entusiasmo. ¿Habrá quien no se muera de amor por ti? ¡Maldito de Dios y de los hombres el que no te adore de rodillas como a los santos del cielo!

Ante el cómico ademán y las exageradas expresiones del Comisario, no pudo menos de sonreírse Cecilia, la cual después continuó derecho a casa de Nemesia, sin cuidarse de averiguar si aquél seguía o no sus pasos. Conociendo ella bien las entradas y salidas, no tocó en ninguna puerta, sino que pasó de la calle al cuarto de su amiga, a quien sorprendió muy afanada cosiendo una pieza de sastrería, delante de una mesita de pino, a la luz dudosa de una vela de sebo de Flandes en un candelero de hoja de lata.

--¡Qué atareada que está una mujer! dijo entrando.

--¡Hola! exclamó Nemesia soltando la costura y yendo al encuentro de Cecilia con los brazos abiertos. ¡Tanto bueno por acá! ¿Quién se querrá morir? Es preciso hacer una raya en el agua.

--¿Estás sola? preguntó Cecilia antes de sentarse en el columpio de madera que le presentó la amiga.

--Solita en alma, aunque José Dolores no tardará mucho.

--No quisiera que me encontrase aquí.

--¿Por qué, china?

--Porque los hombres luego se figuran que una los busca.

--Mi hermano no es de esos, chinita. El te ama, te adora, te idolatra, se le conoce, suspira siempre por ti; pero es tan vergonzoso que no se atrevería a decirte negros ojos tienes, cuanto más a figurarse que vienes por él.

--¡Ay, Nene! continuó Cecilia desentendiéndose de las manifestaciones de su amiga. La otra tarde me encontró Leonardo hablando con José Dolores por la ventana de casa. En mala hora. Me ha costado una tragedia con él.

--¡No me digas! repuso Nemesia sin poder ocultar del todo su contento. Pero ya habrán hecho las paces. ¿No?

--¡Ojalá! exclamó Cecilia suspirando. Se puso _bravo_ y se ha ido peleado conmigo. ¿Quién sabe cuándo nos Núñez de Arce? Tal vez... nunca más. Él es muy perro y yo poco menos.

En diciendo estas palabras, callose por breve rato. Se le había atravesado la voz en la garganta, y en sus bellos ojos aparecieron gruesas lágrimas.

--¡Cómo! dijo Nemesia sorprendida. ¿De veras tú lloras? ¿No te da vergüenza?

--Sí, lloro, repuso Cecilia con visible sentimiento. Lloro, no de dolor, lloro de rabia conmigo misma, porque conozco que he sido una tonta.

--¡Anjá! Me alegro oírte. Ya te lo había dicho yo muchas veces, no debe fiarse una de ningún hombre.

--No lo digo por eso, Nene. ¿Llamas tú fiarme de un hombre el amarlo mucho? Puede ser; y yo te digo, ¿acaso está en tu mano amar o no amar? ¿Conoces algún remedio contra el amor y los celos? Lo mejor sería, china, no tener corazón. Así no sentiríamos cariño por nadie.

--Luego, parece que tú te das por engañada.

--Tal como engañada no. ¡Dios me libre! Leonardo no me ha dejado por otra ni creo que me deje. Si lo sospechase siquiera no estaría diciéndotelo desde esta silla.

--¿Y qué más quieres, mujer? Mucho temo que ese peje no vuelva a picar en tu anzuelo.

--¿Qué sabes tú? preguntó Cecilia asustada.

--Nada, nada, repitió Nemesia. Mas no puedo olvidar el dicho de _seña_ Clara, la mujer de Uribe: cada uno con su cada uno.

--No entiendo.

--Más claro no puede ser. ¿_Seña_ Clara no tiene más experiencia que nosotras? Desde luego. Es mayor de edad y ha visto doble mundo que tú y que yo. Pues si a menudo repite ese dicho, razón buena ha de tener. Aquí, inter nos, _naiden_ me lo ha contado, pero yo sé que a _seña_ Clara siempre le gustaron más los blancos que los pardos, y bien durita ya se casó con _señó_ Uribe. Por supuesto, llevó más quemadas y desengaños que pelos tiene en la cabeza, y por eso ahora se consuela repitiendo a las muchachas como tú y como yo: cada uno con su cada uno. ¿Entiendes?

--Sí, bastante, sólo que no veo cómo me venga el refrán.

--Te viene pintiparado, chinita; te coge por derecho. ¿Tú no prefieres los blancos a los pardos, como seña Clara?

--No lo niego, mucho que sí me gustan más los blancos que los pardos. Se me caería la cara de vergüenza si me casara y tuviera un hijo _saltoatrás_.

--Desengáñate, mujer: bonitura, amor, cariño, constancia, nada sujeta a los blancos. Después, Leonardo no se va a casar tampoco contigo por la iglesia.

--¿Por qué no? replicó Cecilia con vehemencia. El me lo ha prometido y cumplirá su palabra. De otro modo yo no lo querría como lo quiero.

--¡Ay! Me da mucha pena oírte hablar así, mas no quisiera quitarte la ilusión. Sólo te digo que abras los ojos, no sea que mal haya venga muy tarde. No te fíes, no te fíes, y ten siempre presente que la hormiga por meterse a volar se quemó las alas.

--El que por su gusto muere, hasta la muerte le sabe.

--Lo comprendo, mas si una muriese de repente, sin dolor, ni trabajos, pase, sea todo por Dios. El caso es, china, que antes de morir se sufre mucho. Ven acá, ¿duele tanto cuando un hombre blanco nos deja por una mujer de color, como cuando nos deja por una blanca? ¿A que no? Eso sí que duele. Y _me se_ figura que a ti te está pasando eso ahora. Conque no hables, ni digas de esta agua no beberé.

Disponíase Cecilia a negar la exactitud del símil cuando apareció por la puerta del patio José Dolores Pimienta, y si ella no pudo o no supo decir lo que pensaba, él se quedó mudo y estático en el quicio del cuarto. No esperaba semejante compañía, mucho menos a aquella hora de la noche. Repuesto luego de su sorpresa, la manifestó en breves y escogidas frases cuánto se alegraba de verla. Cecilia dijo que había venido solamente a darle una caradita a Nemesia, y se puso en pie para marcharse.

--Tengo una buena noticia que darles, dijo el músico. El baile de etiqueta de la gente de color se ha convenido en darlo la víspera de la Noche buena, en la casa de Soto, esquina a Jesús María. Por supuesto, la señorita está convidada en primera línea, y se espera que vaya Nemesia y _seña_ Clara, y Mercedita Ayala, y todas las amigas.

Será un baile de ringorrango. Hará raya, yo se lo digo a la señorita.

--Lo más fácil es que yo no pueda asistir, dijo Cecilia. Chepilla no está buena y temo dejarla sola.

--Pues si falta la señorita, cuente que no habrá luz para alumbrar el baile.

--No sabía que Vd. era tan lisonjero, dijo Cecilia sonriendo y moviéndose hacia la puerta.

--No debe la señorita ir sola, dijo José Dolores.

--Nadie me comerá, pierda Vd. cuidado. No se moleste. ¡Adiós!

No obstante su negativa, el músico y su hermana acompañaron a Cecilia hasta la puerta de la casa en que vivía.

CAPÍTULO XVII

Y al punto que el triunfo creyera posible _De lúcido acero se vio traspasar._

J. L. LUACES

Dijo José Dolores Pimienta que el baile de la gente de color se celebraría en la casa de Soto. Ocupa la esquina occidental de la calle de Jesús María, en su encuentro con la calzada del Monte, opuesta al Campo de Marte.

Precede al zaguán o entrada un ancho portal con barandilla de madera. Desde éste, por las alterosas ventanas, enteramente abiertas, pudo el público, sin derecho a entrar, presenciar a su sabor la fiesta. En el cuadrado patio, que se cubrió con un toldo, se pusieron las mesas del ambigú; en el comedor tocaba la orquesta; en la amplísima sala se bailaba y en los cuartos se reposaba y tenían las conversaciones íntimas de los amigos o los amantes.

Los adornos de la sala se reducían a unas colgaduras de damasco rojo, el color nacional, recogidas con cintas azules en pabellones, a la altura de los dinteles de las puertas y ventanas. El alumbrado lo proporcionaban bujías de pura esperma, ardiendo en grandes arañas de cristal, con profusión de prismas de lo mismo que reflejaban la luz, la multiplicaban y descomponían en todos los colores del iris.

Con la frase _baile de etiqueta o de corte_, se quiso dar a entender uno muy ceremonioso, de alto tono, y tal, que ya no celebraban los blancos, ni por las piezas bailables, ni por el traje singular de los hombres y de las mujeres. Porque el de éstas debía consistir y consistió en falda de raso blanco, banda azul atravesada por el pecho y pluma de marabú en la cabeza. El de los hombres, en frac de paño negro, chaleco de piqué y corbata de hilo blanco, calzón corto de Nankín, media de seda color de carne y zapato bajo con hebilla de plata; todo según la moda de Carlos III, cuya estatua, hecha por Canova,[43] se hallaba al extremo del Prado, donde hoy se ostenta la fuente de la India o de La Habana.

Para entrar y tomar parte en la fiesta no bastaba el traje especial de los hombres; era preciso venir provisto de papeleta, la que debía presentarse en el zaguán a la comisión allí constituida para recibirla y aposentar a las mujeres. Observose esta medida estrictamente al principio; pero tan luego como llegó la hora de bailar, Brindis y Pimienta, principales aposentadores, delegaron el encargo en sujetos menos escrupulosos y rectos. A semejante descuido se debió el que, tarde de la noche, penetrasen algunos individuos que, si bien en traje de ceremonia, no presentaron papeleta ni eran artesanos tampoco.

De este número fue un negro de talla mediana, algo grueso, de cara redonda y llena, con grandes entradas en ambos lados de la frente, que por poco que pasase él de los cuarenta años de edad, terminarían en una calva completa. Aunque se vestía como se había dispuesto, el frac le venía algo estrecho, el chaleco se le quedaba bastante corto, las medias estaban descoloridas por viejas, carecían de hebillas sus zapatos, no tenía vuelos la camisa y el cuello le subía demasiado hasta cubrirle casi las orejas, tal vez por ser él de pescuezo corto y morrudo.

Sea por estas faltas, o sobras, de que no estamos bien enterados, el negro de las entradas se hizo el blanco de las miradas de todos desde que puso el pie en el baile. Advirtiolo él, que no era ningún tonto, y naturalmente andaba al principio como azorado, esquivando la sala, donde la luz era más profusa y brillante; pero hacia las once de la noche hizo por incorporarse en los corrillos que se formaban en torno de las muchachas bonitas, hasta que se atrevió a invitar a una y bailar un minué de corte, con tanto compás y donaire que llamó por ello la atención general. Dos o tres veces se acercó al grupo que galanteaba o adoraba en Cecilia Valdés a la más hermosa de las mujeres de aquella reunión heterogénea; la contempló de reojo largo rato y luego se alejó con visibles muestras de despecho.

En uno de estos momentos, un oficial de la sastrería de Uribe que le observaba de cerca, le siguió fuera de la sala, le puso la mano en el hombro con alguna familiaridad y le dijo:

--¡Oiga! ¿Estás aquí?

--¿Qué, qué se ofrece? contestó él volviéndose y estremeciéndose de pies a cabeza.

--¿Qué haces por estos barrios, chiquete? le preguntó el oficial con mayor familiaridad.

--Sírvase decirme, señor mío, replicó el de las entradas, enfadado: ¿cuándo y dónde le he echado maloja?

--¡Hombre! repuso el oficial bastante mortificado, esas son palabras mayores.

--Mayores o menores, son las que uso con los importunos como Vd.

--No te vengas haciendo el misterioso y el señorón, que yo sé quién eres tú y tú sabes quién soy yo. Apéate, compadre, del tablado. _Te se_ puede desvanecer la cabeza, y si te caes, das en el fogón de la cocina.

--Vamos, ¿y qué quiere Vd. conmigo ahora?

--Nada, no quiero nadita de este mundo. Reparé sólo que le hiciste el feo a la niña más linda del baile y esto picó mi curiosidad.

--¿Le va o le viene a Vd. algo en este ajiaco?

--Bastante, más de lo que tú te figuras.

--Y Vd. se propone defender a esa niña, ¿no?

--Creo que tú no las has injuriado. Las mujeres no son la cara del rey para agradar a todos. En gustar o disgustar no hay ofensa.

--Bien, entonces déjeme Vd. el alma quieta.

--Eres un mal agradecido, le dijo el oficial, serio. No tienes tú la culpa, sino yo que me ocupo de un individuo inferior a mí, cocinero y... esclavo. Llenose de ira el negro con esto y levantó la mano para pegarle una bofetada a su contrincante; pero, por razones que él se sabía, no descargó el golpe. Había penetrado en aquella casa sin papeleta, no conocía a nadie, era un intruso y todo escándalo que se armase debía redundar en su daño. Contentóse, pues, con amenazarle y decirle que arreglaría cuentas luego que terminase el baile; volviéndole la espalda con desprecio. Semejante salida excitó a lo sumo la risa del oficial de sastre, y dijo por burla:

--Casaca, suelta a ese hombre.

De seguidas buscó a su amigo José Dolores Pimienta, le contó la ocurrencia con el negro de las grandes entradas rieron los dos de la ocurrencia y no se ocuparon más del asunto.

Desde temprano el baile estaba lleno, de bote en bote, según reza la frase familiar. El golpe de gente de todos colores, sexos y condiciones que se apiñaba ante ambas ventanas del ancho portal, presentaba aspecto tan animado, como interesante y tumultuoso. En el gran salón no se cabía ni de pie, al menos mientras no se bailaba; los hombres se codeaban unos con otros, y ocultaban casi del todo a las mujeres sentadas alrededor. Cecilia, con Nemesia y _seña_ Clara, la mujer de Uribe, ocupaba un asiento de frente para la calle, en el lienzo de pared medianero entre la puerta del comedor y la del aposento, y siempre que lo permitían los grupos de hombres que acudían a saludarla, podían oírse las exclamaciones de admiración que su peregrina belleza excitaba en las personas del portal.

A veces, tras las ponderaciones de las gracias de la muchacha, podían oírse voces de compasión, pues tomándola por una joven de pura sangre, era natural que les chocase de verla allí y que creyesen de bajos sentimientos a quien consentía en rozarse tan de cerca con la gente de color. Cecilia, entretanto, saboreaba a sus anchas el triunfo mayor que jamás alcanzó mujer alguna en la flor de su juventud y de su belleza. Uno tras otro, cuantos hombres de cierto viso llenaban el baile aquella noche, conociéndola o no, vinieron a saludarla y rendirla homenaje, cual saben rendirlo los negros criollos de Cuba que han recibido alguna educación y se precian de finos y atentos con las damas. Entre éstos podemos citar a Brindis, músico, elegante y bien criado; a Tondá protegido del Capitán General Vives, negro joven, inteligente y bravo como un león; a Vargas y a Dodge, ambos de Matanzas, barbero el uno, carpintero el otro, que fueron comprendidos en la supuesta conspiración de la gente de color en 1844 y fusilados en el paseo de Versalles de la misma ciudad; a José de la Concepción Valdés, alias _Plácido_, el poeta de más estro que ha visto Cuba, y que tuvo la misma desastrada suerte de los dos precedentes; a Tomás Vuelta y Flores, insigne violinista y compositor de notables contradanzas, el cual en dicho año pereció en la Escalera, tormento a que le sometieron sus jueces para arrancarle la confesión de complicidad en un delito cuya existencia jamás se ha probado lo suficiente; al propio Francisco de Paula Uribe, sastre habilísimo, que por no correr la suerte del anterior, se quitó la vida con una navaja de barbear en los momentos que le encerraban en uno de los calabozos de la ciudadela de la Cabaña; a Juan Francisco Manzano, tierno poeta que acababa de recibir la libertad, gracias a la filantropía de algunos literatos habaneros; a José Dolores Pimienta, sastre y diestro tocador de clarinete, tan agraciado de rostro como modesto y atildado en su persona.

Con este último y con Vargas se dignó Cecilia bailar danza, minué de corte con Brindis, otro con Dodge; conversó amablemente con Plácido, contestó con un saludo gracioso al que le hizo Tondá, habló de contradanzas con Vuelta y Flores, y celebró mucho el talento músico de Ulpiano, que dirigió la orquesta del baile.

Cualquiera mediano observador pudo advertir que, a vueltas de la amabilidad empleada por Cecilia con todos los que se le acercaban, había marcada diferencia entre los negros y los mulatos. Con éstos, por ejemplo, bailó dos contradanzas, con los

primeros sólo minués ceremoniosos. Pero dio amplia rienda a su innato exclusivismo cuando se le presentó el negro de las entradas profundas y la rogó le admitiera como pareja para una danza o un minué. Eso sí, no llevó su negativa hasta el no áspero y seco; le dio sus razones para no bailar con él, que tenía comprometida la siguiente pieza, que se sentía muy cansada, etc. El hombre no se dio por satisfecho, antes se mortificó lo que es indecible y se alejó murmurando frases groseras y amenazantes.

No paró mucho en esto la atención Cecilia; pero cuando poco después se paseaba con Nemesia y _seña_ Clara en torno de las mesas del ambigú y tropezó con el negro de las entradas, que parecía en acecho reclinado en la jamba de la puerta de uno de los cuartos laterales, tuvo miedo; y apretando el brazo de su amiga la dijo en voz baja y apresurada:--¡Ahí está!

--¿Quién? preguntó Nemesia volviendo el rostro.

--Mira, agregó Cecilia. Por acá. Ese.

En este momento el hombre se desprendió de la puerta y avanzó hasta tocar con la barba en el hombro de Cecilia, a la cual sin más preliminar le dijo:

--¿Conque no me ha creído la niña digno de ser su compañero esta noche?

--¿Qué dice Vd.? preguntó Cecilia más asustada que antes.

--Digo, continuó el negro echando una mirada siniestra a Cecilia, digo que la niña me ha hecho un desaire.

--Si lo cree Vd. así le pido mil perdones, porque no be tenido tal intención.

--La niña me dijo que estaba cansada y enseguida salió a bailar con otro. No busque disculpa la niña (añadió de carrera conociendo que Cecilia quería replicar), comprendo la razón por qué la niña me ha desairado. La niña me ve prieto, pobremente vestido, sin amigos en esta selecta reunión y se ha figurado que soy un cualquiera, un malcriado, un pelagatos.

--Se equivoca Vd.

--Yo no me equivoco. Sé lo que digo, como sé quién es la niña.

--Señor, Vd. me toma por otra.

--La conozco más de lo que imagina la niña. La conozco desde que la niña mamaba y gateaba. Conocí a su madre, conozco a su padre como a mis manos y tengo muchos motivos para conocer a la mujer que la crió por más de un año seguido.

--Pues yo no lo conozco a Vd., ni...

--¿Ni le importa tampoco a la niña? Lo comprendo. Debo decirle a la niña, sin embargo, que la niña me desprecia porque se figura que como tiene el pellejo blanco es blanca. La niña no lo es. Si a otros puede engañar, a mí no.

--¿Me ha detenido Vd. para insultarme?

--No, señorita. Yo no estoy acostumbrado a insultar a las personas que gastan túnico. Si como lleva túnico la niña, lleva calzones, crea que no le hablaría así. Me molesta tanto más el orgullo que la niña gasta conmigo...

--Bastante hemos hablado, le interrumpió Cecilia volviéndole la espalda.

--Como la niña guste, continuó él altamente irritado, mas déjeme decirle que baje un poco el cocote, porque si su padre es blanco, su madre no es más blanca que yo, y además, la niña es la causa de que me vea separado de mi mujer por más de doce años.

--¿Y yo qué tengo que ver con eso?

--Debía de tener algo, pues mi mujer ha sido la verdadera madre de la niña, como que la crió desde que nació, no pudiendo criar a la niña su madre por estar loca...

--El loco es Vd., exclamó Cecilia en alta voz.

Nemesia y _seña_ Clara rodearon entonces a su amiga y trataron de llevársela para la sala. Pero se detuvieron al ver a Tondá, a Uribe, al oficial de éste y al mismo José Dolores Pimienta (bajo cuya protección implícita estaba Cecilia), que oyeron el grito y acudieron presurosos para averiguar lo que pasaba. El último nombrado fue el primero a preguntarla.

--Nada. Ese moreno, dijo ella con soberano desprecio, se ha empeñado en tener un lance conmigo... como me ve mujer.

--¡Cobarde! gritó Pimienta, convertido de repente en león el modesto cordero.

Y se avalanzó al desconocido para castigarle; pero hurtó el cuerpo y se puso en guardia.

José Dolores estaba desarmado y se contentó con añadir:

--¿Quién es Vd.?

--Soy quien soy, contestó el otro con impavidez.

--¿Qué busca Vd. aquí?

--Lo que me da la gana.

--Pues ahora mismo sale Vd. de la casa o lo echo a patadas.

--Quisiera verlo.

--¡A, perro! Habías de ser esclavo. ¡Afuera!

En ese punto intervinieron Tondá, Uribe y el oficial de sastre, sin cuya presencia de seguro que se arma una riña sangrienta entre el galante músico y el desconocido de las grandes entradas. El oficial dicho le dio el nombre de Dionisio Gamboa, y habiéndole rodeado todos poco a poco, fueron empujándole hasta ponerle materialmente de patitas en la calle. Mientras se le llevaban así, volvía con frecuencia la cara y decía, dirigiéndose a Cecilia:--Se figura que es blanca y es parda. Su madre vive y está loca. Hablando después con Pimienta, decía:--Señor defensor de las niñas, sangre de _chincha_, el que la debe la paga. No se ha de quedar riendo. Ya nos veremos las caras. Al oficial de sastre, que le repetía:--Cállate la boca, Dionisio Gamboa, vete a cocinar a casa de tu amo, no te metas a farolero, porque pueden darte un bocabajo que te chupes los dedos; casaca, suelta a ese hombre, le decía:--Yo no me llamo Gamboa me llamo Jaruco. Y acuérdate que también me la debes.

Afectaron un tanto a Cecilia la conducta y sobre todo las palabras del negro de las entradas. Daba la casualidad que cuanto dijo respecto de sus padres, coincidía extrañamente con lo que ella misma había antes oído y sospechado. El lenguaje misterioso que empleaba la abuela siempre que del caballero que las favorecía se trataba, era bastante para hacerla pensar a veces que debía de tener con ella alguna otra relación que la de un mero galanteo, aun cuando no le pasara por la mente que fuese su padre el padre de su amante. Este no la amaría ni la prometería unión eterna si supiera, como debía saberlo, que ligaba a los dos tan cercano parentesco. Por lo tocante a su madre, la abuela, mejor autoridad que el cocinero de Gamboa, si bien no la aseguró jamás que hubiese muerto, no la afirmó tampoco que viviese, menos aun que estuviese loca. La mujer a quien _seña_ Josefa solía visitar en el hospital de Paula, según lo poco que se le había escapado de los labios en momentos de vivo pesar y honda tristeza, no era hija suya, siquiera sobrina; tal vez pariente de pariente de una amiga íntima de la mocedad. El cocinero Dionisio Gamboa o Jaruco estaba por fuerza equivocado, repetía meros rumores, hablaba de memoria.

En tal virtud, y teniendo en cuenta la edad y carácter alegre de Cecilia, no es de extrañarse que, tras pasajera preocupación, se entregase de nuevo en brazos de los placeres que le brindaba el baile. Sin embargo, en medio del torbellino de la danza y del incienso de adulación con que los hombres pretendían embebecerla, la inquietaba a veces el pensamiento del riesgo que corría el hermano de su amiga Nemesia, por haberla defendido de los insultos de un loco o de un asesino.

Por eso, como mujer agradecida, desde aquel punto empezó a sentir por José Dolores una especie de simpatía que no había sentido nunca, y en descuento de la deuda contraída no tuvo empacho en manifestarle sus temores. Riose él de ganas al oírla, replicándole, quizás para tranquilizarla que el Dionisio Gamboa, Jaruco o lo que fuese, era un miserable esclavo, muy bocón para parársele delante fuera del baile, porque dice el refrán que perro que mucho ladra no muerde. Observole Cecilia que siendo esclavo y cobarde era más de temer, pues atacaría a traición, no cara a cara. Replicó a esto José Dolores, que, efectivamente, tenía que ir prevenido y con los ojos muy abiertos, no fuera que le dieran por la espalda; pero que por lo demás ya él se había armado con un cuchillo que le acababa de prestar un amigo, y que tenía que ser lince el hombre que le matase del primer _viaje_.

Después del ambigú y de otra danza entre las doce y la una de la madrugada, terminó el baile y cada cual marchó para su casa. _Seña_ Clara, de brazo con Uribe, su marido; Cecilia y Nemesia con el hermano de ésta, en unión agradable se dirigieron a lo largo de las casuchas que había por aquel lado de la calzada, en dirección de la puerta de la muralla, llamada _de Tierra_ por ser

la más inmediata. Al acercarse a la primera esquina de la calle de Cienfuegos o Ancha, notó Cecilia la sombra de un hombre que, ganándoles la delantera, torció por allí a la derecha. Sospechó desde luego quién podría ser y trató de llamarle la atención a su compañero, al lado opuesto, indicándole el café nombrado de Atenas, solitario y oscuro, cerca de la estatua de Carlos III, a la entrada del paseo. Pero el hombre no pasó de largo cual ella esperaba; se plantó en la esquina y dijo alto:--Sinvergüenza, sangre de _chincha_, ven para acá, si eres guapo.

Preciso era que José Dolores tuviese sangre de ese insecto para que se desentendiese de un desafío semejante, hecho delante de la dama de sus pensamientos. Hizo, pues, por desprenderse de sus compañeras, las cuales, sujetándole cada una por un brazo, habrían conseguido el intento si no acude en su ayuda Uribe diciendo a las muchachas:

--Dejen que le dé una _mojada_.

Así fue. José Dolores sacó el cuchillo, tomó el sombrero en la mano izquierda para usarle como la capa el matador delante del toro, y siguió los pasos del contrario sin acercarse demasiado.

Cecilia, con Nemesia y _seña_ Clara, agarradas de las manos y de Uribe, todas temblorosas y con la ansiedad que es de imaginar, se estuvieron a esperar cerca de la esquina el resultado de una lucha que no podía menos de ser sangrienta. A poco más oyeron la voz argentina de José Dolores que dijo:--Aquí; y la ronca del negro que respondió:--Aquí. Y comenzó sin más la horrible brega.

La carencia absoluta del alumbrado público, junto con la oscuridad de una noche sin luna, impedían ver claro los movimientos de los combatientes, no obstante la proximidad a que estaban del grupo espectador. Suponiendo que Dionisio tuviese el valor sereno de José Dolores, no tenía su agilidad y mucho menos su destreza en el manejo del cuchillo. Esto se echó de ver pronto, porque tras unos pocos esguinces y quites con el sombrero, se oyó primero un ruido extraño, como de tela nueva que se rasga con fuerza, y de seguidas el bronco de un cuerpo pesado que da en tierra. Cecilia y Nemesia dieron un grito penetrante y cerraron los ojos. ¿Quién de los dos había caído? ¡Momento de terrible ansiedad!

Mientras el caído continuaba gimiendo sordamente, el otro pareció acercarse a paso menudo hacia la calzada. En segundos, que no en minutos, salió de la densa oscuridad que le rodeaba, mucho más densa para los ojos de los que le aguardaban y que del sobresalto no podían ver claro. Venía riente, ligero como un gamo, envainaba el cuchillo y se ponía el sombrero hecho trizas. Era José Dolores Pimienta. Cecilia fue la primera a recibirle, y sin saber lo que hacía, por un impulso de su alma generosa y sensible, le echó los brazos al cuello, preguntándole con cariño:--¿Te han herido?

--¡Ni un arañazo! contestó él, tanto más orgulloso cuanto que sentía sobre su corazón la cabeza de la mujer a quien adoraba sin esperanza de correspondencia. En oyéndole ella, lloró de pura alegría cual la niña que recupera su muñeca cuando la juzgaba irrevocablemente perdida.

TERCERA PARTE

CAPÍTULO I

Tú vistes de jazmines Al arbusto sabeo, Y el perfume le das que en los jardines La fiebre insana templará a Lieo.

A. BELLO

Separose Leonardo Gamboa de su familia después de almuerzo en la dehesa o potrero de Hoyo Colorado, y en la amable compañía de Diego Meneses tomó por entre Vereda Nueva y San Antonio de los Baños, la vuelta de Alquízar, rumbo al sudoeste de su punto de partida.

A pocas leguas se hallaron en lo que llaman por ahí _Tierra Llana_, planicie extensa e igual, cuyo centro por esa parte lo ocupa la población últimamente nombrada. Su fondo es un calcáreo muy poroso y puro, cubierto de una capa de tierra rojiza, o color de ladrillo, a trechos bastante espesa y suelta, acusando el óxido de hierro de que está cargada y de una fertilidad prodigiosa. Con algunas interrupciones de nivel se dilata hacia el oeste hasta Callajabos, al pie de las serranías de la Vuelta Abajo y hacia el este hasta los últimos límites de Colón, siendo su latitud general estrecha.

Por supuesto, en las porciones más elevadas de dicha mesa, no se ven fuentes naturales, ni llueve tampoco a menudo; pero es tan copioso el rocío nocturno, que moja el suelo y refresca la vegetación. No conociéndose en el país ningún sistema de regadío, a

ese fenómeno meteorológico hay que atribuir la lozanía con que crecen y el verde esmeralda con que se visten las plantas en todas las estaciones del año. En cambio, el descuaje del arbolado, el cultivo general de la mesa, particularmente de aquella parte que iban recorriendo nuestros dos viajeros, habían ahuyentado los pájaros de cuenta, y apenas si se veían uno que otro grupo de judío de vuelo pesado y penetrante graznido, un par de tímidas tojosas, una fugaz bijirita y pequeños tomeguines escondidos en los arbustos inmediatos.

Mientras más se alejaban de Hoyo Colorado, más cafetales encontraban a uno y otro lado del camino; como que esas eran las únicas fincas rurales de cierta importancia en la porción occidental de la mesa, al menos hasta el año de 1840. Hablamos ahora del famoso jardín de Cuba, circunscrito entre las jurisdicciones de Guanajay, Güira de Melena, San Marcos, Alquízar, Ceiba del Agua y San Antonio de los Baños. No se fundaban entonces ahí granjas para la explotación agronómica, en el sentido estricto de la palabra, sino verdaderos jardines para la recreación de sus sibaritas propietarios, mientras se mantuvo alto el precio del café.

Contra el sistema legal de mensuras observado en Cuba desde _ab initio_, estaban divididas esas bellísimas fincas en figuras regulares, prevaleciendo el cuadrado, y acotadas todas con setos de limoneros enanos, con zarzas y más comúnmente con tapias de piedra seca, o cercas primorosas y artísticamente construidas. Cubríanse éstas de enredaderas o aguinaldos, especialmente de campanilla blanca, los cuales abrían por Pascuas de Navidad, daban aspecto risueño a la campiña con sus níveas flores, en contraste con el verdor fuerte del arbolado cercano, mientras que con su exquisito y trascendental perfume embalsamaban el ambiente por millas y millas a la redonda.

Sus ostentosas y cómodas viviendas no caían en las anchas calles o calzadas que separaban entre sí los diferentes predios. Más bien buscaban la reclusión y el sombrío que brindaba el interior, como que crecía ahí más frondoso el naranjo de globos de oro, el limonero indígena y exótico, el mango y la manga de la India, el árbol del pan, de ancha hoja; el ciruelo de varias especies, el copudo tamarindo de ácidas vainas, el guanábano de fruta acorazonada y dulcísima, la gallarda palma, en fin, notable entre la gran familia vegetal por su tronco recto, cilíndrico, liso y grueso como el fuste de una columna dórica, y por el hermoso cerco de _pencas_ con que se corona perennemente.

A flor del camino sí erigían la entrada, portal, mejor, arco triunfal, bajo cuya sombra, como por las horcas caudinas, había que pasar para coger la ancha avenida, flanqueada de palmas y naranjos, que conducía a la apartada vivienda señorial, oculta allá en el espeso arbolado. Aún después de haber avanzado bien adentro, no siempre descubría de lleno el caserío, ni se llegaba a él derecho; porque a menudo ocurría dividirse la avenida en dos ramales, describiendo dos medios círculos, uno de entrada, otro de salida, que limitaban de un lado los cafetos o setos de zarzas, y del opuesto los jardines de flores, desplegados a un tiempo a la vista del sorprendido viajero. Siguiendo por cualquiera de esos medios círculos, de seguro que se daba con la morada de los dueños y sus dependencias inmediatas en primer término; después con la casa, por lo general exenta, del molino, en el centro de una como plaza o batey, en torno del cual se hallaban los tendales o secaderos de café, los almacenes o graneros, las caballerizas, palomar, corral de gallinas y la aldea formada por las cabañas de paja de los esclavos.

Leonardo Gamboa y su amigo, con los caballos algo sofocados, cubiertos ya unos y otros del polvo bermejo y sutil de la tierra llana, avistaron los linderos del cafetal _La Luz_, perteneciente a don Tomás Ilincheta, cosa de media legua distante del pueblo de Alquízar, pasadas las cuatro de la tarde del 22 de Diciembre de 1830. Por la derecha de los viajeros, bajo un cielo azul y sin nubes, se ponía entonces el glorioso sol de los trópicos, cuyos abrasadores rayos lanzaban manojos de luz a través de las ramas de los árboles, tendiendo cada vez más larga la sombra de las palmas sobre el campo verde, tachonado de gayadas flores, a tiempo que encendían el átomo térreo impalpable que se cernía en el tranquilo ambiente.

Resonaba a lo lejos con las pisadas de las caballerías el fondo poroso y hueco de la tierra llana; de manera que, mucho antes de que los jinetes tocaran el portal de la finca, ya se hallaba en la reja de hierro, dispuesto para abrirla, el portero negro, que acababa de salir de una especie de garita grande de mampostería y teja plana, hacia la izquierda. Reconoció desde luego a aquéllos y los recibió con los escorrozos tan propios de las gentes de su raza y condición diciendo:

--_¡Ojó! ¡ojó!_ Niño Leonardito ¿_ya sumerce vinió_? ¡Ah! ¡Ah!, y el niño Dieguito _asina_ mismo.

--¿Cómo está la familia, congo? le preguntó Leonardo.

--_Toos güenos, grasi Dió._ Ahorita _dentraron_ las niñas con doña Juanita. _Vinían_ del _protero_. Milagro que no se toparon con ellas los niños. Si susmercés _jarrean_ un poco _entoavía_ las alcanzan más _pacá_ de la casa.

Y agregó luego hablando con Leonardo:--¡Ah! ¡_Qué si va a legrá_ la niña Isabelita! ¡Y la niña Rosita! (hablando con Meneses). _¡No mi diga!_

Los dos jóvenes se sonrieron y continuaron al paso de sus caballerías por el centro de la magnífica alameda, deseando en secreto, por extraña coincidencia de sentimientos, que se alargase algo más el término de su camino. Es que en los momentos de comparecer ante las damas de sus amores, temía Leonardo que le recibiese la suya, no cual solía, como amiga y amante tierna, sino como juez severo y duro, por sus pasadas flaquezas y veleidades. Para decir verdad, sentía algo que se parecía más a la vergüenza que al contento. Diego, por su parte, próximo a realizar el deseo más vivo e íntimo de su pecho, el de volver a ver a Rosa en su paraíso de Alquízar, después de un año de ausencia, quería probar si retardando el momento apetecido, se calmaba un tanto el tumulto de su sangre y podía saludarla con la compostura del respetuoso caballero.

Pero por ahora, ni la satisfacción de este capricho les fue dado realizarlo a nuestros amigos. Porque en desviándose de la avenida que traían, alcanzaron a ver a las hermanas penetrando en lo más intrincado del jardín, allí donde los rosales de Alejandría, los jazmines del Cabo y las clavellinas, competidores de los más bellos de que se precian Turquía y Persia, si no acertaban a envolverlas con sus ramas, sin duda que las envolvían con sus emanaciones aromáticas.

También las jóvenes, por las pisadas de los caballos, se apercibieron de la presencia de los viajeros, reconociéndolos, especialmente al primero que puso pie a tierra, abandonando la montura a su albedrío, y fue Leonardo Gamboa. Rosa, más joven y cándida que la hermana, hizo una exclamación involuntaria de alegría; Isabel experimentó sentimiento opuesto. Recordaba que su despedida de La Habana no fue agradable ni cordial, y creía que antes de dar entrada en su pecho al placer con que solía recibir a Leonardo, necesitaba cuando menos una explicación suya satisfactoria de lo pasado.

Ni Leonardo ni Diego se hallaban en aptitud de leer claro en el semblante de sus amigas lo que pasaba en sus espíritus cuando llegó el momento de saludarse, según el modo frío y rígido que piden las costumbres cubanas, esto es, sin el significativo apretón de manos. Fue bien marcado, no obstante, el cambio que se operó en el rostro de las dos hermanas. El de Isabel asumió aspecto serio y pálido; el de Rosa tomó el color de la flor de su nombre; y por breve rato, ellos ni ellas supieron qué hacerse ni qué decir. Tocó al cabo a la más avisada de las mujeres el advertir la embarazosa posición de todos, y, para salir pronto del paso, acudió a una de las coqueterías características de su edad y sexo. Tenía Isabel en la mano una rosa de Alejandría, abierta aquella misma tarde, y se la prometió a Meneses diciendo:

--¿No es ésta su flor preferida?

Asomáronsele los colores a la cara del agraciado, y se puso más colorada que antes la de Rosa, quien, ya quisiese ocultar su propio rubor, ya enmendar el aparente desaire hecho a Gamboa, se quitó un clavel que se había prendido en el cabello y se lo dio balbuceando:--¿No es ésta la flor que prefiere el amigo Leonardo?

Bastó esto poco a romper el encanto; sólo que por aquella tarde y noche Isabel se dedicó a obsequiar y atender a Meneses, aunque no veía el momento de conciliación con Leonardo. Entre tanto, juntos los cuatro fueron al encuentro de doña Juana y del señor Ilincheta que venían a saludar a los recién llegados.

Desaparecía por entonces la claridad del día, y el airecillo de la noche, por más que viniese cargado de los perfumes de las flores y de las emanaciones gratas que emite el campo a esa hora, empezó a dejarse sentir. Las señoras, sobre todo, tuvieron que apelar al abrigo acostumbrado, el pañolón de seda, echado al desgaire sobre los hombros. Pero en los momentos de trasladarse a la sala, resonó el melancólico tañido de la campana de la queda en los cafetales circunvecinos y en el de _La Luz_, llamando a amos y esclavos a la oración y al recogimiento. En oyéndolo doña Juana, sus sobrinas, los dos jóvenes y don Tomás Ilincheta, éstos con los sombreros en la mano, y los criados del servicio inmediato de la familia con los brazos cruzados, todos de pie, aquella señora comenzó diciendo:--¡Ave María Purísima!; a que contestaron los circunstantes en coro: Sin pecado concebida.--El Ángel del Señor (prosiguió la señora) anunció a María que el Hijo de Dios Padre encarnaría en sus entrañas, para redención del mundo. ¡Ave María! María Santísima lo admitió diciendo: ves aquí la esclava del Señor, hágase en mí según tu palabra ¡Ave María! El Hijo de Dios se hizo hombre, y vivió entre nosotros. ¡Ave María!

Dadas las buenas noches, las hijas primero y tras ellas los criados, besaron la mano de doña Juana y de don Tomás, y recibieron en contestación el usual _Dios te haga una santa_, o _un santo_.

De seguidas una criada avisó a Isabel que el Contramayoral la esperaba en el otro lado del pórtico. Pidió ella permiso a los huéspedes. Su padre, hablando con éstos, explicó el motivo de su ausencia diciendo:--Es mi Mayordoma, cajera y tenedora de

libros, y cree que primero es la obligación que la devoción. Lleva cuenta del café que se recolecta, del que se descascara, escoge y ensaca, del que se remite a La Habana. Cuando se vende, glosa ella las cuentas del refaccionista, cobra y paga. Todo como un hombre. En una palabra, desde que murió mi esposa, que santa gloria haya, mi Isabel está hecho cargo de la casa, del cafetal y de todos mis negocios. ¡Ay! No sé qué sería de mí si también ella me faltase.

¿Quién era el Contramayoral? Un negro como un trinquete, del color de la pez, cari-ancho, de aspecto franco y mirada inteligente. No bien se apareció su ama, la hizo una genuflexión para pedirla su bendición, porque él mismo acababa de dirigir el rezo de sus treinta o más compañeros en medio del batey, a la luz de las estrellas.

--Niña, la dijo, aquí está la cuenta de _lo barrí llenao_ hoy. ¿Y le alargó un papel? ¿La hoja de una planta con signos caligráficos o aritméticos? Nada de eso. Aunque aquel esclavo había aprendido de coro ciertas oraciones del catecismo que le enseñaron para bautizarle, no sabía escribir ni pintar guarismos. La cuenta de que hablaba se reducía a dos o tres varas cortas de un arbusto del campo, con muchos cortes o muescas de través, tarjas o quipos modernos para indicar el número de barriles de café recolectados durante ocho horas de trabajo.

Con pasar Isabel las yemas de los dedos por las muescas de las tarjas, conoció que no había sido abundante la recolección, y así se lo dijo al esclavo.

--Niña, se apresuró él a explicar en su guirigay especial la causa de la deficiencia. _Niña, la safra va de vencía_, no queda café _maúro_ en la mata, _ni pa remedia. Brujuliando po aquí y po allí se ha llenao 25 barrí._

--Está bien, Pedro, repuso Isabel. No hay para qué estropear las matas, ni que tumbar el grano verde. Sería mucho menor la zafra el año entrante si eso se hiciera. Escúchame Pedro, con atención. Mañana bien temprano pon toda la gente a limpiar el batey y las guardarrayas principales hasta las nueve. Tenemos visitas y quiero que todo esté aseado y bonito. Por la tarde es preciso que unos pilen y avienten el café seco, y que otros, las mujeres y los más débiles, a escoger. El caso es aviar todo el pilado y aventado, mañana mismo si es posible.

--_Asina si jará, niña._

--¡Ah! Lo principal se me olvidaba, agregó Isabel en tono triste. A Leocadio que dé bastante maíz y yerba al trío moro y al trío dorado, porque tienen que emprender largo viaje pasado mañana.

--_¿Va a salí lamo?_

--No, tía Juana, Rosita y yo, que vamos a pasar las Pascuas en la Vuelta Abajo.

--_¡Anjá! La niña si va otra vuelta, la casa parece robá._

--Papa se queda. Estamos convidados a pasar las Pascuas como digo, con la familia del señor Gamboa en su ingenio _La Tinaja_, allá lejos, muy lejos, por el Mariel. Han puesto una gran máquina de vapor para moler caña; romperá la molienda la víspera de Pascuas y aguardan por nosotros. Aquí han llegado a buscarme el niño Leonardito y el niño Diego Meneses, que tú conoces.

--_¿Con que si va otra vuelta?_, repitió el Contramayoral pensativo.

--Estaremos ausentes muy poco tiempo, cuando más hasta después del domingo de Niño perdido. Me da mucha pena dejar a papá solo. Pero espero en Dios que no le sucederá nada, antes me prometo que Vds. le cuidarán bien.

--_Asina si jará niña._

--Pero si por desgracia se enfermare en nuestra ausencia, te encargo, Pedro, que sin pérdida de tiempo me despaches un propio al ingenio _La Tinaja_, cerca del pueblo de Quiebrahacha. Acuérdate de estos dos nombres: _Tinaja_ y _Quiebrahacha_.

--_Asina si jará, niña._

--Rafael o Celedonio, cualquiera de los dos, sirve para el mandado. Ellos conocen el camino de aquí a Guanajay; de allí al Quiebra Hacha se sabe que quien tiene lengua a Roma va.

--_Asina si jará, niña._

--Bueno, confío en ti, Pedro. Es un gran descanso para nosotros, cuando salimos, dejar el cuidado de la casa y de la finca a un hombre tan racional y honrado como tú.

Ni porque le hicieron este elogio franco cuanto sincero, hizo uso el negro de su conocida muletilla. Sólo sacudió la cabeza cual si quisiera desterrar una idea enojosa, y volvió a un lado el rostro, sin darle la espalda a su señorita, lo cual habría sido una falta de respeto.

--Atiende, Pedro, continuó Isabel. Hay que traer del potrero el caballo careto para llevar a Guanajay uno de los dos tríos. El que le lleve, sea Rafael o Celedonio, debe salir al Ave María o con los primeros claros del día de pasado mañana, apearse en la posada de Ochandarena, frente a la plaza, hacer que bañen y den un buen pienso a los caballos y aguardar por nosotros, pues tendrá que regresar con el trío que saquemos de acá. ¿Recordarás todas estas cosas, Pedro?

--_Mi ricorde, niña_, dijo el Contramayoral afectado; añadiendo a la carrera: _Le pobre negre va a tené una Pacua mu maguá._

--¿Por qué? preguntó Isabel con exagerada sorpresa. Le diré a papá que les deje tocar tambor en los dos días de Pascuas y el día de Reyes.

--_Ma como la niña no etá allante, le negre no se diviete._

--¡Qué bobería! Nada, a bailar, a divertirse para que esté contenta la niña cuando vuelva del paseo. ¡Eh! Nada más, Pedro.

Se retiraba éste despacio y de mala gana, e Isabel, que quedaba pensativa apoyada en el barandal del pórtico, llamole luego, diciendo:--Pedro, ¿ya lo ves? Por tus interrupciones y majaderías se me iba o olvidar una de las cosas que tenía más presente. Debo hacerte otro encargo, mi último encargo. Mira, Pedro, estoy pensando que por sí o por no, lo mejor será que guardes el látigo en tu bohío hasta después de Pascuas. Sí, sí, mejor será pues mientras le tengas en la mano has de querer usarlo, y yo no quiero que se levante el látigo para nadie, ¿lo oyes, Pedro? Que no suene el látigo en mi ausencia.

--_Le negre etá perdío_, dijo Pedro sonriéndose, _por mor de la niña_.

--Me importa poco, replicó Isabel con firmeza. Tú sabes que papá botó al mayoral en abril porque daba mucho cuero. Recuerda que la cogió contigo. No ha de oírse un latigazo en el cafetal en mi ausencia. Lo repito, lo quiero así, lo mando, Pedro.

Volviendo de su breve diálogo con el Contramayoral, encontró Isabel puesta la mesa para la cena en medio de la sala. Serían las ocho de la noche. El lujo de la vajilla de plata, de cuyo metal eran hasta los grandes macizos candeleros, parecía competir con la abundancia de los manjares. Mas nada de esto se hacía por vano alarde. En primer lugar, porque habiendo comido la familia a las tres de la tarde, según la costumbre del campo entonces, suponían que los dos huéspedes tuviesen hambre y querrían satisfacerla. En efecto, las señoritas, la tía y el señor Ilincheta, que por cumplimiento habían ocupado juntos un costado de la mesa, participaron únicamente del chocolate o del café con leche; haciendo, eso sí, Isabel, los honores con gracia y naturalidad características.

Tras la cena y una conversación agradable, se levantó don Tomás y se retiró a su cuarto, recomendando a sus hijas no detuvieran mucho a los huéspedes, quienes por fuerza estarían cansados y desearían reposar de las fatigas del viaje.

La casa vivienda del cafetal _La Luz_ estaba hecha a la francesa, es decir, conforme al sistema que para habitaciones tales se seguía en las fincas de igual naturaleza por los criollos de la Guadalupe y Martinica; pues de hecho la había trazado y dirigido un arquitecto natural de una de esas islas. El plano figuraba una cruz con dobles brazos, cuyo centro lo ocupaba la sala, y las ocho alcobas, ambos brazos de la misma, formadas por dos pasillos que terminaban en dos saletas, debajo de los cobertizos de las culatas de la casa. En los ángulos de los pórticos había cuatro cuartos que interiormente se comunicaban con las saletas dichas, y exteriormente con los jardines y aquéllos. Los pórticos, pues, se extendían cuanto la sala, corrían paralelos a ella y estaban cerrados por barandillas de madera y por cortinas de cañamazo en vez de persianas. El techo del cuerpo principal estaba formado con las hojas de la palma llamada _cana_, por su espesor, duración y frescura; y el de los pórticos o cobertizos con teja plana. Las puertas y ventanas, en número por cierto excesivo, abrían todas hacia afuera, dejando entrar a raudales, al menos de día, la luz y el aire siempre cargado con el perfume de las flores o de las frutas en que tanto abundaba aquella morada encantadora.

Por razones que es fácil colegir, las señoras no siguieron desde luego el ejemplo del amo de la casa. Los jóvenes no sentían inclinación ninguna a separarse por el resto de la noche, sin comunicarse con una palabra, con una mirada aunque fuese algo de lo mucho que bullía en sus cabezas. Así es que, por instinto casi, después de la cena volvieron al pórtico fronterizo y

emprendieron paseos de arriba a abajo, en dos grupos: el de Isabel con su tía y Meneses y el de Rosa y Leonardo a retaguardia. A la primera vuelta preguntó éste a aquélla, en tono bajo, indicando a la hermana mayor:

--¿Qué tiene la niña?

Este era casualmente el primer verso de una canción muy popular entonces; y Rosa, que era viva y traviesa, contestó al punto con el segundo verso que la daba nombre:

--Sarampión.

--¿Con qué se le cura?, volvió a preguntar Leonardo con el tercer verso.

--Con coscorrón; concluyó Rosa sin poder tener la risa.

--¿De qué se ríen Vds.?, preguntó Isabel muy atenta a lo que pasaba a sus espaldas.

--No le diga, Gamboa, dijo Rosa. Déjela con su curiosidad. Ella no es de nuestro bando.

Parecía que Isabel se proponía monopolizar por el resto de la velada la conversación y la sociedad de Diego Meneses. De aquí el motivo aparente del pique de Rosa con ella, según lo revelaban sus últimas palabras. La misma sospecha y con igual copia de razones podía abrigar Isabel respecto de su hermana menor, dado que desde el principio se apropió las atenciones y compañía de Leonardo. Mas ninguno de los jóvenes estaba satisfecho de sí mismo ni del otro. Esta era la verdad; de suerte que se cansaron de los paseos más pronto de lo que podía razonablemente esperarse, sólo que en vez de sentarse se apoyaron como por acaso en la barandilla, quedando, también casualmente, cual deseaban en secreto: Isabel al lado de Leonardo. Rosa al de Meneses, y doña Juana fuera del grupo. Amaba ésta a sus sobrinas con amor de madre, como quien las había criado desde pequeñuelas; deseaba su establecimiento, y, siendo ella casamentera de índole, claro está que no tomó a mal una eliminación mediante la cual aquéllas podían tener un rato de íntima comunicación con sus galanes.

Reinaba en torno de la casa la calma más profunda, habiendo abatido el airecillo que se levantara a las puestas del sol. No se movían las ramas de los árboles, ni era bastante la luz de las estrellas, ni la transparencia del cielo para reflejarse en las anchas hojas del plátano, cuyo tallo fibroso sobresalía entre los enanos y espesos cafetos. El único rumor que se apercibía era el distante y sordo procedente de esclavos, los cuales, antes de entregarse al descanso, preparaban la frugal cena a la lumbre de sus bohíos mientras discutían la novedad de la noche, a saber: la próxima ausencia de su señorita. Pero más cerca de nuestros jóvenes no puede decirse con exactitud que formaban ruido apreciable el chirriar de los grillos ocultos en la yerba, ni el aleteo de las mariposillas nocturnas que con fugaz zumbido pasaban del jardín a la casa, atraídas por la luz de la vela dentro de la guardabrisa o fanal en la mesa del centro de la sala.

El sitio, pues, la hora, el silencio de la tierra y del cielo, el aspecto sombrío del pórtico ancho, gacho y de limitado horizonte por el espeso arbolado inmediato, la misma lucha de la débil claridad artificial interior con la oscuridad exterior, todo predisponía a la exaltación de las pasiones de los jóvenes, arrobadas sus almas en la contemplación del bellísimo cuadro que los rodeaba por todas partes. En tales momentos, las mujeres menos agraciadas parecen aéreas y adorables; los hombres más tímidos se atreven a todo, y sintiendo más se expresan con mayor elocuencia.

--Isabel, dijo Leonardo, me extraña tu conducta conmigo.

--Califíquela, repuso Isabel sonriendo.

--No me corresponde calificarla, por la sencilla razón de que soy el agraviado.

--¿Eso más? Pues era lo que faltaba.

--¿Te sorprende? ¿Cómo se compagina, si no, nuestra amigable despedida de La Habana (por mi parte, se entiende), con tu silencio e indiferencia enseguidas...?

--¿Sin motivo que justificara el cambio?

--Sin motivo que lo justificara. Yo al menos no he podido penetrarlo todavía.

--Refresque Vd. la memoria de los hechos.

--Nada, Isabel, no alcanzo, desconozco el motivo.

--¿De verás?

--De veras.

--Entonces he sido una loca, una tonta, he visto visiones.

--Tanto como eso no, Isabel. ¿No te ocurre que hayas podido interpretar mal un acto inocente mío o de otra persona hacia mí?

--Si no se trata de interpretaciones, señor don Leonardo, se trata de lo que yo vi con mis ojos.

--Sepamos lo que vio mi señora doña Isabel con sus ojos.

--Vi lo que Vd. vio, mejor dicho, lo que le pasó Vd. al estribo del quitrín.

--¿Y ése era motivo suficiente para que tú me perdieras el cariño y estuvieras a punto de olvidarme?

--Lo era y grande, para enojarse cualquier mujer de vergüenza, por mucho que la cegara la pasión.

--Veo claro, Isabel, que en todo ello ha habido una equivocación de tu parte, y que, sin quererlo has sido injusta conmigo.

--Explíquese Vd., dijo Isabel con aparente ansiedad.

--Te diré en pocas palabras lo que pasó, continuó Leonardo, poniéndose colorado, porque de hecho pensado iba a mentir. Mientras te decía el último adiós, naturalmente extendí un pie sobre la acera. Una de las dos mulatas que pasaban tropezó conmigo, y, creyendo que le había armado una zancadilla, llena de ira me dio un empellón. Tú sabes lo insolente que son esas mujerzuelas cuando se creen ofendidas.

--Sí, dijo Isabel pensativa. Después de un breve rato añadió: Mas ¿qué motivo le di yo para que me dijese la palabra indecente que aún me zumba en los oídos?

--Tu exclamación, Isabel, y luego el llamarla Adela, cuando tal vez se llamaba Nicolasa o Rosario fue sin duda lo que aumentó su cólera.

--Si la llamé por el nombre de Adela, mejor dicho, si en mi exclamación solté ese nombre, fue porque me figuré que era ella su hermana de Vd. Además de tomarla por el vivo retrato de Adela, no pude, ni debí imaginar que otra mujer tuviese con Vd. semejantes bromas.

--¡Toma! El cuento es que no hubo broma de su parte.

--Luego ella le conoce a Vd. y le maltrató por... celos.

--La conozco de vista, lo confieso, ya me había llamado la atención su semejanza con mi hermana Adela; mas no la he dado jamás ocasión a encelarse de mí.

--Quizá le ama a Vd. en secreto.

--No tendría nada de particular, sólo que en mi vida le he dicho «ojos negros tienes».

--Sentiría hacer a Vd. una injusticia, Leonardo. Las apariencias, sin embargo, le condenan.

--No, Isabel, no. Soy inocente. Si te engañase en este momento, si no te dijese toda verdad, si te pintara una pasión que no sentía, si en consecuencia te hubiese dado justo motivo de agravio, sería el más malo de los hombres...

--Está bien; doblemos la hoja, le interrumpió Isabel convencida.

--¿Pelillos a la mar?, le preguntó Leonardo con amoroso acento.

--Pelillos a la mar, contestó ella con celestial sonrisa. No habría dicha para mí si me viese condenada a dudar de la palabra del hombre a quien tenía por amigo y caballero.

--Bien, agregó Leonardo más animado. ¿No crees tú que debíamos sellar esta dulce reconciliación...?

Diciendo esto dejaba correr disimuladamente la mano por el barandal para coger la de Isabel, que se apoyaba en el mismo. Pero ella, evitando la ocasión, evitó el peligro. Se puso seria y pasó al lado de su tía, a quien dijo alto que era hora de recogerse. El reloj de Leonardo marcaba las once de la noche.

Había volado el tiempo. Diego Meneses, no obstante sabedor de que la ocasión la pintan calva, supo aprovecharla lo que bastaba para hacer a Rosa una formal declaración de amor; habiendo encontrado el tema o pretexto de la conversación en el regalo del clavel que esa joven hizo a Leonardo en el jardín. ¡Cándida paloma del vergel de Alquízar! Ella, que no había escuchado antes un «te amo, Rosa» dicho con intención y con fuego. Ella, que se sentía atraída hacia aquel joven como la aguja al imán, como la avecica a la serpiente, no pudo desviar la atracción, deshacer el encanto; no encontró a mano gesto, palabra ni ardid para negar que había sucumbido y que también amaba a su tentador desde la primer temporada que pasaron juntos en el cafetal _La Luz_.

CAPÍTULO II

Y en los bellos cafetales todo es frescura y olores, besadas sus blancas flores por las brisas tropicales.

J. PADRÍÑEZ

Como novia de Cupido desde la víspera, Rosa Ilincheta, por el temor pudoroso de encararse con su cómplice a la clara luz del día, retardó cuanto pudo su salida del tocador. Pero Isabel tenía obligaciones que llenar y bien temprano apareció en el pórtico del sur de la casa con la sombrilla en la mano derecha, una cestita calada al brazo izquierdo por el aro, y por todo abrigo el pañolón de seda bordado de realce.

Asomaba entonces el sol por un ángulo de la casa, alumbrando una parte del jardín y proyectando la sombra de aquélla y de los árboles, por largo trecho, sobre el espacioso batey de la finca. Había sido abundante el rocío de la madrugada. Empapado estaba el césped, apagado el polvo bermejo de los caminos y las hojas de las plantas y las corolas de las flores cuajadas de menudos aljófares; otros tantos prismas que descomponían la luz del almo sol, al recibirla de soslayo.

Echó Isabel una mirada inquisitiva por todo el país desplegado ante ella, y se aventuró fuera del pórtico; porque desde allí echó a ver una rosa de Alejandría que acababa de abrirse al dulce calor solar, en el cuadro del sudeste del jardín. Cortola sin punzarse ni mojarse, y cuando se adornaba con ella la espléndida trenza de sus cabellos, volvió maquinalmente los ojos hacia la casa y le pareció que uno de sus huéspedes la observaba desde el postigo de la ventana del cuarto, en el extremo del pórtico, donde en efecto se habían los dos alojado. Era Diego Meneses, que por no haber disfrutado de sueño tranquilo, dejó la cama desde el amanecer y aspiraba el puro ambiente del campo, a la sazón que Isabel apareció en medio de sus gayadas flores.

De tal modo la turbó este incidente, que por breve rato estuvo indecisa entre si volvía atrás o seguiría adelante, porque los actos de adornarse el cabello y de mirar para la casa, magüer que inocentes y casuales, podían interpretarse de diversas maneras, y ella huía tanto de la frivolidad como de la necia coquetería. Pero tenía que salir y salió con firme paso.

Por el lado del sur, una cerca de piedra separaba el campo del cuadrado en que se comprendía el variado caserío de la finca. En el centro se alzaba el molino del café, entre los dos pares de tendales, capaces de contener a un tiempo, secándose, la mitad de la cosecha. Más lejos, cerrando el gran espacio por la izquierda, se veía el grueso y oscuro brocal del pozo con su horca y garrucha para la extracción del agua; el palomar después, el corral de las aves y algunos chiqueros; al fondo y a la derecha, el campanario, o más bien el pilar de madera de cuyo brazo cubierto con un tejadillo, pendía la campana; los graneros o almacenes, las caballerizas, el establo de las vacas y las otras dependencias. Los bohíos de los esclavos figuraban una aldea de regular tamaño.

Ni estaba desprovisto de vegetación el magnífico batey que hemos venido describiendo, pues muchos árboles, y sin duda los más copudos y corpulentos de toda aquella hacienda, le adornaban y daban sombra. Entre ellos varios aguacates, mameyes colorados, mangos y caimitos; sobre todo los primeros, cual las coníferas del continente, parecían escalar el cielo con la cúspide de sus ramas. Aquéllos más empinados y coposos eran los escogidos por las gallinas de Guinea (_Numidas Meneagris_ de Cuvier), conocida la hurañía de esas aves exóticas, para sus querencias de noche. La banda, que bien podía componerse de cien, desde antes de aparecer el sol empezaron a removerse y a repetir el clamor o cacareo peculiar suyo, en que parece que una dice _pascual_ y la otra contesta, _pascual_, hasta que todas despiertan y se preparan para descender de sus elevadísimas y naturales alcándaras. Ni los pichones ni las gallinas daban aún señales de vida: aquéllos por no ser madrugadores, éstas por el encierro y la oscuridad de su casa.

Por lo demás, se notaba bastante movimiento en todo el batey. De los esclavos de ambos sexos, quiénes recogían con sus guatacas o azadones las hojas secas y briznas del suelo; quiénes con los mismos instrumentos rozaban la yerba de los caminos; quiénes con ambas manos abiertas levantaban la basura amontonada y la metían en canastas que otros conducían fuera a la cabeza; quiénes a brazo sacaban agua del profundo pozo y la vertían en una amplia cubeta de piedra al pie del brocal para que otros, en unos baldes rústicos hechos del pecíolo de la palma, la distribuyesen en los depósitos de los varios departamentos de la hacienda. A la vera del pozo daba agua y bañaba los caballos de dos en dos o de tres en tres, el calesero Leocadio. Dentro del molino resonaba la voz penetrante del negrito, que, sentado al extremo del eje de la rueda vertical, con que girando en la solera se descascaraba el café, aguijaba sin cesar a la caballería que servía de motor. Cuatro esclavas, entre tanto, tendían el grano, aún no bien seco; mientras otros conducían el _pilado_ o descortezado al aventador, cuyas paletas hacían un ruido tremendo y despertaban los ecos doquiera que la ola sonora encontraba obstáculo elástico en su trayecto. Y una vez limpio de toda paja o polvo, era llevado a los almacenes para que allí se escogiese y clasificase por otros esclavos.

Ninguno de los que pasaban al alcance de Isabel dejaba de darla los buenos días y de pedirla su bendición, doblando la rodilla en señal de sumisión y respeto. Pedro, el Contramayoral, sin la insignia ominosa de su oficio, yendo de un lado a otro, animaba a sus compañeros al trabajo y daba la mano en muchos casos, como para imprimir mayor peso a la palabra con la obra. La subida o aparición de Isabel en los tendales fue la señal para que el negrito del molino alzase la voz argentinada y aguda con la canción, tan ruda como sencilla, improvisada quizás la noche anterior, la cual principiaba con esta especie de verso: _La niña sen va_, y terminaba con este otro, repetido en coro por todos los demás negros: _Probe cravo llorá_. Entre la primera letra y el estribillo o pie insertaba el guía, no obstante que criollo, nacido en el cafetal, frases en congo puro, a que también contestaba el coro con el obligado: _Probe cravo llorá_.

Inútil fuera pedir armonía, siquiera música a una canción, ni civilizada ni salvaje del todo; pero si parecía asaz monótona a oídos delicados, también es verdad que el tono y la letra rebosaban en melancólico sentimiento. Así lo estimó Isabel, aunque hizo como que no oía ni entendía palabra, y siguió adelante hasta el pie de los árboles, donde ya bullían y corrían en todas direcciones las aborotosas gallinas de Guinea. Algunas, las más ariscas, al verla quisieron emprender vuelo, estallando en el grito nasal, chillón y alto con que suelen dar la voz de alarma a sus compañeras. Mas conocida la voracidad de esas aves, bastaron a tranquilizarlas y contenerlas unos granos de maíz que Isabel sacó de la cestita que llevaba al brazo y que tuvo cuidado de arrojarlos en un punto dado, cerca de sí. La banda en masa se echó sobre el escaso alimento, depuesta la vigilancia, olvidado el peligro, y sólo ocupada de egullir granos o pedrezuelas. De esta circunstancia se aprovechó una de las esclavas, a una señal de su señorita, para arrastrarse por el suelo y pillar dos, sin que lo echaran de ver las otras. Muy gustosa es la carne de estas aves, tan gustosa como la de la perdiz, razón por qué Isabel se propuso obsequiar a sus huéspedes con un par de ellas, asadas, en el almuerzo.

A la vista del alimento, arrojado ahora a puñados, acudieron presurosos los pichones. Estos, menos huraños que las guineas, a las cuales temían, y más capaces de simpatía que ellas, revolotearon al principio en torno de la joven, luego se posaron en su cabeza, en sus hombros y en el brazo de la cesta, acabando por arrebatarle el maíz de las manos y aun picarle en la boca. Tales y tan tiernas demostraciones de inocentes avecicas, por más que repetidas un día con otro, siempre la enternecían, y jamás, sino en casos extraordinarios, consintió que las matasen fuera de su vista. Por éste y otros actos parecidos en que se ponía de manifiesto la influencia ejercida por Isabel sobre cuantos seres se le acercaban, no creían menos sus esclavos sino que Dios la había dotado de una especie de encanto o poder secreto, el cual no cabía aludir ni repeler.

Seguía Diego Meneses con la vista los pasos de su amiga, y, bien que, a fuer de hombre civilizado, no estaba dispuesto a conceder nada sobrenatural en ella, sí creía, como los demás, que era una mujer extraordinaria. Desde su puesto de observación daba cuenta fiel de lo que veía u oía, a Leonardo, quien continuaba en la cama descansando y gozando de las finísimas sábanas cargadas de encajes y perfumadas con los pétalos de las rosas de Alejandría, obra toda de las industriosas manos de Isabel. Decía Meneses a Gamboa, entre otras cosas:

--Es mucha mujer ésa, amigo.

--¿No te lo decía yo?, contestaba éste satisfecho.

--Vale un Perú. No se ven muchas como ella por ahí.

--¿Quieres cambiar? La cambio pelo a pelo por Rosa. Vamos.

--No te burles, compadre, contestaba Diego serio. Que reconozca en Isabel prendas raras, dignas de encomio, no quiere decir que me guste más que otras mujeres, ni que esté prendado de ella. Pero la verdad es que cada vez me convenzo más de que tú no te la mereces.

--¡Pues qué! ¿Te figuras que ella es mejor que yo? replicaba Leonardo, herido de la observación de su amigo. Te equivocas, chico, de medio a medio. Ten presente que Isabel es hija de un antiguo empleado del gobierno, empleado cesante, un cafetalista arruinado, un pobretón, en suma; mientras que mis padres tienen potreros, cafetal, ingenio, son hacendados ricos y hacen diferente papel en La Habana. ¿Está Vd.?

--Estoy, sólo que no me referí a nada de eso cuando te dije que no te merecías esa muchacha. Hablando en plata, Leonardo, tú no la quieres.

--¿Por qué supones que no la quiero?

--¡Qué! ¿Acaso no tengo ojos? Desde que llegamos vengo observando tus acciones y palabras, y nada en ti me persuade que amas a Isabel.

--¡Hombre, Diego! Te diré francamente lo que me pasó, dijo Gamboa tras breve rato de silencio. No siento por Isabel aquella pasión ciega y ardiente que sientes tú, por ejemplo... por Rosa.

--Di mejor, le atajó prontamente Meneses, que la que tú sientes por Cecí...

--¡Calla! exclamó Leonardo alarmado, y medio incorporado en la cama. No se mienta la soga en casa del ahorcado. Te pueden oír: las paredes oyen. Ese nombre es vedado aquí.

--Poco importa un nombre. Es muy común y no creo que Isabel lo haya oído en su vida.

--Probable es que no, pero por el hilo se saca el ovillo, cuanto más que Isabel no tiene pelo de tonta.

--Y ahora que viene al caso, ¿cómo te has compuesto respecto a la escena delante de la casa de las Gámez en el momento de la partida de Isabel?

--Creo que sospecha algo y tengo para mí que sus primas le han contado o escrito sobre eso algún cuento. Ello es que Isabel se muestra recelosa y al parecer muy sentida conmigo.

--No dudo que las primas hayan despertado sus celos. La cosa fue, no obstante, muy clara para que se dejase de alarmar Isabel y sospechar lo mismo que tú y yo sabemos. ¡Qué osadía la de aquella muchacha!

--¿Qué quieres? La cegó el demonio de los celos, comprometiéndome a los ojos de Isabel y de sus primas. No puedes imaginarte cuánta fue mi vergüenza.

--Lo considero. Yo, en tu lugar, escondo la cara bajo siete estados de tierra. Mas ¿de dónde sacó Isabel que podía haber sido tu hermana Adela?

--Ahí verás, Diego. Con todo, si bien recuerdas, se parecen mucho a primera vista.

--Ya había hecho yo la misma observación. ¡Qué malo que tu padre tuviese que ver con semejante parecido!

--¿Quién sabe? A él le gusta la _canela_ tanto como a mí. No tendría nada de extraño que, andando a salto de mata, como solía cuando mozo, hubiese dado un tropezón... Lo que es de C... está que se le cae la baba. Me consta.

--Luego no puede ser su padre.

--¡Qué había de serlo! Ni pensarlo. ¡Disparate!

--Pues por ahí se corre que lo es.

--Habladurías de las gentes, Diego. ¿Conciben que estaría enamorado de C... si le ligasen esas relaciones de parentesco con ella?

--Quizás lo ignore, porque tú dices, fue todo a consecuencia de un tropezón. Quizás también la cela de ti, sabedor del parentesco que media entre Vds. dos. ¡Cuando el río suena!...

--En este caso el río no lleva agua, ni piedra. Sólo porque da la casualidad que se parecen mucho C... y Adela se encapricha la gente y habla... Lo que te sé decir es que él me ha hecho pasar más sustos que pelos tengo en la cabeza. Cuando menos lo espero me doy con él de manos a boca. Casi, y sin casi, me causa doble inquietud que el músico Pimienta. Lo único que me tranquiliza por esta parte, es que ella desdeña tanto a los viejos como desprecia a los mulatos.

--No te fíes, sin embargo. Cosa sabida es que hijo de gato ratón caza, y que por donde salta la madre salta la hija. Mas volviendo a nuestro cuento, el resultado de estas misas es que tú no estás en el mejor pie con Isabel.

--No. Como te decía, ella sospecha algo, o alguien la ha predispuesto contra mí. Isabel es, además, muy perra para explicarse con franqueza; yo soy punto menos, de modo que así iremos pasando hasta que Dios quiera, o ella deponga el orgullo y se reconcilie conmigo.

--Esa misma conformidad tuya, observó Meneses, me confirma en la creencia de que tú no amas a Isabel.

--O yo no me he sabido explicar, o tú no me entiendes, Diego. No habiendo puntos de comparación bajo ningún concepto entre las dos mujeres, no puedo querer a la una como quiero a la otra. La de allá me trae siempre loco, me ha hecho cometer más de una locura y todavía me hará cometer muchas más. Con todo, no la amo, ni la amaré nunca como amo a la de acá... Aquélla es toda pasión y fuego, es mi tentadora, un diablito en figura de mujer, la Venus de las mula... ¿Quién es bastante fuerte para resistírsele? ¿Quién puede acercársele sin quemarse? ¿Quién al verla no más no siente hervirle la sangre en las venas? ¿Quién la oye decir: _te quiero_, y no se le trastorna el cerebro cual si bebiera vino? Ninguna de esas sensaciones es fácil experimentar al lado de Isabel. Bella, elegante, amable, instruida, severa, posee la virtud del erizo, que punza con sus espinas al que osa tocarla. Estatua, en fin, de mármol por lo rígida y por lo fría, inspira respeto, admiración, cariño tal vez, no amor loco, no una pasión volcánica.

--Y pensando como piensas, Leonardo, ¿te casarás con Isabel?

--¿Por qué no? Precisamente así es como debe buscarse la mujer para esposa. El que se casa con Isabel está seguro de que no padecerá de... quebraderos de cabeza, aunque sea más celoso que un turco. Con las mujeres como C... el peligro es constante, es fuerza andar siempre cual vendedor de yesca. No me ha pasado jamás por la mente casarme con la de allá, ni con ninguna que se le parezca, y sin embargo, aquí me tienes que me entran sudores cada vez que pienso que ella puede estar coqueteando ahora mismo con un pisaverde o con el mulato músico.

--Lo que prueba, amigo mío, que no hay forma de servir a dos amos.

--En negocios de amores, o galanteos, se puede servir hasta a veinte, cuanto y más a dos. La de La Habana será mi Venus citerea,[44] la de Alquízar mi ángel custodio, mi monjita Ursulina, mi hermana de la caridad.

--Es que no se trata aquí de amores ni de meros galanteos, se trata de amar mucho a una y de casarse con otra que no se ama tanto.

Ya veo que tú no entiendes de la misa la media. Para gozar mucho en la vida el hombre no debe casarse con la mujer que adora, sino con la mujer que quiere. ¿Entiendes ahora?

--Entiendo que tú no has nacido para casado.

Prosiguiendo Isabel en su excursión matutina, muy ajena de la conversación que se tenían los jóvenes habaneros sobre ella, se llegó al pozo. Allí, como en todas partes, impuso respeto su presencia. Por lo que toca al aguador, suspendió el trabajo, no fuera que al verter el agua en la cubeta salpicase el traje de su señorita, que se había acercado demasiado. Al contrario, el calesero criollo, poco más o menos de la edad de aquélla, y que por haberse criado a su vista la trataba con más confianza, no detuvo el bañado de los caballos, dado que se quitó el sombrero. Tampoco dobló la rodilla, cual su compañero, al desearla los buenos días, circunstancia que estamos seguros no advirtió Isabel, ya por estar acostumbrada, ya por no concordar con sus sentimientos filantrópicos la humillación, ni en el esclavo.

--Blas, dijo dirigiéndose al aguador, ¿tiene mucha agua el pozo?

--_A bombón_ (por mucha), _niña._

--¿Cómo lo sabes tú?, le preguntó ella.

--_¡Ah, niña! Yo oye siempre bu, bu, bu._

--Luego se podrá ver el movimiento del agua.

--_Se pue, niña, se pue. Yo mira jervir._

--Veamos, dijo Isabel acercándose todavía más al brocal.

--_¿Sumelsé mira?_, preguntó el negro muy asustado. _No, no mira. Mu jondo. Diablo rempuja la niña._

De los aspavientos del compañero riose Leocadio y sugirió que la señorita podía satisfacer su curiosidad sin riesgo si se afirmaba de un ramal de la soga mientras ellos dos sujetaban el otro cabo. De esta manera se hizo; pero Isabel no alcanzó a ver el fondo por la demasiada profundidad, por el espesor del brocal de mampostería y por los innumerables helechos adheridos a las paredes interiores, que con sus graciosas palmas casi cerraban la boca del pozo.

Enseguida Isabel preguntó al calesero si los caballos estaban en disposición de emprender el viaje del día siguiente:

--Niña Isabelita, contestó él en lenguaje más inteligente que el de su compañero: _Pajarito_ y _Venao_ necesitan _herraura_ nueva.

--¿Por qué no me lo habías dicho, Leocadio de mis culpas?

--¿Y yo he tenío tiempo? Hasta anoche no supe na del viaje. _Dispués_ de bañar los caballos iba a decírselo a la niña.

--Pues tienes que ir al pueblo a herrarlos.

--Iré _dispués_ de almuerzo. Deme la niña la papeleta para el _herraor_. Si no se ha _emborrachao_, estamos bien.

--Por eso, ve lo más temprano que puedas. Y echa ahora a correr y sofocar los caballos antes de tiempo.

--La niña siempre se figura que uno mata los caballos.

--Debías llamarte mata-caballos, no Leocadio.

No se detuvo Isabel en las otras dependencias de la finca por aquel lado del batey; mas al cruzar al opuesto, echó de menos a uno de los esclavos de campo y la informó el Contramayoral que por enfermo no se había presentado en la fila la noche anterior. Reprendió a Pedro que no le dio el aviso oportuno, siguiendo derecho a la enfermería. Se hallaba sentado el enfermo en el suelo, junto a la lumbre, abatido y con un pañuelo atado en la cabeza. Por pronta providencia la enfermera le había suministrado sendas jícaras de infusión de corteza de naranja, endulzada con azúcar de _raspaduras_. Isabel le tomó el pulso, comprendió que tenía fiebre y dispuso se recogiera entre tanto venía el médico. De vuelta a la casa de vivienda, examinó la caballeriza y el salón en que se escogía el café.

La esperaban en el pórtico los huéspedes, junto con su hermana, su tía y su padre. Parecía natural que quien tan puntualmente había desempeñado las obligaciones de administradora de la heredad y de las _cosas_ a ella adscritas, se sintiese satisfecha de sí misma y más dispuesta para el desempeño de sus deberes como ama de casa. En el semblante risueño y animado con que tornó al lado de la familia, se echó bien de ver que la dueña cariñosa y blanda de esclavos sumisos, sabía ser amable y atenta con sus iguales y amigos. Desde ese momento se consagró a obsequiarlos y a hacerles cuanto agradable se pudiese su corta estada en el cafetal.

Como la mañana siguiese siendo fresca y de poco sol, propuso Isabel a sus amigos una breve visita al jardín fronterizo de la casa. Ese era su Edén. Poca cosa se le alcanzaba del arte de la jardinería, mucho menos de botánica; tampoco se había propagado en Cuba el gusto por la floricultura, ni Pedregal u otros jardineros franceses habían importado de Francia la gran variedad de rosas que adelante trajeron la invasión rosada a La Habana. Pero Isabel era florista por instinto y por afición decidida, y como había plantado con sus manos, sabía de coro la historia de todas las flores que crecían en su delicioso pensil. Guardóse, no obstante, de mencionar siquiera el rosal de flores pálidas en que Leonardo, hacía un año cabal, había injertado de púa el rosal de flores encarnadas. Vigoroso y lozano se mostraba, ostentando en cada nudo rosas de uno y otro color; remedo fiel y poético de dos seres sensibles ligados por la más humana de las humanas pasiones: el amor.

Más tarde la visita a los jardines la extendió Isabel a una excursión a caballo de los cuatro jóvenes por los cafetales vecinos. Sentía ella la necesidad de distraerse, más aún, de aturdirse con el continuo movimiento. Aparte de que no la había dejado satisfecha su explicación de la víspera con Leonardo, le dolía alejarse del apacible hogar y del amoroso padre, y ya la acometía aquella especie de fiebre, síntoma infalible de la extrema dolencia conocida por nostalgia.

Así cursó el 2 de diciembre y vino la melancólica mañana del 24. Mucho antes de aclarar había partido para Guanajay el postillón con el relevo de las tres caballerías. En la silla, y armado al uso general con el látigo y largo machete de cabo de carey y plata, aguardaba por las viajeras el apuesto calesero Leocadio. Cerca de allí se veían varias esclavas y algo más distante los otros siervos, aparentemente preparándose para emprender las faenas del nuevo día, en realidad, como después se vio, en expectativa de la tristísima escena que allí se representaría.

Deseosa Isabel de abreviar el doloroso momento de la separación, abrazó a su padre de carrera, tomó el brazo que le brindaba Gamboa y, con los ojos empañados por las lágrimas, salió a la avenida del este para tomar el carruaje. Las señoras iban en el traje riguroso de camino, de seda oscuro y el sombrerito de paja o gorra al estilo francés. A su aparición se observó un movimiento general seguido de un murmullo entre los esclavos espectadores, quienes prorrumpieron a una en el clamor o canto monótono de la víspera: _La niña sen va, probe cravo llorá_, repetido en coro solemne a la luz matinal del nuevo día, que apenas alumbraba la cúspide de los más empinados árboles.

Este inesperado saludo acabó de desconcertar a Isabel. Flameó el pañuelo hacia el grupo de esclavos en señal de despedida y apresuró más el paso. Entonces reparó en el Contramayoral.

A pie firme, callado, la cabeza erguida, dejando ver a través de los cabezones de la camisa el cuello rollizo y parte del membrudo pecho, Espartaco por su varonil musculatura, flaca mujer por la sensibilidad de su inculto espíritu, tenía de la cama del freno de plata el inquieto caballo de Gamboa. Junto a él se hallaba su mujer, también inmóvil y callada, con un niño en los brazos, hondamente afligida, según lo mostraban las gruesas gotas de lágrimas que rodaban por sus mejillas de ébano. Tan conmovida como ella, Isabel le puso la mano en el hombro, imprimió un dulce beso en la frente del niño y dijo a su marido:

--¡Pedro, Pedro!, no le olvides de mis encargos.

Sin aguardar respuesta tomó refugio en el carruaje.

En ese asilo comenzaron las que pudieran llamarse cariñosas importunidades de los esclavos. Las negras especialmente, convencidas de que se marchaba su señorita, rodearon el quitrín y las más expresivas se agolparon al estribo, metían la cabeza por debajo de la cortina o capacete, y, según su costumbre, clamaban a grito herido:

--¡Adiós, niña! ¡Vuelva pronto, niña! ¡No se quede por allá, niñita mía! ¡Dios y la Virgen lleven con bien a la niña! Acompañando estas frases, que hemos traducido en gracia del lector, con sus extravagantes demostraciones, como oprimirle suavemente los pies, besárselos cien veces, lo mismo que las manos con que ella quería rechazarlas. Todo esto dicho y expresado con verdadero sentimiento, con exquisita ternura, y sin dejar de contemplar su angelical semblante, cual el de un ídolo o de una imagen sagrada.

Pobres, sensibles, aunque ignorantes y sencillos esclavos, tenían a su ama por la más hermosa y buena de las mujeres, por un ser delicado y sobrenatural, y se lo demostraban a su manera ruda e idólatra.

Poco a poco, ya por ruegos, ora por amonestaciones suaves, logró Isabel apartar de sí a las más petulantes, dio la orden de partir, y anegada en llanto exclamó:--Yo no sirvo para estas escenas.

A tiempo de montar echó Gamboa una mirada desdeñosa al espectáculo en torno del carruaje, y dijo alto, de modo que lo oyó Pedro, que le tenía el estribo:

--¡Ay! ¡Qué falta hacía aquí un buen _cuero_!

El calesero llamó la atención hacia las riendas del caballo de fuera, y cuando Isabel pudo tomarlas en la mano ya el quitrín y los viajeros habían salvado la portada y se hallaban casi en los límites, por el oeste, del cafetal _La Luz_.

CAPÍTULO III

¡Dulce Cuba!, en tu seno se miran en el grado más alto y profundo, las bellezas del físico mundo, los horrores del mundo moral.

JOSÉ MARÍA HEREDIA

Llaman Vuelta Abajo o Vuelta Bajo en la isla de Cuba, a aquella región que cae a la parte poniente del meridiano de La Habana, y que, principiando en las cercanías de Guanajay, termina en el cabo de San Antonio. Se ha hecho famosa por el excelente tabaco que se produce en las fértiles vegas de sus numerosos ríos, principalmente sobre la vertiente meridional de la cordillera de los Organos. Para darla semejante dictado parece que hay una razón de mucho peso, a saber: la baja nivelación del suelo de ese territorio, comparada con la alta del ya descrito.

Empieza el descenso a pocas millas al oeste de Guanajay, advirtiéndose desde luego un cambio brusco en el aspecto del país. El color del suelo, sus elementos componentes, la vegetación, el clima y el género de cultivo en general son del todo diferentes. Así es que el rápido declive constituye una rampa para el que va y un cerro para el que viene de la Vuelta Abajo.

Al borde de esta precipitosa rampa se despliega ante los ojos del viajero un cuadro inmenso, magnífico, que no hay lienzo que le contenga, ni ojos humanos que le abarquen en toda su grandeza. Figuraos una aparente planicie, limitada al oeste por las brumas del lejano horizonte, al norte por las colinas peladas que corren a lo largo de la costa, y al sur por las ásperas y alterosas sierras que forman parte de la extensa cordillera de montañas de la Vuelta Abajo. Y hemos dicho aparente llanura, porque de hecho es una serie sucesiva de valles transversales, estrechos y hondos, formados por otros tantos riachuelos, arroyos y torrentes que descienden de las laderas septentrionales de los montes y, después de un curso torcido y manso, se pierden en las grandes e insalubres cuencas paludosas del Mariel y de Cabañas.

A la vista del grandioso cuadro, Isabel, que era artista por sentimiento y que amaba todo lo bueno y bello en la naturaleza, mandó parar los caballos a los bordes de la rampa y echó pie a tierra, sin aguardar a que se aceptara la proposición por sus compañeros. Serían las ocho de la mañana. Ensanchábase allí el camino, describiendo una zeda para disminuir en lo posible lo precipitoso de la bajada. Por esta razón, aunque ambas laderas se hallaban cubiertas largo trecho de un arbolado crecido y hojoso, ni sus copas sobresalían mucho del nivel de la planicie que ocupaban los viajeros, ni obstruían, que digamos, la vista panorámica de más allá. Asombrosa era la vegetación. A pesar de lo avanzado de la estación invernal, parece que había vestido sus mejores galas y que orgullosa sonreía a los primeros rayos del almo sol. Do quiera que no había hollado la planta del hombre ni el casco de la bestia, allí brotaba, por decirlo así, a raudales el modesto césped o rastrera grama, el dulce romerillo, el gracioso arbusto, el serpentino bejuco y el membrudo árbol. Hasta de las ramas verdes y gajos secos, cual cabelleras de seres invisibles, pendían las parásitas de todas clases y formas, que viven de la humedad de que está constantemente saturada la atmósfera de los trópicos. El suelo y la floresta, en una palabra, cuajados de flores, ya en ramilletes, ya en festones de variada apariencia y diversidad de matices, formaban un conjunto tan gallardo como pintoresco, aun para aquellas personas acostumbradas a la vista de los campos feracísimos de Cuba.

Para mayor novedad y encanto, se ofrecía allí la vida bajo sus formas más bizarras: bullía materialmente el bosque vecino con todos los insectos y pájaros casi que cría la prolífica tierra cubana. Todos a una zumbaban, silbaban o trinaban entre el sombrío ramaje o la espesa yerba, y hacían concierto tal y tan armonioso como no podrán jamás hacerlo los hombres con la voz ni los instrumentos músicos. Dichosos ellos que de puro pequeños e inermes no excitaban la codicia del cazador, ni temían ser interrumpidos en sus inocentes correrías y revoloteos mientras recogiendo la miel en el cáliz de las flores, o saltando de rama en rama, hacían temblar las hojas, desprendían el rocío cuajado en ellas y las gotas, al dar en la hojarasca seca del suelo, remendaban una lluvia en que no tenían parte las nubes.

No hay paridad ninguna en la fisonomía del país visto por ambos lados de las montañas. Por el del sur, la llanura con sus cafetales, dehesas y plantaciones de tabaco, continúa casi hasta el extremo de la isla y es lo más ameno y risueño que puede imaginarse. Al contrario por el lado del Norte, en el mismo paralelo se ofrece tan hondo, áspero y lúgubre a las miradas del viajero que cree pisar otra tierra y otro clima. Ni porque está ahora cultivado en su mayor parte hasta más allá de Bahía Honda, se desvanece esa mala impresión. Quizás porque sus labranzas son ingenios azucareros, porque el clima es sin duda más húmedo y cálido, porque el suelo es negro y barroso, porque la atmósfera es más pesada, porque el hombre y la bestia se hallan ahí más oprimidos y maltratados que en otras partes de la Isla, a su aspecto sólo la admiración se trueca luego en disgusto y la alegría en lástima.

Tal, poco más o menos, sintió Isabel en presencia de aquel pedazo de la famosa Vuelta Abajo. Sus puertas, que eran de hecho las alturas en que se hallaban detenidos los viajeros, no podían ser más espléndidas; podían calificarse de doradas. Pero ¿qué pasaba por allá abajo? ¿Sería aquélla la morada siquiera de la paz? ¿Habría dicha para el blanco, reposo y contentamiento

alguna vez en su vida para el negro, en un país insalubre y donde el trabajo recio e incesante se imponía como un castigo y no como un deber del hombre en sociedad? ¿A qué aspiraba ni qué podía esperar tanto ser afanoso cuando pasado el día y venida la noche se entregaba al sueño que Dios, en su santa merced, concede a la más miserable de sus criaturas? ¿Ganaba alguno, entre tanto trabajador, el pan libre y honradamente para sostener una familia virtuosa y cristiana? Aquellas fincas colosales que representaban la mayor riqueza en el país, ¿eran los signos del contento y de los puros placeres de sus dueños? ¿Habría dicha, tranquilidad de espíritu para quienes a sabiendas cristalizaban el jugo de la caña-miel con la sangre de millares de esclavos?

Y la ocurrió naturalmente que si se casaba con Gamboa, tarde que temprano tendría que residir por más o menos tiempo en el ingenio de _La Tinaja_, a donde ahora se dirigían en son de paseo. Naturalmente también, se agolparon a su mente, como en procesión fantástica, los rasgos principales de su breve existencia. Recordó su estada en el convento de las monjas Ursulinas de La Habana, donde en medio del silencio y de la paz se nutrió su corazón de los principios más sanos de virtud y caridad cristiana. Como en contraste recordó la muerte de su piadosa madre; la orfandad en que quedó sumida; su desolación y hondo pesar; los días serenos e iguales que después había venido pasando en el cafetal _La Luz_, bello jardín, remedo del que perdieron nuestros primeros padres, acariciada por sus más allegados e idolatrada por sus esclavos como no lo fue reina alguna sobre la tierra. Recordó, en fin, la situación aflictiva en que dejó a su padre, achacoso y ya entrado en años, el cual no aprobaba del todo aquel viaje, tal vez porque podía ser el preludio de separación más grave y prolongada.

Brevísimos fueron el silencio y recogimiento de la joven; pero tan intensa, tan viva su emoción, que no pudo evitar se le llenaran de lágrimas los ojos. Leonardo se hallaba a su lado, teniendo por la brida el brioso caballo, y ya por divertirla de sus tristes ideas, ya por echarla de _cicerone_, comenzó a describir los puntos culminantes del magnífico panorama que tenían a la vista. Había pasado él varias veces por aquellos lugares; conocía a palmos el terreno que pisaba y quería dar muestras a las amigas de su buena memoria. El primer ingenio a nuestros pies, dijo, es el de Zayas. Los árboles de esta parte de la loma nos impiden ver las fábricas, pero aquéllos son sus últimos cañaverales. Debe de estar moliendo, porque hasta acá llega el olor del melado. Muele todavía con trapiche y mulas. Tenemos que pasar por el mismo batey. Después, en el centro de este gran valle, un poco hacia nuestra derecha, por junto al tronco de aquella ceiba, pueden verse las tejas coloradas de la casa de calderas del viejísimo ingenio de Escobar o del Mariel. Según me cuenta mamá, fue el primero que se _fomentó_ en esta parte de la Vuelta Abajo. También debe de estar moliendo pues veo salir humo de entre la arboleda del batey. Luego, ¿no ven Vds., una nube blanca que atraviesa el valle en toda su latitud a la altura de los árboles describiendo una porción de vueltas y revueltas? Un poeta diría que era un cendal de gasa. A mí me parece la piel de una culebra soltada en la huida del monstruo de las montañas al mar. Pues no es otra cosa, si bien reparan Vds., que los vapores que van marcando el curso torcido del río Hondo, notable por lo estrecho de su cause y por las grandes avenidas que hace en tiempo de lluvias. Ahora estará bajo y habrá puentes para pasarlo sin necesidad de mojarnos los pies. Del otro lado, por aquí derecho, en vuelta del noroeste, ¿divisan Vds., un bosque muy verde y tupido del cual asoman unas torres que parecen redondas? Ese es el ingenio _Valvanera_, de don Claudio Martínez de Pinillos, recién creado Conde de Villanueva. A la izquierda, al pie del monte de Rubín o Rubí, se ven los cañaverales del ingenio _La Begoña_, y a la derecha, aún no discernible, _La Tinaja_, cerca de una legua del pueblo de Quiebra Hacha.

Muy pendiente era la bajada por aquel lado al vastísimo valle de los ingenios de azúcar, y aunque trazada en zig zag, todavía trabajaban mucho los caballos para mantener el carruaje en el conveniente nivel. Acortaba el calesero las riendas del de varas, temeroso de un resbalón; y se abatía de nalgas y se deslizaba que no marchaba de firme. Con esto crujían las sopandas de cuero, sobre las cuales se mecía la caja del quitrín a guisa de zaranda, y el sudor empezaba a brotar del tronco de las orejas y de los ijares de las fatigadas bestias.

--Poco a poco, Leocadio, dijo Isabel en llegando a lo más agrio de la cuesta. No había visto yo camino más pendiente.

Cabalgaba Leonardo al estribo derecho del carruaje, y dijo en son de broma:

--¿Es Isabel la que habla? La creía yo más guapa que eso.

--Si se figura Vd. que tengo miedo, repuso ella prontamente, se engaña de medio a medio. No temo ni pizca por mí, temo por los caballos. Mire Vd., el de barras: la carga es mucha y la bajada precipitosa; se ha bañado en sudor, y estoy esperando verle caer y rodar. Sí, mejor será apearnos. Para Leocadio.

--No, no se apee, niña, dijo el calesero con instancia, arriesgando un choque con sus amas. Como su merced se apee en este paraje, tendrá que apearse en todas las lomas. _Pajarito_ es _mu_ resabioso y sabe más que las bibijaguas. Déjeme su merced darle _cuarta_ y verá cómo no se hace más el chiquito.

--Eso es lo que tú quisieras, que te dejase maltratar al pobre caballo. ¿No sabes que no está acostumbrado a las lomas? De ningún modo consentiré que le pegues. Para, te digo.

--La niña tiene _perdíos_ los animales y la gente, murmura Leocadio recogiendo las riendas para parar. Cuando estaba viva la señora estos caballos volaban como pájaros. A ella sí que le gustaba _jarrear_ de duro.

En este punto intervino Leonardo, oponiéndose al propósito anunciado por su amiga, no ya sólo porque de hacerlo así el tronco adquiriría el vicio de que hablaba el calesero, sino porque de resultas de la sombra del arbolado de la derecha aun no había enjugado el sol la humedad del suelo barroso del camino. Cedió ella con visible repugnancia, y como para no tomar parte directa en el martirio, según dijo, de los caballos, entregó los cordones del de la pluma a su hermana Rosa y cerró los ojos mientras duró la bajada.

No deseaba ésta cosa mejor. Joven y viva de carácter, amaba el peligro y se perecía por manejar, fueran las que fuesen las fatigas que experimentasen las caballerías en trasportarla por aquellos derrocaderos, como al niño en su cuna de viento.

Molía Zayas en efecto. Las pilas de caña miel recién segada cerraban casi los costados exentos de la casa de ingenio, pues sólo dejaban un pasaje bastante amplio, eso sí, por el lado del batey, o camino que traían los viajeros. Notábase allí gran vocerío y movimiento, lo mismo dentro que fuera. Dentro, las mulas del trapiche pasaban y repasaban por delante del espacio abierto en su precipitado giro, azotadas despiadadamente por los mozos negros que corrían a par de ellas con ese único propósito. Por entre aquel estrépito infernal se oía distintamente el crujir de los haces de caña que otros esclavos desnudos de medio cuerpo arriba metían de una vez y sin descanso en las masas cilíndricas de hierro. Al otro lado del trapiche, aunque eran mayores si cabe la batahola y la algarabía, por decirlo así, de los ruidos confusos, no se veía cosa alguna; impedíalo completamente el denso humo revuelto con el vapor que se desprendía de las hirvientes calderas, donde se cocía el dulcísimo jugo de la caña y llenaba con sus inmensas olorosas columnas todo el interior del gran laboratorio.

Afuera, una doble fila de carretas, o se acercaban cargadas a dicha casa, o se alejaban de vacío en dirección del campo o del _corte_ de caña, como se dice; todas tiradas por un par de bueyes no menos flacos que tardos en sus movimientos. Pie a pie de cada yunta marchaba el conductor o carretero esclavo, armado de ahijada larga y pincho agudo de hierro; y a todo lo largo de la doble fila de carretas, ya en una dirección, ya en otra opuesta, cabalgaba en su mula marchadora el bovero blanco, armado también, mas no de vara, sino del indispensable _cuero_, con el que de cuando en cuando cruzaba las espaldas de aquel negro que creía remiso en el uso de la férrea ahijada.

La hechura de las carretas era lo más zurdo y primitivo que puede imaginarse; el engrase de los ejes por darse, con lo que las cargadas chirriaban sin cesar; al paso que las de vacío, con sus desmesuradas ruedas y holgura de manga, sobre no guardar jamás la perpendicular, fuera cual fuese la nivelación del piso, hacían un retintín desagradable, chocando de continuo las sueltas bilortas contra los sotrozos de hierros fijos, y saliéndose de su sitio las tablas de la cama. Por largo trecho en una y otra dirección, el batey y las guardarrayas desaparecían bajo las hojas pajizas y aun los trozos útiles de caña dejados caer por incuria, por exceso de carga o por defecto material de los vehículos empleados en su trasporte. A este lamentable desperdicio contribuían como los que más los conductores. No bien se alejaba el boyero de un punto dado, se aprovechaba el conductor inmediato para sacar de la carga el trozo de caña que mejor le parecía, en cuyo acto arrastraba otros varios que se caían en el camino y allí quedaban para ser hollados y molidos por las carretas que venían detrás. No se cuidaba de eso, antes se llevaba a la boca por un extremo el trozo de caña y le chupaba afanoso, sin dejar de animar a los bueyes con voces descompasadas y repetidos pinchazos hasta sacarles sangre: puede ser en desquite por la que el boyero hacía saltar de sus espaldas con la pita, o llámese punta, del terrible látigo.

Tales escenas u otras muy parecidas a éstas se repitieron a la vista de los viajeros, a su paso por los ingenios de _Jabaco_, _Tibotibo_, _El Mariel_ o antiguo de _Escobar_, _Ríohondo_ y _Valvanera._

Entre las dos plantaciones últimamente mencionadas, sólo avistaron una pequeña _sitiería_, a la margen derecha del camino, quiere decir, de un grupo de cabañas pajizas donde algunas familias pobres cultivaban un corto paño de tierra y criaban animales domésticos. No podía dársele siquiera el nombre de aldea, dado que allí, ni en muchas millas a la redonda, había escuela ni iglesia. Los ingenios de fabricar azúcar no consentían, por lo general, en su inmediata vecindad, esos símbolos del progreso y de la civilización.

Para librarse de aquellos amargos pensamientos procuraba separar los ojos del suelo negro, duro y sin lustre, cual hierro dulce, del camino, y los pasaba por cima de las flores o güines color violado claro, de las cañas en sazón, hasta tropezar en la zona azulosa donde se unía el horizonte con las cumbres oscurísimas de las distantes montañas.

Pero por más de un motivo poderoso no la era dable a Isabel aquella concentración que demandaba el espíritu en su agonía. Bruscas cuanto frecuentes eran las ondulaciones del terreno; el camino, aunque ancho, necesariamente torcido; las cañadas estrechas y hondas; la mayor parte de las cuales había que pasarlas por puentes hechos sin arte ni solidez, con maderos rollizos, o con tablas sacadas de los troncos de las palmas. Tenía que ser la marcha, en consecuencia, lenta y cautelosa, y luego no sabía Rosa regir el caballo de fuera; razón por qué más bien que de ayuda servía de estorbo al de varas, ya atravesándosele delante, ya no tirando a la par, o tirando en dirección opuesta a la del movimiento del carruaje. Quejose más de una vez el calesero de estos tropiezos, hasta que Isabel, para acallarle y evitar un contratiempo serio, reasumió los cordones del caballo de la pluma.

Si Rosa supiera, no habría podido manejar mejor en aquella alegre mañana de viaje. A la izquierda del quitrín, donde lo permitía la amplitud del camino, iba Diego Meneses, tan galán a caballo como decidor y amable a pie y entonces inspirado y elocuente, dispuesto más que otras veces a ver las escenas que recorrían sólo por su lado poético y brillante. A cada paso hallaba motivo para empeñar la atención de su entusiasta amiga, ya indicándole los festones de aguinaldos blancos o campanillas pendientes de todos los arbustos a orillas de los cañaverales, ya los güines de las cañas, que comparaba con las garzotas de innumerables guerreros en marcial arreo, mecidos blandamente por la gentil brisa de la mañana; ora los grupos de tomeguines que con rumor sordo, cual de viento rastrero y en gran tropel, seguían por algún trecho la dirección de los viajeros, rozando con las yerbas y luego desapareciendo por entre los troncos de las cañas; o el vivaracho sabanero de tardo vuelo, que salía con estrépito del espeso matorral y se posaba con mucha dificultad en la primer hoja de caña con que tropezaba en su desatentada fuga; o la esquiva garza blanca que se abría paso por entre las ramas del roble ribereño, y con el largo cuello replegado a la espalda y los pies colgando seguía en su huida el curso del arroyo; o la bandada de alborotosas cotorras que cubrían los naranjos silvestres y sólo se veían cuando se aferraban a la dorada fruta para extraerle la simiente; o el gavilán, en fin, águila de Cuba, que daba gritos y gritos penetrantes mientras se cernía por encima de las palmas más alterosas, entre la tierra y el cielo.

Finalmente, pasadas las diez de la mañana, atravesaron los viajeros los cañaverales del ingenio _Valvanera_, a la vista de sus grandes fábricas. Dos millas adelante se acercaron al pueblo de Quiebra Hacha. Aquí se dividía en dos el camino que traían, uno que torcía al oeste y era el carretero de la Vuelta Abajo, y el otro, el de La Angosta, que servía de entrada a los ingenios de azúcar, ya establecidos en esa región de la costa. Este tomaron nuestros viajeros. A su paso por el pueblo varias personas reconocieron y saludaron con amistoso respeto a Leonardo Gamboa.

Presentábase adelante el país tan áspero, desigual y montuoso como el anterior recorrido, aunque el arbolado era más frondoso y lozano, casi primitivo, y el suelo surcado de arroyos bulliciosos y de limpias aguas que corrían a perderse al fondo de la bahía del Mariel, o en el mar abierto al Norte. Tras media hora de camino debajo del bosque, donde no penetraban los rayos del sol, se avistaron los cañaverales de un ingenio en el repecho de una colina, acotados por una cerca rústica hecha de gajos, que mantenían en posición horizontal rajas de leña o estacas con horquilla hincadas en tierra y atados juntos de trecho en trecho, para mayor seguridad, con un bejuco que, cuando verde, es bastante flexible y elástico, conocido en la Vuelta Abajo con el nombre vulgar de colorado, _Bauchinis heterophyllas_.

Luego que, siguiendo por breve espacio, paralelo a dicha ruda cerca, en cuyo tiempo ganaron los viajeros la altura de la colina, se les ofrecieron en toda su extensión y grandeza los campos de caña y allá, en el centro del cuadro, el variado grupo de sus fábricas, coronando otra colina de mayor planicie y más ancha base. Aquél era el ingenio de _La Tinaja_, y Leonardo Gamboa, que servía de guía, se las mostró a sus amigos con cierto sentimiento de orgullo. Para ello había motivo sobrado, no ya sólo por el valor en dinero que representaba la finca, y por las consideraciones sociales que se les guardaban a sus dueños, mas también por el cuadro bello y pintoresco del conjunto, contemplado a buena distancia; encubridora eficaz de los lunares y manchas inherentes a casi todas las obras, así humanas como divinas.

El camino por donde se habían internado los viajeros hasta allí era el denominado de la Playa, porque servía para el acarreo de los azúcares al pueblo del Mariel, desde el cual se embarcaban y conducían en goletas al mercado de La Habana. Cruzaba la colina por su cúspide y había establecida en ella una talanquera no menos rústica que la cerca, pues se reducía a unas varas en bruto, metidas por sus cabezas en los orificios de dos largueros paralelos. Arrimada a la cerca, y en su encuentro con la talanquera, se alzaba una cabaña o bohío de los de vara en tierra o de dos aguas, tan gacho que la techumbre se componía de hojas enteras de la palma tendidas en los costados o vertientes, con las puntas descansando en el suelo.

Adelantose Leonardo para ver por qué no se hallaba en su puesto el negro guardiero y abría la talanquera. Con tal objeto, plantó su caballo ante la única entrada del bohío, e inclinando el cuerpo, trató de registrar el interior. Inútil trabajo: la puerta o boca era muy estrecha y baja, y más allá de dos pies del umbral no podían penetrar ojos humanos, no tanto por la viva claridad del día afuera, cuanto por la densa nube de humo de leña que ardía dentro y no tenía otro medio de escape que ése.

--No veo nada y dudo que haya alma viviente en el bohío, dijo Gamboa hablando con las señoras en el quitrín, parado en medio del camino. ¡Maldito negro!

--Tal vez duerme, dijo Isabel.

--Si no es el sueño de la muerte, repuso Gamboa, juro que no le salva nadie de un bocabajo.

--¿De qué se trata? preguntó Meneses. ¿De abrir la talanquera? Yo abriré y no perderé el casamiento por eso.

--No harás tal, replicó Leonardo colérico. No lo consiento.

--Bien, sugirió Isabel con su voz argentina y dulce. Abrirá el calesero; los caballos están harto cansados para echar a correr. Leocadio, apéate.

--No, no, Isabel, replicó Leonardo, cada vez más colérico. Tampoco puedo consentir en eso, no debo consentirlo. Si el guardiero está vivo abrirá la talanquera, que para eso y para más le han puesto ahí.

Sacó el reloj y añadió enseguida:

--Ya han dado las doce, hora en que sueltan la negrada para que coma. Si hubiéramos llegado aquí un poco antes, habríamos oído la campana del ingenio. Apostaría a que el _taita_ guardiero se ha metido en el cañaveral para verse con alguna de sus carabelas. ¡Por Dios vivo que la paga! Nada, no está en parte alguna. ¡Caimán! ¡Caimán!, gritó a todo torrente.

Los montes del rededor fueron los únicos que le devolvieron el eco de sus voces con temblor continuado, hondo y siniestro; y luego empezó a ladrar un perrillo dogo dentro del bohío. Ahí está el guardiero, pensó el joven, y se hace el dormido para no tomarse el trabajo de abrir la talanquera. Lo haré salir a patadas, agregó alto, dando un puñetazo en el pomo de la silla. Echó pie a tierra sin más demora y se metió en el bohío, teniendo siempre el caballo de la brida.

Muy mal sonaron estas palabras y aquellos juramentos en los oídos de la modesta Isabel, aun cuando para no avergonzar a su amigo ni irritarle más contra el pobre esclavo, se guardó de representarle lo absurdo y aun el riesgo de su final propósito, si a posta éste se escondía por tener oculto algún compañero en el bohío o por otra causa cualquiera. Afortunadamente, nada de eso ocurría. En aquel mismo instante las señoras del carruaje, Meneses y el calesero a caballo oyeron un ruido de ramas en el bosque vecino, agitadas por una persona o animal que se abría paso con alguna dificultad, y después apareció en la orilla un negro anciano mal vestido, con un gorro de lana en la cabeza, un palo largo y nudoso en la mano, que le servía de apoyo, tal vez para no besar la tierra con la frente, pues tenía el cuerpo hecho un arco por la edad, por los trabajos o por la costumbre inveterada de vivir en casas de techo bajo. Echó de ver a los viajeros apenas salió del bosque, porque se detuvo un momento indeciso del partido que debía tomar, y en soltando entre las altas yerbas algo que brillaba a los rayos del sol y parecía botella u otra vasija por el estilo, después continuó andando derecho al carruaje por la parte opuesta al bohío.

Esta circunstancia casual le salvó del primer choque de la ira de su amo, el cual, no bien salió del bohío, le reconoció desde lejos y se lanzó sobre él a carrera tendida. Pero mientras montó a caballo y salvó la distancia que le separaba de su intentada víctima, dio tiempo para que éste se pusiera inconscientemente al amparo de las señoras. Lo probable es que el infeliz esclavo no tuviese noticias de que aquellas personas eran esperadas en el ingenio, ni que entre ellas viniese guiándolas su joven amo. A derechas no le conocía tampoco. Pero al notar que se le venía encima a todo correr, y que gritaba:--¡Ah, perro! ¡Ahora lo verás!, no pudo desconocerle ni dejar de caer de rodillas a los pies del caballo, quien, conteniéndose y todo, le echó a rodar con el solo bote del pecho.

El susto de las señoras fue grande. Rosa hizo una exclamación de horror; doña Juana repitió:--¡Jesús! ¡Jesús! e Isabel medio que se incorporó en el asiento, sacó el brazo fuera del carruaje y dijo más indignada que asustada:--¡No le mate, Leonardo!

--Agradecer debe que están Vds. delante, dijo Leonardo; de otro modo me parece que le mataba. Tan indignado me siento contra él.

--¡Ah, mi _suamito_!, exclamó el viejo incorporándose trabajosamente hasta ponerse otra vez de rodillas, como humildísimo pecador en presencia de su airado juez.

--¿Dónde te habías metido, perro brujo? le preguntó el joven, y sin aguardar por la respuesta continuó preguntando o diciendo: ¿Qué hacías en el monte? ¿Por qué no estabas en tu bohío? ¿A que habías ido a _cambalachar_ por aguardiente con el tabernero del pueblo la raspadura que robas en el ingenio? Sí, sí. Lo juraría.

--_¡No, mi suamito, no siñó, sumercé! ¡Caimán no roba rapaúra! ¡Caimán no bebe aguaurdiente!_

--¡Cállate, perro viejo! Anda, corre a abrir la talanquera. ¿No corres todavía? ¿No sabes correr? Ya haré que el Mayoral te avive un poco con el cuero. ¡Anda! ¡Vuela!... y trató de pegarle (sin alcanzarle por fortuna) un puntapié en la cabeza desde el caballo.

Parecía ser el guardiero hombre de más de sesenta años de edad. Tenía al menos encanecida la cabeza, y aun la escasa barba, que le cubría el labio superior, señal segura de vejez en las gentes de su raza. A unos brazos desproporcionadamente largos y huesosos, unía dedos crispados, cual si padeciese lepra; ojos chicos de expresión hosca y triste, nunca más triste que, cuando después de abierta la talanquera, echó una mirada a las señoras del quitrín y pareció rogarles le protegieran de la cólera de su amo.

Pasado el primer momento de irritación y de ceguedad, comprendió éste que había mostrado demasiado apasionamiento y bastante grosería delante de señoras que, además de hallarse bajo su protección, iban a disfrutar de su hospitalidad en el ingenio. El caballo había sido más generoso que él puesto que, pudiéndolo, no atropelló al esclavo cuando le halló postrado en su camino. Tuvo vergüenza Gamboa de su conducta, pero muy soberbio para reconocer su falta y enmendarla con la franqueza que demandaba el caso, se limitó a referir los rasgos principales de la vida del guardiero, por supuesto, calumniándole de paso.

--No se figuren Vds., dijo, que el _taita_ Caimán es lo que parece, un viejo inerme y manso o esclavo leal y humilde. Han de saber Vds. que el sobrenombre que lleva no se lo han puesto a humo de paja; es lo más astuto, maligno, con ribetes de taimado que existe; ni tan ignorante que no practique ciertas artes, que le dan importante consideración entre los suyos. Pasa por brujo y por hacerse invisible cuando le conviene o se halla en peligro. Construye ídolos y encantos que tienen propiedades mágicas en ciertos casos. Nadie diría que ve, oye ni entiende, y sin embargo, tanto de día como de noche nada ni nadie se le escapa; y sabe, como el caimán, hacerse el dormido para asegurar mejor la presa. La juventud la ha pasado en el monte huido, y en sus repetidas fugas ha visitado todos los palenques del Cuzco y hecho amistad con los negros cimarrones más famosos de la Vuelta Abajo. Ahora está muy viejo para tales trotes, y, en consideración a haber sido uno de los fundadores del ingenio de _La Tinaja_, el único que sobrevive de los que tumbaron aquí los primeros palos, mamá hizo que lo pusieran de guardiero, y le conserva en ese puesto contra la opinión de los empleados que conocen su historia y sus malas mañas. Cuando quiere o le conviene no le gana a vigilante ni el perro más fino. Puede decirse que es libre: cría gallinas, engorda todos los años uno o dos cochinos que vende, y entierra el dinero en alguna parte, y posee una yegua, en la cual puede dar vueltas de noche a los linderos de la finca. Pero como digo, es muy taimado y maligno y apostaría cualquier cosa a que no se hallaba lejos del bohío y de su puesto sin algún objeto doloso y reprobado a la mira. Por el cañaveral se ve con sus compañeros del ingenio; por el monte sólo con los cimarrones o con los taberneros del pueblo para cambiar azúcar por tabaco, aguardiente u otra cosa por el estilo.

--Así debe de ser, Leonardo, comenzó diciendo Rosa, pues me pareció que traía una...

La tía y la hermana, más avisadas que ella, no la dejaron terminar la frase; y nadie más habló en el resto del camino.

Entre la una y las dos de la tarde, bajo un sol de fuego cuyos rayos los reflejaban las hojas de la caña cual si fueran bruñidas espadas, se desmontaron los viajeros en la gran casa de vivienda de La Tinaja.

CAPÍTULO IV

Lo más negro de la esclavitud no es el negro.

JOSÉ DE LA LUZ Y CABALLERO

Bajo más de un concepto era una finca soberbia el ingenio de _La Tinaja_, calificativo que tenía bien merecido por sus dilatados y lozanos campos de caña-miel, por los trescientos o más brazos para cultivarlos, por su gran boyada, su numeroso material móvil, su máquina de vapor con hasta veinticinco caballos de fuerza, recién importada de la América del Norte, el costo de veinte y tantos mil pesos, sin contar el trapiche horizontal, también nuevo y que armado allí había costado la mitad de aquella suma.

La casa de calderas o de ingenio era tan fuerte como vasta: edificio exento casi enteramente, cuya armadura se componía de pares rollizos, apoyados en soleras pesadas y éstas en pilares, dichos horcones en el país, sin escuadría ninguna ni más pulimento que el que pudo darles con la zuela el vizcaíno carpintero-arquitecto contratado en la finca para esos trabajos. Tenía el aire imponente y rústico que parecía demandar su destino. Debajo de su cubierta de tejas coloradas se abrigaban el trapiche, la máquina de vapor y el tren Jamaiquino de elaborar el azúcar, montado sobre tres hornos o fornallas. No se hallaban en el mismo nivel todos estos aparatos: el de las calderas era varios pies más bajo; y para pasar de un departamento a otro había que descender dos anchas escalinatas de piedra, flanqueando el plano del trapiche y máquina de vapor. Esto se hacía así para que tuviese una caída fácil el guarapo, que al salir de las masas corría por una canal de madera a la artesa, llamada allí mansera, donde algo se limpiaba y seguía al tacho o paila para recibir el primer hervor.

Paralelo con este edificio había otro tan grande y más gacho, cerrado por sus costados con paredes de mampostería y una sola entrada, haciendo frente a la parte de las calderas mencionadas. Este era la casa para la purga y el secado del azúcar. En otros separados se hallaban la carpintería, la herrería, la enfermería, y la que puede llamarse casa de maternidad; las habitaciones del mayoral, del boyero, carpintero, mayordomo y maestro de azúcar, quien temporalmente residía también en el ingenio. Para el maquinista, cuyo oficio a la sazón desempeñaba un joven americano, se había construido una habitación provisional con tablas de cedro, cerca de la máquina de vapor; único sitio abrigado en aquel feo caserón. Seguían después, formando grupo, sobre doscientas cabañas o bohíos de paja, con sus correspondientes corrales y gallineros adjuntos, para la morada de los trescientos esclavos, o dotación del ingenio. Las otras casas exentas, a saber: las del bagazo, la de batir el barro para la purificación del azúcar, y otras de menos importancia, se hallaban erigidas en el espacio medianero entre la de calderas y la de purga.

La planta de aquélla, denominada por antonomasia «de vivienda», figuraba en paralelogramo trapezoidad, sentada en el suave declive de una colina, cuya diferencia de nivel se había procurado remediar alzando el piso por el frente. Era de un solo cuerpo de fábrica de manipostería gruesa con cubierta de tejas huecas coloradas, amplio pórtico, la sala cuadrada al medio, flanqueada a ambos lados por dos crujías de cuartos, pasadizos corridos por el interior, patio rectangular en el centro, cerrado por una tapia alta con caballete de vidrios, y una portada en el lienzo del fondo, que se cerraba con cerrojo y cerradura y servía para la comunicación interior de la servidumbre de la casa. En el patio crecían muchas flores, algunos naranjos, higueras y parras, que no contribuían poco con su verdor y su sombrío a la frescura de los cuartos; aunque para quebrar la reflexión de los rayos solares en puntos de medio día, habían puesto cortinas de cañamazo en todo el derredor de los pasadizos. Arreglo igual se advertía en el pórtico, que por su elevación y amplitud, se hallaba más expuesto a los embates del viento y a los efectos desagradables de la reflexión solar en el extenso y desolado batey.

Desde lo alto de la escalinata del pórtico se registraba de un extremo a otro la casa de calderas al frente, la de purga algo más a la derecha, aunque sólo por el lado de las gavetas para secar el azúcar; el barracón de los negros o la estacada que encerraba sus habitaciones rústicas; en suma, la mayor parte de las que componían la vasta población del ingenio; los campos de caña hacia el oeste, los techos pajizos de las casas del potrero, y más allá un palmar inmenso, un codo del río y luego la selva alterosa y primitiva, que formaba como el fondo oscuro de este variado cuadro campestre.

Cosa del medio día del 24 de diciembre de 1830, arrellanados en cómodas butacas de vaqueta, se hallaban los amos del ingenio en cómodas butacas de vaqueta colorada, se hallaban los amos del ingenio _La Tinaja_, junto con otras varias personas, al abrigo de la reflexión solar, tras las cortinas de cañamazo. Casi todos los caballeros, don Cándido Valdés, cura de Quiebra Hacha, el capitán del partido y el médico fumaban tabaco; doña Rosa, la esposa del capitán antes dicho, la mujer y cuñada del mayoral del potrero y las señoritas Gamboa, comían unas dulces cañas de la tierra, otras, naranjas de China y guayaba del Perú, etc., productos éstos de la estancia del ingenio. Por allí andaban nuestros conocidos de La Habana: Tirso, Aponte, Dolores, junto con otra de las negras que habían venido por mar, y dos o tres más de la dotación del ingenio, que por criollas y de mejor apariencia las habían destinado al servicio doméstico, todos haciéndose útiles.

De las señoritas Gamboa, Carmen y Adela no calentaban asiento, picaban un pedazo de guayaba o de naranja y emprendían luego largos paseos, enlazadas de las manos, de un extremo a otro del pórtico, con manifiestas señales de impaciencia por la tardanza, a su juicio, de las amigas de Alquízar. Adela en particular, cada vez que tocaba en el ángulo del sur, levantaba un canto de cortina de cañamazo y echaba una ansiosa mirada por toda la guardarraya maestra adelante hasta su intercepción en el camino de la Playa. Al fin, poco después de la una de la tarde, se oyó a lo lejos ruido de ruedas de un carruaje y la marcha precipitada de varias caballerías; y Adela, sin ver nada aún, exclamó alegre:--¡Ahí están!

No se engañó esta vez. A poco más llegaron al pie de la escalinata del pórtico las señoritas Ilincheta en su carruaje, el cual, junto con sus ocupantes, los caballos y los jinetes, venían cubiertos con el polvo de la tierra colorada. Inútil sería detenernos a describir punto por punto las variadas escenas del encuentro de ambas familias en medio de las soledades de la Vuelta Abajo. Más de un motivo había para que, al menos algunos de los presentes, mirasen aquel instante como un evento verdadero, digno de nota. Sucede, además, que los jóvenes, y también a veces las personas mayores, cuando se reúnen en un sitio de campo con ánimo de pasar sólo unos días en franca y cordial sociedad, lejos de los lugares donde se han acostumbrado a vivir y divertirse, se sienten fuertemente atraídos; si son amigos lo son y lo expresan más; si parientes, se persuaden que los unen más estrechos lazos; si amantes, ¡ah!, su amor les parece eterno, la dicha de amarse, celestial.

Las mujeres se estrecharon fuertemente entre los brazos. Adela lloró de alegría al apretar entre los suyos a Isabel, por la cual sentía afición extraordinaria. Para ella era la más modesta y amorosa de las mujeres. También doña Rosa distinguía a la mayor de las Ilincheta, y en la ocasión de que hablamos la mostró señalada cordialidad. Hasta don Cándido tan seriote y desmañado, que no tuvo ni una sonrisa para su hijo cuando éste se acercó a pedirle la bendición, recibió a las señoritas Ilincheta con desusadas demostraciones de cariño, y se las presentó a los caballeros que estaban de visita, diciendo:--También éstas son mis hijas. Y hablando con Isabel añadió: He aquí tu casa; espero que goces y te diviertas en ella como en la tuya encantadora de Alquízar.

Ya no duró el recibimiento en el pórtico sino corto rato. Sobre estropeadas las señoras del viaje, necesitaban algún reposo, asearse, cambiar de traje, antes de sentarse a la mesa. Doña Rosa, o la mujer del Mayoral Moya, que hacía de ama de llaves para ahorrarle trabajo a esa señora, había hecho preparar alojamientos para las señoritas Ilincheta y para su tía, inmediatos a los aposentos ocupados por la familia de Gamboa en la crujía de la derecha, después de la sala.

Ya de tardecita se sentaron a la mesa en la gran sala de la casa de vivienda, entre señoras y caballeros, unas dieciséis personas, atendidas por la mitad de ese número de siervos. Doña Rosa hizo los honores. La secundó cuanto era compatible con su carácter don Cándido, aunque éste guardó sus cumplimientos para el administrador de _Valvanera_ en primer lugar, en segundo lugar para el cura de Quiebra Hacha, en tercero para el médico de su finca y para el Capitán del partido. Todos debían pasar la noche en el ingenio para tomar parte en las ceremonias que iban a celebrarse al día siguiente, o primero de Pascua de Navidad. Fuera de la esposa y de la cuñada del Mayoral del potrero, ninguno de los empleados del ingenio fue invitado a comer en la casa de vivienda; y el mismo Moya, que tenía vara alta con los amos actuales de _La Tinaja_, no tomó asiento, aún invitado por don Cándido, so pretexto de haber comido.

Reinaron en el banquete la jovialidad y animación, templadas por las maneras decentes propias de la buena crianza, aunque excepto Meneses, el joven Gamboa y el cura, nadie de los presentes había recibido educación esmerada ni frecuentado el trato de la alta sociedad cubana. El último nombrado, don Cándido Valdés, criollo, se había educado en el Seminario de San Carlos, de La Habana. En materias religiosas era tolerante hasta la despreocupación; en política profesaba opiniones liberales que solía llevar hasta la exaltación.[45] El médico Mateu, de Galicia, había hecho la práctica de su profesión a bordo de los buques negreros, y ahora curaba por iguala en varios ingenios de la comarca. Pasaba por buen mozo; pero su bien parecer corría parejas con su necedad y pedantería. Creía que todas las mujeres se enamoraban de él, y desde su puesto en la mesa le lanzaba miradas a hurtadillas a Rosa Ilincheta, cuya graciosa figura, viveza y fogocidad de carácter sobraban para volverle el juicio a hombre de más seso que él. El cura simpatizó desde luego con Isabel, que en todas sus palabras y acciones revelaba las altas prendas de su espíritu. Don Manuel Peña, asturiano, casado con una criolla buena moza, desde el mostrador o taberna del pueblo había ascendido a Capitán pedáneo, especie de Juez de paz, y única circunstancia por la cual los amos del ingenio de _La Tinaja_ le sentaban a su mesa. Don José de Cocco era otra especie de hombre; natural de Cádiz, tenía fina apariencia, los dientes muy blancos y los ojos azules, poca talla, bastante chiste y escasa instrucción.

Este se dedicó a obsequiar a la segunda de las señoritas Gamboa, a cuyo lado quedó en la mesa, con la conciencia, sin embargo, de bajo ninguna circunstancia una de las amas del ingenio _La Tinaja_ daría su corazón ni su mano al Administrador del ingenio _Valvanera_. Por lo que toca a Adela, la más linda de todas, su extremada juventud la ponía a cubierto de los galanteos de los hombres allí reunidos.

Circuló entre éstos libremente la copa del vino desde el principio hasta el fin de la comida; terminada la cual, se levantaron los manteles para servir los postres sobre la tabla desnuda, de bruñida caoba. Trájose enseguida el café puro en tazas de trasluciente China, la espumosa champaña, el coñac francés y el ron de Jamaica. Después don Cándido Gamboa sacó a relucir su gran vejiga olorosa y dorada, y repartió sendos tabacos, cual brevas, entre el Capitán, el Médico y el Cura, pues Cocco no fumaba, tampoco Meneses, y Leonardo no se hubiera atrevido a tocar un cigarro delante de su padre.

Puesto el sol terminó el banquete. Pero pasando la familia y las visitas al amplísimo pórtico donde ya los criados habían enrollado las cortinas de cañamazo, pudo echarse de ver que hacía suficiente claridad en el campo circunvecino. Era que por un lado surgía la luna creciente de entre el bosque lejano y hería oblicuamente las hojas y flores de las cañas y los troncos blancos de las palmas, al paso que desde lo alto del cielo azul y diáfano como el cristal, vertían innumerables estrellas chispas de plata y oro.

Por sus pasos contados, después del banquete, todas las personas reunidas en la casa de vivienda se dividieron en tres grupos. Doña Rosa, en compañía de doña Juana, la Moya, la mujer del Capitán y Antonia, la mayor de las señoritas Gamboa, volvieron a ocupar los sillones de vaqueta colorada. Don Cándido, con el Cura, el Capitán y el Mayoral del potrero, para digerir mejor la comida y saborear sus olorosos tabacos, daban cortos paseos y conversaban en una cabeza del portal. El primero, sobre todo, aprovechó la ocasión de tomar algunos informes, más imparciales que los de su mayoral, acerca de las ocurrencias en la finca durante los quince o más días que precedieron al de su llegada a ella. Con este motivo dirigió como de paso varias preguntas a Moya, el cual, honrado con aquella distinción por el amo del ingenio delante del Cura y del Capitán pedáneo, se apresuró a contestarlas con lisura y no poca satisfacción. Por ejemplo, preguntado:

--¿No se ha sabido nada, Moya, acerca de los negros que se fugaron la semana pasada? El Mayodomo me ha dicho que son siete, entre ellos una negra.

--_Veríficamente_, señor don Cándido, no se ha _sabío naitica_ entre dos platos, contestó.

--Pero, ¿se ha hecho alguna diligencia?

--¡Pues no, señor don Cándido! Se han _registrao_ los montes de Santo Tomás y los montes de La Angosta. En _toas_ partes se han _encontrao_ rastros frescos, mas como los perros de don Liborio Sánchez no son _buscaores_ sino _mordeores_, _anque_ le tienen gran interés a los negros no han _dao_ con ellos. Y _me se_ ha puesto que no han _salío_ de los linderos del ingenio, porque no se han _juío en denantes_ y no saben andar por el monte. Con buenos perros ya se hubieran _topao_, segurito. ¡Ah! Dios me dé perros que huelan un negro _dende_ una legua...

--Por lo que a mí toca, dijo el capitán Peña cortándole la palabra a Moya, debo informar al señor don Cándido que he hecho en su obsequio cuanto cabía en mis facultades. En efecto, apenas tuve aviso de la ocurrencia por parte que me dio su mayoral de Vd., don Liborio Sánchez, no perdí tiempo en pasar atento oficio, valiéndome del correo de Bahía Honda, a los señores don Lucas Villaverde y don Máximo Arosarena, inspectores en San Diego de Núñez, de la partida que capitanea don Francisco Estévez, que acaba de formarse por disposición de la Real Junta de Fomento, para perseguir negros cimarrones en las jurisdicciones desde el muelle de Tablas o el Mariel, Callajabos, Quiebra Hacha, etc., hasta los límites occidentales de Bahía Honda. Con mi oficio a los señores inspectores incluí la filiación, edad y naturaleza (poco más o menos, se entiende, pues Vd. sabe que todos los negros se parecen) de los siete que se le han fugado a Vd. Espero, pues, que si tropieza con ellos la partida, cosa factible, porque sospecho que han tirado hacia las sierras cercanas del Cuzco, que los capture y... Ni debe extrañar al señor don Cándido que se le hayan fugado siete negros, cuando por la misma época se han alzado 12 de _Santo Tomás_, 8 de _Valvanera_, 6 de _Santa Isabel_, 20 de _La Begoña_, y 40, sí señor, 40, como Vd. lo oye, de _La Angosta_, el ingenio aquí inmediato, perteneciente al Excmo. Señor Conde de Fernandina. La lista de todos éstos obra ya en poder de los señores inspectores, y, supongo también, del capitán Estévez.

--No me extraña la fuga de mis siervos, dijo don Cándido pensativo. Ni son éstos los primeros negros que se me huyen. Ahí están, si no, Chilala, José, Sixto, Juan, Lino, Nicolás, Picapica, etc., que no me dejarán mentir. Esos, cuando no se hallan alzados en los montes, sufren, como ahora, una condena más o menos larga en la finca, y llevan grillos de doble ramal, o arrastran cadena con maza. Goyo, o Caimán, el guardiero de la talanquera en el camino de la Playa, se sabe que ha pasado su juventud entre esas serranías que se ven desde aquí... Mas todos ésos son congo real, congo loango o congo musundi, raza humilde, sumisa, leal, la más propia para la esclavitud, que parece su condición natural. Sólo tiene un defecto, eso sí, grave, capital: es la raza más holgazana que sale del África. Si pudieran los congos vivir sin comer, no habría fuerzas humanas que les obligaran a doblar el lomo y trabajar. Serían capaces de pasarse la vida echados panciarriba... Y por no trabajar, a menudo se huyen... Lo que me extraña mucho, lo que no acierto a explicarme es el por qué han seguido el ejemplo de los congos Pedro y Pablo carabalí, Julián arará, Andrés bibí, Tomasa suama, Antonio briche ni Cleto gangá. Estos negros industriosos, incansables para el trabajo, fuertes, robustos, formales, éstos no se fugan sin causa. No, negros que siempre tienen tiempo para sus amos y para sí, que juntan dinero y a menudo se libertan, no se huyen por poca cosa. Son muy soberbios, tal es su único defecto, para alzarse sin causa poderosa. Antes se ahorcan que fugarse al bosque...

Podía echarse de ver por esto poco que algo se le alcanzaba a don Cándido Gamboa de achaque de etnología africana. Ya se ve, el tráfico constante en esclavos por muchos años, la posesión de dos o tres centenas de éstos, le habían enseñado que según su raza eran más sumisos o levantiscos, más o menos a propósito para llevar hasta la muerte el pesado yugo de la esclavitud. Sucedía, sin embargo, que otra cosa le había enseñado a Moya su larga experiencia en el manejo de negros suyos y ajenos, y todo su ser se sublevaba cuando oía decir que los había buenos y malos, y que algunos no se huían jamás sin causa poderosa, más bien se quitaban la vida. Por eso Moya, a riesgo de quebrar pajita con el amo, dijo:

--Se conoce que el señor don Cándido ha visto negros y sabe los que sirven _pa_ esto y no sirven _pa_ lo otro. Con permiso del señor don Cándido yo digo que _toos_ los negros son lo _mesmo_ cuando la Guinea se les mete en la cabeza. Entonces _toos jalan pa_ atrás como los mulos y es preciso _jarrearlos_ con el cuero. Vamos a ver. ¿Por qué se han _juío_ los siete de acá? ¿Por falta de _comía_? ¿Por falta de _frasá_? ¿Por falta de cochino? ¿Por falta de conuco? _Naa_ de eso les hace falta. _Too_ eso lo tienen ellos a bombón. ¿Por el mucho trabajo? ¿Por el mucho cuero? Ahora no trabajan, como quien dice, y _verificamente_ don Liborio de Corpus a San Juan da un bocabajo.

--Si me es dado decir lo que pienso, terció en este punto el Cura modestamente, mi opinión es que no debe esperarse de gente tan ignorante como son los negros, el que juzguen y actúen cual las criaturas racionales. Sería excusado buscar la razón de sus alzamientos y delitos en los instintos de la justicia y el derecho. No. La causa ha sido quizás la más quimérica, la más absurda, la menos justificada... Es, sin embargo, coincidencia rara que a un tiempo se hayan alzado tantos negros y de aquellas fincas precisamente que han cambiado de poco acá su sistema de moler caña. ¿Será que esas estúpidas criaturas se han figurado que se les aumenta el trabajo porque en vez de moler con bueyes o mulas se muele con máquina de vapor? ¿Qué sabemos? Vale la pena investigarlo.

--Ya, dijo don Cándido, siempre pensativo, siguiendo con los ojos entreabiertos las columnas de humo cenizoso que se le escapaban de la boca. El argumento de mi tocayo es bueno tratándose de negros congos, falso, hablándose de negros de otras naciones de África. He observado de cerca sus índoles diversas y sé lo que digo. El trato más que otra cosa tiene que ver con la conducta de ciertos negros. Todos han nacido para la esclavitud, ésa es su condición natural; en su mismo país no son otra cosa que esclavos, o de unos pocos amos o del demonio. Los hay, no obstante, que necesitan rigor, mucho rigor, el látigo siempre encima para que trabajen; los hay que por las buenas se saca de ellos cuanto se quiere.

--_Asina_ es, como dice el señor don Cándido, volvió Moya a meter la cucharada. Mas yo digo que si hay negros que no se _pueen_ quejar del trato, ésos son los del señor don Cándido. Ellos están como las flores: bien _comíos_, bien _vestíos_, _ca_ uno con su conuco y su cochino, muchos _casaos_, no trabajan más que de sol a sol, y no se les da cuero por _náa_ y _náa_, como yo he visto que se hace en otros ingenios. Sacan _mu_ poca fajina: dos o tres horas los domingos. Y cuando no se muele caña casi _too_ el resto del tiempo es suyo para hacer canasta, engordar sus cochinos, guataquear sus conucos... Casi todas las ascuas tienen un día de tambor. ¿Qué más quieren esos _endinos_? Ni el obispo está mejor.

--Y vuelta a la misma tema, dijo don Cándido molesto. Moya, está bien lo que Vd. asegura y repite; pero nada de eso me convence, ni me explica la causa, la causa real y verdadera de la fuga de mis carabalíes. Lo peor es que sospecho que Vd. sabe algo y no quiere decirlo delante del señor Cura y del Capitán.

--Pues por _toas_ éstas y por la en que Jesucristo murió, dijo Moya con vehemencia besando las cinco cruces que había formado con los diez dedos de las manos enlazadas, que no sé _naitica_ más. Y si dejo algo _embuchao_, que aquí _mesmo_ me parta un rayo, y _ustees_ perdonen mi _moo_ de hablar.

--No hay que maldecir por tan poca cosa, dijo el Cura.

--Registre Vd. su memoria, Moya, dijo sonriendo don Cándido al ver su apuro.

--El caso es, repuso éste después de breve detención, que yo no sé que _puée_ ser la causa y que no _puée_ ser causa _pa_ que se _juya_ un negro. El señor don Cándido dice que unos negros se _ajorcan_ y no se _juyen_; y _dispués_ dice que el mal trato es la causa de los cimarrones. Bueno. También dice el señor don Cándido que los _carabalí_ son _mu_ soberbios. Yo digo que son _mu_ perros y más perros que _toos_ los negros juntos. Pedro briche es el cabecilla de sus carabelas en el ingenio. Siempre habla lengua con ellos, y el Mayoral está _quemao_ con él. Yo lo sé; pero no le había puesto nunca la mano encima, ni _dende_ que vino de África creo yo que _naiden_ le sacó sangre con el cuero. Pues, señor, la semana antes _pasáa_, Pedro briche no se presentó en la _jila_, ni _dormió_ por la noche en el barracón. ¿Qué querían que hiciera don Liborio? Al día siguiente va y lo coge

sotaventao, y le da unos cuerazos por arriba de la camisa, lo puso en el cepo por dos días, le quitó el mando de contramayoral y lo sopló al campo a chapear. Se emperró más. Yo le dije que le diera un buen bocabajo, pero temió que le levantara _toa_ la _negráa_. Y ya se ha visto el _resultao_, se fue al monte con seis compañeros porque no se le castigó bastante.

--¿No lo decía? dijo don Cándido con aire satisfecho. Y añadió, antes que Moya le quitara la palabra:--¿Y qué dice de todo eso Goyo, el guardiero del camino de la Playa? ¿Sabe Vd. si le han sondeado?

--¿Cómo que no? contestó Moya prontamente. El primerito que se vio _pa_ eso. ¿No ve el señor don Cándido que hasta la puerta _mesma_ de su _bujío_ se encontró rastro fresco de negros que venían del monte, del lado de allá? Pero él juró por _toos_ los santos del cielo que no vio, oyó ni sintió _náa_ en _too_ este tiempo. Se calentó don Liborio contra él y quiso arrimarle unos cuerazos _pa_ que cantara; mas yo se lo quité de la cabeza, porque pensé que se iba a poner brava la señora doña Rosa en cuanto que supiera que habían _castigao_ al taita Caimán.

Con esto don Cándido menudeó sus paseos sin curarse de las personas que le hacían compañía, quizás para que no le interrumpieran en sus meditaciones. Luego, volviéndose de improviso para Moya, en tono breve e imperioso le preguntó por el Mayoral.

--Cuando yo venía del potrero, contestó Moya, estaba él con la gente en el corte de caña, enfrente de la tumba nueva. No debe de tardar ya, pues como no hay que cortar yerba de Guinea pa la comía de los caballos, porque hay _cojollo_, soltará la gente más temprano. Mire, ahí vienen las carretas con las últimas cañas _pa_ probar la máquina... Allá lejos se ve el boyero en su mula, y más lejos _entoavía_, por la otra guardarraya, veo ahora a don Liborio. El cañaveral me tapa sus perros y yo no _pueo_ decir si va solo o con la gente. El viene a caballo.

CAPÍTULO V

9. Limpio soy yo, y sin delito...

10. Por cuanto ha hallado achaques contra mí, por eso me ha tenido por enemigo suyo.

11. Ha puesto en un cepo mis pies, ha guardado todas mis sendas.

JOB, XXXIV

Mientras en un extremo del pórtico ocurría la escena trazada ya, tenía lugar en el opuesto otra muy diversa. Formaban allí grupo animado e interesante las señoritas Ilincheta, junto con las dos más jóvenes de Gamboa, rodeadas por el medio círculo de los caballeros que las galanteaban o admiraban. Todos en pie. Las señoras apoyadas de espaldas en la barandilla, y los caballeros pendientes de los labios de Rosa Ilincheta que, en pocas palabras, llenas de gracia y gráfica expresión, describía los pequeños incidentes del viaje, su mal manejo parte del camino, y sus propias impresiones.

Leonardo se sonreía, Cocco aplaudía, Mateu el médico hacía piruetas de gusto, y Meneses se mantenía serio de celos, porque crecían con esto los admiradores de su linda amante. Adela e Isabel, dadas las manos, escuchaban y callaban. De pronto alguien le tiró de la falda a Adela por el lado de fuera del pórtico. Volvió ella el rostro con viveza y vio a una negra de buen aspecto, en traje muy diferente del que usaban las demás esclavas de la finca.

--¿Qué quieres?--preguntó Adela bastante asustada.

--Su merced me dispense, niña. Venía por el médico. (No le veía por la oscuridad y las faldas de las señoras interpuestas.)

--Y ¿quién eres tú?

--Soy la enfermera, criada de su merced.

--¡La enfermera! repitió Adela sorprendida.

--Sí, niña, la enfermera María Regla. ¿Y su merced no es la niña Adelita?

--La misma que viste y calza.

--¡Ah! exclamó la esclava, apretándole suavemente los pies a la joven, ya que no podía otra parte de su cuerpo. Me lo decía el corazón. Ayer la vi pasar por el batey desde la ventana de la enfermería. Quedé en dudas de cuál sería mi niña, si la niña Carmen o su merced. ¡Cuánto ha cambiado! ¡Qué linda se ha puesto mi hija, Virgen Santa!

--Me lo decía el corazón, linda, mi hija, remedó Adela. Si soy tu hija, si me quieres tanto, ¿por qué no has venido a verme? Te avisé con Dolores. ¿Por qué no saliste a hablarme? Me tienes muy brava.

--¡Ay! exclamó la negra. No me diga eso, niña, que me mata... Su merced no iba sola.

--No. Iba con mamá, Carmen, la mujer de Moya y su cuñada Panchita. ¿Qué tenía eso de particular?

--Bastante, niña de mis ojos.

--Habla, explícate.

--No puedo ahora, niña mía.

--¡Qué! ¿Tú no piensas pedirle la bendición a mamá?

--Sí, niña. Debo, lo deseo en el alma, venía... Desde el punto que llegó Señorita de La Habana, pensé correr y echarme a sus pies...

--¿Por qué no lo has hecho así? ¿Quién te lo ha impedido?

--Señorita misma.

--¿Mamá? No, no puede ser. Te engañas, sueñas, María de Regla.

--Ni me engaño, ni sueño, niña Adelita. ¡Ojalá! Señorita ha prohibido que ponga los pies en esta casa.

--¿Cómo es que yo no sé nada de eso? ¿Quién te ha ido con semejante cuento?

--No ha sido cuento, niña Adelita. Dolores me refirió una conversación que Señorita tuvo con el amo sobre mí...

--¿Ya lo ves? Dolores entendió mal. Mamá no está brava contigo. Y si no, ahora mismo voy a averiguarlo.

--No lo haga, niña Adelita, no, por el amor de Dios, replicó la esclava muy asustada, deteniendo a la joven por un canto del vestido. Por sí, o por no, será mejor que Señorita no me vea ahora. ¿Está ahí el médico?

--Pues yo quiero verte a solas. Arreglaremos el modo. Con Dolores te avisaré. ¿Y para qué quieres al médico?

--Para un moreno que han traído del monte mordido por los perros.

--¡Mordido por los perros! repitió Adela. ¡Ay! Debe de ser muy serio el caso cuando llaman al médico. ¡Si le habrán despedazado! Es probable. Esos perros son como fieras. ¡Qué horror, Dios mío! Mateu, añadió en alta voz, ahí le buscan.

Cosas bien extrañas en verdad empezaba Isabel a averiguar respecto de la familia bajo cuyo techo se hallaba hospedada y del ingenio tan ponderado de _La Tinaja_. Interesada vivamente en la suerte de la enfermera, antigua nodriza de su tierna amiga, ahora desterrada de la casa solariega, y conmovida, horrorizada con lo que había oído respecto del esclavo, mordido por perros feroces, cosas todas inauditas para ella, no pudo ocultar Isabel de Leonardo, ni su intenso disgusto ni sus hondas emociones.

--¿Qué tienes? ¿Qué te ha dado? le preguntó él.

--No sé, contestó ella. Me siento mal.

--Me pareció, continuó Leonardo, que te había afectado el cuento del negro herido. No seas boba. ¿Qué apostamos a que no ha sido mayor la cosa? ¿A que no pasa de unos cuantos rasguños? Si conocieras a la enfermera pensarías como yo. Mamá no la puede ver por escandalosa. Ni hay que dar nunca entero crédito a lo que dicen los negros. Todo lo exageran y abultan.

--¿Qué fue, Adela? preguntó doña Rosa desde su asiento oyéndola llamar al médico.

La enfermera desapareció en un instante, y antes que Adela contestase a su madre se apareció el Mayoral a caballo, precedido por sus dos hermosos alanos, para dar cuenta en voz campanuda de todo lo que había pasado. Era éste hombre alto, enjuto de

carnes, mas de recios miembros, muy moreno de rostro, ojinegro, el cabello crespo y poblado de barba, cuyas grandes patillas le cubrían ambos lados de la cara hasta tocar en los ángulos de la boca, que por esto parecía más chica. A pesar del sombrero de ala ancha que llevaba siempre puesto, lo mismo en el campo que en la casa, al aire libre que bajo techo, pues muchas veces hacía uso de él como de gorro de dormir, cuando se lo quitó para hablar con don Cándido viose que mientras la parte superior de su frente parecía de un hombre blanco, la nariz, las mejillas y las manos nadie diría sino que eran de un mulato; tan quemadas estaban del sol. Venía armado, como suele decirse, hasta los dientes, de machete de cinta, puñal con cabo de plata o que brillaba como tal, y el ponderoso látigo, cuyo mango, hecho de un gajo de naranjo silvestre, no era arma menos terrible por ser sólo contundente.

Comenzó diciendo:

--Santas tardes tenga el señor don Cándido con _toa la compaña_. Yo soy _venío a participasle_ que han _traío_ a Pedro brichi con algunas _mordías_. Se _arresistió_ y fue preciso atojarle los perros.

--¿Quién le ha capturado? preguntó el amo con mucha calma.

--La _partía_ de don Francisco Estévez, _nombráa pa_ coger negros cimarrones.

--¿Sabe Vd. dónde le han capturado?

--En los cañaverales de _La Begoña_, cerquitica de las sierras.

--¿Estaba él solo? ¿Y los compañeros?

--_Náa_ se sabe de ellos, señor don Cándido, ni Pedro _quie decislo_ tampoco. _Me se_ figura que será preciso _biraslo pa que cante_. Por eso vengo a donde el señor don Cándido _pa_ que me diga qué hago con Pedro. Está muy _emperrao_...

¿Dónde le tiene Vd. don Liborio? preguntó el amo después de larga pausa.

--En la enfermería.

--¿Qué, tan estropeado está?

--No por eso, señor don Cándido. Lo tengo en el cepo de la enfermería _pa_ mayor _seguriá_, y no he _querío ponesle_ grillos por las _herías_; y luego _dispués me se_ figura que tiene malas intenciones. Sus ojos son dos tomates _maúros_, y he _reparao_ que cuando se le ponen _asina_ los ojos a los negros es que _quieen_ hacer una _fechuría_. Yo le digo al señor que está _mu emperrao_ ese negro. Mire el señor si es perro, que cuando lo metí en el cepo me dijo:--el hombre no muere más que una vez, y que «ya estaba _cansao_ de trabajar _pa_ su amo». El señor debe de saber que luego que los negros cogen y hablan _asina_ es porque, como dice mi compadre Moya, que está presente, se les ha _metío_ la Guinea en la cabeza. _Apuráamente_ ellos se tienen _tragáo_ que cuando se _ajorcan_ aquí van derechitos a su tierra.

--¡Aberraciones de la ignorancia! exclamó el Cura.

--Sí, señor don Cándido, continuó el Mayoral, ese negro está pidiendo cuero como los muertos misa.

Se sonrieron el Cura y don Cándido, y éste dijo:

--A su tiempo, don Liborio, a su tiempo se maduran las uvas. Por lo pronto no me parece conveniente azotarle. Se pondrá bueno de las mordidas, y entonces habrá lugar de castigarle por su falta, una de las más graves que pueden cometerse en estas fincas. Alzarse, fugarse el esclavo, privar al amo de sus servicios sin causa poderosa y bastante, por más o menos tiempo, es imperdonable; no sólo por él mismo, sino por el mal ejemplo a sus compañeros. Se le castigará, no lo dude. No habrá quien le apadrine. En otro negro cualquiera esa misma falta aparecería leve. A bien que Pedro puede resistir un novenario... Tiene buenos jarretes. A otra cosa. ¿No sabía la partida de Estévez que ese negro era mío? ¿No la informó Vd. que estaba yo aquí?

--Sí, señor, sabía _toito_ y yo le dije que viniera a la casa de vivienda _pa_ entregar el cimarrón y _recebir_ la captura, que es un doblón de a cuatro. Mas me contestaba y dice que prefería dormir en el monte. Además, que no quería que lo viesen los negros mansos, porque _le_ daban el soplo a los cimarrones; además que tenía que _dir_ donde _La Angosta_ a ver si cogía los cuarenta negros que se le _juyeron_ a _suescelencia_ el señor Conde la Fernandina la semana _pasáa_ arriba, y el Mayoral lo había _mandao_ a _ñamar_...

En aquel punto desfilaban en el batey del ingenio de _La Tinaja_, entre la casa de vivienda y la de calderas, los 300 y más esclavos de su dotación, y el Mayoral diciendo, «con licencia», fue a ponerse a su cabeza para pasarles revista y darles las últimas órdenes por medio de los contramayorales, que eran también esclavos. Desde buena distancia les había precedido el rumor de sus conversaciones y el sonido de las prisiones de los penados. Dos de ellos llevaban grillos, con barra atravesada y cadena de dos ramales suspendida a la cintura, y caminaban con mucho trabajo, pues para avanzar tenían que describir medios círculos, ya con un pie, ya con el otro. Uno llevaba grillete, del cual pendía una cadena como de unos seis pies de largo, cuyo extremo inferior iba engarzado al anillo de una masa férrea como pesa de reloj, la que, al caminar, era fuerza que llevara al brazo, so pena de que el roce de la argolla moliera el hueso de la canilla, aunque se lo había abrigado con un trapo. Este mismo se detenía de cuando en cuando y alzaba la voz en tono melancólico y timbre argentino, que resonaba por todas partes diciendo:--«Aquí va Chilala, cimarrón».

Penados o no, varones o hembras, todos traían algo a la cabeza, ya haces de cogollo, ya de ramas de ramón de que tanto gustan las caballerías en Cuba, ora racimos de plátanos verdes o maduros, ora de _palmiche_ para los cerdos; éste una calabaza, aquel un brazado de leña. Unos pocos, quince o veinte, llevaban camisa y calzón de cañamazo nuevos o de pocos meses de uso y estaban enteros; el traje de los restantes se componía de harapos, a través de cuyos agujeros se les veían las carnes negras y sin lustre. Ninguno calzaba zapatos, uno que otro, abarcas de cuero sin curtir, ajustadas al pie por cordones de majagua, bien de arique de yagua que no son menos resistentes. Las hembras, de treinta a treinta y cinco por todas, sobre andar revueltas entre los hombres, apenas se distinguían por otra cosa que por la especie de saco talar de cañamazo con que se cubrían el cuerpo desde los hombros hasta un poco más abajo de las rodillas, sin mangas; para que no faltase nada a la tosca imitación de la túnica romana.

--_¡Ajilar!_ gritó don Liborio con su voz de trueno, recorriendo a caballo las desordenadas filas como un general que ordena una evolución. Con lo cual, sin tropiezo, por el mero hábito, la mayor parte formó; pero los perezosos, los torpes, los impedidos por las prisiones, por la demasiada carga o por la prisa que se dieron los delanteros a cerrar las filas, ésos se quedaron detrás, menos visibles que los otros. Contra estos infelices estalló la cólera del Mayoral. Enarboló el látigo y empezó a repartir latigazos a diestro y a siniestro, sin distinguir inocente de culpable, hasta lograr la formación deseada.

Si así es como se ha razonado con el esclavo en todos tiempos y países, ¿podría esperarse que fuesen una excepción a esta regla general los señores del ingenio de _La Tinaja_? De ninguna manera. En su opinión, como en la de la mayoría de los amos, no era el negro la _cosa_ de que habla el derecho romano. Había bastante diferencia. Para ellos, que entendían por derecho únicamente aquello que no torcía el cumplimiento de sus pasiones y caprichos, el hombre-cosa de la antigua Roma tal vez no pensaba, era una máquina de trabajo; al paso que el hombre-cosa actual, estaban plenamente convencidos, pensaba al menos en tres cosas: en el modo de sustraerse al trabajo, en quemarle la sangre a su detentor, y en obrar siempre en oposición a sus miras, deseos e intereses.

Para el amo en general, el negro es un compuesto monstruoso de estupidez, de cinismo, de hipocresía, de bajeza y de maldad; y el solo medio de hacerle llenar sin murmuración, reparo ni retraso la tarea que tiene a bien imponerle, es el de la fuerza, la violencia, el látigo. El negro quiere por mal, es dicho común entre los amos. Por eso, en concepto de éstos, aquel Mayoral que no disimula ni perdona falta, que como rayo hiere al que delinque, que en todas ocasiones tiene entereza bastante y valor para «meter en cintura» a gente tan perversa e ingobernable, ése es más meritorio, más digno de consideración y respeto. Siempre se ha admirado más al inquisidor que más herejes mandaba al quemadero.

Así se explica por qué, luego que el Mayoral dio la orden de _tumba_, y todos soltaron la carga a sus pies, no importa si de forraje o de frutos, de cuyas resultas éstos se reventaron con la caída, dando ocasión a que el Mayoral hiciese nuevo uso del látigo, los señores del ingenio de _La Tinaja_ aprobaron y celebraron el _castigo_; porque era claro que los culpables habían procedido de malicia y no por torpeza y ofuscación a causa del anterior vapuleo.

Doña Rosa, mujer cristiana y amable con sus iguales, que se confesaba a menudo, que daba limosna a los pobres, que adoraba en sus hijos, que en abstracto al menos estaba dispuesta a perdonar las faltas ajenas para que Dios, que está en el cielo, la perdonara las suyas; doña Rosa, sentimos decirlo, al ver las contorsiones de aquéllos a quienes la punta del látigo de cuero trenzado del mayoral abría surcos en sus espaldas o brazos, se sonreía, tal vez por creer grotesco el espectáculo, o exclamaba, exclamación en que la hacían coro las personas de que se hallaba rodeadas:--¡Hase visto gente más bruta!

También se sonrieron los caleseros Aponte y Leocadio, junto con dos mozos más, que desde el colgadizo de la gran caballeriza del ingenio, atraídos por el continuo estallar del temible cuero, presenciaban a salvo la escena y esperaban se despejase el campo para salir y recoger el forraje destinado a las caballerías de que estaban hecho cargo inmediatamente.

Si añadimos que en estas circunstancias hasta los perros del Mayoral mostraron a su modo una alegría desusada, no creemos decir nada nuevo. Ello, mientras don Liborio hablaba con los amos del ingenio, se mantuvieron echados a los pies de su caballo; pero apenas se dirigió a los negros, se colocaron a sus flancos y no perdieron de vista ni sus ojos ni los movimientos de su brazo derecho, aguardando sin duda la orden de echarse sobre la víctima y rematarla.

Es de consignarse aquí, sin embargo, que no todas las señoras presentes se unieron al coro a que antes se ha aludido. Doña Juana, al contrario, apartó los ojos para no ver, ya que la política la vedaba retirarse y era fatal el oír los latigazos y los quejidos sordos de las víctimas. En igual caso se hallaban las sobrinas de esta señora y las dos hijas menores de Gamboa; pero éstas tuvieron siquiera el arbitrio de refugiarse en el patio. Allá las seguían Meneses, Cocco y Leonardo, a tiempo que don Cándido llamó a este último y le ordenó acompañase al médico al hospital y se informase menudamente de lo ocurrido con el preso. En conversación íntima a poco con el cura y el capitán, agregó:

--Quiero acostumbrarle (a su hijo) a estas cosas desde temprano, porque yo mañana o esotro día me muero y él por necesidad habrá de reemplazarme en el manejo del caudal; sobre todo en la administración de esta finca, que por más de un motivo le pertenece. Este ha de ser su mayorazgo.

De aquel mandato imperioso de don Cándido nació el que Leonardo, repugnándole y todo la visita, ya que no le era dado desobedecer, ni excusarse tampoco, pretendiera le acompañasen sus amigas y hermanas. Cedieron éstas sin dificultad, lo mismo que Rosa, tanto más cuanto que se brindaron a ir de la mejor gana Meneses y Cocco. Isabel de pronto se negó; mas instada y reflexionando que tal vez habría ocasión de ejercer en aquella visita uno de los actos de misericordia, cedió también, y cuando salía del brazo con Leonardo, dijo al paso a doña Rosa en tono amable y risueño:--Me llevan.

--Bien hecho, repuso doña Rosa.

--¡Buena pareja! dijo doña Teresa, la mujer del capitán Peña, a tiempo que Leonardo e Isabel descendían por las gradas del pórtico al batey.

--¡Hermosa! dijo doña Nicolasa, la mujer de Moya.

--¿No crees, Rosa, (dijo don Cándido a la suya al paño, concordando mentalmente con la oportuna observación de aquellas dos mujeres), cada vez más acertada la idea de casar cuanto antes a Leonardo con Isabel?

--Sí, contestó doña Rosa distraídamente.

--A ella la tengo por una buena cosa. Y se conoce que está enamorada de Leonardo. Luego el matrimonio es un freno...

No sabía don Liborio contar de _cálamo currente_[46] más de una decena. Pero tenía feliz memoria y era buen fisonomista; de modo que, exceptuando los siete esclavos prófugos, ocho enfermos en el hospital y los veintiocho adscritos a las diversas dependencias de la finca, carpinteros, albañiles, herreros, mozos de cuadra y sirvientes, los demás, hasta el número de 306, varones, hembras, solteros, casados, grandes y chicos, no le quedó género de duda que uno tras otro habían pasado por delante de sus ojos y entrado en el barracón. Satisfecho sobre este particular cerró la portada, pasó el cerrojo horizontal de figura de T, y le echó la llave; la cual, junto con el látigo colgó de un clavo fijo en la jamba de la puerta de su casa, por la parte fuera, debajo del colgadizo.

Si hubiera leído el _Quijote_, habría podido decir con el caballero andante: «Nadie las mueva, que estar no pueda con Roldán a prueba.» Porque al pie de esos símbolos del poder señorial cubano, lloviese, ventease, hiciese calor o frío, dormían los feroces alanos del Mayoral y ¡ay del sin ventura que osase acercarse para desprender la llave o el látigo!

Después de comer solo, porque la familia estaba de visita en la estancia, don Liborio a pie, con machete y puñal al cinto, acompañado de sus perros, se dirigió de prisa a reunirse con el médico en el hospital. Para llegar a él, allá en los confines del plano o cuadrado donde se habían erigido todas las fábricas del ingenio, había que pasar por junto al ángulo de un seto de piñones que protegía un cañaveral en flor. Allí los perros se separaron de su amo y en el vano empeño de traspasar el obstáculo, gruñeron, o más bien gimieron de aquel modo que suelen cuando husmean la presa cercana. Pero ya hemos dicho que el Mayoral

estaba de prisa, y siguió adelante llamando a sus perros.

Apenas penetró en la enfermería, bajó por la guardarraya al batey un negro a caballo, lo atravesó de un lado a otro, entró en el colgadizo de la casa del Mayoral, observó bien por todas partes, vio que no había luz ni gente, y sin apearse de la yegua flaca y desvencijada que montaba en pelo, cogió la llave, descorrió con ella el pestillo de la cerradura y la volvió a su sitio. Después de esta hazaña, siguió a la casa de vivienda y solicitó ver a sus amos, los cuales, hallándose aún en el pórtico, no tuvieron embarazo en recibirle.

No se desmontó, se deslizó por los costados de la bestia al suelo no teniendo estribo en que apoyar el pie. Su primer cuidado fue quitarse el gorro de lana con que se cubría la cabeza, y hecho todo un arco su cuerpo y tembloso, se echó de rodillas delante de doña Rosa, y en su mal español dijo:

--_La bendició, mi suamita._

--¡Ah! exclamó dicha señora algo asustada. ¿Eres tú, Goyo? Dios te haga un santo. ¿Cómo estás?

--_Mala, mi suamita._

--¿Qué te duele, Goyo?

Contestó con muchos rodeos y perífrasis ininteligibles las más, que ya le pesaba el cuerpo demasiado; que le faltaban las fuerzas y deseaba descansar en el cementerio; que estaba muy viejo; que el padre de doña Rosa le había sacado del barracón de La Habana cuando esta señora no había nacido; que fue uno de los esclavos fundadores del ingenio _La Tinaja_, uno de los primeros en derribar los montes con el hacha. Todo esto, que se tenía harto sabido la señora con quien hablaba, para informarla, en medio de aspavientos y circunloquios, que sabía donde se hallaban ocultos algunos de los esclavos prófugos, quienes deseaban presentarse desde que supieron que sus amos habían llegado de La Habana, porque estaban casi seguros que no se les castigaría por la falta cometida, en gracia de ser la primera vez; mayormente si el guardiero, que tan largos servicios había prestado en la finca, pedía perdón para ellos a la señora.

--Bien, dijo doña Rosa habiendo consultado con una mirada la opinión de su marido. Está bien, Goyo. Ve. Di a tus ahijados que pueden presentarse sin miedo; que por ti se les hará justicia... ¿Oyes?

Con dirigirse a doña Rosa para pedirla el perdón de los prófugos, dio a entender el guardiero que a lo menos podía concebir su cerebro dos ideas bien definidas. La una, que juzgaba más capaz de caridad el corazón de doña Rosa, por el hecho de ser mujer, que el de don Cándido; la otra, que siquiera por ama legítima del ingenio, pues le había heredado de su padre, había de ser ella más indulgente con las faltas de sus esclavos que él, quien, aunque señor de hecho, no lo era de derecho.

El pensamiento así expuesto parece demasiado abstruso para caber en la cabeza de un negro doblemente estúpido por sus largos años de esclavitud. Pero fuéralo o no en efecto, de esta manera fue como don Cándido interpretó el discurso del esclavo, hiriéndole en lo vivo, de un lado, que prescindiera de él en su embajada; del otro, la odiosa diferencia que marcó entre ama y amo. Es que llovía sobre mojado, como suele decirse, y cogió la ocasión por los cabellos para vengarse del insulto y recobrar, ante las personas testigos de la escena, la que él creía rebajada dignidad del señor amo. En esta disposición de ánimo, y cuando el anciano todo tembloso hacía los mayores esfuerzos para ganar de nuevo el lomo desnudo de su mansísima yegua, dijo don Cándido:

--Lindos estaríamos si por el primer zopenco que se interpone, hubiésemos de perdonar, no ya sólo las faltas más graves, sino hasta los delitos de nuestros esclavos.

Mirole asombrada doña Rosa, y luego dijo con aparente calma:

--¿Pues no estabas tú de acuerdo con mi decisión?

--Tal vez.

--¿Luego...?

--Luego es preciso que se haga justicia a esos bribones que osaron fugarse cuando más necesidad teníamos de sus servicios.

--¿Qué entiendes, Gamboa, por hacer justicia?

--Entiendo, repuso él con sorna, dar a cada quisque su merecido, castigar cual se debe al que delinque.

--Pero eso no sería hacer justicia.

--¿Cómo que no? pregúntale a tu hijo que estudia leyes, qué se entiende por hacer justicia. Recuerda, si no, cómo rezan los edictos de los fiscales de la comisión militar permanente que publica con frecuencia _El Diario_. «Yo, Fulano de tal, capitán del ejército por S. M., etc., cito, llamo y emplazo por éste mi primer edicto, a Zutano de Cual, para que se presente en la cárcel pública de esta ciudad dentro del improrrogable plazo de tantos días, a descargarse de la culpa que le resulta en la causa que le sigo por asalto y robo en despoblado o por infidencia; cierto y seguro de que si compareciere dentro del término señalado, _se le hará cumplida justicia_...» ¿Oíste? Cumplida justicia. Me le sé de memoria.

--No creo yo que la comisión militar, o como se llame, castigue a todo el que cita para hacerle justicia.

--Tienes que creerlo, porque por fas o por nefas, así sucede. ¿Cómo es que por más que le citen, llamen y emplacen, nadie se presenta de _motu proprio_? Claro, porque lo de _hacer justicia_ no pasa de ser jarabe de pico. Puede ser el emplazado tan inocente como un recién nacido; con todo, si le pillan, de seguro que mamá cárcel por tres o cuatro años, y ya esto es un castigo... que de buena gana le daría a todos los que me quieren mal.

--Bien, Cándido, está bien todo eso; el caso es que yo no hablé en el sentido que dices. En resumidas cuentas, prometí el perdón que Goyo vino a pedirme para sus compañeros.

--Pues ahí está el engaño tuyo, Rosa. Tú no has prometido tal perdón ni calabazas. Ni si hubieras prometido era posible cumplir...

--Pero es que mi palabra está empeñada.

--Ese es el ajo, mi cara Rosa. En pocas palabras, tú no has prometido nada y tal fue lo que me propuse probarte para evitar mayores males. Por el mero hecho de decir _se les hará justicia_ no se deduce que prometiste el perdón, lisa y llanamente... sin condiciones.

--Sí, pero Goyo creerá otra cosa, creerá que le he engañado.

--¿Y qué importa el quedar mal con el negro en la apariencia? Nadie tampoco guardó lealtad con los desleales _a nativitate_.[47]

--Tal vez no importe mucho por Goyo, que al fin es un negro viejo e ignorante, y de seguro no me entendió. Pero, ¿y mi conciencia, Cándido? Mi intención fue...

--Tu intención fue perdonar, la interrumpió don Cándido. Lo sé. Por lo que respecta a tu conciencia, añadió con exquisita ironía, debe estar más tranquila y serena que una balsa de aceite, en este caso. Y si hay en ello alguna culpa, échala sobre mí. Tú sabes que el diablo las carga. Quien sintió alguna vez escrúpulos de conciencia respecto de lo que dijo o no dijo, hizo o no hizo a los negros, ese santo varón, o esa santa mujer no ha debido tener esclavos jamás. ¡Escrúpulos de conciencia por semejantes bestias! ¡Ja! ¡Ja!

A este tiempo volvieron de la enfermería las señoritas y caballeros. El médico dijo que el negro había recibido varias mordeduras de carácter grave, no peligroso, en los brazos, antebrazos, canillas y carpos de las manos y de los pies. Parecía desgarrada la epidermis de algunos de los dedos de la mano derecha.--Pero por fortuna, agregó en su lenguaje peculiar, los incisivos de la fiera no han interesado lo bastante para romper ningún vaso principal y no hay temor de hematosis, aunque se ha presentado la hemalopia consiguiente a la exasperación física y moral, bajo la cual viene laborando hace tiempo el enfermo. Esto es preciso combatirlo con aplicaciones de sanguijuelas a las sienes; las que, de paso sea dicho, habrá que traer del pueblo, pues faltan en el botiquín de la finca. Por lo que hace al tétano, fácil es que se presente mediante a que el negro se ha mojado después de recibir las heridas. Con este motivo he dispuesto se le den unturas frecuentes de sebo y aceite con unas cabecitas de ajo majadas. Puedo decir, sin embargo, que hasta ahora no aparece dañado ningún nervio...

Leonardo fue más conciso. Hablando con su madre, dijo de manera que lo oyese su padre: que Pedro apenas le había reconocido a él como su amo; que estaba negado a declarar; que nada sabía de sus compañeros; que, como para intimidarle y obligarle a hablar le dijese don Liborio que ahora sí no se escaparía del cepo y que ahí le tendría hasta que doblase el cogote, contestó riendo que no había nacido el hombre capaz de sujetarle en ninguna parte contra su voluntad. Leonardo, lleno de indignación, le había vuelto la espalda; y, cosa extraña, agregó éste, luego que nos retirábamos, me llamó para decirme que deseaba ver a su amo, a papá.

--Lo esperaba, murmuró don Cándido alejándose. Hay tiempo mañana; no me molestaré ahora por su señoría.

Si se hubiera pedido informe a las señoritas sobre lo que habían visto en la enfermería, habrían referido muy diferente historia de la relatada por el médico y Leonardo. Hubieran dicho que el Hércules africano tendido boca-arriba en la dura tarima, con ambos pies en el cepo, con los hoyos cónicos de los dientes de los perros aún abiertos en sus carnes cenizosas, con los vestidos hechos trizas, por toda almohada para descansar la cabeza, las palmas de las manos, a pesar de tener rasgados los dedos y, necesariamente doloridos, Jesucristo de ébano en la cruz, como alguna de ellas observó, era espectáculo digno de conmiseración y de respeto. Su arrepentimiento de haber concurrido a aquel lugar no podía compararse sino con el dolor que experimentaron, singularmente la piadosa Isabel, cuando se desengañaron que no podían hacer nada en alivio de esta otra víctima de la tiranía civil en su desventurada patria.

CAPÍTULO VI

Los negros... ¡Oh! mi lengua se resiste A formular de su miseria el nombre!

D. V. TEJERA

Por mostrar celo y actividad a los dueños, o por equivocar la hora precisa, como se guió por el canto de los gallos, el Mayoral del ingenio de _La Tinaja_, en la mañana de Pascua, puso la _gente_ en pie mucho más temprano de lo acostumbrado.

Con el último solemne tañido de la campana, después de tomar sendas tazas de café, de encender un tabaco y de armarse, descolgó la llave, llamó a sus perros y se encaminó a pie al barracón para abrir la reja de hierro. Metió resueltamente la ponderosa llave en la cerradura, quiso hacerla girar en la guarda y no pudo: ¡Qué _demongo_! dijo para sí. Aquí han _andao_. Me parece que voy a dar más cuero... que Dios toca a juicio.

Alumbró con el tabaco el ojo de la llave, dio media vuelta en sentido de cerrar y oyó distintamente correr el pestillo y entrar en el cerradero del cerrojo.--¡Voto a Dios! exclamó. Si estaba abierta la puerta y yo he _sío_ tan caballo que la he _cerrao_. ¡Va que la dejé abierta anoche! ¿Estaba yo _bebió_, o loco, o _trastornao_? ¿O ha _habío_ aquí brujería? ¿Qué pasa, Liborio?

Salían en aquel punto los negros de sus bohíos y fue preciso que don Liborio pensase en lo que había de hacer con ellos. Descorrido el cerrojo, se plantó junto a la jamba de la puerta para verlos desfilar uno a uno, según tenía ordenado. Por eso, aunque hacía bastante oscuro, pudo observar que una negra se parapetaba del compañero y quería pasar desapercibida. Malicioso y vigilante, no necesitó de más para echársele encima, cogerla por un brazo y acercarle la lumbre del tabaco a la cara. Con sorpresa mezclada de alegría vio que era la negra Tomasa suama, prófuga hacía entonces precisamente dos semanas. Mientras sujetaba ésta, apareció recatándose también Cleto gangá, y tras él Julián arará, Andrés bibí y Antonio Macuá, los cuales detuvo y colocó a un lado.

Así que pasaron todos los demás y que formaron en medio del batey, echó por delante a los cinco presos y les ordenó hacer alto frente a frente del centro de la fila, tanto más larga cuanto que era sencilla. Seguidamente empezó el interrogatorio:

--Venga acá, mamá Tomasa, y dígame por _vía_ suyita, ¿de _aónde_ viene la niña ahora?

--_De la monte_, contestó ella imperturbable.

--¡Oiga! ¿Y qué fue a buscar al monte la niña Tomasa?

--_¿Siñó...?_

--No lo diga. No se tome ese trabajo la niña; lo sé: fue a _pajariar_. Yo le daré pajareo. Pero, ¿cómo es que se aparece ahora doña Tomasa suama?

--_Venga a presentarse a la suamos._

--¡Bueno! _Asina_ se hace. Pero ¿por _aónde dentraron_ ustedes en el barracón?

--_Po la pueta._

--¿Quién abrió la puerta a la niña?

--_Naide._ Tenía la _pueta abieta_.

Aquí se remató la paciencia del cómitre.

--Conque estaba abierta la puerta, ¿eh? ¡Ah, pedazo de p...!

Y sin más ni más la pegó tan fuerte bofetón, que la tendió en el suelo aturdida. Mientras ella se ponía en pie, dirigió poco más o menos las mismas preguntas a los cuatro compañeros de la negra y obtuvo poco más o menos idénticas respuestas.

--¡_Vírate_!,[48] dijo a la esclava echándole garra por un hombro con el objeto de derribarla de bruces.

Mas ella joven, robusta y ya prevenida, se mantuvo firme y dijo:

--_Sumecé no me catiga, mi suama mi madrina._

--¡Ja! ¡Ja! déjame reír. ¿La señora tu madrina? Pues dile que se levante de la cama y que venga a salvarte del bocabajo. Mira, negra de Barrabás, vírate o te mato...

--_¡Mata!_ repuso ella con arrogancia.

--Agárrala tú. Túmbala tú, gritó el Mayoral, ya en el paroxismo de la ira, a los compañeros de la esclava.

Tres de éstos obedecieron sin tardanza. Dos la cogieron por un brazo y el otro por un pie, con lo que fue fácil hacerla perder el equilibrio y dar con ella en tierra boca abajo.

De presumir es que la misma ciega obediencia con que los tres se prestaron a ejecutar la orden perentoria del Mayoral, excitara más la cólera de éste respecto a Julián ararará, que parecía dispuesto a desobedecer. Midiole don Liborio de alto a bajo con ojos en que se traslucía algo de la rabia que le dominaba, no poco de sorpresa y un mundo de recelos, porque era amenazadora la actitud del negro y, como la mayoría de sus compañeros allí presentes, estaba armado de machete corto o calabozo y azadón. Vino a comprender entonces que había andado algo imprudente, y que estaba perdido como flaquease en el momento crítico. Así que, haciendo de tripas corazón, gritó con más aparente brío que nunca:

--¿Y tú qué haces, perro? ¿Por qué no metes mano? Dobla el lomo... (soltando uno de los ternos que acostumbraba, a falta de mejor expletivo).

Acompañó, además, las palabras con tan fuerte garrotazo con el mango del látigo en la cabeza del esclavo, que le hizo titubear y caer luego de rodillas a los pies de Tomasa. Aun allí, abatido y todo, no dio muestras Julián de que iba a obedecer; antes temiendo el Mayoral que se recobrara del golpe y se pusiera de nuevo en pie, agregó:

--Sujeta por la pata a esa grandísima p... o ¡vive Dios! que te muelo a palos.

Y por vía de apremio le asestó un segundo garrotazo, que no por más fuerte que el primero, sino porque quizás acertó a darle en lugar donde el cabello lanudo no protegía completamente el cráneo, le dividió la piel como con un cuchillo y brotó un chorro de sangre de la herida. Julián a tientas apoyó la mano abierta en la garganta del pie de su compañera, y... empezó el bocabajo.

Tan singular conducta de parte de aquel negro en tales circunstancias, habría llamado la atención imparcial de persona menos estúpida o menos cegada por la pasión que don Liborio; habría inspirado consideración, ya que no respeto, en toda alma noble y generosa; habría excitado siquiera la curiosidad de averiguar el origen de un sentimiento que no dejaba de ser bello porque se abrigase en el pecho de un hombre semi-salvaje.

Varias circunstancias, además, concurrían en el caso del negro y de la negra, que servían para explicar la conducta de ambos en estos momentos de prueba. Y es de creerse que porque estaba al cabo de ellas don Liborio, mostraba tanta saña con la pareja. Julián y Tomasa eran poco más o menos de la misma edad; joven, robusta, agraciada ella; joven, atlético y gallardo él; procedían del mismo país en África; se tenían por paisanos o carabelas, según dicen. ¿Qué extraño sería que se amasen?

Tomasa, por su juventud, alegre humor y buena presencia era la favorita de sus camaradas y de los empleados blancos de la finca. La esclavitud no pesaba tanto para ella, ni tenía motivo para quejarse de su suerte, comparativamente hablando. ¿Por qué se había fugado? Parecía claro: por seguir a Julián, que, arrastrado por Pedro, su padrino de bautismo, el cabecilla del motín, adoptó esa malhadada resolución. Hizo más Tomasa: luego que cayó prisionero Pedro, del modo trágico referido, recabó de Julián el que se presentase y solicitase perdón de los amos por medio de Caimán, que ellos sabían tenía ascendiente en doña Rosa.

Para mayor abrigo, llevaba don Liborio atado a la cabeza un pañuelo de algodón, dos puntas de la lazada del cual le caían por detrás, y encima se había encasquetado el sombrero de paja. Traía la camisa suelta por fuera o faldeta, el puñal en la cinta y el machete en su puesto, asegurado con una faja de lienzo blanco. Apoyó la mano izquierda en la empuñadura, y con la extremidad del mango del látigo arrolló las faldas del vestido de la esclava hasta más arriba de las caderas y soltó la trenza del cuero crudo, que había sujetado en el hueco de la misma mano derecha. Todo esto por su orden, bien calculado con calma y formalidad, como quien no tenía prisa, antes se proponía saborear goce exquisito, a cuyo efecto no debía precipitar los sucesos.

Clareaba el horizonte por el este con las purísimas luces del alba. Descargado el primer latigazo con el aplomo y tino de quien posee brazo experimentado y de hierro, pudo convencerse el Mayoral que la _pajuela_ o punta de cáñamo torcida y nudosa, con chasquido peculiar, había trazado un surco ceniciento en las carnes de la muchacha. Enseguida descargó otros y otros en más rápida sucesión hasta saltar pedazos de la piel y fluir la sangre; sin que a todas éstas la víctima exhalase una queja, ni hiciese otro movimiento que contraer los músculos y morderse los labios.

Así tuvo un desfogue momentáneo la ira del Mayoral, mas el estoicismo de la muchacha le privó en mucha parte del placer que se prometía al azotarla. El dolor, sensación fatal en todo ser animado, no la redujo, como él esperaba, al extremo de pedir perdón a su verdugo. Por eso, y porque deseaba concluir antes de salir el sol, encomendó a los dos contramayorales el castigo de Julián y de sus compañeros, contentándose él con observarlos de cerca para hacerles «apretar la mano» cada vez que por compasión o por otro motivo cualquiera suponía que no daban bastante recio. Tan pronto como se despachaba uno, le hacía lavar la llaga con orines en que se habían echado de antemano unas puntas de tabaco, a fin de evitar el _pasmo_ o tétano, ordenando que los herreros les pusieran los grillos que para eso se hicieron venir de la mayordomía de la finca. Por lo que respecta a Julián, que se había desmayado dos o tres veces, o por el rigor del castigo, o por la pérdida de la sangre, juzgó prudente fuese trasladado a la enfermería para que le curasen la herida de la cabeza. A los demás penados, impedidos por el peso de los grillos y el dolor de los crueles azotes, los obligó a trabajar, junto con los restantes negros, en el _chapeo_ de las guardarrayas alrededor del _caserío_ del ingenio, que fue la _fajina_ que desde el principio se propuso sacar don Liborio.

--¿Escuchas, Cándido? dijo doña Rosa entre sábanas a su marido. Me parece que oigo el cuero. Temprano ha madrugado hoy don Liborio.

Dormía profundamente don Cándido para que le despertase la música de los latigazos de su Mayoral, no obstante que por el vigor con que los descargaba y la calma de la naturaleza, resonaban por millas a la redonda. Pero repetida la pregunta a sus oídos, entre bostezo y bostezo, contestó luego con esta otra:

--¿Qué tengo de oír, Rosa?

--El _cuero_ del Mayoral. Ni que fueras sordo.

--Ya, ya. Como que oigo algo. Sí. Está castigando. ¿Y qué?

--Alabo tu sangre fría. Aparte de otras cosas, ¿te parece poco habernos quitado el sueño tan temprano? De seguro voy a tener hoy un dolor de cabeza de los bravos. Me ha puesto nerviosa ese maldito hombre. Lo peor es que voy creyendo que el tal don Liborio no tiene ni pizca de consideración con nosotros. Nunca me gustó su cara de bandolero.

--¿Y qué querías que hiciera el hombre?

--Lo que toda persona decente hubiera hecho en su lugar. Irse a otra parte, lejos de la casa de vivienda a castigar los negros, si es que han cometido una gran falta y no podía dejar el castigo para luego.

--Quizás no ha podido remediarlo. Los negros a veces se empeñan en que los azoten y fuerza es darles gusto o se expone uno a que se le vayan a las barbas. También suele convenir en muchos casos que la pena siga al delito sobre la marcha para que surta el debido efecto.

--¿Pero tú no sabes mejor que yo la causa de este escándalo tan de madrugada?

--La supongo, Rosa, y es lo mismo. Me basta saber que los negros se le cayeron de las uñas al diablo.

--Sean o no malos los negros en general, y los nuestros en particular, la verdad es que don Liborio no para la mano desde ayer. Y si esto hace estando nosotros aquí, ¿qué no será cuando estamos lejos? Crucifica vivos a los negros.

--Pues tú le celebrabas anoche de hombre recto, y...

--¿Qué querías que dijera delante de la gente? Por dentro estaba que me comía los hígados. También no había él enseñado todas las uñas. Mas ya esto es demasiado. Qué ¿no sabrá el muy bestia que tenemos visitas? ¿Qué dirá Meneses, joven instruido, casi extraño para nosotros, no acostumbrado a estas escenas? Lo menos que se figurará es que éste es un presidio, el Vedado, y que somos de alma negra...

--No te dé cuidado por el mozo, dijo don Cándido. Apostaría cualquier cosa a que duerme a pierna suelta, arrullado con la música de los latigazos...

--Sí, pero ahora que me acuerdo, ¿qué dirá Isabelita si ha despertado? Por fuerza que ha de haber despertado. Deben oírse los cuerazos en el muelle de Tablas. Resuenan en mis oídos como cañonazos. Vea Vd.; y esa muchacha que es tan delicada, tan enemiga de los castigos. No será mucho que de esta hecha rompa con tu hijo, creyendo que sus padres son dos verdugos y que él le ha bebido los vientos. Lo sentiría por ti que estás tan empeñado en que se casen...

--Poco a poco, mi cara Rosa, la interrumpió don Cándido con más viveza que de costumbre. Hablas cual si no aprobaras el matrimonio en proyecto.

--¿De dónde has sacado tú que yo lo apruebo?

--¡Hombre! Hasta habíamos acordado el día de la boda, poco más o menos.

--Tú has arreglado eso, yo no. Si consiento en el matrimonio no es que lo apruebo de corazón, no es que me empeño en que se casen. Por una parte, no podré aprobar nunca que mi hijo querido deje mi abrigo y se vaya a vivir en otra casa. Por otra parte, no conozco mujer bastante buena para mi Leonardo. Ni Isabelita, a quien tengo por una santa, ni la diosa Venus que bajara de nuevo a la tierra, me parecería digna de él. Si consiento en que se casen (todavía puede que se arrepientan) es por ti, es porque no te cansas de repetirme y cantaletearme noche y día que el mozo se va a perder, que tendrá mal fin, que es preciso sujetarlo, que es muy enamorado (el pobrecito hasta ahora no ha mirado sino para Isabel), que asoma inclinaciones bajas... Me pones la cabeza tamaña con tales agüeros, me asustas y digo para mí: no es mal sastre el que conoce el paño: tal padre, tal hijo, y desaprobando, doy el consentimiento. El es un niño todavía, necesita de mis caricias; pero tú eres implacable, quieres casarlo y te saldrás con la tuya. Se casará, si es que la muchacha no se vuelve atrás... A veces creo contigo que el matrimonio es un freno, aunque si hemos de juzgar por ti... las mayores locuras las has cometido después de casado, y sabe Dios...

--En esto había de venir a parar la cerrazón, volvió a interrumpir don Cándido a su mujer. Más vale así. Al fin te has distraído y dejado en paz a don Liborio.

--Lo que es a ese pícaro no pararé hasta botarlo...

--Sería mala política despedir a don Liborio a raíz de haber castigado con mano fuerte las desvergüenzas de los esclavos. ¿A dónde iría a parar el prestigio de la autoridad? El Mayoral representa aquí el mismo papel que el coronel delante de su reglamento, o que el capitán general delante de los vasallos de S. M. en esta colonia. ¿Cómo, si no, se conservarían el orden, la paz ni la disciplina en el ingenio, en el cuartel o en la Capitanía General de la isla de Cuba? Nada, Rosa, el prestigio de la autoridad lo primero.

--¿De manera, repuso doña Rosa con la lógica parda de las mujeres, que por conservar el prestigio de la autoridad de don Liborio vas a dejar que acabe con los negros?

--¡Acabar con los negros! repitió don Cándido fingiendo sorpresa. No hará tal, por la sencilla razón de que de ellos está llena el África.

--Allá se pueden estar todos los negros del mundo; el caso es que cada vez se dificulta más la reposición de los que se pierden por causa de los ingleses.

--Tampoco es eso como suena, Rosa. Aparte de que por un bocabajo más o menos no se muere negro ninguno, ríete de que los ingleses lleguen a impedir la trata al punto de hacer escasear los brazos. Ya ves cómo les pasamos por los bigotes los de la última partida del _Veloz_, haciéndoles creer que eran ladinos de Puerto Rico.

--Continúa el cuero, Cándido. Es preciso averiguar qué es eso. Haz que venga el Mayordomo. Levántate, dispón alguna cosa.

--Ahí llaman. Dile a Dolores que pregunte entre tanto me visto.

Esta dormía en el cuarto inmediato con las señoritas. A las voces de su ama se asomó a un postigo y dijo:

--Es Tirso, con el café para el amo y para Señorita.

--Pregúntale qué pasa allá por el batey, dijo ésta a la esclava. ¡Qué día de ascuas se nos depara! ¡Y luego la mala noche... y el bochorno! ¡Qué prestigio de autoridad ni qué calabazas! ¡Al infierno con don Liborio!

Informó Tirso, temblando del frío o del miedo, que se habían aparecido los negros fugados, que el Mayoral los estaba castigando y que había matado a Julián porque no había querido _virarse_.

--¿No te lo decía? dijo doña Rosa. Ni siquiera ha respetado que yo les servía de madrina.

--Probable es que él no lo supiera.

--Ellos han debido decírselo.

--No los ha creído sobre su palabra. Además, Tirso miente como un bellaco. Me levantaré, sin embargo, por darte gusto. Cuando se te pone una cosa en la cabeza, eso ha de ser.

--Me da no sé qué tu santa calma. Te están matando a los negros y no corres. ¡Cómo si no costaran dinero!

--Ahora sí que has hablado como un Salomón, dijo don Cándido saliendo al pórtico.

Según es de suponer, mucho antes que de costumbre estaban en movimiento toda la familia y las visitas en la casa de vivienda del ingenio de _La Tinaja_. El sitio que ofrecía más desahogo y sombrío era el pórtico, y allá acudieron todos. El sol hería la casa por la espalda, proyectando la sombra por largo trecho adentro del batey donde, entre las ocho y las nueve de la mañana, se hallaba tendida la dotación de esclavos de la finca, en su traje ordinario, sucio y harapiento.

Acercose don Liborio al pórtico a caballo, se desmontó, le ató por el ronzal a la barandilla y ascendió la escalinata hasta situarse en el último escalón. Desde allí, quitándose respetuosamente el sombrero, saludó a la compañía en general, y en particular a doña Rosa, quien, sentada con mucha gravedad en el sillón más conspicuo, cual reina en su trono, y rodeada de sus hijas y amigas, contestó con un murmullo inaudible. No podía perdonarle esta señora a aquel hombre el mal rato, si es que don Cándido se había dado por satisfecho después de oírle el relato parcial de lo sucedido por la madrugada.

Las criadas al inmediato servicio de la familia presenciaban el espectáculo desde la puerta de la sala, y doña Rosa, por conducto de la más anciana, hizo decir al Mayoral que llamara a los dos contramayorales. Venidos, hicieron la genuflexión de costumbre en presencia de sus amos, cruzándose de brazos y permaneciendo en silencio, cual dos estatuas de piedra negra. El aire de dignidad con que se presentaron aquellos dos hombres, indicaba claramente que no eran congos. Eran lucumíes, raza guerrera del África y está dicho todo.

--¿Qué tal les va? fue la primera pregunta que les dirigió doña Rosa.

Se miraron el uno al otro y de soslayo a don Liborio, como si se animaran mutuamente a decir algo, o dar algún desahogo a su espíritu atribulado. Adivinó doña Rosa el motivo del embarazo de sus esclavos: se morían por hablar, mas temerosos de las consecuencias, por la presencia del Mayoral, juzgaron más cuerdo callarse. No necesitó ella de más para hacerles salir de su reserva. Cambió la pregunta.

--¿Tienen bastante comida?

--Sí, _siñora_, contestaron a una sin titubear.

--¿Mucho trabajo?

--No, _siñora_.

--¿Están Vds. contentos?

Volvió a sucederse la escena mímica de antes. Después de mirarse el uno al otro, y de reojo al Mayoral, que empezaba a manifestar bastante inquietud, quizás se disponía el más viejo de los dos a hacer la breve cuanto dolorosa relación de sus trabajos

y miserias, cuando don Cándido los atajó ordenando en alta voz que les entregaran la ropa nueva traída de La Habana para regalo de Pascua de la dotación del ingenio.

Constaba cada muda para los varones, de camisa de cañamazo o rusia, nada cumplida, pantalón de lo mismo, gorro y frazada de lana; para las hembras, de una como camisa talar llamada túnica, también de rusia, pañuelo de algodón de colores y frazada. Estas piezas constituían lo que en lenguaje marino de Cuba se entendía por la _esquifación_ de los negros que trabajan en el campo.

Buena dosis de soberbia había en el carácter de doña Rosa, no siendo de aquellas mujeres a quienes es fácil desviar de sus propósitos con subterfugios ni sutilezas dialécticas. La mera suposición de que don Cándido, con achaque de proteger el prestigio de la autoridad investida en el Mayoral, tendía a rebajar sus derechos de ama, delante de personas extrañas, bastó a poner espuelas a su deseo de afirmarlos, y de un modo señalado. En tal virtud, no bien se retiraron los contramayorales cargados con las esquifaciones para ellos y sus compañeros, siempre por medio del Mayoral hizo comparecer en su presencia al negro que denominaban Chilala. Acercose despacio y con bastante trabajo, clamando, como le estaba ordenado:--Aquí va Chilala, cimarrón.

Así que depositó la masa de hierro en el piso del pórtico, se arrodilló delante de doña Rosa, cruzó los brazos sobre el pecho, y con gran humildad en su peculiar lenguaje, dijo:

--_La bendició, mi suama sumecé._

--Dios te haga un santo, Isidoro, contestó doña Rosa amablemente. Levántate.

--_Asi ta mijó mi suama sumecé._

--¿Por qué te huyes, Isidoro? le preguntó el ama en tono compasivo.

Extrema era la flacura de este esclavo. Apenas tenía otra cosa que huesos y nervios. Luego, el color rojizo de sus cabellos, la palidez cenicienta del rostro, su mirar vagaroso e inquieto, comunicaban a su semblante una expresión de azoramiento como de animal montaraz.

--_¡Ah, mi suama sumecé!_ exclamó dando un suspiro. _Tlabaja, tlabaja; poco comía; no conuca; no cuchina; no mujé: cuera, cuera, cuera..._

--De modo, replicó doña Rosa con mucho reposo y cierta sonrisa de satisfacción, de modo que si te acortan el trabajo y te dan mejor comida y un conuco, y un cochino, y mujer con quien casarte y no te castigan tanto, ¿tú no te huyes más y te portas bien?

--Si, _siñó, mi suama sumecé. Chilala no juye ma: Chilala tlabaja; Chilala fino, fino_.

--Pues bien, Isidoro, ya que tú me prometes que no te huirás más y que te portarás como hombre formal, haré que no te castiguen tanto, que no te hagan trabajar mucho, que te den bastante comida, y un cochino, y un conuco, y mujer con quien casarte. ¿Estás contento?

--_Sí, siñora, mi suama sumecé; Chilala contente, mu contente._

--Más todavía quiero hacer por ti, segura de que no me has de engañar. Don Liborio, añadió en tono alto e imperioso: quítenle ahora mismo los grillos a este negro.

La larga esclavitud, la ignorancia crasa en que había vivido, el durísimo trato del ingenio, nada había podido borrar la sensibilidad, el sentimiento de la gratitud en el pecho del esclavo. Costole trabajo y esfuerzo de imaginación entender lo que su ama le decía; mas tan luego como entendió que iban a quitarle los grillos, faltándole las palabras apeló a las demostraciones para expresar su inmenso agradecimiento. Se echó de bruces a las plantas de doña Rosa, cual lo hiciera delante de un fetiche en su país natal, y con grandes aspavientos y exclamaciones incoherentes de una alegría loca, besó muchas veces el suelo que ella había hollado.

En todo son extremadas las mujeres de la índole de Isabel: o aman, o aborrecen; las medias tintas de sus pasiones se quedan para casos raros. En las pocas horas de su estada en el ingenio, había podido observar cosas que, aunque oídas antes, no las creyó nunca reales y verdaderas. Vio, con sus ojos, que allí reinaba un estado permanente de guerra, guerra sangrienta, cruel, implacable, del negro contra el blanco, del amo contra el esclavo. Vio que el látigo estaba siempre suspendido sobre la cabeza de éste como el solo argumento y el solo estímulo para hacerle trabajar y someterle a los horrores de la esclavitud. Vio que se aplicaban castigos injustos y atroces por toda cosa y a todas horas; que jamás la averiguación del tanto de la culpa precedía a la

aplicación de la pena; y que a menudo se aplicaban dos y tres penas diferentes por una misma falta o delito; que el trato era inicuo, sin motivo que le aplacara ni freno que le moderase; que apelaba el esclavo a la fuga o al suicidio en horca como el único medio para librarse de un mal que no tenía cura ni intermitencia. He aquí la síntesis de la vida en el ingenio, según se ofreció a los ojos del alma de Isabel, en toda su desnudez.

Pero nada de esto era lo peor; lo peor, en opinión de Isabel, era la extraña apatía, la impasibilidad, la inhumana indiferencia con que amos o no, miraban los sufrimientos, las enfermedades y aún la muerte de los esclavos. Como si a nadie importara su vida bajo ningún concepto. Como si no fuera nunca el propósito de los amos corregir y reformar a los esclavos, sino meramente el deseo de satisfacer una venganza. Como si el negro fuese malvado por negro y no por esclavo. Como si tratado como bestia se extrañara que se portara a veces como fiera.

¿Cuál podía ser la causa original de un estado de cosas tan opuesto a todo sentimiento de justicia y moralidad? ¿Tendría el hábito o la educación, fuerza bastante para sofocar en el corazón, sobre todo de la mujer, el sentimiento de la piedad? ¿La costumbre de presenciar actos crueles sería capaz de encallecer la sensibilidad natural del hombre y de la mujer ilustrada y cristiana? ¿Tenía algo que ver en el asunto la antipatía instintiva de raza? ¿No estaba en el interés del amo la conservación o la prolongación de la vida del esclavo, capital viviente? Sí lo estaba, a no quedar género de duda; pero eso tenía de perversa la esclavitud, que poco a poco e insensiblemente infiltraba su veneno en el alma de los amos, trastornaba todas sus ideas de lo justo y de lo injusto, convertía al hombre en un ser todo iracundia y soberbia, destruyendo de rechazo la parte más bella de la segunda naturaleza de la mujer: la caridad.

Repasando Isabel todas estas cosas en la mente, mientras los demás contraían su atención a las escenas que se representaban en el pórtico y en el batey, la ocurrió preguntarse:--¿Por qué quiero yo a Leonardo? ¿Qué hay de común entre mis ideas y las suyas? ¿Llegaremos alguna vez a ponernos de acuerdo sobre el trato que ha de darse a los negros? Suponiendo que sobre este particular cupiera concordancia entre nosotros, ¿me resignaría a seguirle a este infierno? Y siguiéndole, ¿vería yo, cual doña Rosa, con impasibilidad, los horrores e injusticias que aquí se cometen día y noche impunemente?...

En este punto del soliloquio de Isabel, empezaba doña Rosa a mostrar el lado bello de su carácter, que aquélla ni muchas otras personas aún habían visto. Como va dicho, a su voz cayeron las prisiones del más infeliz, por humilde, de sus esclavos. Y una vez empeñada en esta línea de conducta, la prosiguió hasta el fin. Era que la impelia la especie de fiebre que produce el deseo de las buenas o las malas acciones, y procedía a ciegas en la obra del bien. Aún tenía de bruces a sus pies a Isidoro, cuando ordenó se quitaran los grillos a los seis compañeros del mismo, y no contenta con esta trascendental medida, hizo comparecer a su presencia a Tomasa y a los tres castigados por la madrugada; oyó con paciencia sus quejas, les dio algunos consejos, los consoló cuanto pudo en aquellas circunstancias y acabó por decir en tono airado:--Contra mi voluntad y expreso mandato los han azotado a Vds hoy. ¡Ea, don Liborio!, quítenle los grillos a estos negros.

Fuera el que fuese el motivo secreto que impelía a doña Rosa a reasumir _coram populi_[49] la autoridad domínica en su ingenio de _La Tinaja_, los actos piadosos con que la afirmó produjeron honda y sincera impresión en el ánimo de la concurrencia. Los hombres aprobaron y aplaudieron; las mujeres, conmovidas, derramaron lágrimas de alegría. A los ojos de Isabel, la señora de Gamboa se transfiguró, pasando de golpe, allá en su noble corazón, de las profundidades del desprecio a la más alta cima de la admiración. La vio entonces la más hermosa y buena de las mujeres. La hubiera estrechado en sus brazos con el mismo cariño que solía estrechar a su madre sana y risueña tras días y horas de ausencia; la hubiera adorado de rodillas con el mismo fervor que el primer esclavo, objeto de la piedad del ama, la había mostrado su agradecimiento.

--¡Qué dulce es, exclamó, perdonar las faltas de aquellos que dependen de nosotros! ¡Para esto únicamente es una dicha ser ama de esclavos! Y dio a llorar ya sin fuerzas para dominar su emoción.

--¡Qué! ¿Llora Vd., señorita? la preguntó el cura compadecido.

--No me es dado, contestó ella sollozando, contemplar las acciones generosas y caritativas con los ojos enjutos.

--Muchas más lágrimas derramaría Vd. tal vez por motivos opuestos, si continuase en el ingenio.

--No me parece que pudiera vivir aquí mucho tiempo.

--Señorita, observó el cura admirado de tanta sensibilidad y discreción: veo que no es Vd. de carne y de los huesos de los amos de esclavos.

--No, no lo soy. Si me viera en el caso forzoso de escoger entre ama y esclava, preferiría la esclavitud, por la sencilla razón de que creo más llevadera la vida de la víctima que la del victimario.

Adela, en su entusiasmo, rodeó el cuello de su madre con los brazos, imprimió una porción de amorosos besos en sus mejillas y la dijo:

--Pues que es hoy día de perdones, ¿llamo a...? No dio el nombre en voz alta.

--¿Quién? preguntó doña Rosa torciendo el ceño.

Con mayor timidez que antes repitió Adela al oído de su madre el nombre reprobado.

Cambió doña Rosa de repente de semblante y de actitud, pasando del fervor piadoso a la seriedad y... a la ira.

--No, no. Ella no merece perdón... Tampoco se ha dignado pedírmelo.

--Ahí cerca está para pedírtelo. Sólo aguarda mi aviso.

--No, no, hija. Que no se me presente. Me haría arrepentir de lo que he estado haciendo. No, que no se me presente.

Alejose Adela del lado de su madre afligida y llorosa.

Enseguida se procedió al bautizo de los 27 negros bozales de la expedición del bergantín _Veloz_ que le tocaron en suerte a don Cándido Gamboa; luego al casamiento de tres o cuatro esclavas, cuya voluntad no se exploró ni por mera forma; en fin, se dio permiso para que hubiera tambor (baile) en la finca hasta la puesta del sol.

Por disposición de doña Rosa, el boyero tomó interinamente el bastón, quiere decir, el látigo, mejor, el mando de los esclavos del ingenio de _La Tinaja_.

CAPÍTULO VII

15. ¿En dónde, pues, está ahora mi esperanza?

16. A lo más profundo del sepulcro descenderán mis cosas, ¿crees tú que siquiera allí tendré yo reposo?

JOB. XVII

Declinaba a toda prisa la tarde. Allá, por el rincón más apartado del batey, aún se oía el rudo tambor con que los negros se acompañaban el melancólico canto y el baile salvaje de su país natal.

Acá, por la casa de ingenio, había gran agitación y ruido. Las torres o chimeneas de los hornos para hacer vapor y calentar las pailas del tren Jamaiquino,[50] lanzaban al aire columnas de humo negruzco y espeso.

El bozal del maquinista, recién llegado del granítico Maine, en los Estados Unidos de Norte América, con la alcuza de cuello largo y corvo en la mano, iba del trapiche para la máquina y de ésta para aquél, dando aceite a las juntas y ejes, a fin de moderar la fricción, causa fatal de las pérdidas de fuerza.

Impaciente y desazonado el maestro de azúcar, aguardaba la corriente del guarapo que debía poner a prueba su habilidad en hacer ese dulce con caña molida según un nuevo sistema. Por su parte los negros del cuarto de prima miraban recelosos y azorados los preparativos que se hacían para resolver el problema de hacer azúcar sin necesidad de las ariscas mulas ni de los cachazudos bueyes.

Se ponía el sol, redondo y encendido cual bala roja, por detrás del inmenso palmar del potrero, cuando invadieron la casa de calderas los dueños de la finca, en compañía de su familia, amigos y empleados. Guiaba la procesión el cura de Quiebra Hacha, revestido de la sotana y el bonete de ceremonia. Marchaban a su lado dos caballeros conduciendo cada uno un haz de cañas, atados con cintas de seda blanca y azul, que sujetaban por la punta cuatro señoritas. Llegados delante del trapiche, murmuró el cura una breve oración en latín, roció los cilindros con agua bendita, valiéndose para ello del hisopo de plata, los caballeros colocaron enseguida las cañas en el tablero de alimentación y dio comienzo la primer molienda con máquina de vapor el célebre ingenio de _La Tinaja_.

Más tarde, o entre dos luces, se sirvió el banquete de tabla en la casa de vivienda. En el intermedio de la comida a los postres vinieron a avisar al médico que su presencia era necesaria en la enfermería. Fue, y volvió al cabo de media hora un si es no es cariacontecido, saliendo a recibirle don Cándido con desusada solicitud para preguntarle:

--¿Novedad, Mateu?

--Novedad y gorda, señor don Cándido, contestó el médico con el mismo laconismo.

--Bien vengas, mal, si vienes sólo, dijo don Cándido revestido de toda su calma. Afuera con el embuchado.

--Acaba Vd. de perder su mejor negro.

--Sea todo por Dios. ¿Cuál?

--Pedro carabalí. Se ha suicidado en el cepo.

--¡Bah! Más ha perdido él que yo. ¿Qué arma ha empleado?

--Ninguna.

--¡Cómo! Entonces ha hecho uso del dogal.

--Menos. En pocas palabras, señor don Cándido, el negro se ha tragado la lengua.

--¡Qué me dice Vd.! ¡Ahora menos lo entiendo!

--Lo entenderá Vd., cuando le diga que este es un caso de asfixia por causa mecánica.

--¡Si creerá Vd., doctor, que yo hablo el griego!

--Diré a Vd., señor don Cándido. Ora haya hecho uso el negro de los dedos, ora de un poderoso esfuerzo de absorción, evidente es que, doblando la punta de la lengua hacia dentro, empujó la glotis sobre la tráquea y quedó ésta obliterada, impidiendo la entrada y salida del aire en los pulmones, o cesando la inspiración y la expiración. He aquí lo que el vulgo llama tragarse la lengua, y que nosotros llamamos asfixia por causa mecánica. Durante mis viajes a la costa del África he tenido ocasión de observar varios casos; pero en mi larga práctica de los ingenios de la Isla, éste es el primero que se me presenta. Tal género de muerte, lo mismo que el del ahogado, debe ser muy doloroso, peor que el de estrangulación en horca, porque no se produce la asfixia instantáneamente, sino por grados, en todo su conocimiento, y después de una agonía atroz. Si hiciéramos la autopsia del cadáver, veríamos que el sistema venoso está ingurgitado de sangre de color negruzco muy oscuro, lo mismo el pulmón y el cerebro.

--A fe que no había oído en mi vida semejante cosa, dijo Cándido. Vamos a la enfermería.

En esta excursión (no fue otra cosa) acompañaron a don Cándido sus huéspedes y algunos empleados. El Cura y el Capitán del partido meramente por hacerle honor, pues para el primero ya había pasado la ocasión de ejercer su santo ministerio con el suicida; para el segundo, ni antes ni después de la muerte del esclavo habría tenido ocasión de ejercer el suyo, mediante a que dentro de los límites de sus haciendas o dominios era _ipso jure_ señor de horca y cuchillo don Cándido Gamboa.

Dispuso éste retiraran el cadáver del cepo. Horrorosa era su vista, habiendo adquirido ya la rigidez de la muerte. Tendido de espaldas en la tarima, su lecho de agonía, aún apretaba los bordes con los dedos crispados. A consecuencia de las mordidas de los perros, tenía hinchados los brazos, las piernas y el levantado pecho; los ojos casi fuera de sus cuencas e inyectados de sangre, de la cual estaban salpicadas sus ropas en girones.

Contribuía a darle un aspecto feroz el tener la piel de la frente arrollada desde la línea de las cejas hasta el nacimiento de la pasa, y zajadas las mejillas verticalmente desde el párpado inferior hasta la orilla de la quijada, a usanza de la tribu en su país natal. Parte de esa costumbre era el aguzarse los dientes superiores, que dejaba ver a través de los labios entreabiertos, trabados con los de la mandíbula inferior: nueva prueba ésta de la lucha entre la vida y la muerte. No acusaba su semblante más de 27 ó 30 años de edad; de modo que se hallaba entonces en todo el vigor y desarrollo de su juventud.

--¡Lástima de negro!, dijo Cocco.

--Valía lo que pesaba en oro para el trabajo, dijo don Cándido interpretando en su verdadero sentido la exclamación del administrador de _Valvanera_.

--He ahí la vera efigie de un salvaje africano, dijo el Cura. Dios tenga piedad de su alma.

--Debió haber sido ese negro la pura soberbia, dijo el Capitán Peña con aire sentencioso.

--Y dígalo, dijo Moya satisfecho, porque había allí uno que diera forma a su pensamiento en aquel instante. Más cachorro no ha _salío_ de la Guinea.

--Ha muerto en su ley, dijo el gallego mayordomo de la finca. Dios no le tome en cuenta sus muchos pecados.

--Veamos lo que dice María de Regla, dijo don Cándido sin mirar de lleno a la cara de la enfermera.

Insensiblemente las personas que acababan de hablar se habían situado en torno del cadáver, que entonces alumbraba a medias con la vela de cera amarilla, desde el pie de la tarima, la negra mencionada por don Cándido. Ella, con los ojos bajos, dijo:

--Le contaré a mi señor lo que ha pasado.

La precisión y claridad de las pocas palabras vertidas, junto con el acento argentino y medido de su voz, pregonándola como mujer de talento y de algún trato social, le ganaron desde luego la atención de los circunstantes. Poseía ella ambas cosas en grado notable, relativamente a su falta de escuela y a su condición de esclava desde la cuna. A la natural perspicacia y carácter dulce y simpático, combinados con un exterior agradable y fino, se agregaba el haber servido de doncella a sus primeros amos; teniendo ocasión de rozarse más con éstos y con las personas decentes que visitaban la casa que con las ignorantes de su misma condición, y de aprender, no ya sólo las maneras, sino el modo de decir y de portarse en sociedad la gente blanca y educada. Frisaba en los 36 ó 40 de la edad, como la atestaban sus formas redondeadas y voluptuosas. Dos medias lunas grandes de oro pendían de sus orejas, y para ocultar las pasas, que detestaba, se cubría la cabeza con un pañuelo de algodón, dicho de Bayajá, atado con bastante gracia y coquetería, a guisa de turbante turco. En el momento de que hablamos, su aspecto y tono de voz revelaban mucho disgusto y tristeza.

--Le contaré a mi señor lo que ha pasado a mi vista, dijo ella cual si hablara con el muerto y no con su amo. Pedro, desde que le pusieron en el cepo, se negó a comer y hablar. Sólo esta madrugada bebió un poco de sambumbia, que le hice tragar, como quien dice, de por fuerza. El hambre se aguanta, la sed no hay quien la entretenga siquiera, y él, por las mordidas, debía de sentir una sed ardiente. Después, como hacía veinticuatro horas que no pasaba bocado, como había ya perdido mucha sangre y se le habían inflamado las heridas, a pesar de las unturas que ordenó el médico, estaba muy débil, irritado, no podía reconciliar el sueño. Se calmó un poco luego que apagó la sed. Pero no ladraba un perro, no cantaba un gallo, no se oían pasos de gente o de animales en el batey sin que él se moviera, le crujieran los huesos en la tarima y se pusiera a escuchar. Los primeros cuerazos de don Liborio esta mañanita le causaron un sobresalto grandísimo y no tuvo un momento de reposo. A cada cuerazo se estremecía de pies a cabeza, lo mismito que hace el caballo (y perdonen sus mercedes la comparación) cuando le quitan la silla después de un largo viaje.

«Estoy segura, añadió la enfermera con cierta timidez, que más le dolieron los bocabajos a Pedro que a aquéllos a quienes se los dieron. Le entró una especie de furia. Murmuraba en su lengua palabras que yo no entendía. Parecía loco. En esto trajeron a Julián más muerto que vivo, entre cuatro morenos. Pedro lo vio. Era su ahijado de bautismo y se convenció de que estaban castigando a sus compañeros de fuga. Entonces se remató. Estoy persuadida que si hubiera podido, hace añicos el cepo. Le cogí miedo. Trataba de sacar los pies de los agujeros; dejé la cura de Julián y me acerqué cuanto pude a la tarima de Pedro. Le encontré sentado, mirando para todas partes, cual si esperara que vinieran por él a cada rato para darle un bocabajo.

«¿Qué tienes, Pedro?, le pregunté. ¿Qué sientes? ¿qué te duele? ¿qué quieres? Me miró fijamente, dio un gran suspiro y dijo con la garganta, no con la lengua:--_Lamo._ ¿Llamo?, le pregunté. ¿A quién llamo, al médico? Se quedó callado. Di, Pedro, ¿quieres que mande por el amo? Abrió tamaños ojos, enseñó los dientes y repitió: _Lamo, lamo... su mercea_, concluyó diciendo María de Regla con mayor timidez, sin levantar la vista para don Cándido.»

Este no hizo más que sonreírse ligeramente y la enfermera prosiguió su gráfica narración.

«Yo le contesté: todavía no, Pedro; todo el mundo duerme en la casa de vivienda; velaré, y así que salga el amo, le avisaré que quieres verlo. Duerme, descansa un rato. Por fortuna en aquella misma hora se oyó alejarse a la gente y Pedro dio un suspiro. No

venían por él. Después me pareció inútil avisar al amo. Estaban ocupados con la repartición de las esquifaciones, el bautismo de los bozales... Señorita estaba quitando grillos y perdonando a todos; ¿quién no creería que se había pasado el peligro? Pero en mala hora entró aquí don Liborio a buscar algo que se le había quedado anoche. Venía furioso. Dijo que lo habían botado por culpa de Pedro, pero que no se quedaría riendo el muy cachorro, pues había ordenado el señor don Cándido que le dieran un novenario luego que se pusiera bueno, y que si él no tenía el gusto de dárselo se lo daría el otro Mayoral. No se aparecía el amo y Pedro creyó que estaba bravo y que don Liborio decía verdad. Desde este momento decidió quitarse la vida. Me asomé a la ventana para ver el baile de tambor por un instante, cuando sentí que Pedro se movía; volvía la cara y noté que se andaba en la boca con los dedos. No pensé nada malo, pero hizo un movimiento cual si le entraran náuseas. Corrí a su lado... Acababa de sacarse los dedos de la boca, apretaba los dientes y procuraba agarrarse de la tarima con las dos manos. Entonces le entraron convulsiones. Me dio horror; mandé llamar al médico, y sin saber cómo ni cuándo se me quedó muerto entre los brazos. Así como está ahora le encontró el señor don José (el médico). Muchos he visto morir desde que estoy aquí, pero ningún muerto me ha causado tanto horror.»

--Se explica la negra, dijo Cocco a don Cándido cuando salían de la enfermería.

--No sabe Vd., todas las letras menudas que tiene, repuso don Cándido a media voz. He aquí la causa de su perdición. Si fuese menos bachillera estaría quizás más contenta con su suerte.

--Pues qué, ¿es mujer de aspiraciones?

--¡Que si es! Demasiado. Apresurémonos no sea que perdamos el plus café. Luego Rosa extrañará nuestra demora y no conviene todavía que sepa la muerte del negro.

Conocidamente pasaba don Cándido por el carácter de la enfermera como por sobre ascuas. No era indiferencia la suya, tampoco desdén, menos desprecio: era miedo, puro miedo no fuera que se averiguase la posición en que se hallaba colocado respecto de ésa su humilde esclava. Porque es bueno se diga una vez más, que don Cándido Gamboa y Ruiz, caballero español, rico hacendado de Cuba, fundador de una familia distinguida que llevaría su preclaro nombre quién sabe hasta qué generación, con ínfulas de noble, ya en camino de titular y ganoso de rozarse con la gente encopetada y aristocrática de La Habana, se sentía atado a la enfermera de su ingenio de _La Tinaja_ por lazos que, no por invisibles eran menos fuertes e inquebrantables. María de Regla poseía el único secreto de su vida libertina que le avergonzaba y hacía infeliz en medio de la grandeza y el boato de que ahora se veía rodeado.

El día siguiente armose en _La Tinaja_ divertida cabalgata, compuesta de las señoritas Ilincheta y las dos más jóvenes de Gamboa, escoltadas por el hermano de éstas, por Meneses y por Coceo.

Hacía tiempo hermoso, quiere decir, que las nubes aplomadas que encapotaban el cielo, impedían el brillo del sol en toda su fuerza, mientras el aire seco del norte, que a su paso por el angosto brazo del Golfo no había podido despojarse de los fríos vapores del vecino continente, refrescaba que era una delicia la atmósfera de toda esa costa cubana. Isabel, diestra jinete, orgullosa de su habilidad, amaba el ejercicio a caballo y se hacía la ilusión que dominaría a su sabor el campo desde la silla, respiraría aire más puro y más libre y ensancharía los horizontes de su existencia, cruelmente circunscritos en el ingenio de _La Tinaja_. Este inesperado desahogo lo demandaban a una su cuerpo, su espíritu y su corazón.

El tropel de las caballerías, esguazando el río, camino de la estancia, hizo levantar a los vocingleros totíes y a las hurañas palomas rabiches que habían bajado a beber o a bañarse a la lengua del agua, abrigadas por las tendidas ramas de los robles.

--¡Qué sombrío! exclamó Isabel. Convida ese charco a bañarse.

--Es muy hondo al pie de la palma sobre la margen derecha, observó Gamboa.

--¿Cómo que hondo? preguntó la joven.

--Tapa a un hombre.

--Entonces se podrá nadar con desembarazo.

--Sí, pero es muy peligroso bañarse allí a causa de los caimanes que suelen ascender el río desde la boca. En ese mismo charco que tanto incita a Isabel, perdió papá un perdiguero que quería mucho. Yo era un chicuelo entonces y le acompañaba en la caza. Le disparó un tiro a un aguaitacaimán y cayó en mitad del charco; tras él se lanzó el perro para traerle a la orilla, pero sin darle

alcance se hundió bajo de las aguas cual si le faltaran las fuerzas de repente. Luego apareció en la superficie un borbollón de sangre, por donde conoció papá que le había atrapado un caimán.

Buen efecto producían el arrozal en lo más hondo de un vallecito, irguiendo sus innumerables espigas, todavía verdes, en busca del calor solar y el campo de maíz en las laderas de las colinas, con sus flores de color morado y las barbas rubias de sus mazorcas.

En el platanal inmediato abundaban los racimos amarillos, que por su mucho peso hacían inclinar la cepa hasta besar la tierra con la punta de sus anchas y largas hojas, cual láminas de acero.

Corriendo a la ventura, sin detenerse en ninguna parte, nuestros paseantes repasaron el río por un vado más abajo del anterior, dejando tras sí los terrenos de la estancia y entrando en los del potrero, por medio de un dilatadísimo palmar. Sus enhiestos y blancos troncos remedaban las gigantes columnas de un templo antiguo arruinado. Tenía establecido en él su campamento una banda de aquellas aves, especie de cuervos que en su canto o grito expresan por onomatopeya el nombre bajo el cual se les conoce vulgarmente en Cuba: cao, cao.

En tan gran número se habían juntado que ennegrecían el racimo de la palma o la penca donde se posaban; y lejos de asustarlas o hacerlas abandonar el puesto las pisadas de las caballerías o las voces alegres de los jinetes, eso mismo pareció aumentar su algarabía y desfachatez, expresada en las miradas de soslayo que lanzaban desde sus naturales alcándaras, cual si poseyeran inteligencia y quisieran burlarse de quienes no tenían alas para llegar hasta ellas.

--No se reirían Vds. de mí, dijo Gamboa, si tuviera a mano mi escopeta. Yo haría descender más que de prisa a algunos de esos bribones.

--Tan dudoso es lo que Vd. dice, dijo Cocco con sorna, que viene bien aquí aquello de «al mejor cazador se le va una liebre».

--¿Por qué así? preguntó Isabel, que se daba por diestra tiradora.

--Diré a Vd., señorita, repuso Cocco con su vocecilla gangosa e innata cortesía. Porque con el calor del día se le pone la pluma muy resbaladiza lo mismo al cao que a la paloma torcaz, y no le entra fácilmente la munición.

Luego cambiaron de rumbo los paseantes, rodeando la finca por el lado norte, que era la porción más elevada del terreno. Desde una de sus alturitas se alcanzaba a ver un pedazo del mar azul, en la apariencia sereno, y allá en el horizonte algunas velas blancas como otras tantas aves acuáticas rizando la linfa de un manso lago.

Cerraba la guardarraya que recorrían los paseantes, un bosque alteroso que servía de línea divisoria entre el ingenio de _La Tinaja_ y el de _La Angosta_ del otro lado. Según recordaba Leonardo debía de haber una vereda que atravesaba dicho bosque, y siguiendo la cual podía llegarse a la finca del Conde de Fernandina en la mitad del tiempo que se emplearía en caso de ir por el camino real o de la Playa. La vía naturalmente era muy estrecha y estaría en parte obstruida por ramas bajas y espinosas de los árboles y plantas trepadoras, en las cuales bien podían dejar las señoras, como se descuidasen, girones de sus vestidos. Esto entendido, les propuso acometer la ardua empresa.

Había novedad en la propuesta, por lo mismo que se corría peligro; razón de más para que las señoritas, ganosas de aventuras, la aceptasen de plano y aun con entusiasmo. ¿Qué importaba un arañazo más o menos si se prolongaba un poco aquel rato de libertad y de expansión? La intrépida Isabel, sobre todas, a quien el aire del campo y el ejercicio ecuestre habían devuelto las rosas a sus mejillas, el fuego a sus ojos y la sonrisa a sus labios, exclamó:--¿Quién dijo miedo? Adelante. No se diría nunca que por donde pasó un hombre a caballo Isabel se quedó atrás.

Penetraron todos en el sombrío bosque, llenos de alegría. Pero apenas anduvieron corto trecho, uno detrás de otro, abriéndose paso a veces con las manos, cuando tuvieron que detenerse. Empezó a sentirse un hedor fuerte, como de cuerpo muerto; y de seguidas descubriose una vasta congregación de _auras tiñosas_, rindiendo con su peso las ramas de los árboles que servían como de arcos triunfales a la vereda. Algunas de esas asquerosas aves, las más cercanas, a la vista de los caminantes emprendieron el vuelo, y haciendo un ruido tremendo con sus amplias y pesadas alas, fueron a posarse algo más lejos. Otras, las más distantes, no sólo no se movieron de sus perchas naturales, sino que se pusieron a ojear en todas direcciones con aire siniestro. La causa de su amenazadora actitud se echó luego de ver: se entretenían en devorar el cadáver de un negro, colgado por el pescuezo de la rama de un árbol a orillas de la vereda, e interrumpidas en lo más interesante del festín, manifestaban su indignación de la manera dicha.

En los momentos de acercarse los jóvenes, oscilaba ligeramente el cuerpo. Esta circunstancia engañó de pronto a Leonardo, que llevaba la delantera, respecto de su estado actual; pero la reflexión de que las auras al abandonarle le habían impreso el movimiento oscilatorio, aun observable, le sacó prontamente del error. Habíanle extraído los ojos y la lengua, y cuando fueron interrumpidas buscaban afanosas el corazón con sus encorvados picos.

--¡Mira! dijo Gamboa a Isabel, que le seguía de cerca indicándola, con el brazo tendido, el horrible cadáver contra el cual estuvo él mismo a punto de tropezar.

--¡Ay, Leonardo! exclamó ella horrorizada.

Perdió el color y el habla, y hubiera perdido también el conocimiento y caído de la silla al suelo si Leonardo, advirtiendo su imprudencia, no revuelve a toda prisa el caballo, la coge de la mano, le da los dictados más cariñosos, le pide mil perdones y la saca al limpio, invirtiendo el orden de la marcha.

Mientras Leonardo despachaba el guardiero Caimán al bosque para identificar, si era posible, la persona del suicida, Meneses acudió por agua al arroyo inmediato, la trajo y se la hizo beber a Isabel en un vaso rústico, de forma de cartucho, hecho de una yagua recién desprendida de la palma.

Averiguose que el muerto era Pablo, compañero de Pedro, que se quedó en el bosque cuando los otros cinco prófugos, inducidos por Tomasa y con el apoyo de Caimán, resolvieron presentarse a los amos.

La estaba reservado a Isabel, en su breve correría por los campos del ingenio de _La Tinaja_, encuentro no menos desagradable que el anterior. Dando la vuelta con lento paso por una guardarraya paralela a la que llevaron antes, no a fin de alargar el paseo, sino con el de distraer a Isabel, aun no repuesta del choque, avistaron un cercado de regular tamaño, con puerta de tablas mal unidas y una cruz tosca de madera sobrepuesta en el centro. Parecía indicar su destino este signo de la fe del cristiano; pero ante la ausencia absoluta de monumentos, losas o camellones de sepulturas, ante la lujosa vegetación herbácea del suelo, costaba creer que era el cementerio donde se enterraban los esclavos que morían en el ingenio de _La Tinaja_. El señor Obispo Espada había concedido su establecimiento en aquellas fincas rurales que por su lejanía de los centros de población o de las parroquias hacía difícil a la salud pública la conducción de los cadáveres.

Sin duda porque todos, o casi todos, sabían el destino del cercado, nadie habló de él. Pasaron de largo y tomaron otra guardarraya en dirección del ingenio. Descendían luego una cuesta suave y prolongada a medida que la subían tres negros a pie. Dos caminaban delante, cada cual con su azadón al hombro. El otro algo más atrás, conducía del diestro un caballo de mal pelaje. A cierta distancia no era fácil conocer, al menos por las señoritas de la cabalgata, el objeto de la procesión ni la naturaleza de la carga.

Descubríanse solamente dos como cilindros o trozos de cepa de plátano, asegurados longitudinalmente en los lados del aparejo común de carga en el país, a guisa de cañones de campaña trasportados a lomos de acémilas. Para Leonardo todo este misterio desapareció desde el momento que pudo ligar la idea de los tres negros que marchaban en esa dirección, preparados para abrir una sepultura.

Pero, ¿quién era el muerto? ¿dónde estaba? Iba de espaldas en lo que puede llamarse la batalla del aparejo encajonado entre las dos cepas de plátano. Por más señas que, sobresaliendo el cuerpo, la cabeza cubierta con un pañuelo a cuadros, batía colgando un lado del pescuezo del caballo, por más despacio que marchaba; al mismo tiempo que le golpeaba las ancas con los calcañales de los pies desnudos.

La guardarraya era muy angosta. A un lado y otro se desplegaban cañaverales extensos y cerrados. El encuentro se hacía inevitable. En tal aprieto, y deseoso Leonardo de ahorrar a sus amigos, en cuanto cabía, el nuevo mal rato que se les esperaba, mandó picar el paso so pretexto de que se hacía tarde, y él mismo procuró tomar la derecha de Isabel y divertir su atención hacia el otro lado del campo. Inútil cuidado. Todas las jóvenes, que entonces marchaban de dos en fondo, vieron y entendieron perfectamente de lo que se trataba, tributando quien un ¡pobrecito! quien una lágrima silenciosa a la memoria del muerto Pedro; el cual, por ser negro y esclavo, no era menos digno de su compasión. Porque ellas, aunque criadas a la leche de la esclavitud, como tiernas flores que abrían sus pétalos a los primeros rayos del sol de la vida, bien podían exclamar con el orador latino: _homo sum; humani nihil a me alienum puto_.[51]

Recibió doña Rosa a los paseantes con vivas muestras de cariño y regocijo. Tomó a Isabel por la mano y dijo hablando en general:

--Gracias a Dios que han vuelto. Sobre que ya iba entrando en cuidado. Me pareció que les había sucedido algo. Luego, me acaban de decir que ésta (Isabel) pierde el juicio en cuanto monta a caballo. Supongo que se han divertido mucho.

Isabel se sonrió meramente y se retiró a su cuarto con Adela; pero Leonardo, Meneses y Cocco protestaron del juicio con que todas las señoritas se habían portado en el largo paseo.

--Me alegro, me alegro, dijo doña Rosa. Mas luego, dirigiéndose en particular a su hijo, añadió: ¿Qué tiene? (Se refería a Isabel.)

--Nada, que yo sepa, replicó Leonardo.

--Me parece que ha venido más triste. ¿Se ha enfermado en el paseo? ¿O tú le has hecho algo?

--¿Yo, mamá? Jamás he estado más amable y cumplido con ella.

Entonces Leonardo refirió a su madre cuanto habían visto en su malhadado paseo; su encuentro con el negro ahorcado en el bosque y con el entierro de Pedro.

--Pero ¡hombre! ¿a quién se le ocurre llevar a las muchachas por semejantes andurriales?

--¿Y yo qué sabía, mamá? Para adivino, Dios.

--¿No lo decía yo? De esta hecha Isabel no vuelve a poner los pies en el ingenio. Se figurará que siempre es lo mismo.

--Ella no se ha quejado.

--Sabe mucho Isabel y es demasiado discreta para decir lo que siente, sin ton ni son; pero se conoce que esto no le ha gustado ni un poquito. Y tu padre está creído que cuando te cases con ella vendrán Vds. a menudo a _La Tinaja_ a pasar largas temporadas. El dice que tú tarde que temprano, has de ser el administrador, y parecería muy feo que tu mujer se quedase en La Habana...

--¿Han arreglado ya Vds. el plan?

--¡Cómo! ¡Qué! ¿No te gusta?

--¿El plan o la novia?

--La novia y el plan, hijo.

--La novia me gusta un puñado, no lo puedo negar; pero, ¿es hora de casarme, mamá? El casamiento es cosa seria, tú lo sabes. No ha de hacerse cochiherviti. En cuanto a la administración del ingenio, ¿crees tú que yo deba encerrarme en este desierto, cuando empiezo a gozar?

--No sabes cuánto gusto me da el oírte hablar así, hijo mío. Salomón no se expresaría con más juicio. Eso mismo le decía yo a tu padre anoche. ¿Para qué tanta prisa? Pero él es muy porfiado, testarudo y caprichoso, más que un vizcaíno. Se le ha puesto que te cases el año entrante y eso ha de ser. Tú, sin embargo, no tienes por qué apurarte ni afligirte. Como tú eres quien se casa y no tu padre, se hará el casamiento cuando convenga. Mas si bien se mira, Leonardito, tu padre no deja de tener razón. El me ha hecho sus reflexiones, y... casi, casi que me ha convencido. Porque dice: Mañana es otro día nos morimos nosotros. ¿Qué será de todo esto? ¿Qué de nuestros cuantiosos bienes? ¿qué de tus hermanas si aún no se han casado? Soltero tú no podrás cuidarlas, dirigirlas ni protegerlas. Todo andará manga por hombro, vendrán a menos los bienes cada día, y, sobre todo, se destruirá la casa que tanto trabajo nos ha costado fundar... El cree que en el primer correo de España le viene el título de Conde de La Tinaja o de Casa Gamboa. Ha dejado el nombre a la elección de su agente en Madrid. El título pasará a ti, mejor dicho, tú lo disfrutarás, pues para ti verdaderamente se ha pedido. Entonces, además que sería una vergüenza que trabajaras personalmente, como tu padre ha trabajado toda su vida, ¿qué necesidad, tampoco tendrías tú de ello? Al contrario, si nuestra muerte y el condado te encuentran casado y firmemente establecido, ¿cuán diferente no será tu suerte y la de tus hermanas? ¿Ni con quién pudieras enlazarte mejor que con Isabel que es tan buena y virtuosa? Cada vez me gusta más esa muchacha. Si yo fuera hombre me parece que la enamoraba y me casaba con ella. Por otra parte, hijo mío, ¿quién atendería esto mejor que tú que eres su dueño y que te duele? Mira, cada vez que me acuerdo que por debilidad mía... No tal, por majaderías de tu padre, se dejó tanto tiempo de Mayoral de esta finca a don Liborio, a ese bandolero, cara de hereje, me da cólera de mí misma. ¿Para qué servía ese condenado? Nada más

que para enamorar las negras y desollar los negros con el cuero. Se deleitaba en dar bocabajos, según me ha contado la mujer de Moya. Tenía convertido el ingenio en un presidio. Por nada y nada cargaba de grillos al mejor negro después de arrancarle la tira del pellejo. Creo firmemente que si no le boto no me deja uno vivo. El tuvo la culpa de que se huyeran tantos; por él es fácil que se muera de pasmo todavía Julián. Le dio un bocabajo a Tomasa sabiendo que yo le servía de madrina, lo mismo que a los otros que se habían huido con ella. ¡Bárbaro! Estamos de malas. Dios quiera que el año venidero sea mejor para nosotros. Para complemento de desgracias, acaba de recibirse carta de La Habana en que participa don Melitón que desapareció Dionisio desde el día 24, y que ha oído decir lo mataron de una puñalada por el barrio de Jesús María. Descerrajó el escaparate de tu padre y se llevó la casaca, el calzón corto de paño, las medias de seda y los zapatos con hebillas de oro que usaba antes de la Constitución del año 12. ¿Qué se propuso hacer con esa ropa? ¿Venderla? Nadie se la compraría. ¿Has visto qué pícaro? ¡Qué malvado! ¡Y después de esto crea Vd. en la honradez y formalidad de los negros! Dios me perdone, pero el mejor... merece que lo quemen vivo. ¡Cuánta ingratitud contra amos tan buenos!

CAPÍTULO VIII

¡Ay del señor, que sus vasallos deja Al cielo remitir su justa queja!

LOPE DE VEGA

La familia de Gamboa, en unión de sus huéspedes, pasó la mayor parte de la noche del segundo día de Pascuas en la casa de calderas.

Alumbraban el trapiche unas fogatas que habían encendido los negros, no tanto para obtener claridad en aquel ancho y tenebroso edificio, como para calentarse; pues se sentía un relente desapacible y ellos carecían de abrigo, excepto el gorro de lana que algunos llevaban puesto. Ruidos distintos y gran batahola reinaban por todas partes. Hombres y mujeres pasaban y repasaban del tablero de alimentación del trapiche a las pilas de cañas, ya con los brazados a la cabeza, ya de vacío, según era el caso; todos siempre de carrera, estimulados por el látigo del contramayoral, que no les concedía momentos de descanso ni de respiro. En sus idas y venidas pasaban lo más cerca que podían de las fogatas, así para atizarlas con el pie como para recibir de lleno el calor, en cuyas ocasiones la llama rojiza, cual siniestro relámpago en medio de una noche tempestuosa, solía iluminarlos de pies a cabeza, con lo que se podía echar de ver que eran seres humanos y no fantasmas de las regiones infernales quienes desempeñaban tan recias faenas en horas que la mayoría de los obreros se entrega al sueño.

En esta parte de la casa de calderas no se oían, pues, más que los estallidos de los ramos verdes y del bagazo todavía húmedo con que los negros alimentaban el fuego, o el crujido de los haces de caña al pasar por entre los cilindros macizos y relucientes del trapiche, o el zumbido sordo, peculiar del volante de la máquina de vapor en sus vertiginosos giros. Con este afanoso trabajar, desaparecían una tras otra las pilas de caña, especie de murallas verdes, que al principio circunvalaban casi la casa de ingenio; de suerte que la corriente del guarapo en la canal de madera hacía el mismo murmurio que un arroyuelo ordinario.

El departamento propio de las calderas estaba pobremente alumbrado por unos cuantos candiles de grasa común colgados a trechos de las gruesas vigas, en derredor del laboratorio o tren Jamaiquino. Más humo que luz emitían, soltando de cu

The Planet of Dread

By R. F. Starzl

[Illustration: _This time Forepaugh was ready for it._]

[Sidenote: A stupid blunder--and Mark Forepaugh faces a life of castaway loneliness in the savage welter of the planet Inra's monster-ridden jungles.]

There was no use hiding from the truth. Somebody had blundered--a fatal blunder--and they were going to pay for it! Mark Forepaugh kicked the pile of hydrogen cylinders. Only a moment ago he had broken the seals--the mendacious seals that certified to the world that the flasks were fully charged. And the flasks were empty! The supply of this precious power gas, which in an emergency should have been sufficient for six years, simply did not exist.

He walked over to the integrating machine, which as early as the year 2031 had begun to replace the older atomic processes, due to the shortage of the radium series metals. It was bulky and heavy compared to the atomic disintegrators, but it was much more economical and very dependable. Dependable--provided some thick-headed stock clerk at a terrestrial supply station did not check in empty hydrogen cylinders instead of full ones. Forepaugh's unwonted curses brought a smile to the stupid, good-natured face of his servant, Gunga--he who had been banished for life from his native Mars for his impiety in closing his single round eye during the sacred Ceremony of the Wells.

The Earth man was at this steaming hot, unhealthful trading station under the very shadow of the South Pole of the minor planet Inra for an entirely different reason. One of the most popular of his set on the Earth, an athletic hero, he had fallen in love, and the devoutly wished-for marriage was only prevented by lack of funds. The opportunity to take charge of this richly paid, though dangerous, outpost of civilization had been no sooner offered than taken. In another week or two the relief ship was due to take him and his valuable collection of exotic Inranian orchids back to the Earth, back to a fat bonus, Constance, and an assured future.

It was a different young man who now stood tragically before the useless power plant. His slim body was bowed, and his clean features were drawn. Grimly he raked the cooling dust that had been forced in the integrating chamber by the electronic rearrangement of the original hydrogen atoms--finely powdered iron and silicon--the "ashes" of the last tank of hydrogen.

* * * * *

Gunga chuckled.

"What's the matter?" Forepaugh barked. "Going crazy already?"

"Me, haw! Me, haw! Me thinkin'," Gunga rumbled. "Haw! We got, haw! plenty hydr'gen." He pointed to the low metal roof of the trading station. Though it was well insulated against sound, the place continually vibrated to the low murmur of the Inranian rains

that fell interminably through the perpetual polar day. It was a rain such as is never seen on Earth, even in the tropics. It came in drops as large as a man's fist. It came in streams. It came in large, shattering masses that broke before they fell and filled the air with spray. There was little wind, but the steady green downpour of water and the brilliant continuous flashing of lightning shamed the dull soggy twilight produced by the large, hot, but hidden sun.

"_Your_ idea of a joke!" Forepaugh growled in disgust. He understood what Gunga's grim pleasantry referred to. There was indeed an incalculable quantity of hydrogen at hand. If some means could be found to separate the hydrogen atoms from the oxygen in the world of water around them they would not lack for fuel. He thought of electrolysis, and relaxed with a sigh. There was no power. The generators were dead, the air drier and cooler had ceased its rhythmic pulsing nearly an hour ago. Their lights were gone, and the automatic radio utterly useless.

"This is what comes of putting all your eggs in one basket," he thought, and let his mind dwell vindictively on the engineers who had designed the equipment on which his life depended.

An exclamation from Gunga startled him. The Martian was pointing to the ventilator opening, the only part of this strange building that was not hermetically sealed against the hostile life of Inra. A dark rim had appeared at its margin, a loathsome, black-green rim that was moving, spreading out. It crept over the metal walls like the low-lying smoke of a fire, yet it was a solid. From it emanated a strong, miasmatic odor.

"The giant mold!" Forepaugh cried. He rushed to his desk and took out his flash pistol, quickly set the localizer so as to cover a large area. When he turned he saw, to his horror, Gunga about to smash into the mold with his ax. He sent the man spinning with a blow to the ear.

"Want to scatter it and start it growing in a half-dozen places?" he snapped. "Here!"

* * * * *

He pulled the trigger. There was a light, spiteful "ping" and for an instant a cone of white light stood out in the dim room like a solid thing. Then it was gone, and with it was gone the black mold, leaving a circular area of blistered paint on the wall and an acrid odor in the air. Forepaugh leaped to the ventilating louver and closed it tightly.

"It's going to be like this from now on," he remarked to the shaken Gunga. "All these things wouldn't bother us as long as the machinery kept the building dry and cool. They couldn't live in here. But it's getting damp and hot. Look at the moisture condensing on the ceiling!"

Gunga gave a guttural cry of despair. "It knows, Boss; look!"

Through one of the round, heavily framed ports it could be seen, the lower part of its large, shapeless body half-floating in the lashing water that covered their rocky shelf to a depth of several feet, the upper part spectral and gray. It was a giant amoeba, fully six feet in diameter in its present spheroid form, but capable of assuming any shape that would be useful. It had an envelope of tough, transparent matter, and was filled with a fluid that was now cloudy and then clear. Near the center there was a mass of darker matter, and this was undoubtedly the seat of its intelligence.

The Earth man recoiled in horror! A single cell with a brain! It was unthinkable. It was a biological nightmare. Never before had he seen one--had, in fact, dismissed the stories of the Inranian natives as a bit of primitive superstition, had laughed at these gentle, stupid amphibians with whom he traded when they, in their imperfect language, tried to tell him of it.

They had called it the Ul-lul. Well, let it be so. It was an amoeba, and it was watching him. It floated in the downpour and watched him. With what? It had no eyes. No matter, it was watching him. And then it suddenly flowed outward until it became a disc rocking on the waves. Again its fluid form changed, and by a series of elongations and contractions it flowed through the water at an incredible speed. It came straight for the window, struck the thick, unbreakable glass with a shock that could be felt by the men inside. It flowed over the glass and over the building. It was trying to eat them, building and all! The part of its body over the port became so thin that it was almost invisible. At last, its absolute limit reached, it dropped away, baffled, vanishing amid the glare of the lightning and the frothing waters like the shadows of a nightmare.

* * * * *

The heat was intolerable and the air was bad.

"Haw, we have to open vent'lator, Boss!" gasped the Martian.

Forepaugh nodded grimly. It wouldn't do to smother either. Though to open the ventilator would be to invite another invasion by the black mold, not to mention the amoebae and other fabulous monsters that had up to now been kept at a safe distance by the repeller zone, a simple adaptation of a very old discovery. A zone of mechanical vibrations, of a frequency of 500,000 cycles per second, was created by a large quartz crystal in the water, which was electrically operated. Without power, the protective zone had vanished.

"We watch?" asked Gunga.

"You bet we watch. Every minute of the 'day' and 'night.'"

He examined the two chronometers, assuring himself that they were well wound, and congratulated himself that they were not dependent on the defunct power plant for energy. They were his only means of measuring the passage of time. The sun, which theoretically would seem to travel round and round the horizon, rarely succeeded in making its exact location known, but appeared to shift strangely from side to side at the whim of the fog and water.

"Th' fellas," Gunga remarked, coming out of a study. "Why not come?" He referred to the Inranians.

"Probably know something's wrong. They can tell the quartz oscillator is stopped. Afraid of the Ul-lul, I suppose."

"'Squeer," demurred the Martian. "Ul-lul not bother fellas."

"You mean it doesn't follow them into the underbrush. But it would find tough going there. Not enough water; trees there, four hundred feet high with thorny roots and rough bark--they wouldn't like that. Oh no, these natives ought to be pretty snug in their dens. Why, they're as hard to catch as a muskrat! Don't know what a muskrat is, huh? Well, it's the same as the Inranians, only different, and not so ugly."

* * * * *

For the next six days they existed in their straitened quarters, one guarding while the other slept, but such alarms as they experienced were of a minor nature, easily disposed of by their flash pistol. It had not been intended for continuous service, and under the frequent drains it showed an alarming loss of power. Forepaugh repeatedly warned Gunga to be more sparing in its use, but that worthy persisted in his practice of using it against every trifling invasion of the poisonous Inranian cave moss that threatened them, or the warm, soggy water-spiders that hopefully explored the ventilator shaft in search of living food.

"Bash 'em with a broom, or something! Never mind if it isn't nice. Save our flash gun for something bigger."

Gunga only looked distressed.

On the seventh day their position became untenable. Some kind of sea creature, hidden under the ever-replenished storm waters, had found the concrete emplacements of their trading post to its liking. Just how it was done was never learned. It is doubtful that the creatures could gnaw away the solid stone--more likely the process was chemical, but none the less it was effective. The foundations crumbled; the metal shell subsided, rolled half over so that silty water leaked in through the straining seams, and threatened at any moment to be buffeted and urged away on the surface of the flood toward that distant vast sea which covers nine-tenths of the area of Inra.

"Time to mush for the mountains," Forepaugh decided.

Gunga grinned. The Mountains of Perdition were, to his point of view, the only part of Inra even remotely inhabitable. They were sometimes fairly cool, and though perpetually pelted with rain, blazing with lightning and reverberating with thunder, they had caves that were fairly dry and too cool for the black mold. Sometimes, under favorable circumstances on their rugged peaks, one could get the full benefit of the enormous hot sun for whose actinic rays the Martian's starved system yearned.

"Better pack a few cans of the food tablets," the white man ordered. "Take a couple of waterproof sleeping bags for us, and a few hundred fire pellets. You can have the flash pistol; it may have a few more charges in it."

* * * * *

Forepaugh broke the glass case marked "Emergency Only" and removed two more flash pistols. Well he knew that he would need them after passing beyond the trading area--perhaps sooner. His eyes fell on his personal chest, and he opened it for a brief examination. None of the contents seemed of any value, and he was about to pass when he dragged out a long, heavy, .45 caliber six-shooter in a holster, and a cartridge belt filled with shells. The Martian stared.

"Know what it is?" his master asked, handing him the weapon.

"Gunga not know." He took it and examined it curiously. It was a fine museum piece in an excellent state of preservation, the metal overlaid with the patina of age, but free from rust and corrosion.

"It's a weapon of the Ancients," Forepaugh explained. "It was a sort of family heirloom and is over 300 years old. One of my grandfathers used it in the famous Northwest Mounted Police. Wonder if it'll still shoot."

He leveled the weapon at a fat, sightless wriggler that came squirming through a seam, squinting unaccustomed eyes along the barrel. There was a violent explosion, and the wriggler disappeared in a smear of dirty green. Gunga nearly fell over backward in fright, and even Forepaugh was shaken. He was surprised that the ancient cartridge had exploded at all, though he knew powder making had reached a high level of perfection before explosive chemical weapons had yielded to the newer, lighter, and infinitely more powerful ray weapons. The gun would impede their progress. It would be of very little use against the giant Carnivora of Inra. Yet something--perhaps a sentimental attachment, perhaps what his ancestors would have called a "hunch"--compelled him to strap it around his waist. He carefully packed a few essentials in his knapsack, together with one chronometer and a tiny gyroscopic compass. So equipped, they could travel with a fair degree of precision toward the mountains some hundred miles on the other side of a steaming forest, a-crawl with feral life, and hot with blood-lust.

* * * * *

Man and master descended into the warm waters and, without a backward glance, left the trading post to its fate. There was not even any use in leaving a note. Their relief ship, soon due, would never find the station without radio direction.

The current was strong, but the water gradually became shallower as they ascended the sloping rock. After half an hour they saw ahead of them the loom of the forest, and with some trepidation they entered the gloom cast by the towering, fernlike trees, whose tops disappeared in murky fog. Tangled vines impeded their progress. Quagmires lay in wait for them, and tough weeds tripped them, sometimes throwing one or another into the mud among squirming small reptiles that lashed at them with spiked, poisonous feet and then fell to pieces, each piece to lie in the bubbling ooze until it grew again into a whole animal.

Several times they almost walked under the bodies of great, spheroidal creatures with massive short legs, whose tremendously long, sinuous necks disappeared in the leafy murk above, swaying gently like long-stalked lilies in a terrestial pond. These were azornacks, mild-tempered vegetarians whose only defense lay in their thick, blubbery hides. Filled with parasites, stinking and rancid, their decaying covering of fat effectively concealed the tender flesh underneath, protecting them from fangs and rending claws.

Deeper in the forest the battering of the rain was mitigated. Giant neo-palm leaves formed a roof that shut out not only most of the weak daylight, but also the fury of the downpour. The water collected in cataracts, ran down the boles of the trees, and roared through the semi-circular canals of the snake trees, so named by early explorers for their waving, rubbery tentacles, multiplied a millionfold, that performed the duties of leaves. Water gurgled and chuckled everywhere, spread in vast dim ponds and lakes writhing with tormented roots, up-heaved by unseen, uncatalogued leviathans, rippled by translucent discs of loathsome, luminescent jelly that quivered from place to place in pursuit of microscopic prey.

Yet the impression was one of calm and quiet, and the waifs from other worlds felt a surcease of nervous tension. Unconsciously they relaxed. Taking their bearings, they changed their course slightly for the nesting place of the nearest tribe of Inranians where they hoped to get food and at least partial shelter; for their food tablets had mysteriously turned to an unpleasant viscous liquid, and their sleeping bags were alive with giant bacteria easily visible to the eye.

* * * * *

They were doomed to disappointment. After nearly twelve hours of desperate struggling through the morass, through gloomy aisles, and countless narrow escapes from prowling beasts of prey in which only the speed and tremendous power of their flash pistols saved them from instant death, they reached a rocky outcropping which led to the comparatively dry rise of land on which a

tribe of Inranians made its home. Their faces were covered with welts made by the hanging filaments of blood-sucking trees as fine as spider webs, and their senses reeled with the oppressive stench of the abysmal jungle. If the pampered ladies of the Inner Planets only knew where their thousand-dollar orchids sprang from!

Converging runways showed the opening of one of the underground dens, almost hidden from view by a bewildering maze of roots, rendered more formidable by long, sharp stakes made from the iron-hard thigh-bones of the flying kabo.

Forepaugh cupped his hands over his mouth and gave the call.

"Ouf! Ouf! Ouf! Ouf! Ouf!"

He repeated it over and over, the jungle giving back his voice in a muffled echo, while Gunga held a spare flash pistol and kept a sharp lookout for a carnivore intent on getting an unwary Inranian.

There was no answer. These timid creatures, who are often rated the most intelligent life native to primitive Inra, had sensed disaster and had fled.

Forepaugh and Gunga slept in one of the foul, poorly ventilated dens, ate of the hard, woody tubers that had not been worth taking along, and wished they had a certain stock clerk at that place at that time. They were awakened out of deep slumber by the threshing of an evil looking creature which had become entangled among the sharpened spikes. Its tremendous maw, splitting it almost in half, was opened in roars of pain that showed great yellow fangs eight inches in length. Its heavy flippers battered the stout roots and lacerated themselves in the beast's insensate rage. It was quickly dispatched with a flash pistol and Gunga cooked himself some of the meat, using a fire pellet; but despite his hunger Forepaugh did not dare eat any of it, knowing that this species, strange to him, might easily be one of the many on Inra that are poisonous to terrestials.

* * * * *

They resumed their march toward the distant invisible mountains, and were fortunate in finding somewhat better footing than they had on their previous march. They covered about 25 miles on that "day," without untoward incident. Their ray pistols gave them an insuperable advantage over the largest and most ferocious beasts they could expect to meet, so that they became more and more confident, despite the knowledge that they were rapidly using up the energy stored in their weapons. The first one had long ago been discarded, and the charge indicators of the other two were approaching zero at a disquieting rate. Forepaugh took them both, and from that time on he was careful never to waste a discharge except in case of a direct and unavoidable attack. This often entailed long waits or stealthy detours through sucking mud, and came near to ending both their lives.

The Earth man was in the lead when it happened. Seeking an uncertain footing through a tangle of low-growing, thick, ghastly white vegetation, he placed a foot on what seemed to be a broad, flat rock projecting slightly above the ooze. Instantly there was a violent upheaval of mud; the seeming rock flew up like a trap-door, disclosing a cavernous mouth some seven feet across, and a thick, triangular tentacle flew up from its concealment in the mud in a vicious arc. Forepaugh leaped back barely in time to escape being swept in and engulfed. The end of the tentacle struck him a heavy blow on the chest, throwing him back with such force as to bowl Gunga over, and whirling the pistols out of his hands into a slimy, bulbous growth nearby, where they stuck in the phosphorescent cavities the force of their impact had made.

* * * * *

There was no time to recover the weapons. With a bellow of rage the beast was out of its bed and rushing at them. Nothing stayed its progress. Tough, heavily scaled trees thicker than a man's body shuddered and fell as its bulk brushed by them. But it was momentarily confused, and its first rush carried it past its dodging quarry. This momentary respite saved their lives.

Rearing its plumed head to awesome heights, its knobby bark running with brown rivulets of water, a giant tree, even for that world of giants, offered refuge. The men scrambled up the rough trunk easily, finding plenty of hand and footholds. They came to rest on one of the shelflike circumvoluting rings, some twenty-five feet above the ground. Soon the blunt brown tentacles slithered in search of them, but failed to reach their refuge by inches.

And now began the most terrible siege that interlopers in that primitive world can endure. From that cavernous, distended throat came a tremendous, world-shaking noise.

"HOOM! HOOM! HOOM! HOOM! HOOM! HOOM!"

Forepaugh put his hand to his head. It made him dizzy. He had not believed that such noise could be. He knew that no creature could long live amidst it. He tore strips from his shredded clothing and stuffed his ears, but felt no relief.

"HOOM! HOOM! HOOM! HOOM! HOOM!"

It throbbed in his brain.

Gunga lay a-sprawl, staring with fascinated eye into the pulsating scarlet gullet that was blasting the world with sound. Slowly, slowly he was slipping. His master hauled him back. The Martian grinned at him stupidly, slid again to the edge.

Once more Forepaugh pulled him back. The Martian seemed to acquiesce. His single eye closed to a mere slit. He moved to a position between Forepaugh and the tree trunk, braced his feet.

"No you don't!" The Earth man laughed uproariously. The din was making him light-headed. It was so funny! Just in time he had caught that cunning expression and prepared for the outlashing of feet designed to plunge him into the red cavern below and to stop that hellish racket.

"And now--"

He swung his fist heavily, slamming the Martian against the tree. The red eye closed wearily. He was unconscious, and lucky.

Hungrily the Earth man stared at his distant flash pistols, plainly visible in the luminescence of their fungus bedding. He began a slow, cautious creep along the top of a vine some eight inches thick. If he could reach them....

* * * * *

Crash! He was almost knocked to the ground by the thud of a frantic tentacle against the vine. His movement had been seen. Again the tentacle struck with crushing force. The great vine swayed. He managed to reach the shelf again in the very nick of time.

"HOOM! HOOM! HOOM! HOOM! HOOM!"

A bolt of lightning struck a giant fern some distance away. The crash of thunder was hardly noticeable. Forepaugh wondered if his tree would be struck. Perhaps it might even start a fire, giving him a flaming brand with which to torment his tormentor. Vain hope! The wood was saturated with moisture. Even the fire pellets could not make it burn.

"HOOM! HOOM! HOOM! HOOM! HOOM! HOOM! HOOM!"

The six-shooter! He had forgotten it. He jerked it from its holster and pointed it at the red throat, emptied all the chambers. He saw the flash of yellow flame, felt the recoil, but the sound of the discharges was drowned in the Brobdignagian tumult. He drew back his arm to throw the useless toy from him. But again that unexplainable, senseless "hunch" restrained him. He reloaded the gun and returned it to its holster.

"HOOM! HOOM! HOOM! HOOM! HOOM! HOOM!"

A thought had been struggling to reach his consciousness against the pressure of the unbearable noise. The fire pellets! Couldn't they be used in some way? These small chemical spheres, no larger than the end of his little finger, had long ago supplanted actual fire along the frontiers, where electricity was not available for cooking. In contact with moisture they emitted terrific heat, a radiant heat which penetrated meat, bone, and even metal. One such pellet would cook a meal in ten minutes, with no sign of scorching or burning. And they had several hundred in one of the standard moisture-proof containers.

* * * * *

As fast as his fingers could work the trigger of the dispenser Forepaugh dropped the potent little pellets down the bellowing throat. He managed to release about thirty before the bellowing stopped. A veritable tornado of energy broke loose at the foot of the tree. The giant maw was closed, and the shocking silence was broken only by the thrashing of a giant body in its death agonies. The radiant heat, penetrating through and through the beast's body, withered nearby vegetation and could be easily felt on the perch up the tree.

Gunga was slowly recovering. His iron constitution helped him to rally from the powerful blow he had received, and by the time the jungle was still he was sitting up mumbling apologies.

"Never mind," said his master. "Shin down there and cut us off a good helping of roast tongue, if it has a tongue, before something else comes along and beats us out of a feast."

"Him poison, maybe," Gunga demurred. They had killed a specimen new to zoologists.

"Might as well die of poison as starvation," Forepaugh countered.

Without more ado the Martian descended, cut out some large, juicy chunks as his fancy dictated, and brought his loot back up the tree. The meat was delicious and apparently wholesome. They gorged themselves and threw away what they could not eat, for food spoils very quickly in the Inranian jungles and uneaten meat would only serve to attract hordes of the gauzy-winged, glutinous Inranian swamp flies. As they sank into slumber they could hear the beginning of a bedlam of snarling and fighting as the lesser Carnivora fed on the body of the fallen giant.

When they awoke the chronometer recorded the passing of twelve hours, and they had to tear a network of strong fibers with which the tree had invested them preparatory to absorbing their bodies as food. For so keen is the competition for life on Inra that practically all vegetation is capable of absorbing animal food directly. Many an Inranian explorer can tell tales of narrow escapes from some of the more specialized flesh-eating plants; but they are now so well known that they are easily avoided.

* * * * *

A clean-picked framework of crushed and broken giant bones was all that was left of the late bellowing monster. Six-legged water dogs were polishing them hopefully, or delving into them with their long, sinuous snouts for the marrow. The Earth man fired a few shots with his six-shooter, and they scattered, dragging the bodies of their fallen companions to a safe distance to be eaten.

Only one of the flash pistols was in working order. The other had been trampled by heavy hoofs and was useless. A heavy handicap under which to traverse fifty miles of abysmal jungle. They started with nothing for breakfast except water, of which they had plenty.

Fortunately the outcroppings of rocks and gravel washes were becoming more and more frequent, and they were able to travel at much better speed. As they left the low-lying jungle land they entered a zone which was faintly reminiscent of a terrestial jungle. It was still hot, soggy, and fetid, but gradually the most primitive aspects of the scene were modified. The over-arching trees were less closely packed, and they came across occasional rock clearings which were bare of vegetation except for a dense carpet of brown, lichenlike vegetation that secreted an astonishing amount of juice. They slipped and sloshed through this, rousing swarms of odd, toothed birds, which darted angrily around their heads and slashed at them with the razor-sharp saw edges on the back of their legs. Annoying as they were, they could be kept away with branches torn from trees, and their presence connoted an absence of the deadly jungle flesh-eaters, permitting a temporary relaxation of vigilance and saving the resources of the last flash gun.

They camped that "night" on the edge of one of these rock clearings. For the first time in weeks it had stopped raining, although the sun was still obscured. Dimly on the horizon could be seen the first of the foothills. Here they gathered some of the giant, oblong fungus that early explorers had taken for blocks of porous stone because of their size and weight, and, by dint of the plentiful application of fire pellets, managed to set it ablaze. The heat added nothing to their comfort, but it dried them out and allowed them to sleep unmolested.

* * * * *

An unwary winged eel served as their breakfast, and soon they were on their way to those beckoning hills. It had started to rain again, but the worst part of their journey was over. If they could reach the top of one of the mountains there was a good chance that they would be seen and rescued by their relief ship, provided they did not starve first. The flyer would use the mountains as a base from which to search for the trading station, and it was conceivable that the skipper might actually have anticipated their desperate adventure and would look for them in the Mountains of Perdition.

They had crossed several ranges of the foothills and were beginning to congratulate themselves when the diffused light from above was suddenly blotted out. It was raining again, and above the echo-augmented thunder they heard a shrill screeching.

"A web serpent!" Gunga cried, throwing himself flat on the ground.

Forepaugh eased into a rock cleft at his side. Just in time. A great grotesque head bore down upon him, many-fanged as a medieval dragon. Between obsidian eyes was a fissure whence emanated a wailing and a foul odor. Hundreds of short, clawed legs slithered on the rocks under a long sinuous body. Then it seemed to leap into the air again. Webs grew taut between the legs, strumming as they caught a strong uphill wind. Again it turned to the attack, and missed them. This time Forepaugh was ready for it. He shot at it with his flash pistol.

* * * * *

Nothing happened. The fog made accurate shooting impossible, and the gun lacked its former power. The web serpent continued to course back and forth over their heads.

"Guess we'd better run for it," Forepaugh murmured.

"Go 'head!"

They cautiously left their places of concealment. Instantly the serpent was down again, persistent if inaccurate. It struck the place of their first concealment and missed them.

"Run!"

They extended their weary muscles to the utmost, but it was soon apparent that they could not escape long. A rock wall in their path saved them.

"Hole!" the Martian gasped.

Forepaugh followed him into the rocky cleft. There was a strong draft of dry air, and it would have been next to impossible to hold the Martian back, so Forepaugh allowed him to lead on toward the source of the draft. As long as it led into the mountains he didn't care.

The natural passageway was untenanted. Evidently its coolness and dryness made it untenable for most of Inra's humidity and heat loving life. Yet the floor was so smooth that it must have been artificially leveled. Faint illumination was provided by the rocks themselves. They appeared to be covered by some microscopic phosphorescent vegetation.

After hundreds of twists and turns and interminable straight galleries the cleft turned more sharply upward, and they had a period of stiff climbing. They must have gone several miles and climbed at least 20,000 feet. The air became noticeably thin, which only exhilarated Gunga, but slowed the Earth man down. But at last they came to the end of the cleft. They could go no further, but above them, at least 500 feet higher, they saw a round patch of sky, miraculously bright blue sky!

"A pipe!" Forepaugh cried.

He had often heard of these mysterious, almost fabulous structures sometimes reported by passing travelers. Straight and true, smooth as glass and apparently immune to the elements, they had been occasionally seen standing on the very tops of the highest mountains--seen for a few moments only before they were hidden again by the clouds. Were they observatories of some ancient race, placed thus to pierce the mysteries of outer space? They would find out.

* * * * *

The inside of the pipe had zigzagging rings of metal, conveniently spaced for easy climbing. With Gunga leading, they soon reached the top. But not quite.

"Eh?" said Forepaugh.

"Uh?" said Gunga.

There had not been a sound, but a distinct, definite command had registered on their minds.

"Stop!"

They tried to climb higher, but could not unclasp their hands. They tried to descend, but could not lower their feet.

The light was by now relatively bright, and as by command their eyes sought the opposite wall. What they saw gave their jaded nerves an unpleasant thrill--a mass of doughy matter of a blue-green color about three feet in diameter, with something that resembled a cyst filled with transparent liquid near its center.

And this thing began to flow along the rods, much as tar flows. From the mass extended a pseudopod; touched Gunga on the arm. Instantly the arm was raw and bleeding. Terrified, immovable, he writhed in agony. The pseudopod returned to the main mass, disappearing into its interior with the strip of bloody skin.

Its attention was centered so much on the luckless Martian that its control slipped from Forepaugh. Seizing his flash pistol, he set the localized for a small area and aimed it at the thing, intent on burning it into nothingness. But again his hand was stayed. Against the utmost of his will-power his fingers opened, letting the pistol drop. The liquid in the cyst danced and bubbled. Was it laughing at him? It had read his mind--thwarted his will again.

Again a pseudopod stretched out and a strip of raw, red flesh adhered to it and was consumed. Mad rage convulsed the Earth man. Should he throw himself tooth and nail on the monster? And be engulfed?

He thought of the six-shooter. It thrilled him.

But wouldn't it make him drop that too?

* * * * *

A flash of atavistic cunning came to him.

He began to reiterate in his mind a certain thought.

"This thing is so I can see you better--this thing is so I can see you better."

He said it over and over, with all the passion and devotion of a celibate's prayer over a uranium fountain.

"This thing is harmless--but it will make me see you better!"

Slowly he drew the six-shooter. In some occult way he knew it was watching him.

"Oh, this is harmless! This is an instrument to aid my weak eyes! It will help me realize your mastery! This will enable me to know your true greatness. This will enable me to know you as a god."

Was it complacence or suspicion that stirred the liquid in the cyst so smoothly? Was it susceptible to flattery? He sighted along the barrel.

"In another moment your great intelligence will overwhelm me," proclaimed his surface mind desperately, while the subconscious tensed the trigger. And at that the clear liquid burst into a turmoil of alarm. Too late. Forepaugh went limp, but not before he had loosed a steel-jacketed bullet that shattered the mind cyst of the pipe denizen. A horrible pain coursed through his every fibre and nerve. He was safe in the arms of Gunga, being carried to the top of the pipe to the clean dry air, and the blessed, blistering sun.

The pipe denizen was dying. A viscous, inert mass, it dropped lower and lower, lost contact at last, shattered into slime at the bottom.

* * * * *

Miraculous sun! For a luxurious fifteen minutes they roasted there on the top of the pipe, the only solid thing in a sea of clouds as far as the eye could reach. But no! That was a circular spot against the brilliant white of the clouds, and it was rapidly coming closer. In a few minutes it resolved itself into the _Comet_, fast relief ship of the Terrestial, Inranian, Genidian, and Zydian Lines, Inc. With a low buzz of her repulsion motors she drew alongside. Hooks were attached and ports opened. A petty officer and a crew of roustabouts made her fast.

"What the hell's going on here?" asked the cocky little terrestial who was skipper, stepping out and surveying the castaways. "We've been looking for you ever since your directional wave failed. But come on in--come on in!"

He led the way to his stateroom, while the ship's surgeon took Gunga in charge. Closing the door carefully, he delved into the bottom of his locker and brought out a flask.

"Can't be too careful," he remarked, filling a small tumbler for himself and another for his guest. "Always apt to be some snooper to report me. But say--you're wanted in the radio room."

"Radio room nothing! When do we eat?"

"Right away, but you'd better see him. Fellow from the Interplanetary News Agency wants you to broadcast a copyrighted story. Good for about three years' salary, old boy."

"All right. I'll see him"--with a happy sigh--"just as soon as I put through a personal message."

The Lord of Space

By Victor Rousseau

[Illustration]

[Sidenote: A Black Caesar had arisen on Eros--and all Earth trembled at his distant menace.]

"On the day of the next full moon every living thing on earth will be wiped out of existence--unless you succeed in your mission, Lee."

Nathaniel Lee looked into the face of Silas Stark, President of the United States of the World, and nodded grimly. "I'll do my best, Sir," he answered.

"You have the facts. We know who this self-styled Black Caesar is, who has declared war upon humanity. He is a Dane named Axelson, whose father, condemned to life imprisonment for resisting the new world-order, succeeded in obtaining possession of an interplanetary liner.

"He filled it with the gang of desperate men who had been associated with him in his successful escape from the penitentiary. Together they sailed into Space. They disappeared. It was supposed that they had somehow met their death in the ether, beyond the range of human ken.

"Thirty years passed, and then this son of Axelson, born, according to his own story, of a woman whom the father had persuaded to accompany him into Space, began to radio us. We thought at first it was some practical joker who was cutting in.

[Illustration: _It was like struggling with some vampire creatures in a hideous dream._]

"When our electricians demonstrated beyond doubt that the voice came from outer space, it was supposed that some one in our Moon Colony had acquired a transmitting machine. Then the ships we sent to the Moon Colony for gold failed to return. As you know, for seven weeks there has been no communication with the Moon. And at the last full moon the--blow--fell.

"The world depends upon you, Lee. The invisible rays that destroyed every living thing from China to Australia--one-fifth of the human race--will fall upon the eastern seaboard of America when the moon is full again. That has been the gist of Axelson's repeated communications.

"We shall look to you to return, either with the arch-enemy of the human race as your prisoner, or with the good news that mankind has been set free from the menace that overhangs it.

"God bless you, my boy!" The President of the United States of the World gripped Nat's hand and stepped down the ladder that led from the landing-stage of the great interplanetary space-ship.

* * * * *

The immense landing-field reserved for the ships of the Interplanetary Line was situated a thousand feet above the heart of New York City, in Westchester County. It was a flat space set on the top of five great towers, strewn with electrified sand, whose glow

had the property of dispersing the sea fogs. There, at rest upon what resembled nothing so much as iron claws, the long gray shape of the vacuum flyer bulked.

Nat sneezed as he watched the operations of his men, for the common cold, or coryza, seemed likely to be the last of the germ diseases that would yield to medical science, and he had caught a bad one in the Capitol, while listening to the debate in the Senate upon the threat to humanity. And it was cold on the landing-stage, in contrast to the perpetual summer of the glass-roofed city below.

But Nat forgot the cold as he watched the preparations for the ship's departure. Neon and nitrogen gas were being pumped under pressure into the outer shell, where a minute charge of leucon, the newly discovered element that helped to counteract gravitation, combined with them to provide the power that would lift the vessel above the regions of the stratosphere.

In the low roof-buildings that surrounded the stage was a scene of tremendous activity. The selenium discs were flashing signals, and the radio receivers were shouting the late news; on the great power boards dials and light signals stood out in the glow of the amylite tubes. On a rotary stage a thousand feet above the ship a giant searchlight, visible for a thousand miles, moved its shaft of dazzling luminosity across the heavens.

Now the spar-aluminite outer skin of the ship grew bright with the red neon glare. Another ship, from China, dropped slowly to its stage near by, and the unloaders swarmed about the pneumatic tubes to receive the mail. The teleradio was shouting news of a failure of the Manchurian wheat crop. Nat's chief officer, a short cockney named Brent, came up to him.

"Ready to start, Sir," he said.

* * * * *

Nat turned to him. "Your orders are clear?"

"Yes, Sir."

"Send Benson here."

"I'm here, Sir." Benson, the ray-gunner in charge of the battery that comprised the vessel's armament, a lean Yankee from Connecticut, stepped forward.

"You know your orders, Benson? Axelson has seized the Moon and the gold-mines there. He's planning to obliterate the Earth. We've got to go in like mad dogs and shoot to kill. No matter if we kill every living thing there, even our own people who are inmates of the Moon's penal settlement, we've got to account for Axelson."

"Yes, Sir."

"We can't guess how he got those gold-ships that returned with neon and argon for the Moon colonists. But he mustn't get us. Let the men understand that. That's all."

"Very good, Sir."

The teleradio suddenly began to splutter: A-A-A, it called. And instantly every sound ceased about the landing-stage. For that was the call of Axelson, somewhere upon the Moon.

"Axelson speaking. At the next full moon all the American Province of the World Federation will be annihilated, as the Chinese Province was at the last. There's no hope for you, good people. Send out your vacuum liners. I can use a few more of them. Within six months your world will be depopulated, unless you flash me the signal of surrender."

Would the proud old Earth have to come to that? Daily those ominous threats had been repeated, until popular fears had become frenzy. And Nat was being sent out as a last hope. If he failed, there would be nothing but surrender to this man, armed with a super-force that enabled him to lay waste the Earth from the Moon.

Within one hour, those invisible, death-dealing rays had destroyed everything that inhaled oxygen and exhaled carbon. The ray with which the liner was equipped was a mere toy in comparison. It would kill at no more than 500 miles, and its action was quite different.

As a prelude to Earth's surrender, Axelson demanded that World President Stark and a score of other dignitaries should depart for the Moon as hostages. Every ray fortress in the world was to be dismantled, every treasury was to send its gold to be piled up in a great pyramid on the New York landing-stage. The Earth was to acknowledge Axelson as its supreme master.

* * * * *

The iron claws were turning with a screwlike motion, extending themselves, and slowly raising the interplanetary vessel until she looked like a great metal fish with metal legs ending with suckerlike disks. But already she was floating free as the softly purring engines held her in equipoise. Nat climbed the short ladder that led to her deck. Brent came up to him again.

"That teleradio message from Axelson--" he began.

"Yes?" Nat snapped out.

"I don't believe it came from the Moon at all."

"You don't? You think it's somebody playing a hoax on Earth? You think that wiping out of China was just an Earth-joke?"

"No, Sir." Brent stood steady under his superior's sarcasm. "But I was chief teleradio operator at Greenwich before being promoted to the Province of America. And what they don't know at Greenwich they don't know anywhere."

Brent spoke with that self-assurance of the born cockney that even the centuries had failed to remove, though they had removed the cockney accent.

"Well, Brent?"

"I was with the chief electrician in the receiving station when Axelson was radioing last week. And I noticed that the waves of sound were under a slight Doppler effect. With the immense magnification necessary for transmitting from the Moon, such deflection might be construed as a mere fan-like extension. But there was ten times the magnification one would expect from the Moon; and I calculated that those sound-waves were shifted somewhere."

"Then what's your theory, Brent?"

"Those sounds come from another planet. Somewhere on the Moon there's an intercepting and re-transmitting plant. Axelson is deflecting his rays to give the impression that he's on the Moon, and to lure our ships there."

"What do you advise?" asked Nat.

"I don't know, Sir."

"Neither do I. Set your course Moonward, and tell Mr. Benson to keep his eyes peeled."

* * * * *

The Moon Colony, discovered in 1976, when Kramer, of Baltimore, first proved the practicability of mixing neon with the inert new gas, leucon, and so conquering gravitation, had proved to be just what it had been suspected of being--a desiccated, airless desolation. Nevertheless, within the depths of the craters a certain amount of the Moon's ancient atmosphere still lingered, sufficient to sustain life for the queer troglodytes, with enormous lung-boxes, who survived there, browsing like beasts upon the stunted, aloe-like vegetation.

Half man, half ape, and very much unlike either, these vestiges of a species on a ruined globe had proved tractable and amenable to discipline. They had become the laborers of the convict settlement that had sprung up on the Moon.

Thither all those who had opposed the establishment of the World Federation, together with all persons convicted for the fourth time of a felony, had been transported, to superintend the efforts of these dumb, unhuman Moon dwellers. For it had been discovered that the Moon craters were extraordinarily rich in gold, and gold was still the medium of exchange on Earth.

To supplement the vestigial atmosphere, huge stations had been set up, which extracted the oxygen from the subterranean waters five miles below the Moon's crust, and recombined it with the nitrogen with which the surface layer was impregnated, thus creating an atmosphere which was pumped to the workers.

Then a curious discovery had been made. It was impossible for human beings to exist without the addition of those elements existing in the air in minute quantities--neon, krypton, and argon. And the ships that brought the gold bars back from the Moon had conveyed these gaseous elements there.

* * * * *

The droning of the sixteen atomic motors grew louder, and mingled with the hum of gyroscopes. The ladder was drawn up and the port hole sealed. On the enclosed bridge Nat threw the switch of durobronze that released the non-conducting shutter which gave play to the sixteen great magnets. Swiftly the great ship shot forward into the air. The droning of the motors became a shrill whine, and then, growing too shrill for human ears to follow it, gave place to silence.

Nat set the speed lever to five hundred miles an hour, the utmost that had been found possible in passing through the earth's atmosphere, owing to the resistance, which tended to heat the vessel and damage the delicate atomic engines. As soon as the ether was reached, the speed would be increased to ten or twelve thousand. That meant a twenty-two hour run to the Moon Colony--about the time usually taken.

He pressed a lever, which set bells ringing in all parts of the ship. By means of a complicated mechanism, the air was exhausted from each compartment in turn, and then replaced, and as the bells rang, the men at work trooped out of these compartments consecutively. This had been originated for the purpose of destroying any life dangerous to man that might unwittingly have been imported from the Moon, but on one occasion it had resulted in the discovery of a stowaway.

Then Nat descended the bridge to the upper deck. Here, on a platform, were the two batteries of three ray-guns apiece, mounted on swivels, and firing in any direction on the port and starboard sides respectively. The guns were enclosed in a thin sheath of osmium, through which the lethal rays penetrated unchanged; about them, thick shields of lead protected the gunners.

He talked with Benson for a while. "Don't let Axelson get the jump on you," he said. "Be on the alert every moment." The gunners, keen-looking men, graduates from the Annapolis gunnery school, grinned and nodded. They were proud of their trade and its traditions; Nat felt that the vessel was safe in their hands.

The chief mate appeared at the head of the companion, accompanied by a girl. "Stowaway, Sir," he reported laconically. "She tumbled out of the repair shop annex when we let out the air!"

* * * * *

Nat stared at her in consternation, and the girl stared back at him. She was a very pretty girl, hardly more than twenty-two or three, attired in a businesslike costume consisting of a leather jacket, knickers, and the black spiral puttees that had come into style in the past decade. She came forward unabashed.

"Well, who are you?" snapped Nat.

"Madge Dawes, of the Universal News Syndicate," she answered, laughing.

"The devil!" muttered Nat. "You people think you run the World Federation since you got President Stark elected."

"We certainly do," replied the girl, still laughing.

"Well, you don't run this ship," said Nat. "How would you like a long parachute drop back to Earth?"

"Don't be foolish, my dear man," said Madge. "Don't you know you'll get wrinkles if you scowl like that? Smile! Ah, that's better. Now, honestly, Cap we just had to get the jump on everybody else in interviewing Axelson. It means such a lot to me."

Pouts succeeded smiles. "You're not going to be cross about it, are you?" she pleaded.

"Do you realize the risk you're running, young woman?" Nat demanded. "Are you aware that our chances of ever getting back to Earth are smaller than you ought to have dreamed of taking?"

"Oh, that's all right," the girl responded. "And now that we're friends again, would you mind asking the steward to get me something to eat? I've been cooped up in that room downstairs for fifteen hours, and I'm simply starving."

Nat shrugged his shoulders hopelessly. He turned to the chief mate. "Take Miss Dawes down to the saloon and see that Wang Ling supplies her with a good meal," he ordered. "And put her in the Admiral's cabin. That good enough for you?" he asked satirically.

"Oh that'll be fine," answered the girl enthusiastically. "And I shall rely on you to keep me posted about everything that's going on. And a little later I'm going to take X-ray photographs of you and all these men." She smiled at the grinning gunners. "That's the new fad, you know, and we're going to offer prizes for the best developed skeletons in the American Province, and pick a King and Queen of Beauty!"

* * * * *

"A radio, Sir!"

Nat, who had snatched a brief interval of sleep, started up as the man on duty handed him the message. The vessel had been constantly in communication with Earth during her voyage, now nearing completion, but the dreaded A-A-A that prefaced this message told Nat that it came from Axelson.

"Congratulations on your attempt," the message ran, "I have watched your career with the greatest interest, Lee, through the medium of such scraps of information as I have been able to pick up on the Moon. When you are my guest to-morrow I shall hope to be able to offer you a high post in the new World Government that I am planning to establish. I need good men. Fraternally, the Black Caesar."

Nat whirled about. Madge Dawes was standing behind him, trying to read the message over his shoulder.

"Spying, eh?" said Nat bitterly.

"My dear man, isn't that my business?"

"Well, read this, then," said Nat, handing her the message. "You're likely to repent this crazy trick of yours before we get much farther."

And he pointed to the cosmic-ray skiagraph of the Moon on the curved glass dome overhead. They were approaching the satellite rapidly. It filled the whole dome, the craters great black hollows, the mountains standing out clearly. Beneath the dome were the radium apparatus that emitted the rays by which the satellite was photographed cinematographically, and the gyroscope steering apparatus by which the ship's course was directed.

Suddenly a buzzer sounded a warning. Nat sprang to the tube.

"Gravitational interference X40, gyroscopic aberrancy one minute 29," he called. "Discharge static electricity from hull. Mr. Benson, stand by."

"What does that mean?" asked Madge.

"It means I shall be obliged if you'll abstain from speaking to the man at the controls," snapped Nat.

"And what's that?" cried Madge in a shriller voice, pointing upward.

* * * * *

Across the patterned surface of the Moon, shown on the skiagraph, a black, cigar-shaped form was passing. It looked like one of the old-fashioned dirigibles, and the speed with which it moved was evident from the fact that it was perceptibly traversing the Moon's surface. Perhaps it was travelling at the rate of fifty thousand miles an hour.

Brent, the chief officer, burst up the companion. His face was livid.

"Black ship approaching us from the Moon, Sir," he stammered. "Benson's training his guns, but it must be twenty thousands miles away."

"Yes, even our ray-guns won't shoot that distance," answered Nat. "Tell Benson to keep his guns trained as well as he can, and open fire at five hundred."

Brent disappeared. Madge and Nat were alone on the bridge. Nat was shouting incomprehensible orders down the tube. He stopped and looked up. The shadow of the approaching ship had crossed the Moon's disk and disappeared.

"Well, young lady, I think your goose is cooked," said Nat. "If I'm not mistaken, that ship is Axelson's, and he's on his way to knock us galley-west. And now oblige me by leaving the bridge."

"I think he's a perfectly delightful character, to judge from that message he sent you," answered Madge, "and--"

Brent appeared again. "Triangulation shows ten thousand miles, Sir," he informed Nat.

"Take control," said Nat. "Keep on the gyroscopic course, allowing for aberrancy, and make for the Crater of Pytho. I'll take command of the guns." He hurried down the companion, with Madge at his heels.

* * * * *

The gunners stood by the ray-guns, three at each. Benson perched on a revolving stool above the batteries. He was watching a periscopic instrument that connected with the bridge dome by means of a tube, a flat mirror in front of him showing all points of the compass. At one edge the shadow of the black ship was creeping slowly forward.

"Eight thousand miles, Sir," he told Nat. "One thousand is our extreme range. And it looks as if she's making for our blind spot overhead."

Nat stepped to the speaking-tube. "Try to ram her," he called up to Brent. "We'll open with all guns, pointing forward."

"Very good, Sir," the Cockney called back.

The black shadow was now nearly in the centre of the mirror. It moved upward, vanished. Suddenly the atomic motors began wheezing again. The wheeze became a whine, a drone.

"We've dropped to two thousand miles an hour, Sir," called Brent.

Nat leaped for the companion. As he reached the top he could hear the teleradio apparatus in the wireless room overhead begin to chatter:

"A-A-A. Don't try to interfere. Am taking you to the Crater of Pytho. Shall renew my offer there. Any resistance will be fatal. Axelson."

And suddenly the droning of the motors became a whine again, then silence. Nat stared at the instrument-board and uttered a cry.

"What's the matter?" demanded Madge.

Nat swung upon her. "The matter?" he bawled. "He's neutralized our engines by some infernal means of his own, and he's towing us to the Moon!"

* * * * *

The huge sphere of the Moon had long since covered the entire dome. The huge Crater of Pytho now filled it, a black hollow fifty miles across, into which they were gradually settling. And, as they settled, the pale Earth light, white as that of the Moon on Earth, showed the gaunt masses of bare rock, on which nothing grew, and the long stalactites of glassy lava that hung from them.

Then out of the depths beneath emerged the shadowy shape of the landing-stage.

"You are about to land," chattered the radio. "Don't try any tricks; they will be useless. Above all, don't try to use your puny ray. You are helpless."

The ship was almost stationary. Little figures could be seen swarming upon the landing-stage, ready to adjust the iron claws to clamp the hull. With a gesture of helplessness, Nat left the bridge and went down to the main deck where, in obedience to his orders, the crew had all assembled.

"Men, I'm putting it up to you," he said. "Axelson, the Black Caesar, advises us not to attempt to use the Ray-guns. I won't order you to. I'll leave the decision with you."

"We tried it fifteen minutes ago, Sir," answered Benson. "I told Larrigan to fire off the stern starboard gun to see if it was in working order, and it wasn't!"

At that moment the vessel settled with a slight jar into the clamps. Once more the teleradio began to scream:

"Open the port hold and file out slowly. Resistance is useless. I should turn my ray upon you and obliterate you immediately. Assemble on the landing-stage and wait for me!"

"You'd best obey," Nat told his men. "We've got a passenger to consider." He glared at Madge as he spoke, and Madge's smile was a little more tremulous than it had been before.

"This is the most thrilling experience of my life, Captain Lee," she said. "And I'll never rest until I've got an X-Ray photograph of Mr. Axelson's skeleton for the Universal News Syndicate."

* * * * *

One by one, Nat last, the crew filed down the ladder onto the landing-stage, gasping and choking in the rarefied air that lay like a blanket at the bottom of the crater. And the reason for this was only too apparent to Nat as soon as he was on the level stage.

Overhead, at an altitude of about a mile, the black ship hung, and from its bow a stupendous searchlight played to and fro over the bottom of the crater, making it as light as day. And where had been the mining machinery, the great buildings that had housed convicts and Moon people, and the huge edifice that contained the pumping station, there was--nothing.

The devilish ray of Axelson had not merely destroyed them, it had obliterated all traces of them, and the crew of the liner were breathing the remnants of the atmosphere that still lay at the bottom of the Crater of Pytho.

But beside the twin landing-stages, constructed by the World Federation, another building arose, with an open front. And that front was a huge mirror, now scintillating under the searchlight from the black ship.

"That's it, Sir!" shouted Brent.

"That's what?" snapped Nat.

"The deflecting mirror I was speaking of. That's what deflected the ray that wiped out China. The ray didn't come from the Moon. And that's the mirror that deflects the teleradio waves, the super-Hertzian rays that carry the sound."

Nat did not answer. Sick at heart at the failure of his mission, he was watching the swarm of Moon men who were at work upon the landing-stage, turning the steel clamps and regulating the mechanism that controlled the apparatus. Dwarfed, apish creature, with tiny limbs, and chests that stood out like barrels, they bustled about, chattering in shrill voices that seemed like the piping of birds.

It was evident that Axelson, though he had wiped out the Moon convicts and the Moon people in the crater, had reserved a number of the latter for personal use.

* * * * *

The black ship was dropping into its position at the second landing-stage, connected with the first by a short bridge. The starboard hold swung open, and a file of shrouded and hooded forms appeared, masked men, breathing in condensed air from receptacles upon their chests, and staring with goggle eyes at their captives. Each one held in his hand a lethal tube containing the ray, and, as if by command, they took up their stations about their prisoners.

Then, at a signal from their leader, they suddenly doffed their masks.

Nat looked at them in astonishment. He had not known whether these would be Earth denizens or inhabitants of some other planet. But they were Earth men. And they were old.

Men of sixty or seventy, years, with long, gray beards and wrinkled faces, and eyes that stared out from beneath penthouses of shaggy eyebrows. Faces on which were imprinted despair and hopelessness.

Then the first man took off his mask and Nat saw a man of different character.

A man in the prime of life, with a mass of jet black hair and a black beard that swept to his waist, a nose like a hawk's, and a pair of dark blue eyes that fixed themselves on Nat's with a look of Luciferian pride.

"Welcome, Nathaniel Lee," said the man, in deep tones that had a curious accent which Nat could not place. "I ought to know your name, since your teleradios on Earth have been shouting it for three days past as that of the man who is to save Earth from the threat of destruction. And you know me!"

"Axelson--the Black Caesar," Nat muttered. For the moment he was taken aback. He had anticipated any sort of person except this man, who stood, looked, and spoke like a Viking, this incarnation of pride and strength.

Axelson smiled--and then his eyes lit upon Madge Dawes. And for a moment he stood as if petrified into a block of massive granite.

"What--who is this?" he growled.

"Why, I'm Madge Dawes, of the Universal News Syndicate," answered the girl, smiling at Axelson in her irrepressible manner. "And I'm sure you're not nearly such a bold, bad pirate as people think, and you're going to let us all go free."

* * * * *

Instantly Axelson seemed to become transformed into a maniac. He turned to the old men and shouted in some incomprehensible language. Nat and Madge, Brent and Benson, and two others who wore the uniforms of officers were seized and dragged across the bridge to the landing-stage where the black ship was moored. The rest of the crew were ordered into a double line.

And then the slaughter began.

Before Nat could even struggle to break away from the gibbering Moon men to whom he and the other prisoners had been consigned, the aged crew of the Black Caesar had begun their work of almost instantaneous destruction.

Streams of red and purple light shot from the ray-pistols that they carried, and before them the crew of the ether-liner simply withered up and vanished. They became mere masses of human débris piled on the landing-stage, and upon these masses, too, the old men turned their implements, until only a few heaps of charred carbon remained on the landing-stage, impalpable as burned paper, and slowly rising in the low atmospheric pressure until they drifted over the crater.

Nat had cried out in horror at the sight, and tried to tear himself free from the grasp of the Moon dwarfs who held him. So had the rest. Never was struggle so futile. Despite their short arms and legs, the Moon dwarfs held them in an unshakable grip, chattering and squealing as they compressed them against their barrel-like chests until the breath was all but crushed out of their bodies.

"Devil!" cried Nat furiously, as Axelson came up to him. "Why don't you kill us, too?" And he hurled furious taunts and abuse at him, in the hope of goading him into making the same comparatively merciless end of his prisoners.

Axelson looked at him calmly, but made no reply. He looked at Madge again, and his features were convulsed with some emotion that gave him the aspect of a fiend. And then only did Nat realize that it was Madge who was responsible for the Black Caesar's madness.

Axelson spoke again, and the prisoners were hustled up the ladder and on board the black vessel.

* * * * *

"The Kommandant-Kommissar will see you!" The door of their prison had opened, letting in a shaft of light, and disclosing one of the graybeards, who stood there, pointing at Nat.

"The--who?" Nat demanded.

"The Kommandant-Kommissar, Comrade Axelson," snarled the graybeard.

Nat knew what that strange jargon meant. He had read books about the political sect known as Socialists who flourished in the Nineteenth and Twentieth Centuries, and, indeed, were even yet not everywhere extinct. And with that a flash of intuition explained the presence of these old men on board.

These were the men who had been imprisoned in their youth, with Axelson's father, and had escaped and made their way into space, and had been supposed dead long since. Somewhere they must have survived.

And here they were, speaking a jargon of past generations, and ignorant that the world had changed, relics of the past, dead as the dead Moon from which the black ship was winging away through the ether.

"Don't go, Captain," pleaded Madge. "Tell him we'll all go together."

Nat shook his head. "Maybe I'll be able to make terms with him," he answered, and stepped out upon the vessel's deck.

The graybeard slammed the door and laughed savagely. "You'll make no terms with the Black Caesar," he said. "This is the reign of the proletariat. The bourgeois must die! So Lenin decreed!"

But he stopped suddenly and passed his hand over his forehead like a man awakening from a dream.

"Surely the proletariat has already triumphed on earth?" he asked. "A long time has passed, and daily we expect the summons to return and establish the new world-order. What year is this? Is it not 2017? It is so hard to reckon on Eros."

"On Eros?" thought Nat. "This is the year 2044," he answered. "You've been dreaming, my friend. We've had our new world-order, and it's not in the least like the one you and your friends anticipated."

"Gott!" screamed the old man. "Gott, you're lying to me, bourgeois! You're lying, I tell you!"

* * * * *

So Eros was their destination! Eros, one of the asteroids, those tiny fragments of a broken planet, lying outside the orbit of Mars. Some of these little worlds, of which more than a thousand are known to exist, are no larger than a gentleman's country estate; some are mere rocks in space. Eros, Nat knew, was distinguished among them from the fact that it had an eccentric orbit, which brought it at times nearer Earth than any other heavenly body except the Moon.

Also that it had only been known for thirty years, and that it was supposed to be a double planet, having a dark companion.

That was in Nat's mind as he ascended the bridge to where Axelson was standing at the controls, with one of the graybeards beside him. The door of his stateroom was open, and suddenly there scuttled out of it one of the most bestial objects Nat had ever seen.

It was a Moon woman, a dwarfish figure, clothed in a shapeless garment of spun cellulose, and in her arms she held a heavy-headed Moon baby, whose huge chest stood up like a pyramid, while the tiny arms and legs hung dangling down.

"Here is the bourgeois, Kommandant," said Nat's captor.

Axelson looked at Nat, eye meeting eye in a slow stare. Then he relinquished the controls to the graybeard beside him, and motioned Nat to precede him into the stateroom.

Nat entered. It was an ordinary room, much like that of the captain of the ether-liner now stranded on the Moon. There were a bunk, chairs, a desk and a radio receiver.

Axelson shut the door. He tried to speak and failed to master his emotion. At last he said:

"I am prepared to offer you terms, Nathaniel Lee, in accordance with my promise."

"I'll make no terms with murderers," replied Nat bitterly.

* * * * *

Axelson stood looking at him. His great chest rose and fell. Suddenly he put out one great hand and clapped Nat on the shoulder.

"Wise men," he said, "recognize facts. Within three weeks I shall be the undisputed ruler of Earth. Whether of a desert or of a cowed and submissive subject-population, rests with the Earth men. I have never been on Earth, for I was born on Eros. My mother died at my birth. I have never seen another human woman until to-day."

Nat looked at him, trying to follow what was in Axelson's mind.

"My father fled to Eros, a little planet seventeen miles in diameter, as we have found. He called it a heavenly paradise. It was his intention to found there a colony of those who were in rebellion against the tyrants of Earth.

"His followers journeyed to the Moon and brought back Moon women for wives. But there were no children of these unions. Later there were dissensions and civil war. Three-fourths of the colony died in battle with one another.

"I was a young man. I seized the reins of power. The survivors--these old men--were disillusioned and docile. I made myself absolute. I brought Moon men and women to Eros to serve us as slaves. But in a few years the last of my father's old compatriots will have died, and thus it was I conceived of conquering Earth and having men to obey me. For fifteen years I have been experimenting and constructing apparatus, with which I now have Earth at my mercy.

"But I shall need assistance, intelligent men who will obey me and aid me in my plans. That is why I saved you and the other officers of your ether-lines. If you will join me, you shall have the highest post on Earth under me, Nathaniel Lee, and those others shall be under you."

* * * * *

Axelson paused, and, loathing the man though he did, Nat was conscious of a feeling of pity for him that he could not control. He saw his lonely life on Eros, surrounded by those phantom humans of the past, and he understood his longing for Earth rule--he the planetary exile, the sole human being of all the planetary system outside Earth, perhaps, except for his dwindling company of aged men.

"To-day, Nathaniel Lee," Axelson went on, "my life was recast in a new mould when I saw the woman you have brought with you. I did not know before that women were beautiful to look on. I did not dream that creatures such as she existed. She must be mine, Nathaniel Lee.

"But that is immaterial. What is your answer to my offer?"

Nat was trying to think, though passion distorted the mental images as they arose in his brain. To Axelson it was evidently incomprehensible that there would be any objection to his taking Madge. Nat saw that he must temporize for Madge's sake.

"I'll have to consult my companions," he answered.

"Of course," answered Axelson. "That is reasonable. Tell them that unless they agree to join me it will be necessary for them to die. Do Earth men mind death? We hate it on Eros, and the Moon men hate it, too, though they have a queer legend that something in the shape of an invisible man raises from their ashes. My father told me that that superstition existed on Earth in his time, too. Go and talk to your companions, Nathaniel Lee."

The Black Caesar's voice was almost friendly. He clapped Nat on the shoulder again, and called the graybeard to conduct him back to his prison.

"Oh, Captain Lee, I'm so glad you're back!" exclaimed Madge. "We've been afraid for you. Is he such a terrible man, this Black Caesar?"

Nat sneered, then grinned malevolently. "Well, he's not exactly the old-fashioned idea of a Sunday-school teacher," he answered. Of course he could not tell the girl about Axelson's proposal.

* * * * *

The little group of prisoners stood on the upper deck of the black ship and watched the Moon men scurrying about the landing-stage as she hovered to her position.

Axelson's father had not erred when he had called the tiny planet, Eros, a heavenly paradise, for no other term could have described it.

They were in an atmosphere so similar to that of Earth that they could breathe with complete freedom, but there seemed to be a lightness and a vigor in their limbs that indicated that the air was supercharged with oxygen or ozone. The presence of this in large amounts was indicated by the intense blueness of the sky, across which fleecy clouds were drifting.

And in that sky what looked like threescore moons were circling with extraordinary swiftness. From thirty to forty full moons, of all sizes, from that of a sun to that of a brilliant planet, and riding black against the blue.

The sun, hardly smaller than when seen from Earth, shone in the zenith, and Earth and Mars hung in the east and north respectively, each like a blood-red sun.

The moons were some of the thousand other asteroids, weaving their lacy patterns in and out among each other. But, stupendous as the sight was, it was toward the terrestrial scene that the party turned their eyes as the black ship settled.

A sea of sapphire blue lapped sands of silver and broke into soft lines of foam. To the water's edge extended a lawn of brightest green, and behind this an arm of the sea extended into what looked like a tropical forest. Most of the trees were palmlike, but towered to immense heights, their foliage swaying in a gentle breeze. There were apparently no elevations, and yet, so small was the little sphere that the ascending curve gave the illusion of distant heights, while the horizon, instead of seeming to rise, lay apparently perfectly flat, producing an extraordinary feeling of insecurity.

Near the water's edge a palatial mansion, built of hewn logs and of a single story, stood in a garden of brilliant flowers. Nearer, beyond the high landing-stage, were the great shipbuilding works, and near them an immense and slightly concave mirror flashed back the light of the sun.

"The death ray!" whispered Brent to Nat.

Axelson came up to the party as the ship settled down. "Welcome to Eros," he said cordially. "My father told me that in some Earth tongue that name meant 'love'."

* * * * *

Never, perhaps, was so strange a feast held as that with which Axelson entertained his guests that day. Dwarfish Moon men passed viands and a sort of palm wine in the great banquet-room, which singularly resembled one of those early twentieth century interiors shown in museums. Only the presence of a dozen of the aged guards, armed with ray-rods, lent a grimness to the scene.

Madge sat on Axelson's right, and Nat on his left. The girl's lightheartedness had left her; her face grew strained as Axelson's motives--which Nat had not dared disclose to her--disclosed themselves in his manner.

Once, when he laid his finger for a moment against her white throat, she started, and for a moment it seemed as if the gathering storm must break.

For Nat had talked with his men, and all had agreed that they would not turn traitor, though they intended to temporize as long as possible, in the hope of catching the Black Caesar unawares.

Then slowly a somber twilight began to fall, and Axelson rose.

"Let us walk in the gardens during the reign of Erebos," he said.

"Erebos?" asked Nat.

"The black world that overshadows us each sleeping period," answered Axelson.

Nat knew what he meant. The dark companion of Eros revolves around it every six hours; the day of Eros would therefore never be longer than six hours, this without reckoning the revolution of Eros around the sun. But owing to its small size, it was probable that it was bathed in almost perpetual sunshine.

The sweet scent of the flowers, much stronger than of any flowers on earth, filled the air. They walked across the green lawn and entered a jungle path, with bamboos and creeping plants on either side, and huge palmlike trees. Behind them stalked the guards with their ray-rods.

A lake of deepest black disclosed itself. Suddenly Madge uttered a scream and clung to Nat. "Look, look!" she cried. "It's horrible!"

* * * * *

Suddenly Nat realized that the lake swarmed with monsters. They were of crocodilian form, but twice the size of the largest crocodile, and sprawled over one another in the shallows beside the margin. As the party drew near, an enormous monster began waddling on its clawed feet toward them.

A mouth half the length of the creature opened, disclosing a purplish tongue and hideous fangs. Madge screamed again.

"Ah, so fear exists on Earth, too?" asked Axelson blandly. "That makes my conquest sure. I suspected it, and yet I was not sure that science had not conquered it. But there is no cause for fear. A magnetic field protects us. See!"

For the waddling monster suddenly stopped short as if brought up sharply by the bars of a cage, and drew back.

Axelson turned and wheezed in the Moon language--if the gibbering of the dwarfs could be called speech--and one of the guards answered him.

"These primitive dwellers on Eros I have preserved," said Axelson, "as a means of discipline. The Moon animals are afraid of them. I keep a supply of those who have transgressed my laws to feed them. See!"

He turned and pointed. Two guards were bringing a gibbering, screeching, struggling Moon man with them. Despite his strength, he seemed incapable of making any resistance, but his whole body quivered, and his hideous face was contorted with agony of terror.

At a distance of some fifty feet they turned aside into a little bypath through the jungle, reappearing close beside the Lake upon a raised platform. And what happened next happened so swiftly that Nat was unable to do anything to prevent it.

The guards disappeared; the Moon man, as if propelled by some invisible force, moved forward jerkily to the lake's edge. Instantly one of the saurians had seized him in its jaws, and another had wrenched half the body away, and the whole fighting, squirming mass vanished in the depths.

And from far away came the screeching chant of the Moon men, as if in invocation to some hideous deity.

And, moving perceptibly, the huge black orb of Eros's dark satellite crept over the sky, completely covering it.

* * * * *

Axelson stepped forward to where Nat stood, supporting Madge in his arms. The girl had fainted with horror at the scene.

"Your answer Nathaniel Lee," he said softly. "I know you have been postponing the decision. Now I will take the girl, and you shall give me your answer. Will you and these men join me, or will you die as the Moon man died?" He spoke wheezily, as if he, like Nat, had a cold.

And he put his arm around Madge.

Next moment something happened to him that had never happened in his life before. The Black Caesar went down under a well-directed blow to the jaw.

He leaped to his feet trembling with fury and barked a command. Instantly the old guards had hurled themselves forward. And behind them a horde of Moon men came, ambling.

While the guards covered their prisoners with their ray-rods, two Moon men seized each of them, imprisoning him in their unbreakable grasp.

Axelson pointed upward. "When the reign of Erebos is past," he said, "you become food for the denizens of the lake, unless you have agreed to serve me."

And he raised Madge in his arms, laughing as the girl fought and struggled to resist him.

"Madge!" cried Nat, trying to run toward her.

So furious were his struggles that for a moment he succeeded in throwing off the Moon men's grasp. Then he was caught again, and, fighting desperately, was borne off by the dwarfs through the shadows.

They traversed the border of the lake until a small stone building disclosed itself. Nat and the others were thrust inside into pitch darkness. The door clanged; in vain they hurled themselves against it. It was of wood, but it was as solid as the stone itself, and it did not give an inch for all their struggles.

* * * * *

"Where is your Kommandant?" The whisper seemed in the stone hut itself. "Your Nathaniel Lee. I must speak to him. I am the guard who brought him to the Black Caesar on board the ship."

"I'm here," said Nat. "Where are you?"

"I am in the house of the ray. I am on guard there. I am speaking into the telephone which runs only to where you are. You can speak anywhere in the hut, and I shall hear you."

"Well, what do you want?" asked Nat.

"You love the Earth woman. I remember, when I was a boy, we used to love. I had forgotten. There was a girl in Stamford.... Tell me, is it true that this is the year 2044 and that the proletariat has not yet triumphed?"

"It's true," said Nat. "Those dreams are finished, We're proud of the World Federation. Tell me about Madge Dawes--the Earth woman. Is she safe?"

"He has taken her to his house. I do not think she is harmed. He is ill. He is closely guarded. There are rumors afoot. I do not know."

"What do you want, then?"

"If the Black Caesar dies will you take me back to Earth again? I long so for the old Earth life. I will be your slave, if only I can set foot on Earth before I die."

"Can you rescue us?" Nat held his breath.

"The Moon men are on guard."

"They have no ray-guns and you have."

"The penalty would be terrible. I should be thrown to the monsters."

"Can you get us each a ray-gun? Will you risk it, to get back to Earth?" asked Nat.

A pause. Then, "My friend, I am coming."

Nat heard Benson hissing in his ear, "If we can surprise them, we can get possession of the black ship and return."

"We must get Madge Dawes."

"And smash the mirror," put in Brent.

After that there was nothing to do but wait.

* * * * *

The door clicked open. An indistinct form stood in the entrance. It was already growing light; the dark satellite that eclipsed Eros was passing.

"Hush! I have brought you ray-rods!" It was the old man with whom Nat had spoken on the boat. Under his arm he held five metallic rods, tipped with luminous glass. He handed one to each of the prisoners. "Do you know how to use them?" he asked.

Nat examined his. "It's an old-style rod that was used on earth fifty years ago," he told his men. "I've seen them in museums. It came into use in the Second World War of 1950 or thereabouts. You slip back the safety catch and press this button, taking aim as one did with the pistol. You fellows have seen pistols?"

"My father had an old one," said the chief mate, Barnes.

"How many times can they be fired without reloading?" Nat asked the old guard.

"Ten times; sometimes more; and they were all freshly loaded yesterday."

"Take us to where Axelson is."

"First you must destroy the guards. I sent the one on duty here away on some pretext. But the others may be here at any moment. Talk lower. Are you going to kill them?"

"We must," said Nat.

The old fellow began to sob. "We were companions together. They seized us and imprisoned us together, the capitalists, years ago. I thought the proletariat would have won, and you say it is all different. I am an old man, and life is sad and strange."

"Listen. Is Axelson in the house?" demanded Nat.

"He is in his secret room. I do not know the way. None of us has ever entered it."

"And Madge?"

"She was with him. I do not know anything more." He sank down, groaning, broken.

* * * * *

Nat pushed his way past him. It was fast growing light now. A ray of sunshine shot from beneath the edge of the dark sphere overhead, which still filled almost all the heavens. At that moment the hideous face and squat body of one of the Moon men came into view at the end of the path. The creature stopped, gibbering with surprise, and then rushed forward, mewing like a cat.

Nat aimed his ray-rod and pressed the button. The streak of light, not quite aimed, in Nat's excitement, sheared off one side of the Moon man's face.

The creature rocked where it stood, raised its voice in a screech, and rushed forward again, arms flailing. And this time Nat got home. The streak passed right through the body of the monster, which collapsed into a heap of calcined carbon.

But its screech had brought the other dwarfs running to the scene. In a moment the path was blocked by a score of the hideous monsters, which, taking in what was happening, came forward in a yelling bunch.

The ray-rods streaked their message of death into the thick of them. Yet so fierce was the rush that some parts got home. Arms, legs, and barrel chests, halves of men, covering the five with that impalpable black powder into which their bodies were dissolving. Nat remembered afterward the horror of a grinning face, apparently loose in the air, and a flailing arm that lashed his chest.

For fifteen seconds, perhaps, it was like struggling with some vampire creatures in a hideous dream. And then, just when it seemed to Nat that he was going mad, he found the path free, and the huddled remnants of the Moon men piled up about him on every side.

He emptied two more ray-shots into the writhing mass, and saw it cease to quiver and then dissolve into the black powder. He turned and looked at his companions. They, too, showed the horror of the strain they had undergone.

"We must kill the guards now," Nat panted. "And then find Madge and save her."

"We're with you," answered Brent, and together the five rushed into the sunlight and the open.

* * * * *

There were no guards on duty at the entrance of the house, and the door stood wide open. Nat rushed through the door at the head of his men. A single guard was in the hall, but he only looked up as they came in. And it was evident that he was in no condition to resist, for he was in the grip of some terrible disease.

His features were swollen so that they were hardly recognizable, and hoarse, panting breaths came from his lungs. He was so far gone that he hardly registered surprise at the advent of the five.

"Where's Axelson?" demanded Nat.

The guard pointed toward the end of the corridor, then let his arm fall. Nat led his men along the half-dark passage.

At the end of the corridor two more guards were on duty, but one was collapsed upon the floor, apparently unconscious, and the other, making a feeble attempt to draw his ray-rod, crumbled into ashes as Brent fired. The five burst through the door.

They found themselves in the banquet-hall. The remnants of the meal were still upon the table, and three Moon men, looking as if they had been poisoned, were writhing on the floor. At the farther end of the hall was another door.

This gave upon a central hall, with a door in each of its four sides, and a blaze of sunlight coming through the crystal roof. The five stopped, baffled. Then of a sudden Axelson's voice broke the silence--his voice, yet changed almost beyond recognition, hoarse, broken, and gasping:

"Try the doors, Nathaniel Lee. Try each door in turn, and then go back. And know that in an instant I can blast you to nothingness where you stand!"

And suddenly there came Madge's voice, "He can't! He can't, Nat. He's dying, and he knows it. I won't let him, and he hasn't got the strength to move."

"Which door?" cried Nat in desperation.

"None of the doors. They're a trick," came Madge's voice. "Go forward and press the grooved panel upon the wall in front of you."

* * * * *

Nat stepped forward, found the panel, and pressed it. The wall swung open, like two folded doors, revealing another room within, perfectly circular.

It contained a quantity of pieces of apparatus, some glowing with light, some dark, and a radio transmitting set; it was evidently the secret lair of the Black Caesar. And there he was, trapped at last by the mortal illness that had overtaken him!

He was lying upon the couch, his great form stretched out, his features hideously swollen by the same disease that had attacked the guards.

Nat raised his ray-rod, but Axelson feebly put up his hand, and Nat lowered the weapon. And, as the five gathered about the dying man, again Nat felt that strange sense of pathos and pity for him.

He had never known Earth life, and he was not to be measured by the common standards applicable on Earth.

"Don't fire, Nat," said Madge in a shaky voice. She was seated beside Axelson, and--the wonder of it--she was sponging the foam from his lips and moistening his forehead. She raised a crystal that contained some fluid to his lips, and he drained it greedily.

"So--Earth wins, Nathaniel Lee," whispered Axelson hoarsely. "I am dying. I know it. It is the same dreaded disease that came to the Moon at the time of my father's landing there. Three-fourths of the Moon animals died. It is mortal. The lungs burn away.

"My father told me that on Earth it is not mortal. He called it 'cold'--but I am burning hot."

Then only did Nat understand, and the irony of it made him catch his breath and grit his teeth to check his hysterical laughter. The Black Caesar, the terror of Earth, was dying of a common cold which he himself had given him.

The coryza germ, almost harmless on Earth, among a population habituated to it for countless generations, had assumed the potency of a plague here, where no colds had ever been known--among the Moon men, and even among the guards, after their lifetime in the germless climate of Eros.

"I've failed, Nathaniel Lee," came the Black Caesar's voice. "And yet that hardly troubles me. There is something more that I do not understand. She is a creature like ourselves--with will and reason. She is not like the Moon women. She told me that she did not wish to be queen of the Earth because she did not love me. I do not understand. And so--I am glad to go."

* * * * *

A gasp came from Axelson's throat as he raised his head and tried to speak, but the death-rattle was already in his throat. A slight struggle, and the massive form upon the couch was nothing but inanimate clay.

Madge rose from beside him, and the tears were streaming down her face.

"He wasn't a bad man, Nat," she said. "He was--gentle with me. He didn't understand; that was all. When I refused to be his queen, he was overcome with bewilderment. Oh, Nat, I can never, never write this story for the Universal News Syndicate."

Nat led her, sobbing, from the room.

Soon he succeeded in getting into teleradio communication with Earth. He broadcast the news that the Black Caesar was dead, and that his power for evil was at an end forever.

Then, in the few hours of daylight that remained, he set his men to work to smash the ray outfit that had destroyed China. There was some principle involved which he did not altogether understand, though Brent professed to have a clue to it, but it was evident that, except for the ray, Axelson had possessed no knowledge superior to that of the Earth scientists.

Of the guards, a few were already recovering, principally those of comparatively younger age. Not a Moon man, on the other hand, had survived the epidemic. As soon as Nat had got the guards out of the house, he reduced it to ashes by the aid of an old-fashioned box of phosphoric matches.

As the dark satellite was again creeping over Eros, the black ship set sail.

* * * * *

But of the return journey to the Moon, where they transferred to their own ship, of their landing at New York, and of the triumphal reception that was accorded them, this is no place to speak. Nat's journey with Madge from the center of the city, in what was the old Borough of Westchester, to his home in the suburb of Hartford, was a continual ovation.

Crowds lined the air-route, and every few miles, so thick was the air-traffic, he was forced to hover and address the cheering multitudes. Hartford itself was _en fete_, and across the main road the City Bosses had hung an old-fashioned banner, strung from house to house on either side, bearing the legend: For World President: NATHANIEL LEE!

Nat turned to Madge, who was seated beside him silently. "Ever hear of 'getting married?'" he asked.

"Of course I've heard of it," replied the girl indignantly. "Do you think I'm as dumb as that, Nat Lee? Why, those old-fashioned novels are part of the public schools' curriculum."

"Pity those days can't come back. You ought to be a World Presidentess, you know," said Nat. "I was thinking, if we registered as companionates, I could take you into the White House, and you'd have a swell time there taking X-rays on visiting days."

"Well," answered Madge slowly. "I never thought of that. It might be worth trying out."

The Second Satellite

By Edmond Hamilton

[Illustration: _The city of the frog-men!_]

[Sidenote: Earth-men war on frog-vampires for the emancipation of the human cows of Earth's second satellite.]

Norman and Hackett, bulky in their thick flying suits, seemed to fill the little office. Across the room Harding, the field superintendent, contemplated them. Two planes were curving up into the dawn together from the field outside, their motors thunderous as they roared over the building. When their clamor had receded, Harding spoke:

"I don't know which of you two is crazier," he said. "You, Norman, to propose a fool trip like this, or you, Hackett, to go with him."

Hackett grinned, but the long, lean face of Norman was earnest. "No doubt it all sounds a little insane," he said, "but I'm convinced I'm right."

The field superintendent shook his head. "Norman, you ought to be writing fiction instead of flying. A second satellite--and Fellows and the others on it--what the devil!"

"What other theory can account for their disappearance?" asked Norman calmly. "You know that since the new X-type planes were introduced, hundreds of fliers all over Earth have been trying for altitude records in them. Twenty-five miles--thirty--thirty-five--the records have been broken every day. But out of the hundreds of fliers who have gone up to those immense heights, four have never come down nor been seen again!

"One vanished over northern Sweden, one over Australia, one over Lower California, and one, Fellows, himself, right here over Long Island. You saw the globe on which I marked those four spots, and you saw that when connected they formed a perfect circle around the Earth. The only explanation is that the four fliers when they reached a forty-mile height were caught up by some body moving round Earth in that circular orbit, some unknown moon circling Earth inside its atmosphere, a second satellite of Earth's whose existence has until now never been suspected!"

* * * * *

Harding shook his head again. "Norman, your theory would be all right if it were not for the cold fact that no such satellite has ever been glimpsed."

"Can you glimpse a bullet passing you?" Norman retorted. "The two fliers at Sweden and Lower California vanished within three hours of each other, on opposite sides of the Earth. That means that this second satellite, as I've computed, circles Earth once every six hours, and travelling at that terrific speed it is no more visible to us of Earth than a rifle bullet would be."

"Moving through Earth's atmosphere at such speed, indeed, one would expect it to burn up by its own friction with the air. But it does not, because its own gravitational power would draw to itself enough air to make a dense little atmosphere for itself that would cling to it and shield it as it speeds through Earth's upper air. No, I'm certain that this second satellite exists, Harding, and I'm as certain that it's responsible for the vanishing of those four fliers."

"And now you and Hackett have figured when it will be passing over here and are going up in an X-type yourselves to look for it," Harding said musingly.

"Look for it?" echoed Hackett. "We're not going to climb forty miles just to get a look at the damn thing--we're going to try landing on it!"

"You're crazy sure!" the field superintendent exploded. "If Fellows and those others got caught by the thing and never came down again, why in the name of all that's holy would you two want--" He stopped suddenly. "Oh, I think I see," he said, awkwardly. "Fellows was rather a buddy of you two, wasn't he?"

"The best that ever flew a crippled Nieuport against three Fokkers to pull us out of a hole," said Norman softly. "Weeks he's been gone, and if it had been Hackett and I he'd be all over the sky looking for us--the damned lunatic. Well, we're not going to let him down."

"I see," Harding repeated. Then--"Well, here comes your mechanic, Norman, so your ship must be ready. I'll go with you. It's an event to see two Columbuses starting for another world."

* * * * *

The gray dawn-light over the flying field was flushing to faint rose as the three strode out to where the long X-type stood, its strangely curved wings, enclosed cabin and flat, fan-like tail gleaming dully. Its motor was already roaring with power and the plane's stubby wheels strained against the chocks. In their great suits Norman and Hackett were like two immense ape-figures in the uncertain light, to the eyes of those about them.

"Well, all the luck," Harding told them. "You know I'm pulling for you, but--I suppose it's useless to say anything about being careful."

"I seem to have heard the words," Hackett grinned, as he and Norman shook the field superintendent's hand.

"It's all the craziest chance," Norman told the other. "And if we don't come down in a reasonable time--well, you'll know that our theory was right, and you can broadcast it or not as you please."

"I hope for your sake that you're dead wrong," smiled the official. "I've told you two to get off the Earth a lot of times, but I never meant it seriously."

Harding stepped back as the two clambered laboriously into the cramped cabin. Norman took the controls, the door slammed, and as the chocks were jerked back and the motor roared louder the long plane curved up at a dizzy angle from the field into the dawn. Hackett waved a thick arm down toward the diminishing figures on the field below; then turned from the window to peer ahead with his companion.

The plane flew in a narrow ascending spiral upward, at an angle that would have been impossible to any ship save an X-type. Norman's eyes roved steadily over the instrument as they rose, his ears unconsciously alert for each explosion of the motor. Earth receded swiftly into a great gray concave surface as they climbed higher and higher.

By the time the five-mile height was reached Earth's surface had changed definitely from concave to convex. The plane was ascending by then in a somewhat wider spiral, but its climb was as steady and sure as ever. Frost begin to form quickly on the cabin's windows, creeping out from the edges. Norman spoke a word over the motor's muffled thunder, and Hackett snicked on the electrical radiators. The frost crept back as their warm, clean heat flooded the cabin.

Ten miles--fifteen--they had reached already altitudes impossible but a few years before, though it was nothing to the X-types. As they passed the ten-mile mark, Hackett set the compact oxygen-generator going. A clean, tangy odor filled the cabin as it began functioning. Twenty miles--twenty-two--

* * * * *

After a time Norman pointed mutely to the clock on the instrument board, and Hackett nodded. They were well within their time schedule, having calculated to reach the forty-mile height at ten, the hour when, by its computed orbit, the second satellite should be passing overhead. "--26--27--28--" Hackett muttered the altimeter figures to himself as the needle crept over them.

Glancing obliquely down through the window he saw that Earth was now a huge gray ball beneath them, white cloud-oceans obscuring the drab details of its surface here and there. "--31--32--" The plane was climbing more slowly, and at a lesser angle. Even the X-type had to struggle to rise in the attenuated air now about them. Only the super-light, super-powered plane could ever have reached the terrific height.

It was at the thirty-four mile level that the real battle for altitude began. Norman kept the plane curving steadily upward, handling it with surpassing skill in the rarefied air. Frost was on its windows now despite the heating mechanism. Slowly the altimeter needle crept to the forty mark. Norman kept the ship circling, its wings tilted slightly, but not climbing, Earth a great gray misty ball beneath.

"Can't keep this height long," he jerked. "If our second satellite doesn't show up in minutes we've had a trip for nothing."

"All seems mighty different up here," was Hackett's shouted comment. "Easy enough to talk down there about hopping onto the thing, but up here--hell, there's nothing but air and mighty little of that!"

Norman grinned. "There'll be more. If I'm right about this thing we won't need to hop it--its own atmosphere will pick us up."

Both looked anxious as the motor sputtered briefly. But in a moment it was again roaring steadily. Norman shook his head.

"Maybe a fool's errand after all. No--I'm still sure we're right! But it seems that we don't prove it this time."

"Going down?" asked Hackett.

"We'll have to, in minutes. Even with its own air-feed the motor can't stand this height for--"

* * * * *

Norman never finished the words. There was a sound, a keen rising, rushing sound of immense power that reached their ears over the motor's roar. Then in an instant the universe seemed to go mad about them: they saw the gray ball of Earth and the sun above skyrocketing around them as the plane whirled madly.

The rushing sound was in that moment thunderous, terrible, and as winds smashed and rocked the plane like giant hands, Hackett glimpsed another sphere that was not the sphere of Earth, a greenish globe that expanded with lightning speed in the firmament beside their spinning plane! The winds stilled; the green globe changed abruptly to a landscape of green land and sea toward which the plane was falling! Norman was fighting the controls--land and sea were gyrating up to them with dizzy speed--crash!

With that cracking crash the plane was motionless. Sunlight poured through its windows, and great green growths were all around it. Hackett, despite Norman's warning cry, forced the door open and was bursting outside, Norman after him. They staggered and fell, with curious lightness and slowness, on the ground outside, then clutched the plane for support and gazed stupefiedly around them.

The plane had crashed down into a thicket of giant green reeds that rose a yard over their heads, its pancake landing having apparently not damaged it. The ground beneath their feet was soft and soggy, the air warm and balmy, and the giant reeds hid all the surrounding landscape from view.

In the sky the sun burned near one horizon with unusual brilliance. But it was dwarfed, in size, by the huge gray circle that filled half the heavens overhead. A giant gray sphere it was, screened here and there by floating white mists and clouds, that had yet plain on it the outlines of dark continents and gleaming seas. A quaking realization held the two as they stared up at it.

* * * * *

"Earth!" Norman was babbling. "It's Earth, Hackett--above us; my God, I can't believe even yet that we've done it!"

"Then we're on--the satellite--the second satellite!--" Hackett fought for reality. "Those winds that caught us--"

"They were the atmosphere of this world, of the second satellite! They caught us and carried us on inside this smaller world's atmosphere, Hackett. We're moving with it around Earth at terrific speed now!"

"The second satellite, and we on it!" Hackett whispered, incredulously. "But these reeds--it can't all be like this--"

They stepped together away from the plane. The effort sent each of them sailing upward in a great, slow leap, to float down more than a score of feet from the plane. But unheeding in their eagerness this strange effect of the satellite's lesser gravitational power, they moved on, each step a giant, clumsy leap. Four such steps took them out of the towering reeds onto clear ground.

It was a gentle, grassy slope they were on, stretching away along a gray-green sea that extended out to the astoundingly near horizon on their right. To the left it rose into low hills covered with dense masses of green junglelike vegetation. Hackett and Norman, though, gazed neither at sea or hills for the moment, but at the half-score grotesque figures who had turned toward them as they emerged from the reeds. A sick sense of the unreal held them as they gazed, frozen with horror. For the great figures returning their gaze a few yards from them were--frog-men!

* * * * *

Frog-men! Great mottled green shapes seven to eight feet in height, with bowed, powerful legs and arms that ended in webbed paws. The heads were bulbous ones in which wide, unwinking frog-eyes were set at the sides, the mouths white-lipped and white-lined. Three of the creatures held each a black metal tube-and-handle oddly like a target-pistol.

"Norman!" Hackett's voice was a crescendo of horror. "_Norman!_"

"Back to the plane!" Norman cried thickly. "The plane--"

The two staggered back, but the frog-men, recovering from their own first surprise, were running forward with great hopping steps! The two fliers flung themselves back in a floating leap toward the reeds, but the green monsters were quick after them. A croaking cry came from one and as another raised his tube-and-handle, something flicked from it that burst close beside Norman. There was no sound or light as it burst, but the reeds for a few feet around it vanished!

* * * * *

A hoarse cry from Hackett--the creatures had reached him, grasped him at the edge of the reeds! Norman swerved in his floating leap to strike the struggling flier and frog-men. The scene whirled around him as he fought them, great paws reaching for him. With a sick, frantic rage he felt his clenched fist drive against cold, green, billowy bodies. Croaking cries sounded in his ears; then, Hackett and he were jerked to their feet, held tightly by four of the creatures.

"My God, Norman," panted Hackett, helpless. "What are they--frog-things?--"

"Steady, Hackett. They're the people of the second satellite, it seems; wait!"

One of the armed frog-men approached and inspected them, and then croaked an order in a deep voice. Then, still holding the two tightly, the party of monsters began to move along the slope, skirting the sea's edge. In a few minutes they reached two curious objects resting on the slope. They seemed long black metal boats, slender and with sharp prow and stern. A compact mechanism and control-board filled the prow, while at the stern and sides were long tubes mounted on swivels like machine-guns.

The frog-men motioned Norman and Hackett into one, fastening the two prisoners and themselves into their seats with metal straps provided for the purpose. Four had entered the one boat, the others that of the captives. One at the prow moved his paws over the control-board and with a purring of power the boat, followed by the other, rose smoothly into the air. It headed out over the gray-green sea, land dropping quickly from sight behind, the horizons water-bounded on all sides. From their nearness Norman guessed that this second satellite of Earth's was small indeed beside its mother planet. He had to look up to earth's great gray sphere overhead to attain a sense of reality.

Hackett was whispering beside him, the frog-men watchful. "Norman, it's not real--it can't be real! These things--these boats--intelligent like men--"

The other sought to steady him. "It's a different world, Hackett. Gravitation different, light different, everything different, and evolution here has had a different course. On Earth men evolved to be the most intelligent life-forms, but here the frog-races, it seems."

"But where are they taking us? Could we ever find the plane again?"

"God knows. If we ever get away from these things we might. And we've got to find Fellows, too; I wonder where he is on this world."

* * * * *

For many minutes the two boats raced on at great speed over the endless waters before the watery skyline was broken far ahead by something dark and unmoving. Hackett and Norman peered with intense interest toward it. It seemed at first a giant squat mountain rising from the sea, but as they shot nearer they saw that its outline was too regular, and that colossal as it was in size it was the work of intelligence. They gasped as they came nearer and got a better view of it.

For it was a gigantic dome of black metal rising sheer from the lonely sea, ten miles if anything in diameter, a third that in greatest height. There was no gate or window or opening of any kind in it. Just the colossal, smooth black dome rearing from the watery plain. Yet the two boats were flashing lower toward it.

"They can't be going inside!" Hackett conjectured. "There's no way in and what could be in there? The whole thing's mad--"

"There's some way," Norman said. "They're slowing--"

The flying-boats were indeed slowing as they dipped lower. They were very near the dome now, its curving wall a looming, sky-high barrier before them. Suddenly the boats dipped sharply downward toward the green sea. Before the two fliers could comprehend their purpose, could do aught more than draw instinctive great breaths in preparation, the two craft had shot down into the waters and were arrowing down through the green depths.

Blinded, flung against his metal strap by the resistance of the waters they ripped through, Norman yet retained enough of consciousness to glimpse beams of light that stabbed ahead from the prows of their rushing boats, to see vaguely strange creatures of the deep blundering in and out of those beams as the boats hurtled forward. The water that forced its way between his lips was fresh, he was vaguely aware, and even as he fought to hold his breath was aware too that the frog-men seemed in no way incommoded by the sudden transition into the water, their amphibian nature allowing them to stay under it far longer than any human could do.

The boats ripped through the waters at terrific speed and in a few seconds there loomed before them the giant metal wall of the great dome, going down into the depths here. Norman glimpsed vaguely that the whole colossal dome rested on a vast pedestal-like mountain of rock that rose from the sea's floor almost to the surface. Then a great round opening in the wall; the boats flashed into it and were hurtling along a water-filled tunnel. Norman felt his lungs near bursting--when the tunnel turned sharply upward and the boats whizzed up and abruptly out of the water-tunnel into air!

* * * * *

But it was not the open air again. They were beneath the gigantic dome! For as Norman and Hackett breathed deep, awe fell on their faces as they took in the scene. Far overhead stretched the dome's colossally curving roof, and far out on all sides. It was lit beneath that roof by a clear light that the two would have sworn was sunlight. The dome was in effect the roof of a gigantic, illuminated building, and upon its floor there stretched a mighty city.

The city of the frog-men! Their boats were rising up over it and Norman and Hackett saw it clear. Square mile upon square mile of structures stretched beneath the dome, black buildings often of immense size, varying in shape, but all of square, rectangular proportions. Between them moved countless frog-hordes, swirling throngs in streets and squares, and over the roofs darted thick swarms of flying-boats. And at the city's center, in a great, circular, clear space, lay a wide, round, green pool--the opening of the water-tunnel up through which they had come.

Norman pointed down toward it. "That's your answer!" he cried. "The only entrance to this frog-city is from the sea, up through that water-tunnel!"

"Good God, an amphibian city!" Hackett was shaken, white-faced.

The two boats were driving quickly over the city, through the swarming craft. Norman glimpsed towering buildings that might have been palaces, temples, laboratories. They slowed and dipped toward one block-like building not far from the water-tunnel's opening. Armed frog-guards were on its roof, and other boats rested there. The two came to rest and the two captives were jerked out, the guards seizing them.

Half-dragged and half-floating they were led toward an opening in the roof from which a stair led downward. They passed down thus into the building's interior, lit by many windows. Norman glimpsed long halls ending in barred doors, guards here and there. Tube-lines ran along the walls and somewhere machines were throbbing dully. They came at last to a barred door whose guard opened it at the croaking order of the frog-men who held the two, and they were thrust inside, as the door clanged. They turned, and exclaimed in amazement. The room held fully a half-hundred men!

They were men such as the two fliers had never seen before, like humans except that their skins were a light green instead of the normal white and pink. They were dressed in dark short tunics, and kept talking to each other in a tongue quite unintelligible to Norman and Hackett. They came closer, flocking curiously around the two men, with a babel of voices quite meaningless to the two. Then one of the men uttered an exclamation, and all turned.

* * * * *

The barred door had swung open and a half-dozen frog-guards entered, followed by two frog-men carrying a square little mechanism from which tubing led back out through the door.

"Norman--these men--" Hackett was whispering rapidly. "If there are men in this world too, it may be that--"

"Quiet, Hackett--look at what they're doing."

The two frog-men had set their mechanism in place and then croaked out a brief word or order. Slowly, reluctantly, one of the green men moved toward them. Quickly they removed a metal disk fastened to his arm, exposing a small orifice like an unhealed wound. Onto this they fastened a suckerlike object from which a transparent tube led back through the mechanism. The machine hummed and at once a red stream pulsed through the tube and back through the mechanism. The man to whom it was attached was growing rapidly pale!

Norman, sick with horror, clutched his companion. "Hackett--these frog-men are sucking his blood from him!"

"Good God! And look--they're doing it with another!"

"All of these men--kept prisoners to furnish them with blood. It must be the damned creatures' food! And we here with the others--"

A common horror shook the two. It did not seem to affect the green men in the room, though, who advanced to the mechanism one by one with a reluctant air as of cows unwilling to be milked. Each was attached to the mechanism by the sucking disk on his arm, and out of each the blood poured through the tube. The metal disk was replaced on his arm then and he went back to the others. Norman saw that the frog-men took only from each an amount of blood that they could lose and yet live, since, though each came back pale and weak from the mechanism, they were able to walk.

"It must be their food--human blood!" Norman repeated. "They may have thousands on thousands of humans penned up like this, like so many herds of cows, and perhaps they live entirely on the life-blood they milk from them. Human cows--God!"

"Norman--look--they're calling to us!"

* * * * *

The two stiffened. All the others in the room had taken their turn at the blood-sucking mechanism and now the frog-men croaked their order to the two fliers. They had forgotten their own predicament in the horror of the scene, but now it became real to them. They backed against the room's wall, quivering, dangerous.

The frog-guards came forward to drag them to the machine. A webbed paw was outstretched but Hackett with a wild blow drove the frog-man back and downward. The frog-guards leaped, and Norman and Hackett struck them back with all the greater strength the lesser gravitation gave them. The room was in an uproar, the green men shouting hoarsely and seeming on the point of rushing to their aid.

But the menacing force-pistols of the other frog-guards held back the shouting men and in moments the two fliers were overpowered by sheer weight of frog-bodies. Norman felt himself dragged to the machine.

Pain needled his upper arm as an incision was made. He felt the sucking-disk attached; then the machine hummed, and a sickening nausea swept him as the blood drained from his body. Held tightly by the guards he went dizzy, weak, but at last felt the sucker removed and a metal disk fastened over the incision. He was jerked aside and Hackett, his face deathly white, was dragged into his place. In a moment some of the latter's blood had been pumped from him also.

The machine was withdrawn, Norman and Hackett were released, and the frog-men, with their black force-pistols watchfully raised, withdrew, the door clanging. The room settled back to quietness, the green men stretching in lassitude on the metal bunks around it. The two fliers crouched down near the door, shuddering nausea and weakness still holding them.

Norman found that Hackett was laughing weakly. "To think that twenty-four hours ago I was in New York," he half-laughed, half-sobbed. "On Earth--Earth--"

The other gripped his arm. "It's horrible, Hackett, I know. But it isn't instant death, and we've still a chance to escape. Hell, can damn frog-men keep us here? Where's your nerve, man?"

A voice beside them made them turn in amazement. "You are men from Earth?" it asked, in queerly accented English. "From Earth?"

* * * * *

Astonishment held them as they saw who spoke. It was one of the green men in the room, who had settled down by their side. A tall figure with superb muscles and frank, clean countenance, his dark eyes afire with eagerness.

"English?" Norman exclaimed. "You know English--you understand me?"

The other showed his teeth in a smile. "I know, yes. I'm Sarja, and I learned to speak it from Fallas, in my city, before the Ralas caught me."

"Fallas--" Norman repeated, puzzled; then suddenly he flamed. "By God, he means Fellows!"

"Fallas, yes," said the other. "From the sky he fell into our city in a strange flying-boat that was smashed. He was hurt but we cared for him, and he taught me his speech, which I heard you talking now."

"Then Fellows is in your city now?" asked Hackett eagerly. "Where is that?"

"Across this sea--back in the hills," the other waved. "It is far from the sea but I was rash one day and came too near the water in my flying-boat. The Ralas were out raiding and they saw me, caught me, and brought me here. No escape now, until I die."

"The Ralas--you mean these frog-men?" Norman asked.

Sarja nodded. "Of course. They are the tyrants and oppressors of this world. Our little world is but a tenth or less the size of your great Earth which it circles, but it has its lands and rivers, and this one great fresh-water sea into which the latter empty. In this sea long ago developed the Ralas, the great frog-men who acquired such intelligence and arts that they became lords of this world.

"Through the centuries, while on the land our races of green men have been struggling upward, the Ralas have oppressed them. Long ago the Ralas left all their other cities to build this one great amphibian city at the sea's center. Entrance to it is only by the water-tunnel from without, and being frog-people entrance thus is easy for them since they can move for many minutes under water, though they drown like any other breathing animal if kept under too long. Humans dare not try to enter it thus by the water-tunnel, since, before they could find it and make their way up through it, they would have drowned.

* * * * *

"So the Ralas have ruled from this impregnable amphibian city. Its colossal metal dome is invulnerable to ordinary attack, and though solid and without openings it is always as light beneath the dome here as outside, since the Ralas' scientists contrived light-condensers and conductors that catch light outside and bring it in to release inside. So when it is day outside the sunlight is as bright here, and when night comes the Earth-light shines here the same as without.

"From this city their raiding parties have gone out endlessly to swoop down on the cities of us green men. Since we learned to make flying-boats like theirs, with molecular-motors, and to make the guns like theirs that fire shells filled with annihilating force, we have resisted them stoutly but their raids have not ceased. And always they have brought their prisoners back in to this, their city.

"Tens of thousands of green men they have prisoned here like us, for the sole purpose of supplying them with blood. For the Ralas live on this blood alone, changing it chemically to fit their own bodies and then taking it into their bodies. It eliminates all necessity for food here for them. Every few days they drain blood from us, and since we are well fed and cared for to keep us good blood-producers, we will be here for a long time before we die."

"But haven't you made any attempt to get out of here--to escape?" Norman asked.

Sarja smiled. "Who could escape the city of the Ralas? In all recorded history it has never been done, for even if by some miracle you got a flying-boat, the opening of the water-tunnel that leads outward is guarded always."

"Guards or no guards, we're going to try it and not sit here to furnish blood for the Ralas," Norman declared. "Are you willing to help, to try to get to Fellows and your city?"

The green man considered. "It is hopeless," he said, "but as well to die beneath the force-shells of the Ralas as live out a lifetime here. Yes, I will help, though I cannot see how you expect to escape even from this room."

"I think we can manage that," Norman told him. "But first--not a word to these others. We can't hope to escape with them all, and there is no knowing what one might not betray us to the frog-men."

He went on then to outline to the other two the idea that had come to him. Both exclaimed at the simpleness of the idea, though Sarja remained somewhat doubtful. While Hackett slept, weak still from his loss of blood, Norman had the green man scratch on the metal floor as well as possible a crude map of the satellite's surface, and found that the city, where Fellows was, seemed some hundreds of miles back from the sea.

* * * * *

While they talked, the sunlight, apparently sourceless, that came through the heavily barred windows of the room faded rapidly, and dusk settled over the great amphibian city beneath the giant dome, kept from total darkness by a silvery pervading light that Norman reflected must be the light from Earth's great sphere. With the dusk's coming the activities in the frog-city lessened greatly.

With dusk, too, frog-guards entered the room bearing long metal troughs filled with a red jellylike substance, that they placed on racks along the wall. As the guards withdrew the men in the room rushed toward the troughs, elbowing each other aside and striking each other to scoop up and eat as much of the red jelly as possible. It was for all the world like the feeding of farm-animals, and Hackett and Norman so sickened at the sight that they had no heart to try the food. Sarja, though, had no such scruples and seemed to make a hearty meal at one of the troughs.

After the meal the green men sought the bunks and soon were stretched in sonorous slumber. It was, Norman reflected, exactly the existence of domesticated animals--to eat and sleep and give food to their masters. A deeper horror of the frog-men shook him, and a deeper determination to escape them. He waited until all in the room were sleeping before beckoning to Sarja and Hackett.

"Quiet now," he whispered to them. "If these others wake they'll make such a clamor we won't have a chance in the world. Ready, Sarja?"

The green man nodded. "Yes, though I still think such a thing's impossible."

"Probably is," Norman admitted. "But it's the one chance we've got, the immensely greater strength of our Earth-muscle that the frog-men must have forgotten when they put us in here."

They moved silently to the room's great barred door, outside which a frog-guard paced. They waited until he had passed the door and on down the hall, then Norman and Hackett and Sarja grasped together one of the door's vertical bars. It was an inch and a half in thickness, of solid metal, and it seemed ridiculous that any men could bend it by the sheer strength of their muscles.

Norman, though, was relying on the fact that on the second satellite, with its far lesser gravitational influence, their Earth-muscles gave them enormous strength. He grasped the bar, Hackett and Sarja gripping it below him, and then at a whispered word they pulled with all their force. The bar resisted and again, with sweat starting on their foreheads, they pulled. It gave a little.

* * * * *

They shrank back from it as the guard returned, moving past. Then grasping the bar again they bent all their force once more upon it. Each effort saw it bending more, the opening in the door's bars widening. They gave a final great wrench and the bent bar squealed a little. They shrank back, appalled, but the guard had not heard or noticed. He moved past it on his return along the hall, and no sooner was past it than Norman squeezed through the opening and leaped silently for the great frog-man's back.

It went down with a wild flurry of waving webbed paws and croaking cries, stilled almost instantly by Norman's terrific blows. There was silence then as Hackett and Sarja squeezed out after him, the momentary clamor of the battle having aroused no one.

The three leaped together toward the stairs. In two great floating leaps they were on the floor above, Hackett and Norman dragging Sarja between them. They were not seen, were sailing in giant steps up another stair, hopes rising high. The last stair--the roof-opening above; and then from beneath a great croaking cry swelled instantly into chorus of a alarmed shouts.

"They've found the door--the guard!" panted Hackett.

They were bursting out onto the roof. Frog-guards were on it who came in a hopping rush toward them, force-pistols raised. But a giant leap took Hackett among them, to amaze them for a moment with great flailing blows. Sarja had leaped for the nearest flying-boat resting on the roof, and was calling in a frantic voice to Norman and Hackett. Norman was turning toward Hackett, the center of a wild combat, but the latter emerged from it for a brief second to motion him frantically back.

"No use, Norman--get away--get away!" he cried hoarsely, frenziedly.

"Hackett--for God's sake--!" Norman half-leaped to the other, but an arm caught him, pulled him desperately onto the boat's surface. It was Sarja, the long craft flying over the roof beneath his control.

"They come!" he panted. "Too late now--" Frog-men were pouring up onto the roof from below. Sarja sent the craft rocketing upward, as Hackett gestured them away for a last frantic time before going down beneath the frog-men's onslaught.

* * * * *

The roof and the combat on it dropped back and beneath them like a stone as their craft ripped across the silvery dusk over the mighty frog-city. They were shooting toward the city's center, toward the green pool that was the entrance to the water-tunnel, while behind and beneath an increasing clamor of alarm spread swiftly. Norman raged futilely.

"Hackett--Hackett! We can't leave him--"

"Too late!" Sarja cried. "We cannot help him but only be captured again. We escape now and come back--come back--"

The truth of it pierced Norman's brain even in the wild moment. Hackett had fought and held back the frog-guards only that they might escape. He shouted suddenly.

"Sarja--the water-tunnel!" A half-dozen boats with frog-guards on them were rising round it in answer to the alarm!

"The force-gun!" cried the green man. "Beside you--!"

Norman whirled, glimpsed the long tube on its swivel beside him, trained it on the boats rising ahead as they rocketed nearer. He fumbled frantically at a catch at the gun's rear, then felt a stream of shells flicking out of it. Two of the boats ahead vanished as the shells released their annihilating force, another sagged and fell. From the remaining three invisible force-shells flicked around them, but in an instant Sarja had whirled the boat through them and down into the water-tunnel!

Norman clung desperately to his seat as the boat flashed down through the waters, and then, as Sarja sent it flying out through the great tunnel's waters, glimpsed, close behind, the beams of the three Rala boats as they pursued them through the tunnel, overtaking them. Could the force-shells be fired under water? Norman did not know, but desperately he swung the force-gun back as they rushed through the waters, and pressed the catch. An instant later beams and boats behind them in the tunnel vanished.

His lungs were afire; it seemed that he must open them to the strangling water. The boat was ripping the waters at such tremendous speed that he felt himself being torn from his hold on it. Pain seemed poured like molten metal through his chest--he could hold out no longer; and then the boat stabbed up from the waters into clear air!

* * * * *

Norman panted, sobbed. Behind them rose the colossal metal dome of the frog-city, gleaming dully in the silvery light that flooded the far-stretching seas. That light poured down from a stupendous silver crescent in the night skies. Norman saw dully the dark outlines on it before he remembered. Earth! He laughed a little hysterically. Sarja was driving the flying-boat out over the sea and away from the frog-city at enormous speed. At last he glanced back. Far behind them lay the great dome and up around it gleaming lights were pouring, lights of pursuing Rala boats.

"We escape," Sarja cried, "the city of the Ralas, from which none ever before escaped!"

Remembrance smote Norman. "Hackett! Held off those frog-men so we could get away--we'll come back for him, by God!"

"We come back!" said Sarja. "We come back with all the green men of this world to the Ralas' city, yes! I know what Fallas has planned."

"Can you find your way to him--to your city?" Norman asked.

Sarja nodded, looking upward. "Before the next sun has come and gone we can reach it."

The boat flew onward, and the great dome and the searching lights around it dropped beneath the horizon. Norman felt the warm wind drying his drenched garments as they rushed onward. Crouched on the boat he gazed up toward the silver crescent of Earth sinking toward the horizon ahead. That meant, he told himself, that the satellite turned slowly on its axis as it whirled around Earth. It came to him that its night and day periods must be highly irregular.

When the sun climbed from the waters behind them they were flying still over a boundless waste of waters, but soon they sighted on the horizon ahead the thin green line of land. Sarja slowed as they reached it, took his bearings, and sent the craft flying onward.

They passed over a green coastal plain and then over low hills joined in long chains and mantled by dense and mighty jungles, towering green growths of unfamiliar appearance to Norman. He thought he glimpsed, more than once, huge beastlike forms moving in them. He did see twice in the jungles great clearings where were fair-sized cities of bright-green buildings, a metal tower rising from each. But when he pointed to them Sarja shook his head.

* * * * *

At last, as they passed over another range of hills and came into sight of a third green city with its looming tower, the other pointed, his face alight.

"My city," he said. "Fallas there."

Fellows! Norman's heart beat faster.

They shot closer and lower and he saw that the buildings were obviously green to lend them a certain protective coloration similar to that of the green jungles around them. The tower with its surmounting cage puzzled him though, but before he could ask Sarja concerning it his answer came in a different way. A long metal tube poked slowly out of the cage on the tower's top and sent a hail of force-shells flicking around them.

"They're firing on us!" Norman cried. "This can't be your city!"

"They see our black boat!" Sarja exclaimed. "They think we're Rala raiders and unless we let them know they'll shoot us out of the air! Stand up--wave to them--!"

Both Norman and Sarja sprang to their feet and waved wildly to those in the tower-cage, their flying-boat drifting slowly forward. Instantly the force-shells ceased to hail toward them, and as they moved nearer a sirenlike signal broke from the cage. At once scores of flying-boats like their own, but glittering metal instead of black, shot up from the city where they had lain until now, and surrounded them.

As Sarja called in his own tongue to them the green men on the surrounding boats broke into resounding cries. They shot down toward the city, Norman gazing tensely. Great crowds of green men in their dark tunics had swarmed out into its streets with the passing of the alarm, and their craft and the others came to rest in an open square that was the juncture of several streets.

The green men that crowded excitedly about Norman and Sarja gave way to a half-dozen hurrying into the square from the greatest of the buildings facing on it. All but one were green men like the others. But that one--the laughing-eyed tanned face--the worn brown clothing, the curious huge steps with which he came--Norman's heart leapt.

"Fellows!"

"Great God--Norman!" The other's face was thunderstruck. "Norman--how by all that's holy did you get here?"

* * * * *

Norman, mind and body strained to the breaking point, was incoherent. "We guessed how you'd gone--the second satellite, Fellows--Hackett and I came after you--taken to that frog-city--"

As Norman choked the tale, Fellows' face was a study. And when it was finished he swallowed, and gripped Norman's hand viselike.

"And you and Hackett figured it out and came after me--took that risk? Crazy, both of you. Crazy--"

"Fellows, Hackett's still there, if he's alive! In the Rala city!"

Fellows' voice was grim, quick. "We'll have him out. Norman, if he still lives. And living or dead, the Ralas will pay soon for this and for all they've done upon this world in ages. Their time nears--yes."

He led Norman, excited throngs of the green men about them, into the great building from which he had emerged. There were big rooms inside, workshops and laboratories that Norman but vaguely glimpsed in passing. The room to which the other led him was one with a long metal couch. Norman stretched protestingly upon it at the other's bidding, drifted off almost at once into sleep.

He woke to find the sunlight that had filled the room gone and replaced by the silvery Earth-light. From the window he saw that the silver-lit city outside now held tremendous activity, immense hordes of green men surging through it with masses of weapons and equipment, flying-boats pouring down out of the night from all directions. He turned as the door of the room clicked open behind him. It was his old friend Fellows.

"I thought you'd be awake by now, Norman. Feeling fit?"

"As though I'd slept a week," Norman said, and the other laughed his old care-free laugh.

"You almost have, at that. Two days and nights you've slept, but it all adds up to hardly more than a dozen hours."

"This world!" Norman's voice held all his incredulity. "To think that we should be on it--a second satellite of Earth's--it seems almost beyond belief."

* * * * *

"Sometimes it seems so to me, too," Fellows said thoughtfully. "But it's not a bad world--not the human part of it, at least. When this satellite's atmosphere caught me and pitchforked me down among these green men, smashing the plane and almost myself, they took care of me. You say three others vanished as I did? I never heard of them here; they must have crashed into the sea or jungles. Of course, I'd have got back to Earth on one of these flying-boats if I'd been able, but their molecular power won't take them far from this world's surface, so I couldn't.

"As it was, the green men cared for me, and when I found how those frog-men have dominated this world for ages, how that city of the Ralas has spread endless terror among the humans here, I resolved to smash those monsters whatever I did. I taught some of the green men like Sarja my own speech, later learning theirs, and in the weeks I've been here I've been working out a way to smash the Ralas.

"You know that amphibian city is almost impregnable because humans can hardly live long enough under the water to get into it, let alone fight under water as the frog-men can. To meet them on even terms the green men needed diving-helmets with an oxygen supply. They'd never heard of such an idea, too afraid of the sea ever to experiment in it, but I convinced them and they've made enough helmets for all their forces. In them they can meet the Ralas under water on equal terms.

"And there's a chance we can destroy that whole Rala city with their help. It's built on a giant pedestal of rock rising from the sea's floor, as you saw, and I've had some of the green men make huge force-shells or force-bombs that ought to be powerful enough to split that pedestal beneath the city. If we can get a chance to place those bombs it may smash the frog-men forever on this world. But one thing is sure: we're going to get Hackett out if he still lives!"

"Then you're, going to attack the Rala city now?" Norman cried.

Fellows nodded grimly. "While you have slept all the forces of the green men on this world have been gathering. Your coming has only precipitated our plans, Norman--the whole soul of the green races has been set upon this attack for weeks!"

* * * * *

Norman, half bewildered at the swiftness with which events rushed upon him, found himself striding with Fellows in great steps out through the building into the great square. It was shadowed now by mass on mass of flying-boats, crowded with green men, that hung over it and over the streets. One boat, Sarja at its controls, waited on the ground and as they entered and buckled themselves into the seats the craft drove up to hang with the others.

A shattering cheer greeted them. Norman saw that in the silvery light of Earth's great crescent there stretched over the city and surrounding jungle now a veritable plain of flying-boats. On each were green men and each bristled with force-guns, and had as many great goggled helmets fastened to it as it had occupants. He glimpsed larger boats loaded with huge metal cylinders--the force-bombs Fellows had mentioned.

Fellows rose and spoke briefly in a clear voice to the assembled green men on their craft, and another great shout roared from them, and from these who watched in the city below. Then as he spoke a word, Sarja sent their craft flying out over the city, and the great mass of boats, fully a thousand in number, were hurtling in a compact column after them.

Fellows leaned to Norman as the great column of purring craft shot on over the silver-lit jungles. "We'll make straight for the Rala city and try setting into it before they understand what's happening."

"Won't they have guards out?"

"Probably, but we can beat them back into the city before their whole forces can come out on us. That's the only way in which we can get inside and reach Hackett. And while we're attacking the force-bombs can be placed, though I don't rely too much on them."

"If the attack only succeeds in getting us inside," Norman said, grim-lipped, "we'll have a chance--"

"It's on the knees of the gods. These green men are doing an unprecedented thing in attacking the Ralas, the masters of this world, remember. But they've got ages of oppression to avenge; they'll fight."

The fleet flew on, hills and rivers a silver-lit panorama unreeling beneath them. Earth's crescent sank behind them, and by the time they flashed out over the great fresh-water sea, the sun was rising like a flaming eye from behind it. Land sank from sight behind and the green men were silent, tense, as they saw stretching beneath only the gray waters that for ages had been the base of the dread frog-men. But still the fleet's column raced on.

* * * * *

At last the column slowed. Far ahead the merest bulge broke the level line where sky and waters met. The amphibian city of the Ralas! At Fellows' order-the flying-boats sank downward until they moved just above the waters. Another order made the green hosts don the grotesque helmets. Norman found that while cumbersome their oxygen supply was unfailing. They shot on again at highest speed, but as the gigantic black dome of the frog-city grew in their vision there darted up from around it suddenly a far-flung swarm of black spots.

"Rala boats!"

The muffled exclamation was Fellows'. There needed now no order on his part, though. Like hawks, leaping for prey, the fleet of the green men sprang through the air. Norman, clutching the force-gun between his knees, had time only to see that the Rala craft were a few hundred in number and that, contemptuous of the greater odds that favored these humans they had so long oppressed, they were flying straight to meet them. Then the two fleets met--and were spinning side by side above the waters.

Norman saw the thing only as a wild whirl of Rala boats toward and beside them, great green frog-men crowding the craft, their force-guns hailing shells. Automatically, with the old air-fighting instinct, his fingers had pressed the catch of the gun between his knees and as its shells flicked toward the rushing boats he saw areas of nothingness opening suddenly in their mass, shells striking and exploding in annihilating invisibility there and in their own fleet.

The two fleets mingled and merged momentarily, the battle becoming a thing of madness, a huge whirl of black and glittering flying-boats together, striking shells exploding nothingness about them. The Ralas were fighting like demons.

The merged, terrific combat lasted but moments; could last but moments. Norman, his gun's magazine empty, seemed to see the mass of struggling ships splittering, diverging; then saw that the black craft were dropping, plummeting downward toward the waves! The Ralas, stunned by that minute of terrific combat, were fleeing. Muffled cries and cheers came from about him as the glittering flying-boats of the green men shot after them. They crashed down into the waters and curved deeply into their green-depths, toward the gigantic dome.

* * * * *

Ahead the Rala boats were in flight toward their city, and now their pursuers were like sharks striking after them. There in the depths the force-guns of black and glittering boats alike were spitting, and giant waves and underwater convulsions rocked pursued and pursuers as the exploding shells annihilated boats and water about them. The tunnel! Its round opening yawned in the looming wall ahead, and Norman saw the Rala craft, reduced to scores in number, hurtling into it, to rouse all the forces of the great amphibian city. Their own boats were flashing into the opening after them. He glimpsed as he glanced back for a moment the larger craft with the great force-bombs veering aside behind them.

It was nightmare in the water-tunnel. Flashing beams of the craft ahead and waters that rocked and smashed around them as in flight the Ralas still rained back force-shells toward them in a chaos of action. Once the frog-men turned to hold them back in the tunnel, but by sheer weight the rushing ships of the green men crashed them onward. Boats were going into nothingness all around them. A part of Norman's brain wondered calmly why they survived even while another part kept his gun again working, with refilled magazine. Fellows and Sarja were grotesque shapes beside him. Abruptly the tunnel curved upward and as they flashed up after the remaining Rala craft their boats ripped up into clear air! They were beneath the giant dome!

The frog-men chased inward spread out in all directions over their mighty, swarming city and across it a terrific clamor of alarm ran instantly as the green men emerged after them! Norman saw flying-boats beginning to rise across all the city and realized that moments would see all the immense force of the Ralas, the thousands of craft they could muster, pouring upon them. He pointed out over the city to a block-like building, and shouted madly through his helmet to Fellows and Sarja:

"Hackett!"

But already Sarja had sent their craft whirling across the city toward the structure, half their fleet behind it, with part still emerging from the water-tunnel. Rala boats rose before them, but nothing could stop them now, their force-shells raining ahead to clear a path for their meteor-flight. They shot down toward the block-structure, and Norman, half-crazed by now, saw that to descend and enter was suicide in the face of the frog-forces rising now over all the city. He cried to Fellows, and with two of the guns as they swooped lower they sprayed force-shells along the building's side.

* * * * *

The shells struck and whiffed away the whole side, exposing the level on the building's interior. Out from it rushed swarms of crazed green men, sweeping aside the frog-men guards, while far over the city the invading craft were loosing shells on the block-like buildings that held the prisoners, tens of thousands of them swarming forth. In the throng below as they raced madly forth Norman saw one, and shouted wildly. The one brown garbed figure looked up, saw their boat swooping lower, and leaped for it in a tremendous forty-foot spring that brought his fingers to its edge. Norman pulled him frenziedly up.

"Norman!" he babbled. "In God's name--Fellows--!"

"That helmet, Hackett!" Fellows flung at him. "My God, look at those prisoners--Norman!"

The countless thousands of green men released from the buildings whose walls had vanished under the shells of the invaders had poured forth to make the amphibian city a chaos of madness. Oblivious to all else they were throwing themselves upon the city's crowding frog-men in a battle whose ferocity was beyond belief, disregarding all else in this supreme chance to wreak vengeance on the monstrous beings who had fed upon their blood. In the incredible insanity of that raging fury the craft of the green men hanging over the city were all but forgotten.

Suddenly the city and the mighty dome over it quivered violently, and then again. There came from beneath a dull, vast, grinding roar.

"The great force-bombs!" Fellows screamed. "They've set them off--the city's sinking--out of here, for the love of God!"

The boat whirled beneath Sarja's hands toward the pool of the water-tunnel, all their fleet rushing with them. The grinding roar was louder, terrible; dome and city were shaking violently now; but in the insensate fury of their struggle the frog-men and their released prisoners were hardly aware of it. The whole great dome seemed sinking upon them and the city falling beneath it as Sarja's craft ripped down into the tunnel's waters, and then out, at awful speed, as the great tunnel's walls swayed and sank around them! They shot out into the green depths from it to hear a dull, colossal crashing through the waters from behind as the great pedestal of rock on which the city had stood, shattered by the huge force-bombs, collapsed. And as their boats flashed up into the open air they saw that the huge dome of the city of the Ralas was gone.

Beneath them was only a titanic whirlpool of foaming waters in which only the curved top of the settling dome was visible for a moment as it sank slowly and ponderously downward, with a roar as of the roar of falling worlds. Buckling, collapsing, sinking, it vanished in the foam-wild sea with all the frog-men who for ages had ruled the second satellite, and with all those prisoners who had at the last dragged them down with them to death! Ripping off their helmets, with all the green men shouting crazily about them, Norman and Fellows and Hackett stared down at the colossal maelstrom in the waters that was the tomb of the masters of a world.

Then the depression's sides collapsed, the waters rushing together ... and beneath them was but troubled, tossing sea....

* * * * *

Earth's great gray ball was overhead again and the sun was sinking again to the horizon when the three soared upward in the long, gleaming plane, its motor roaring. Norman, with Hackett and Fellows crowding the narrow cabin beside him, waved with them through its windows. For all around them were rising the flying-boats of the green men.

They were waving wildly, shouting their farewells, Sarja's tall figure erect at the prow of one. Insistent they had been that the three should stay, the three through whom the monstrous age-old tyranny of the frog-men had been lifted, but Earth-sickness was on them, and they had flown to where the plane lay still unharmed among the reeds, a hundred willing hands dragging it forth for the take-off.

The plane soared higher, motor thundering, and they saw the flying-boats sinking back from around them. They caught the wave of Sarja's hand still from the highest, and then that, too, was gone.

Upward they flew toward the great gray sphere, their eyes on the dark outlines of its continents and on one continent. Higher--higher--green land and gray tea receding beneath them; Hackett and Fellows intent and eager as Norman kept the plane rising. The satellite lay, a greenish globe, under them. And as they went higher still a rushing sound came louder to their ears.

"The edge of the satellite's atmosphere?" Fellows asked, as Norman nodded.

"We're almost to it--here we go!"

As he shot the plane higher, great forces smote it, gray Earth and green satellite and yellow sun gyrating round it as it reeled and plunged. Then suddenly it was falling steadily, gray Earth and its dark continent now beneath, while with a dwindling rushing roar its second satellite whirled away above them, passing and vanishing. Passing as though, to Norman it seemed, all their strange sojourn on it were passing; the frog-men and their mighty city, Sarja and their mad flight, the green men and the last terrific battle; all whirling away--whirling away.

HISTORIC EXPERIMENT PROVES EARTH'S ROTATION

The famous experiment which proves that the "earth do move" by letting the observer actually see it twisting underneath his feet, an experiment invented by the French mathematician Jean B. L. Foucault nearly a century ago was repeated recently under unusually impressive circumstances before an international scientific congress at Florence, Italy, the same city where Galileo once was persecuted for holding the same opinion.

From the center of the dome of the Church of Santa Maria di Fiore, Father Guido Alfani, director of the Astronomical Observatory, suspended a 200-pound weight on a wire 150 feet long. On the bottom of this weight was a tiny projecting point which traced a line on a table-top sprinkled with sand, as the great pendulum swung slowly back and forth. At a given signal Father Alfani set the pendulum to swinging. While the assembled scientists watched it, slowly the line traced across the sand table-top changed direction.

As Foucault proved long ago and as the watching scientists well knew, the table was being twisted underneath the pendulum by the rotation of the earth.

A REVOLUTIONARY AIRPLANE

A new airplane propeller has recently been patented by J. Kalmanson of Brooklyn, N. Y. Greater speed and marked saving in fuel is claimed for the invention, which may be attached to any type of airplane.

The device is in two parts, which may be used separately as front and rear propellers or combined into a single blade. The principle is that the front one acts to bring air to the other, giving the propeller more of a hold, so to speak, and greater power. This is accomplished by four air-spoons, one on each side of each blade of the propeller.

It is said that the device can double the speed of an airplane and raise it from the ground in ninety feet instead of the 200 feet most airplanes now require. It is also claimed that the new propeller will prevent the plane from making a nose drive unless the pilot forces it to do so, and enable it to make a safe landing within a short distance. Because of the increase in power and speed, the device would save a large amount of gasoline and oil, as well as guarding the motor from part of the strain on it.

The device is said to be also applicable to ships, the same principle operating in water as well as air.

Silver Dome

By Harl Vincent

[Illustration: _Orris led the way to a great underground city._]

[Sidenote: In her deep-buried kingdom of Theros, Phaestra reveals the amazing secret of the Silver Dome.]

In a secluded spot among the hills of northern New Jersey stood the old DeBost mansion, a rambling frame structure of many wings and gables that was well-nigh hidden from the road by the half-mile or more of second-growth timber which intervened. High on the hill it stood, and it was only by virtue of its altitude that an occasional glimpse might be obtained of weatherbeaten gable or partly tumbled-down chimney. The place was reputed to be haunted since the death of old DeBost, some seven years previously, and the path which had once been a winding driveway was now seldom trod by human foot.

It was now two years since Edwin Leland bought the estate for a song and took up his residence in the gloomy old house. And it had then been vacant for five years since DeBost shot himself in the northeast bedroom. Leland's associates were sure he would repent of his bargain in a very short time, but he stayed on and on in the place, with no company save that of his man-servant, an aged hunch-back who was known to outsiders only as Thomas.

Leland was a scientist of note before he buried himself in the DeBost place, and had been employed in the New York research laboratory of one of the large electrical manufacturers, where he was much admired and not a little envied by his fellow workers. These knew almost nothing of his habits or of his personal affairs, and were much surprised when he announced one day that he had come into a sizable fortune and was leaving the organization to go in for private research and study. Attempts to dissuade him were of no avail, and the purchase of the DeBost property followed, after which Leland dropped from sight for nearly two years.

* * * * *

Then, on a blustery winter day, a strange telephone call was received at the laboratory where he had previously worked. It was from old Thomas, out there in the DeBost mansion, and his quavering voice asked for Frank Rowley, the genial young engineer whose work had been most closely associated with Leland's.

"Oh, Mr. Rowley," wailed the old man, when Frank responded to the call, "I wish you would come out here right away. The master has been acting very queerly of late, and to-day he has locked himself in his laboratory and will not answer my knocks."

"Why don't you break in the door?" asked Frank, looking through the window at the snow storm that still raged.

"I thought of that, Mr. Rowley, but it is of oak and very thick. Besides, it is bound with steel or iron straps and is beyond my powers."

"Why not call the police?" growled Frank. He did not relish the idea of a sixty or seventy mile drive in the blizzard.

"Oh--no--no--no!" Old Thomas was panicky at the suggestion. "The master told me he'd kill me if I ever did that."

Before Frank could formulate a reply, there came a sharp gasp from the other end of the line, a wailing cry and a thud as of a falling body; then silence. All efforts to raise Leland's number merely resulted in "busy" or "line out of order" reports.

Frank Rowley was genuinely concerned. Though he had never been a close friend of Leland's, the two had worked on many a knotty problem together and were in daily contact during the nearly ten years that the other man had worked in the same laboratory.

"Say, Tommy," said Frank, replacing the receiver and turning to his friend, Arnold Thompson, who sat at an adjoining desk, "something has happened out at Leland's place in Sussex County. Want to take a drive out there with me?"

"What? On a day like this? Why not take the train?"

"Don't be foolish, Tommy," said Frank. "The place is eight miles from the nearest station, which is a flag stop out in the wilds. And, even if you could find a cab there--which you couldn't--there isn't a taxi driver in Jersey who'd take you up into those mountains on a day like this. No, we'll have to drive. It'll be okay. I've got chains on the rear and a heater in the old coupe, so it shouldn't be so bad. What do you say?"

So Tommy, who usually followed wherever Frank led, was prevailed upon to make the trip. He had no particular feeling for Leland, but he sensed an adventure, and, in Frank's company, he could ask for no more.

* * * * *

Frank was a careful driver, and three hours were required to make the sixty-mile journey. Consequently, it was late in the afternoon when they arrived at the old DeBost estate. It had stopped snowing, but the drifts were deep in spots, and Frank soon found that the car could not be driven through the winding path from the road to the house. So they left it half buried in a drift and proceeded

on foot.

It was a laborious task they had undertaken, and, by the time they set foot on the dilapidated porch, even Frank, husky and athletic as was his build, was puffing and snorting from his exertions. Little Tommy, who tipped the scales at less than a hundred and twenty, could hardly speak. They both were wet to the waist and in none too good humor.

"Holy smoke!" gasped Tommy, stamping the clinging snow from his sodden trouser legs and shoes, "if it snows any more, how in Sam Hill are we going to get out of this place?"

"Rotten trip I let you in for Tommy," growled Frank, "and I hope Leland's worth it. But, darn it all, I just had to come."

"It's all right with me, Frank. And maybe it'll be worth it yet. Look--the front door's open."

* * * * *

He pointed to the huge oaken door and Frank saw that it was ajar. The snow on the porch was not deep and they saw that footprints led from the open door to a corner of the porch. At that point the snow on the railing was disturbed, as if a hurrying man had clung to it a moment before jumping over and into the drifts below. But the tracks led no further, for the drifting snow had covered all excepting a hollow where some body had landed.

"Thomas!" exclaimed Frank. "And he was in a hustle, by the looks of the tracks. Bet he was frightened while at the telephone and beat it."

They entered the house and closed the door behind them. It was growing quite dark and Frank searched for the light switch. This was near the door, and, at pressure on the upper button, the spacious old hall with its open staircase was revealed dimly by the single remaining bulb in a cluster set in the center of the high ceiling. The hall was unfurnished, excepting for a telephone table and chair, the chair having fallen to the floor and the receiver of the telephone dangling from the edge of the table by its cord.

"You must have heard the chair fall," commented Tommy, "and it sure does look as if Thomas left in a hurry. Wonder what it was that frightened him?"

The house was eerily silent and the words echoed awesomely through the adjoining rooms which connected with the hall through large open doorways.

"Spooky place, isn't it?" returned Frank.

* * * * *

And then they were both startled into immobility by a rumble that seemed to shake the foundations of the house. Heavier and heavier became this vibration, as if some large machine was coming up to speed. Louder and louder grew the rumble until it seemed that the rickety old house must be shaken down about their ears. Then there came a whistling scream from the depths of the earth--from far underground it seemed to be--and this mounted in pitch until their eardrums tingled. Then abruptly the sounds ceased, the vibration stopped, and once more there was the eery silence.

Rather white-faced, Tommy gazed at Frank.

"No wonder old Thomas beat it!" he said. "What on earth do you suppose that is?"

"Search me," replied Frank. "But whatever it is, I'll bet it has something to do with Leland's strange actions. And we're going to find out."

He had with him the large flashlamp from the car, and, by its light, the two made their way from room to room searching for the iron-bound door mentioned by Thomas.

They found all rooms on the first and second floors dusty and unused with the exception of two bedrooms, the kitchen and pantry, and the library. It was a gloomy and spooky old house. Floor boards creaked startlingly and unexpectedly and the sound of their footsteps echoed dismally.

"Where in time is that laboratory of Leland's?" exclaimed Frank, his ruddy features showing impatient annoyance, exaggerated to an appearance of ferocity by the light of the flashlamp.

"How about the cellar?" suggested Tommy.

"Probably where it is," agreed Frank, "but I don't relish this job so much. I'd hate to find Leland stiff down there, if that's where he is."

"Me, too," said Tommy. "But we're here now, so let's finish the job and get back home. It's cold here, too."

"You said it. No steam in the pipes at all. He must have let the fire go out in his furnace, and that's probably in the cellar too--usually is."

* * * * *

While talking, Frank had opened each of the four doors that opened from the kitchen, and the fourth revealed a stairway that led into the blackness beneath. With the beam of his torch directed at the steps, he proceeded to descend, and Tommy followed carefully. There was no light button at the head of the stairs, where it would have been placed in a more modern house, and it was not until they had reached the furnace room that they located a light fixture with a pull cord. An ordinary cellar, with furnace, coal bin, and a conglomeration of dust-covered trunks and discarded furniture, was revealed. And, at its far end, was the iron-bound door.

The door was locked and could not be shaken by the combined efforts of the two men.

"Have to have a battering ram," grunted Frank, casting about for a suitable implement.

"Here you are," called Tommy, after a moment's search. "Just the thing we are looking for."

* * * * *

He had come upon a pile of logs, and one of these, evidently a section of an old telephone pole, was of some ten or twelve inches diameter and about fifteen feet long. Frank pounced upon it eagerly, and, supporting most of the weight himself, led the attack on the heavy oak door with the iron bands.

No sound from within greeted the thunderous poundings. Clearly, if Leland was behind that door, he was either dead or unconscious.

Finally the double lock gave way and Tommy and Frank were precipitated headlong into the brightly lighted room beyond. Recovering their balance, they took stock of their surroundings and were amazed at what they saw--a huge laboratory, fitted out with every modern appliance that money could buy. A completely equipped machine shop there was; bench after bench covered with the familiar paraphernalia of the chemical and physical laboratory; huge retorts and stills; complicated electrical equipments; dozens of cabinets holding crucibles, flasks, bottles, glass tubing, and what not.

"Good Lord!" gasped Tommy. "Here's a laboratory to more than match our own. Why, Leland's got a fortune invested here!"

"I should say so. And a lot of stuff that our company does not even have. Some of it I don't know even the use of. But where is Leland?"

* * * * *

There was no sign of the man they had come to help. He was not in the laboratory, though the door had been locked from within and the lights left burning throughout.

With painstaking care they searched every nook and cranny of the large single room and were about to give up in despair when Tommy happened to observe an ivory button set into the wall at the only point in the room where there were no machines or benches at hand. Experimentally he pressed the button, and, at the answering rumble from under his feet, jumped back in alarm. Slowly there opened in the paneled oak wall a rectangular door, a door of large enough size to admit a man. From the recess beyond there came a breath of air, foul with the musty odor of decayed vegetation, dank as the air of a tomb.

"Ah-h-h!" breathed Frank. "So that is where Ed Leland is hiding! The secret retreat of the gloomy scientist!"

He spoke half jestingly, yet when he squeezed his stalwart bulk through the opening and flashed the beam of his light into the darkness of a narrow passage ahead he was assailed with vague forebodings. Tommy followed close behind and spoke not a word.

* * * * *

The passage floor was thick with dust, but the marks of many footsteps going and returning gave mute evidence of the frequency of Leland's visits. The air was heavy and oppressive and the temperature and humidity increased as they progressed along the winding length of the rock-walled passageway. The floor sloped, ever downward and, in spots, was slippery with slimy seepage. It seemed that they turned back on their course on several occasions but were descending deeper and deeper into the heart of the mountain. Then, abruptly, the passage ended at the mouth of a shaft, which dropped vertically from almost beneath their feet.

"Whew!" exclaimed Frank. "Another step and I'd have dropped into it. That's probably what happened to Leland."

He knelt at the rim of the circular opening and looked into the depths of the pit, Tommy following suit. The feeble ray of the flashlight was lost in the blackness below.

"Say, Frank," whispered Tommy, "turn off the flash. I think I saw a light down there."

And, with the snapping of the catch, there came darkness. But, miles below them, it seemed, there was a tiny pin-point of brilliance--an eery green light that was like a wavering phosphorescence of will-o'-the-wisp. For a moment it shone and was gone. Then came the dreadful vibration they had experienced in the hall of the house--the whistling scream that grew louder and louder until it seemed they must be deafened. The penetrating wail rose from the depths of the pit, and the vibration was all around them, in the damp rock floor on which they knelt, and in the very air of the cavern. Hastily Frank snapped on the light of his flash.

"Oh boy!" he whispered. "Leland is certainly up to something down there and no mistake! How're we going to get down?"

"Get down?" asked Tommy. "You don't want to go down there, do you?"

"Sure thing. We're this far now and, by George, we're going to find out all there is to learn."

"How deep do you suppose it is?"

"Pretty deep, Tommy. But we can get an idea by dropping a stone and counting the seconds until it strikes."

* * * * *

He played the light of the flash over the floor and soon located a smooth round stone of the size of a baseball. This he tossed over the rim of the pit and awaited results.

"Good grief!" exclaimed Tommy. "It's not falling!"

What he said was true, for the stone poised lightly over the opening and drifted like a feather. Then slowly it moved, settling gradually into oblivion. Frank turned the flash downward and they watched in astonishment as the two-pound pebble floated deliberately down the center of the shaft at the rate of not more than one foot in each second.

"Well, I'll be doggoned," breathed Frank admiringly. "Leland has done it. He has conquered gravity. For, in that pit at least, there is no gravity, or at any rate not enough to mention. It has been almost completely counteracted by some force he has discovered and now we know how to follow him down there. Come on Tommy, let's go!"

And, suiting action to his words, Frank jumped into the mouth of the pit where he bobbed about for a moment as if he had jumped into a pool of water. Then slowly he sank from view, and Tommy followed him.

* * * * *

It was a most unique experience, that drop into the heart of the mountain. Practically weightless, the two young men found it quite difficult to negotiate the passage. For the first hundred or more feet they continued to bump about in the narrow shaft and each sustained painful bruises before he learned that the best and simplest method of accommodating himself to the strange condition was to remain absolutely motionless and allow the greatly weakened gravity to take its course. Each movement of an arm or leg was accompanied by a change in direction of movement, and contact with the hard stone walls followed. If they endeavored to push themselves from the contact the result was likely to be an even more serious bump on the opposite side of the shaft. So they continued the leisurely drop into the unknown depth of the pit.

Frank had turned off the flashlamp, for its battery was giving out and he wished to conserve its remaining energy for eventualities. Thus they were in Stygian darkness for nearly a half-hour, though the green luminosity far beneath them grew stronger with each passing minute. It now revealed itself as a clearly defined disc of light that flickered and sputtered continually, frequently lighting the lower end of the shaft with an unusual burst of brilliance. Remotely distant it seemed though, and unconscionably slow in drawing nearer.

"How far do you think we must drop?" called Tommy to Frank, who was probably fifty feet below him in the shaft.

"Well, I figure we have fallen about a thousand feet so far," came the reply, "and my guess is that we are about one third of the way down."

"Then this shaft is over a half-mile deep, you think?"

"Yes, at least a thousand yards, I should say. And I hope his gravity neutralizing machinery doesn't quit all of a sudden and let us down."

"Me, too," called Tommy, who had not thought of that possibility.

* * * * *

This was no joke, this falling into an unknown region so far beneath the surface of good old mother earth, thought Tommy. And how they would ever return was another thing that was not so funny. Frank was always rushing into things like this without counting the possible cost and--well--this might be the last time.

Gradually the mysterious light became stronger and soon they could make out the conformation of the rock walls they were passing at such a snail's pace. Layers of vari-colored rock showed here and there, and, at one point there was a stratum of gold-bearing or mica-filled rock that glistened with a million reflections and re-reflections. The air grew warmer and more humid as they neared the mysterious light source. They moved steadily, without acceleration, and Frank estimated the rate at about forty feet a minute. Then, with blinding suddenness, the light was immediately below and they drifted into a tremendous cavern that was illuminated by its glow.

Directly beneath the lower end of the shaft through which they had passed, there was a glowing disc of metal about fifteen feet in diameter. They drifted to its surface and sprawled awkwardly where they fell. Scrambling to gain a footing, they bounced and floated about like toy balloons before realizing that it would be necessary to creep slowly from the influence of that repelling force which had made the long drop possible without injury. Gravity met them at the disc's edge with what seemed to be unusual violence.

* * * * *

At first it seemed that their bodies weighed twice the normal amount, but this feeling soon passed and they looked about them with incredulous amazement. The metal disc was quite evidently the medium through which the repelling force was set up in the shaft, and to this disc was connected a series of heavy cables that led to a pedestal nearby. On the pedestal was a controlling lever and this moved over a quadrant that was graduated in degrees, one end of the quadrant being labeled "Up" and the other "Down." The lever now stood at a point but a very few degrees from the center or "Zero" mark and on the down side. Frank pulled this lever over to the full "Down" position and they found that they could walk over the disc with normal gravity.

"I suppose," said Frank, "that if the lever is at the other end of the scale one would fall upward with full gravity acceleration--reversed. At zero, gravity is exactly neutralized, and the intermediate positions are useful in conveying materials or human beings up and down the shaft as desired. Very clever; but what is the reason for it all?"

In the precise center of the great cavern there was a dome or hemisphere of polished metal, and it was from this dome that the eery light emanated. At times, when the light died down, this dome gleamed with dull flickerings that threatened to vanish entirely. Then suddenly it would resume full brilliance, and the sight was marvelous beyond description. A slight hissing sound came from the direction of the dome, and this varied in intensity as did the light.

"Gosh!" said Tommy. "That looks like silver to me. And, if it is, what a wealthy man our friend Leland has become. He has spent his fortune well, even if he used it all to get to this."

"Yes, but where is he?" commented Frank. Then: "Leland! Leland!" he called.

* * * * *

His voice echoed through the huge vault and re-echoed hollowly. But there was no reply save renewed flickerings from the dome.

Leaving the vicinity of the gravity disc, the two men advanced in the direction of the shining dome, which was about a quarter-mile from where they stood. Both perspired freely, for the air was very close and the temperature high. But the light of the dome was as cold as the light of a firefly and they had no hesitancy in drawing near. It was a beautiful sight, this dome of silver with its flickering lights and perfect contour.

"By George, I believe it _is_ silver," exclaimed Frank, when they were within a few feet of the dome. "No other metal has that precise color. And look! There is a wheelbarrow and some mining tools. Leland has been cutting away some of the material."

Sure enough, there was indisputable evidence of the truth of his statement. And the material was undoubtedly silver!

"Silver Dome," breathed Tommy, holding a lump of the metal in his hand. "A solid dome of pure silver--fifty feet high and a hundred in diameter. How much does that figure in dollars and cents, Frank?"

"Maybe it isn't solid," said Frank dryly, "though it's worth a sizeable fortune even if it is hollow. And we haven't found Leland."

* * * * *

They circled the dome twice and looked into every corner of the great cavern, but there was no sign of the man for whom they searched. The wheelbarrow was half filled with lumps of the heavy metal, and maul and drill lay where they had been dropped by the lone miner. A cavity three feet across, and as many deep, appeared in the side of the dome to show that considerably more than one wheelbarrow load had been removed.

"Funny," grunted Tommy. "Seems almost like the old dome had swallowed him up."

At his words there came the terrific vibration. The light of the dome died out, leaving them in utter darkness, and from its interior there rose the mounting scream that had frightened old Thomas away. From so close by it was hideous, devastating; and the two men clung to each other in fright, expecting momentarily that the earth would give way beneath their feet and precipitate them into some terrible depth from which there could be no return.

Then the sound abruptly ceased and a gleam of light came from under the dome of silver. A crack appeared between its lower edge and the rocky floor of the cavern, and through this crack there shone a light of dazzling brilliancy--a warm light of rosy hue. Wider grew the opening until there was a full three feet between the floor and the bottom of the dome. Impelled by some irresistible force from within, the two men stumbled blindly to the opening, fell to the floor and rolled inside.

There was a heavy thud and the dome had returned to its normal position, with Frank and Tommy prisoners within its spacious hollow. The warm light bathed them with fearful intensity for a moment, then faded to a rosy glow that dulled their senses and quieted their nerves. Morpheus claimed them.

* * * * *

When Frank awoke he found himself between silken covers, and for a moment he gazed thoughtfully at a high arched ceiling that was entirely unfamiliar. Then, remembering, he sprang from the downy bed to his feet. The room, the furnishings, his silken robe, everything was strange. His bed, he saw, was a high one, and the frame was of the same gleaming silver as the dome under which they had been trapped. The arched ceiling glowed softly with the same rosy hue as had the inner surface of the dome. A large pool of water invited him, the surface of the pool being no more than a foot below the point where it was built into the tile floor of the room. A large open doorway connected with a similar adjoining room, where he suspected Tommy had been taken. On his bare toes, he moved silently to the other room and saw that his guess had been correct. Tommy lay sleeping quietly beneath covers as soft as his own and amidst equal luxury of surroundings.

"Well," he whispered, "this doesn't look as though we would come to any harm. And I might as well take a dive in that pool."

Returning to his own room, he removed the silken garment with which he had been provided and was quietly immersed in the cool, invigorating water of the bath. His head cleared instantly.

"Hi there!" called Tommy from the doorway. "Why didn't you wake me up? Where are we, anyway?"

With dripping head and shoulders above the water, Frank was compelled to laugh at the sleepy-eyed, wondering expression on the blue-jowled face of his friend. "Thought you were dead to the world," he returned, "you old sleepy-head. And I don't know where we are, excepting that it is somewhere under the silver dome. What's more, I don't much care. You should get into this water. It's great!"

* * * * *

So saying, he dived to the bottom of the pool and stood on his hands, his feet waving ludicrously above the surface. Tommy sniffed once and then made a quick dash for the pool in his own room. He was not to be outdone by his more energetic partner.

A half-hour later, shaved and attired in their own garments, which had been cleaned and pressed and hung neatly in the closets, they settled themselves for a discussion of the situation. Having tried the doors of both rooms and found them locked from the outside, there was no other course open to them. They must await developments.

"Looks like Leland has quite an establishment down here inside the mountain," ventured Tommy.

"Hm!" snorted Frank, "this place is none of Leland's work. He is probably a prisoner here, as are we. He just stumbled on to the silver dome and was captured by whatever race is living down here beneath it, the same as we were. Who the real inhabitants are, and what the purpose of all this is, remains to be seen."

"You think we are in friendly hands?"

"These quarters do not look much like prison cells, Tommy, but I must admit that we are locked in. Anyhow, I'm not worrying, and we will soon learn our fate and have to be ready to meet it. The people who own this place must have everything they want, and they sure have some scientific knowledge that is not known to us on the surface."

"Wonder if they are humans?"

"Certainly they are. You never heard of wild beasts sleeping in beds like these, did you?"

* * * * *

Tommy laughed at he examined the exquisite hand-wrought figures on the silver bedstead. "No, I didn't," he admitted; "but where on earth did they come from, and what are they doing here?"

"You ask too many questions," replied Frank, shrugging his broad shoulders. "We must simply wait for the answers to reveal themselves."

There was a soft rap at the door of Frank's room, where the two men were talking.

"Come in," called Frank, chuckling at the idea of such consideration from their captors.

A key rattled in the lock and the door swung open to admit the handsomest man they had ever set eyes on. He was taller than Frank by several inches, standing no less than six feet five in his thin-soled sandals, and he carried himself with the air for an emperor. His marble-white body was uncovered with the exception of a loin cloth of silver hue, and lithe muscles rippled beneath his smooth skin as he advanced to meet the prisoners. His head, surmounted by curly hair of ebon darkness, was large, and his forehead high. The features were classic and perfectly regular. The corners of his mouth drew upward in a benign smile.

"Greetings," he said, in perfect English and in a soft voice, "to the domain of Theros. You need fear no harm from our people and will be returned to the upper world when the time comes. We hope to make your stay with us enjoyable and instructive, and that you will carry back kind memories of us. The morning meal awaits you now."

* * * * *

So taken aback were the two young Americans that they stared foolishly agape for a space. Then a tinkling laugh from the tall stranger set them once more at ease.

"You will pardon us, I hope," apologized Frank, "but this is all so unexpected and so unbelievable that your words struck me speechless. And I know that my friend was similarly affected--We place ourselves in your hands."

The handsome giant nodded understanding. "No offense was taken," he murmured, "since none was intended. And your feelings are not to be wondered at. You may call me Orrin."

He turned toward the open door and signified that they were to follow him. They fell in at his side with alacrity, both suddenly realizing that they were very hungry.

They followed in silent wonderment as Orrin led the way to a broad balcony that overlooked a great underground city--a city lighted by the soft glow from some vast lighting system incorporated in its vaulted ceiling high overhead. The balcony was many levels above the streets, which were alive with active beings of similar appearance to Orrin, these speeding hither and yon by means of the many lanes of traveling ways of which the streets were composed. The buildings--endless rows of them lining the orderly streets--were octagonal in shape and rose to the height of about twenty stories, as nearly as could be judged by earthly standards. There were no windows, but at about every fifth floor there was an outer silver-railed balcony similar to the one on which they walked. The air was filled with bowl-shaped flying ships that sped over the roof tops in endless procession and without visible means of support or propulsion. Yet the general effect of the busy scene was one of precise orderliness, unmarred by confusion or distracting noises.

* * * * *

Orrin vouchsafed no explanations and they soon reentered the large building of which the balcony was a part. Here they were conducted to a sumptuously furnished dining room where their breakfast awaited them.

During the meal, which consisted of several courses of fruits and cereals entirely strange to Frank and Tommy, they were tended by Orrin with the utmost deference and most painstaking attention. He anticipated their every want and their thoughts as well. For, when Frank endeavored to ask one of the many questions with which his mind was filled, he was interrupted by a wave of the hand and a smile from their placid host.

"It is quite clear to me that you have many questions to propound," said Orrin, "and this is not a matter of wonder. But it is not permitted that I enlighten you on the points you have in mind. You must first finish your meal. Then it is to be my privilege to conduct you to the presence of Phaestra, Empress of Theros, who will reveal all. May I ask that you be patient until then?"

So friendly was his smile and so polished his manner that they restrained their impatience and finished the excellent breakfast in polite silence.

And Orrin was as good as his word, for, no sooner had they finished when he led them from the room and showed the way to the elevator which conveyed them to the upper floor of the building.

From the silver-grilled cage of the lift they stepped into a room of such beauty and magnificence of decoration that they gazed about them in wondering admiration. The paneling and mouldings were of hammered silver that gleamed with polished splendor in the soft rose glow of the hidden lights. The hangings were of heavy plush of deep green hue and bore intricate designs of silver thread woven into the material. At the opposite side of the room there was a pair of huge double doors of chased silver and on either side of this pretentious portal there stood an attendant attired as was Orrin, but bearing a silver scepter to denote his official capacity.

"Phaestra awaits the visitors from above," intoned one of the attendants. Both bowed stiffly from the waist when Orrin led the two young scientists through the great doors which had opened silently and majestically at their approach.

* * * * *

If the outer room was astonishing in its sumptuousness of decoration and furnishing, the one they now entered was positively breath-taking. On every side there were the exquisite green and silver hangings. Tables, divans, and rugs of priceless design and workmanship. But the beauty of the surroundings faded into insignificance when they saw the empress.

A canopied dais in the center of the room drew their attention and they saw that Phaestra had risen from her seat in a deeply cushioned divan and now stood at its side in an attitude of welcome. Nearly as tall as Frank, she was a figure of commanding and imperious beauty. The whiteness of her body was accentuated by the silver embroidered and tightly fitted black vestments that

covered yet did not conceal its charms. A halo of glorious golden hair surmounted a head that was poised expectantly alert above the perfectly rounded shoulders. The exquisite oval of her face was chiseled in features of transcendent loveliness. She spoke, and, at sound of her musical voice, Frank and Tommy were enslaved.

* * * * *

"Gentlemen of the upper world," she said gently, "you are welcome to Theros. Your innermost thoughts have been recorded by our scientists and found good. With a definite purpose in mind, you learned of the existence of the silver dome of Theros, yet you came without greed or malice and we have taken you in to enlighten you on the many questions that are in your minds and to return you to mankind with a knowledge of Theros--which you must keep secret. You are about to delve into a mystery of the ages; to see and learn many things that are beyond the ken of your kind. It is a privilege never before accorded to beings from above."

"We thank you, oh, Queen," spoke Frank humbly, his eyes rivetted to the gaze of those violet orbs that seemed to see into his very soul. Tommy mumbled some commonplace.

"Orrin--the sphere!" Phaestra, slightly embarrassed by Frank's stare, clapped her hands.

At her command, Orrin, who had stood quietly by, stepped to the wall and manipulated some mechanism that was hidden by the hangings. There was a musical purr from beneath the floor, and, through a circular opening which appeared as if by magic, there rose a crystal sphere of some four feet in diameter. Slowly it rose until it reached the level of their eyes and there it came to rest. The empress raised her hands as if in invocation and the soft glow of the lights died down, leaving them in momentary darkness. There came a slight murmur from the sphere, and it lighted with the eery green flickerings they had observed in the dome of silver.

* * * * *

Fascinated by the weaving lights within, they gazed into the depths of the crystal with awed expectancy. Phaestra spoke.

"Men from the surface," she said, "you, Frank Rowley, and you, Arnold Thompson, are about to witness the powers of that hemisphere of metal you were pleased to term 'Silver Dome.' As you rightly surmised, the dome is of silver--mostly. There are small percentages of platinum, iridium, and other elements, but it is more than nine-tenths pure silver. To you of the surface the alloy is highly valuable for its intrinsic worth by your own standards, but to us the value of the dome lies in its function in revealing to us the past and present events of our universe. The dome is the 'eye' of a complicated apparatus which enables us to see and hear any desired happening on the surface of the earth, beneath its surface, or on the many inhabited planets of the heavens. This is accomplished by means of extremely complex vibrations radiated from the hemisphere, these vibrations penetrating earth, metals, buildings, space itself, and returning to our viewing and sound reproducing spheres to reveal the desired past or present occurrences at the point at which the rays of vibrations are directed.

* * * * *

"In order to view the past on our own planet, the rays, which travel at the speed of light, are sent out in a huge circle through space, returning to earth after having spent the requisite number of years in transit. Instantaneous effect is secured by a connecting beam that ties together the ends of the enormous arc. This, of course, is beyond your comprehension, since the Ninth Dimension is involved. When it is desired that events of the present be observed, the rays are projected direct. The future can not be viewed, since, in order to accomplish this, it would be necessary that the rays travel at a speed greater than that of light, which is manifestly impossible."

"Great guns!" gasped Frank. "This crystal sphere then, is capable of bringing to our eyes and ears the happenings of centuries past?"

"It is, my dear Frank," said Phaestra, "and I would that I were able to describe the process more clearly." She smiled, and in the unearthly light of the sphere she appeared more beautiful than before, if such a thing were possible.

On the pedestal which supported the sphere there was a glittering array of dials and levers. Several of these controls were now adjusted by Phaestra, the delicate motions of her tapered fingers being watched by the visitors with intense admiration. There came a change in the note of the sphere, a steadying of the flickerings within.

"Behold!" exclaimed Phaestra.

* * * * *

They gazed into the depths of the sphere and lost all sense of detachment from the scene depicted therein. It seemed they were at a point several thousand miles from the surface of a planet. A great continent spread beneath them, its irregular shore line being clearly outlined against a large body of water. Here and there the surface was obscured by great white patches of clouds that cast their shadows below.

"Atlantis!" breathed Phaestra reverently.

The lost continent of mythology! The fabled body of land that was engulfed by the Atlantic thousands of years ago--a fact!

Tommy glanced at Frank, noting that he had withdrawn his gaze from the sphere and was devouring Phaestra with his eyes. As if drawn by the ardor of his observation, she raised her own eyes from the sphere to meet those of the handsome visitor. Obviously confused, she dropped her long lashes and turned nervously to the controls. Tommy experienced a sudden feeling of dread. Surely his pal was not falling in love with this Theronian empress!

Then there came another change in the note of the sphere and once more they lost themselves in contemplation of the scene within. The surface of the lost continent was rushing madly to meet them. With terrific velocity they seemed to be falling. An involuntary gasp was forced from Tommy's lips. Mountains, valleys, rivers could now be discerned.

* * * * *

Then the scene shifted slightly and they were stationary, directly above a large seacoast city. A city of great beauty it was, and its buildings were of the same octagonal shape as were those of Theros! There could be but one inference--the Theronians were direct descendants of those inhabitants of ancient Atlantis.

"Yes," sighed Phaestra, in answer to the thought she had read, "our ancestors were those you now see in the streets of this city of Atlantis. A marvelous race they were, too. When the rest of the world was still savage and unenlightened, they knew more of the arts and sciences than is known on the surface to-day. The mysteries of the Fourth Dimension they had already solved. Their telescopes were of such power that they knew of the existence of intelligent beings on Mars and Venus. They had conquered the air. They knew of the relation between gravity and magnetism but recently propounded by your Einstein. They were prosperous, happy. Then--but watch!"

Faint sounds of the life of the city came to their ears. A swarm of monoplanes roared past just beneath them. The streets were crowded with rapidly moving vehicles, the roof-tops with air-craft. Then suddenly the scene darkened; a deep rumbling came from the sea. As they watched in fascinated wonder, a great chasm opened up through the heart of the city. Tall buildings swayed and crumbled, falling into heaps of twisted metal and crushed masonry and burying hundreds of the populace in their fall. The confusion was indescribable, the uproar terrific, and within the space of a very few minutes the entire city was a mass of ruins, fully half of the wrecked area having been swallowed up by the heaving waters of the ocean.

* * * * *

Phaestra stifled a sob. "Thus it began," she stated. "Trovus was first--the city you just saw--then came three more of the cities of the western coast in rapid succession. Computations of the scientists showed that the upheaval was widespread and that the entire continent was to be engulfed in a very short time. The exodus began, but it was too late, and only a few hundred people were able to escape the continent before it was finally destroyed. The ocean became the tomb of two hundred millions. The handful of survivors reached the coast of what is now North America. But the rigors of the climate proved severe and more than three-quarters of them perished within a few days after their planes landed. Then the rest took to the caves along the shore, and for a while were safe."

She manipulated the controls once more and there was a quick shift to another coast, a rugged, wave-beaten shore. Closer they drew until they observed a lofty palisade that extended for miles along the barren waterfront. They saw a fire atop this elevation and active men and women at various tasks within the narrow circle of its warmth. A cave mouth opened at the brink of the precipice near the spot they occupied.

Then came a repetition of the upheaval at Trovus. The ocean rushed in and beat against the cliff with such ferocity that its spray was tossed hundreds of feet in the air. The earth shook and the group of people around the fire made a hasty retreat to the mouth

of the cave. The sky darkened and the winds howled with demoniac fury. Quake after quake rent the rugged cliffs: huge sections toppled into the angry waters. Then a great tidal wave swept in and covered everything, cliffs, cave mouths and all. Nought remained where they had been but the seething waters.

* * * * *

"But some escaped!" exulted Phaestra, "and these discovered Theros. Though many miles of the eastern seaboard of your United States were submerged and the coastline entirely altered, these few were saved. Their cave connected with a long passage, a tunnel that led into the bowels of the earth. With the outer entrance blocked by the upheaval they had no alternative save to continue downward."

"They traveled for days and days. Some were overcome by hunger and fell by the wayside. The most hardy survived to reach Theros, a series of enormous caverns that extends for hundreds of miles under the surface of your country. Here they found subterranean lakes of pure water; forests, game. They had a few tools and weapons and they established themselves in this underground world. From that small beginning came this!"

Phaestra's slim fingers worked rapidly at the controls. The scenes shifted in quick succession. They were once more in the present, and seemed to be traveling speedily through the underground reaches of Theros. Now they were racing through a long lighted passage; now over a great city similar to the one in which they had arrived. Here they visited a huge workshop or laboratory; there a mine where radium or cobalt or platinum was being wrested from the vitals of the unwilling earth. Then they visited a typical Theronian household, saw the perfect peace and happiness in which the family lived. Again they were in a large power plant where direct application of the internal heat of the earth as obtained through deep shafts bored into the interior was utilized in generating electricity.

They saw vast quantities of supplies, fifty-ton masses of machinery, moved from place to place as lightly as feathers by use of the gravity discs, those heavily charged plates whose emanations counteracted the earth's attraction. In one busy laboratory they saw an immense television apparatus and heard scientists discussing moot questions with inhabitants of Venus, whose images were depicted on the screen. They witnessed a severe electrical storm in the huge cavern arch over one of the cities, a storm that condensed moisture from the artificially oxygenated and humidified atmosphere in such blinding sheets as to easily explain the necessity for well-roofed buildings in the underground realm. And, in all the speech and activities of the Theronians, there was evident that all-pervading feeling of absolute contentment and freedom from care.

"What I can not understand," said Frank, during a quiet interval, "is why the Theronians have never migrated to the surface. Surely, with all your command of science and mechanics, that would be easy."

"Why? Why?" Phaestra's voice spoke volumes. "Here--I'll show you the reason."

* * * * *

And again the scene in the sphere changed. They were on the surface and a few years in the past--at Chateau Thierry. They saw their fellow men mangled and broken; saw human beings shot down by hundreds in withering bursts of machine-gun fire; saw them in hand-to-hand bayonet fights; gassed and in delirium from the horror of it all.

They traveled over the ocean; saw a big passenger liner the victim of torpedo fire; saw babies tossed into the water by distracted mothers who jumped in after them to join them in death.

A few years were passed by and they saw gang wars in Chicago and New York; saw militia and picketing strikers in mortal combat; saw wealthy brokers and bank presidents turn pistols on themselves following a crash in the stock market; government officials serving penitentiary terms for betrayal of the people's trust; opium dens, speakeasies, sex crimes. It was a fearful indictment.

"Ah, no," said Phaestra kindly, "the surface world has not yet emerged from savagery. We should be unwelcome were we to venture outside. And now we come to the reason for your visit. You come in search of one Edwin Leland, a fellow worker at one time. Your motives are above reproach. But Leland came as a greedy searcher of riches. We brought him within to teach him the error of his ways and to beg him to desist from his efforts at destroying the dome of silver. He alone knew the secret."

"Then you followed him and we took you in for similar reasons, though our scientists found very quickly that your mental reactions were of entirely different type from Leland's and that the secret would be safe in your keeping. Leland remains obdurate. He

threatens us with physical violence, and his reactions to the thought-reading machines are of the most treacherous sort. We must keep him with us. He shall remain unharmed, but he must not be allowed to return. That is the story. You two are free to leave when you choose. I ask not that you give your word to keep the secret of 'Silver Dome.' I know it is not necessary."

* * * * *

The lights had resumed their normal glow, and the marvelous sphere returned to its receptacle beneath the floor. Phaestra resumed her seat on the canopied divan. Frank dropped to a seat on the edge of the dais. Tommy and Orrin remained standing, Tommy lost in thought and Orrin stolidly mute. The empress avoided Frank's gaze studiously. Her cheeks were flushed; her eyes bright with emotion.

Frank was first to break the silence. "Leland is in solitary confinement?" he asked.

"For the present he is under guard," replied Phaestra. "He was quite violent and it was necessary to disarm him after he had killed one of my attendants with a shot from his automatic pistol. When he agrees to submit peacefully, he shall be given the freedom of Theros for the remainder of his life."

"Perhaps," suggested Frank, "if I spoke to him...."

"The very thing." Phaestra thanked him with her wondrous eyes.

A high pitched note rang out from behind the hangings, and, in rapid syllables of the language of Theros, a voice broke forth from the concealed amplifiers. Orrin, startled from his stoicism, sprang to the side of his empress. She rose from her seat as the voice completed its excited message.

"It is Leland," she said calmly. "He has escaped and recovered his pistol. I have been told that he is now at large in the palace, terrorizing the household. We have no weapons here, you see."

"Good God!" shouted Frank. "Suppose he should come here?"

* * * * *

He jumped to his feet just as a shot rang out in the antechamber. Orrin dashed to the portal when a second shot spat forth from the automatic which must certainly be in the hands of a madman. The doors swung wide and Leland, hair disarranged and bloodshot eyes staring, burst into the room. Orrin went down at the next shot and the hardly recognizable scientist advanced toward the dais.

When he saw Frank and Tommy he stopped in his tracks. "So you two have been following me!" he snarled. "Well, you won't keep me from my purpose. I'm here to kill this queen of hell!"

Once more he raised his automatic, but Frank had been watching closely and he literally dove from the steps of the dais to the knees of the deranged Leland. As beautiful a tackle as he had ever made in his college football days laid the maniac low with a crashing thud that told of a fractured skull. The bullet intended for Phaestra went wide, striking Tommy in the shoulder.

Spun half way around by the impact of the heavy bullet, Tommy fought to retain his balance. But his knees went suddenly awry and gave way beneath him. He crumpled helplessly to the floor, staring foolishly at the prostrate figure of Leland and at Frank, who had risen to his feet and now faced the beautiful empress of Theros. Strange lights danced before Tommy's eyes, and he found it difficult to keep the pair in focus. But he was sure of one thing--his pal was unharmed. Then the two figures seemed to merge into one and he blinked his eyes rapidly to clear his failing vision. By George, they were in each other's arms! Funny world--above or below--it didn't seem to make any difference. But it was a tough break for Frank--morganatic marriage and all that. No chance--well--

Tommy succumbed to his overpowering drowsiness.

* * * * *

The awakening was slow, but not painful. Rather there was a feeling of utter contentment, of joy at being alive. A delicious languor pervaded Tommy's being as he turned his head on a snow white silken pillow and stared at the figure of the white-capped nurse who was fussing with the bottles and instruments that lay on an enameled table beside the bed. Memory came to him immediately. He felt remarkably well and refreshed. Experimentally he moved his left shoulder. There was absolutely no pain and it felt perfectly

normal. He sat erect in his surprise and felt the shoulder with his right hand. There was no bandage, no wound. Had he dreamed of the hammer blow of that forty-five caliber bullet?

His nurse, observing that her patient had recovered consciousness, broke forth in a torrent of unintelligible Theronian, then rushed from the room.

He was still examining his unscarred shoulder in wonder, when the nurse returned, with Frank Rowley at her heels. Frank laughed at the expression of his friend's face.

"What's wrong, old-timer?" he asked.

"Why--I--thought that fool of a Leland had shot me in the shoulder," stammered Tommy, "but I guess I dreamed it. Where are we? Still in Theros?"

"We are." Frank sobered instantly, and Tommy noted with alarm that his usually cheerful features were haggard and drawn and his eyes hollow from loss of sleep. "And you didn't dream that Leland shot you. That shoulder of yours was mangled and torn beyond belief. He was using soft nosed bullets, the hell-hound!"

"Then how--?"

* * * * *

"Tommy, these Theronians are marvelous. We rushed you to this hospital and a half-dozen doctors started working on you at once. They repaired the shattered bones by an instantaneous grafting process, tied the severed veins and arteries and closed the gaping wound by filling it with a plastic compound and drawing the edges together with clamps. You were anaesthetized and some ray machine was used to heal the shoulder. This required but ten hours and they now say that your arm is as good as ever. How does it feel?"

"Perfectly natural. In fact I feel better than I have in a month." Tommy observed that the nurse had left the room and he jumped from his bed and capered like a school boy.

This drew no sign of merriment from Frank, and Tommy scrutinized him once more in consternation. "And you," he said, "what is wrong with you?"

"Don't worry about me," replied Frank impatiently. Then, irrelevantly, he said "Leland's dead."

"Should be. I knew we shouldn't have started out to help him. But, Frank, I'm concerned about you. You look badly." Tommy was getting into his clothes as he spoke.

"Forget it, Tommy. You've been sleeping for two days, you know--part of the cure--and I haven't had much rest during that time. That is all."

"It's that Phaestra woman," Tommy accused him.

"Well, perhaps. But I'll get over it, I suppose. Tommy, I love her. But there's no chance for me. Haven't seen her since the row in the palace. Her council surrounds her continually and I have been advised to-day that we are to be returned as quickly as you are up and around. That means immediately now."

"Good. The sooner the better. And you just forget about this queen as soon as you are able. She's a peach, of course, but not for you. There's lots more back in little old New York." But Frank had no reply to this sally.

* * * * *

There came a knock at the door and Tommy called, "Come in."

"I see you have fully recovered," said the smiling Theronian who entered at the bidding, "and we are overjoyed to know this. You have the gratitude of the entire realm for your part in the saving of our empress from the bullets of the madman."

"I?"

"Yes. You and your friend. And now, may I ask, are you ready to return to your own land?"

Tommy stared. "Sure thing," he said, "or rather, I will be in a few minutes."

"Thank you. We shall await you in the transmitting room." The Theronian bowed and was gone.

"Well, I like that," said Tommy. "He hands me an undeserved compliment and then asks how soon we can beat it. A 'here's your hat, what's your hurry' sort of thing."

"It's me they're anxious to be rid of," remarked Frank, shrugging his broad shoulders, "and perhaps it is just as well."

"You bet it is!" agreed Tommy enthusiastically, "and I'm in favor of making it good and snappy." He completed his toilet as rapidly as possible and then turned to face the down-hearted Frank.

"How do we go? The way we came?" he asked.

* * * * *

"No, Tommy. They have closed off the shaft that led from the cavern of the silver dome. They are taking no more chances. It seems that the shaft down which we floated was constructed by the Theronians; not by Leland. They had used it and the gravity disc to transport casual visitors to the surface, who occasionally mixed with our people in order to learn the languages of the upper world and to actually touch and handle the things they were otherwise able to see only through the medium of Silver Dome and the crystal spheres. Further visits to the surface are now forbidden, and we are to be returned by a remarkable process of beam transmission of our disintegrated bodies."

"Disintegrated?"

"Yes. It seems they have learned to dissociate the atoms of which the human body is composed and to transmit them to any desired point over a beam of etheric vibrations, then to reassemble them in the original living condition."

"What? You mean to say we are to be shot to the surface through the intervening rock and earth? Disintegrated and reintegrated? And we'll not even be bent, let alone busted?"

* * * * *

This time he was rewarded by a laugh. "That's right. And I have gone through the calculations with one of the Theronian engineers and can find no flaw in the scheme. We're safe in their hands."

"If you say so, Frank, it's okay with me. Let's go!"

Reluctantly his friend lifted his athletic bulk from the chair. In silence he led the way to the transmitting room of the Theronian scientists.

Here they were greeted by two savants with whom Frank was already acquainted, Clarux and Rhonus by name. A bewildering array of complex mechanisms was crowded into the high-ceilinged chamber and, prominent among them, was one of the crystal spheres, this one of somewhat smaller size than the one in the palace of Phaestra.

"Where do you wish to arrive?" asked Clarux.

"As near to my automobile as possible," replied Frank, taking sudden interest in the proceedings. "It is parked in the lane between Leland's house and the road."

Tommy looked quickly in his direction, encouraged by the apparent change in his attitude. The scientists proceeded to energize the crystal sphere. They were bent upon speeding the parting guests. Their beloved empress was to be saved from her own emotions.

Quick adjustments of the controls resulted in the locating of Frank's car, which was still buried to its axles in snow. The scene included Leland's house, or rather its site, for it appeared to have been utterly demolished by some explosion within.

* * * * *

Tommy raised questioning eyebrows.

"It was necessary," explained Rhonus, "to destroy the house in obliterating all traces of our former means of egress. It has been commanded that you two be returned safely, and we are authorized to trust implicitly in your future silence regarding the existence of Theros. This is satisfactory, I presume?"

Both Tommy and Frank nodded agreement.

"Are you ready, gentlemen?" asked Clarux, who was adjusting a mechanism that resembled a huge radio transmitter. Its twelve giant vacuum tubes glowed into life as he spoke.

"We are," chimed the two visitors.

They were requested to step to a small circular platform that was raised about a foot from the floor by means of insulating legs. Above the table there was an inverted bowl of silver in the shape of a large parabolic reflector.

"There will be no alarming sensations," averred Clarux. "When I close the switch the disintegrating energy from the reflector above will bathe your bodies for a moment in visible rays of a deep purple hue. You may possibly experience a slight momentary feeling of nausea. Then--presto!--you have arrived."

"Shoot!" growled Frank from his position on the stand.

Clarux pulled the switch and there was a murmur as of distant thunder. Tommy blinked involuntarily in the brilliant purple glow that surrounded him. Then all was confusion in the transmitting room. Somebody had rushed through the open door shouting, "Frank! Frank!" It was the empress Phaestra.

* * * * *

In a growing daze Tommy saw her dash to the platform, seize Frank in a clutch of desperation. There was a violent wrench as if some monster were twisting at his vitals. He closed his eyes against the blinding light, then realized that utter silence had followed the erstwhile confusion. He sat in Frank's car--alone.

The journey was over, and Frank was left behind. With awful finality it came to him that there was nothing he could do. It was clear that Phaestra had wanted his pal, needed him--come for him. From the fact that Frank remained behind it was evident that she had succeeded in retaining him. A sickening fear came to Tommy that she had been too late; that Frank's body was already partly disintegrated and that he might have paid the price of her love with his life. But a little reflection convinced him that if this were the case a portion of his friend's body would have reached the intended destination. Then, unexplainably, he received a mental message that all was well.

* * * * *

Considerably heartened, he pressed the starter button and the cold motor of Frank's coupe turned over slowly, protestingly. Finally it coughed a few times, and, after considerable coaxing by use of the choke, ran smoothly. He proceeded to back carefully through the drifts toward the road, casting an occasional regretful glance in the direction of the demolished mansion.

He would have some explaining to do when he returned to New York. Perhaps--yes, almost certainly, he would be questioned by the police regarding Frank's disappearance. But he would never betray the trust of Phaestra. Who indeed would believe him if he told the story? Instead, he would concoct a weird fabrication regarding an explosion in Leland's laboratory, of his own miraculous escape. They could not hold him, could not accuse him of murder without producing a body--the _corpus delicti_, or whatever they called it.

Anyway, Frank was content. So was Phaestra.

Tommy swung the heavy car into the road and turned toward New York, alone and lonely--but somehow happy; happy for his friend.

Earth, the Marauder

PART TWO OF A THREE-PART NOVEL

By Arthur J. Burks

[Illustration: Closer and closer they came.]

[Sidenote: Deep in the gnome-infested tunnels of the Moon, Sarka and Jaska are brought to Luar, the radiant goddess against whose minions the marauding Earth had struck in vain.]

WHAT HAS GONE BEFORE

The Earth was dying. Ever since Sarka the First, king of scientists, had given mankind the Secret of Life, which prolonged life indefinitely, the Earthlings had multiplied beyond all count, and been forced to burrow deep into the ground and high into the air in the desperate search for the mere room in which to live. There was much civil war. The plight of the children of men was desperate. Something had to be done.

[Illustration]

Then Sarka the Third called the Spokesmen of the Gens of Earth around him, and proposed to them a new scheme which had come to him in his laboratory atop the Himalayas. He would swing the Earth from its orbit!--send it careening through space toward the Moon!--there to destroy its inhabitants and supplant them with a colony of Earthlings! And then they would surge on to Mars!

One by one the twelve Spokesmen, each the head and representative of the teeming trillions comprising his Gens, acceded. Even Dalis, the jealous rival of Sarka, finally gave his sulky consent.

So, under Sarka's commands, the Earth's hordes were mobilized; and in tune with the Master Beryl in Sarka's laboratory all the Beryls of the Earth vibrated, freeing the Earth from her age-old orbit and swinging her out towards the Moon.

The Gens of Dalis--the trillions of people who swore allegiance to him--would lead the attack on the Moon. When within fifty thousand miles, they darted out, clad only in their tight green clothing and the helmets that held the anti-gravitational ovoids, which neutralized gravity for them and enabled them to instantly fly where they willed. Their only weapons were hand atom-disintegrators. And out from the Moon came mysterious aircars, with long clutching tentacles--the weapons of the Moon's minions! The war of the worlds was begun!

Yet Dalis, leader of the Gens that now engaged the Moon's aircars, was still in the laboratory with Sarka. For Dalis' treacherous mind coveted control of the Earth, and though the urge to lead his Gens into battle was tremendous, still he stayed, watching Sarka closely, waiting for the moment when he could trick Sarka and assume control.

And at the head of the Gens of Dalis was a woman, Jaska, whom Sarka loved. The Moon's aircars swept away the Gens of Dalis, and out from Earth poured the Gens of Cleric, who was Jaska's father. The newcomers fought desperately to save Jaska from the deadly clutches of the aircars.

Dalis could stand it no longer. He sped forth from the laboratory, to reorganize his beaten Gens. Jaska flew for home; but behind her a single aircar, splashed with crimson, reached forth its tentacles to clutch her--and Sarka groaned with the agony of his impotence to help the woman he loved.

CHAPTER XI

Escape--and Dalis' Laughter

But Sarka was not to be so easily beaten. There still remained an infinite number of possible changes of speed by manipulation of ovidum by vibration set up by the Beryls, without which this flight from the beginning would have been impossible. But for two hours, while the white robed men of Cleric fought against the car of the crimson splashes to prevent the capture of the daughter of their Spokesman--and died by hundreds in the grip of those grim tentacles--Sarka was forced to labor with the Beryls until perspiration bathed his whole body and his heart was heavy as he foresaw failure. And failure meant death or worse for Jaska.

But at the end of two hours, while the men of Cleric fought like men inspired against the aircar of the crimson slashes, a cessation in the outward speed of the earth could be noted. At the end of three hours the body of Jaska, all this time fighting manfully to attain to landing place on the Earth, was at last bulking larger; but the tentacles of the aircar were groping after her, reaching for her, striving to catch and clasp her to her death.

The two Sarkas watched and prayed while the might of the Beryls, traveling at top speed, fought against the force of whatever was used by the Moon-men to compel the Moon to withdraw. Still the men of Cleric fought that single car, and died by hundreds in the fighting. White robed figures which became shriveled and black in the grip of those tentacles.

* * * * *

Countless of the men of Cleric deliberately cast themselves against those tentacles, throwing their lives away to give Jaska more leeway in her race for life.

"Will she make it, father?" queried Sarka in a whisper.

"If the courage and loyalty of her people stand for anything, she will make it," he replied.

On she came at top speed, and now through the micro-telescopes the Sarkas could see the agony of effort on her face, even through the smooth mask used by the people of Earth for flight in space where there was no atmosphere. Courage was there, and the will of never-say-die; and Jaska, moreover, was coming back to the man she loved. In a nebulous sort of way Sarka realized this, for though these two had not mated there was a resonant inner sympathy between them which had rounded into an emotion of overpowering force since Jaska had proved to Sarka that she was to be trusted--that he had been something less than a faithful lover when he had mistrusted her, ever so little.

Closer now and closer, and at last the aircar of the crimson splashes was drawing away, losing in the race for life. It was falling back, as though minded to turn about and race back for the Moon, now a ball in the sky, far away, the outlines of its craters growing dim and misty with distance. Now the men of Cleric, those who remained, were breaking contact with the aircar, and forming a valiant rear-guard for the retreat of Jaska.

* * * * *

Throughout the Earth, as the Beryls fought with ever increasing speed to lower the rate of the earth's outward race from the Moon, was such a trembling, such a vibration induced by conflicting, alien forces as there had not been even in that moment when back there in its orbit, the Earth could have either been kept within its orbit, or hurled outward into space at the touch of a finger.

Now Jaska, surrounded by her father's men, was almost close enough to touch the Earth.

She made it, weak and weary, and rested for a moment while her father's men steadied her. Then, thrusting them aside, with gestures bidding them return to their Gens, she lifted into the air again, and fled straight for the laboratory of Sarka.

She entered tiredly through the exit dome, and all but collapsed into the arms of Sarka. Gently he removed her helmet of the anti-gravitational ovoid, noting as she leaned against him the tumultuous beating of her heart. Then her gentle eyes opened and she whispered to Sarka.

"You trust me now?"

For answer he bent and kissed her softly on the lips--for the kiss, from the far distant time when the first baby was kissed by the first mother, had been the favored caress of mankind. Her face was transfigured as she read his answer in his eyes, and the touch of his lips. Then, remembering, fear flashed across her face. She straightened, and grasping Sarka by the hand, hurried with him into the observatory.

* * * * *

She took the seat in which Dalis had sat before he had gone out to the command of his Gens, studied for many minutes the battle in space between the two alien worlds.

"Dalis is winning," said the Elder Sarka quietly, "apparently!"

"The qualification is a just one," said Jaska softly. "'Apparently,' indeed! You will note now that, though men of the Gens of Dalis swarm all about the aircars, and even clamber atop them, no more are dying in the grasp of those tentacles? Is Dalis arranging a treacherous truce with the Moon-men?"

"I have been wondering about that," said Sarka softly, "for it is my belief that nothing not conducive to his own selfish interests would have forced Dalis to leave this place and take command of his Gens, as I had first ordered, unless he had schemes planned of which father and I could know nothing. Now that I think of it, Jaska, how did Dalis know our secret code of fingers?"

Jaska started, and turned a blanched face to Sarka.

"_Did_ he know?" she cried. "Did he? If he did that proves a suspicion that I have entertained since the first moment when Dalis swept into the fight, and I sensed that alien signals were being flashed back and forth!"

"Flashed back and forth!" ejaculated Sarka. "How do you mean? That Dalis was somehow able to communicate with the Moon-men in their own language, or through their own signals?"

* * * * *

"Why not? He knew our secret code, did he not? I never gave it to him, and I know that you did not. No, Dalis has some means, never discovered or suspected by you Sarkas, whereby he is able to understand alien tongues and alien sign manuals!"

"That means," said Sarka the Elder in a dead voice, "that by forcing Dalis to go out at the head of his Gens...."

"We have," interrupted Sarka the Younger, "placed a new weapon of treason in his hands! Dalis, at the very moment of contact with the aircars, loaded with Moon-men, broke in on their signals--they must have had some means of signalling one another--and communicated with them in their own way! Do you think it possible that, with all his Gens, he may go over to the Moon-men, form an alliance with them?"

For many moments no one dared to answer the question; yet, from what the Sarkas knew of him, it was not impossible at all. For Dalis was the master egotist always, and never overlooked opportunity to gain something for himself.

It was Jaska who broke the silence.

"Did you note carefully," she said, "those aircars which were partially destroyed by our ray directors and atom-disintegrators?"

The Sarkas nodded.

"Did you note that no men, formed like our own, no creatures of any sort whatever, fell from the cars?"

* * * * *

Again the awesome silence, and the keen brains of the Sarkas wrestled with this vague hint of the uncanny.

"You mean, Jaska ... you mean...."

"That the occupants of aircars are part of the cars, but--Beings of the Moon! That they are either metal monsters endowed with brains or tiny creatures irrevocably attached to the cars themselves!"

"But how," said Sarka at last, "are we to be sure? I can understand what Dalis might do if the Moon-men granted his wish for an alliance with them. It is easy to understand why his Gens would follow his lead, for with the Moon forced outward from the Earth faster than his Gens could retreat, there is but one direction for his Gens to go--toward the Moon! They would go to the Moon as captives and trust the keen brain of Dalis to gain the mastery, sooner or later, over the Moon-men. And then...."

"And then--?" repeated Sarka the Elder.

"Then, Dalis has already been inspired by the speed with which those aircars travel! You will remember that he did not take kindly to leaving the Earth and making his abode on some other planet! But why could he not do so, combine forces and knowledge with the people of that planet--and then return to Earth in alliance with them?--after we have depleted our forces by placing a large portion of our people on Mars and Venus and Saturn?"

"Sarka, my son," said Sarka's father, "before we continue with our flight to Mars, we must know the truth! We must somehow learn exactly what is going on on the Moon! If you could reach the Moon, alone, undetected, and bring back a report...."

* * * * *

For a moment he left it there, and the faces of all three were gray with worry and abysmal fear.

"I can't go bodily, father," said Sarka at last, "but you remember my secret exit dome, to the right of the observatory, from which I have never yet dared exit from this place for fear that it might cost me my life?"

Sarka the Elder nodded, while Jaska looked puzzled. Another evidence of the fact that Sarka had not always trusted her, for she knew nothing of a secret exit dome. Sarka's eyes, as he looked at Jaska, mutely asked her forgiveness, which she gave him with her smile.

"I remember, son, and now?..."

"Surely it is worth risking one's life to know what new menace looms over the children of men!"

"What is the use of this secret dome?" asked Jaska softly.

"It is merely an elaboration of the regular exit dome, combined with certain phases of our atom-distintegrators, and the principle involved in the anti-gravitational ovoids. I step into the secret exit dome, garbed for flight Outside, and will myself to appear bodily in a certain place. It is instantaneous. I step into the dome, for example, and will myself to appear whole upon the Moon, and there I will appear!"

"You mean that during the period of transposition you are invisible?"

"Yes, invisible because non-existent, except for the essential elements of me, broken down by the secret exit dome, reassembled at the place willed in their entirety! I can't fly there, for a million eyes would see me approach! I must go in secret, as a spy, and wearing the clothing and insignia of a member of the Gens of Dalis!"

Silence in the observatory for a brief breathing space, and then Jaska spoke that speech out of the books of antiquity, which remains the classic expression of loyalty.

"Whithersoever thou goest, there will I go also!"

From the laboratory came a sudden burst of laughter, the laughter which all three recognized as the laughter of Dalis; but when they entered the place of the Revolving Beryl, there was no one there--and a feeling of dread, all encompassing, held them thralled for the space of several heart-beats. Dalis, they knew, was thousands of miles away, upon the Moon; yet here in the place of the Master Beryl they all three had just heard his sardonic laughter!

CHAPTER XII

Ashes of the Moon

Through the micro-telescopes it was possible to see what had happened after Dalis had assumed command of the Gens of Dalis. For even though the Moon, in spite of the speed of the Beryls, was being forced further and further from the Earth, the eyes of the micro-telescopes picked out and enlarged details to such an extent that the battle seemed to be transpiring under the eyes of the beholders.

A terrific jumble, in which Earthlings and aircars were all tumbled together in mad chaos, a great mass of writhing, green-garbed figures. Infinite in number--in the midst of which were the gigantic aircars, like monster beetles being beset by armies upon armies of ants.

Then, by the time Jaska had seated herself in the observatory atop the Himalayas, to watch what developed, the battle seemed to be over, and the Moon-men had won. For the huge cars swung around between the myriads of the Gens of Dalis, and seemed to be herding them toward the Moon, as though they were prisoners.

Telepathically, Sarka and his father had been able to catch some hint of the thoughts of the Earthlings in the battle, and these thoughts had been tinged with doubt, fear and horror, so that even thus to receive them, by mental telepathy, was to feel the

searing heat of their fear.

* * * * *

Now, in the instant when the battle in Space seemed to be over and the Gens of Dalis were prisoners, the thought waves were no more, and a brooding silence took their place. Dalis, the Sarkas knew, possessed the power to mask his thoughts, for it was a power possessed in common by all the scientists of Earth. But the common people of his Gens did not posses that power. However, for the moment Sarka had forgotten an all important something: that, when people were outside the roof of the world, they were subservient to the will of a common commander to whom they had sworn allegiance.

If, therefore, Dalis could mask his own thoughts from the brains of men, he could also mask the thoughts of the people of his Gens, merely by willing it! So Sarka and his father and Jaska could not know whether the Gens of Dalis had gone over in a body with him, in a truce with the people of the Moon, or whether they were dual prisoners--of Dalis and of the Moon-men!

More than ever was it necessary for someone to somehow reach the Moon and make a thorough investigation, discover just what Dalis was doing, what mischief he was hatching.

The secret exit dome seemed to be the answer.

"You can manage without me, father?" asked Sarka.

* * * * *

The elder Sarka nodded.

"Of the other Spokesmen of Earth," went on Sarka, "I trust Gerd the most. Might I suggest that you bring him here, trust him in all details, and let him take my place wherever possible? Or, better still, keep Jaska here with you! I ... I may not be able to return! I'll try to find a way, but--we can always communicate telepathically. Jaska...."

"Jaska," said that young lady grimly, "goes with Sarka wherever Sarka goes!"

"But it may mean death! We can only guess at the cunning of the Moon dwellers! They may have been in secret communication with Dalis for centuries! Dalis, who somehow discovered our secret finger code, may also know of the secret exit dome, and the principle upon which it operates! If he does, he may know how to combat it! Perhaps that explains his laughter! Perhaps he heard and understood every word we spoke, hears and understands every word we speak now! Who knows? He may wait until I have passed through the secret exit dome, and then make it impossible for me to be reincarnated on the Moon--or elsewhere!"

"No matter," said Jaska softly, "wherever Sarka goes, there goes Jaska! It is useless to attempt to dissuade me, and it is time you learned that!"

In spite of himself Sarka smiled, and his father met his smile with a quizzical one of his own. Both men had the same thought.

"The eternal woman!" said Sarka the Elder. "No man has ever understood her--no man ever will! And all men are ruled by her!"

Sarka shrugged, and Jaska spoke again.

"Don't you think it is time we tried this new experiment?"

* * * * *

Sarka nodded, and his face was suddenly alight with the excitement which burned within him.

"First," he said, "we need accoutrements of the Gens of Dalis for two people!"

Jaska smiled.

"Forseeing that we might have need of such equipment, I had several complete outfits sent here when I took charge of the Gens of Dalis as its Spokesman!"

Two minutes later, arrayed in the green clothing of the House of Dalis, swathed in it from neck to toe, wearing their belts and the masks which were necessary to life in space where there was no atmosphere, the whole topped by the gleaming helmets whose

skull-pans held the infinitesimally small anti-gravitational ovoids, Jaska and Sarka entered the secret exit dome, side by-side.

On the breast and back of each showed the yellow stars of the Gens of Dalis. There was no hiding their identity otherwise, and if any of the Gens saw them, both would be immediately recognized--for Jaska had commanded the Gens, and Sarka was the world's greatest scientist known to every human being. But they planned on carrying out their investigations by stealth.

"Father," said Sarka, "when the inner door is closed upon us, you have but to press the button to the right of the door. Press it when the light beside it glows red, which will indicate that we have willed ourselves to go to a certain destination!"

* * * * *

The inner door closed upon Sarka and Jaska, and, hand in hand, side by side, their bodies glowing with knowledge of warm, sympathetic contact, they waited for a miracle which had never before been attempted.

"Are you afraid, beloved?" queried Sarka.

"When I am with you," she said softly, "I have no fear."

"Then face the outer door, and will to go wherever I will to take you!"

Side by side, hand-in-hand still, they faced the outer door, and Sarka willed:

"Let us appear together in a deserted spot, within sight but unseen, of the Moon crater from which those aircars were sent against us!"

A sudden blur, a cessation of all knowledge, and then....

Sarka and Jaska stood side by side in a desolate expanse surrounded by bleak and appalling mountains of grotesque shape, in a light that was weirdly, awesomely blue. Their feet were invisible, deeply rooted in some soft, fine material which looked like snow.

After a swift glance around to see if anything lived or moved in this awful desolation, Sarka stooped and dipped up some of the fine stuff with his fingers, touched it to his lips.

* * * * *

The material seemed to be fine blue ashes and on his tongue it had a soapy savor. He peered at Jaska, whose eyes were glowing with excitement, whose lips were parted with anticipation, and instantly he opened a mental conversation with her.

"We must speak with each other telepathically, but do not speak with me until I have explained to you how to mask your thoughts from all persons save the one with whom you hold converse! First, I love you! Second, let us see if, searching the sky, we can find the Earth!"

In a few brief, highly technical words, Sarka told his beloved how to talk with him in the manner which he had never before explained to her. They had used telepathy before, countless times, but they had not cared who heard--while now secrecy in all things was the prime essential for success, even for life.

When he had told her, and she replied, "I understand perfectly, and it seems quite easy," they turned and surveyed the heavens, out of which, by this new miracle of the secret exit dome, they had dropped to the face of the Moon.

Away across the space between worlds, its transfiguration plainly visible to the two, they could make out and identify the world from which they had come. Save that they knew themselves standing on the Moon, they would have thought as far as appearances went, that the place where they had come was the Moon, many times enlarged. It seemed incredible that they had come so far in the twinkling of an eye; but that they had was proved by the fact of their physical presence.

"Look, Jaska!" said Sarka suddenly. "See how our Earth glows, as though it were afire inside!"

* * * * *

They stared at the great circular yellowish flame that he pointed out, and Sarka, always the scientist whose science was one of exactness, tried to estimate just where, on the Earth's surface, the glow was.

"Jaska," he said again, "that glow comes out of the heart of the Gens area which Dalis ruled! And no one lives there, since Dalis' Gens flew out to do battle! That's why we did not know of it before we left! That glow, somehow, beloved, is the cause of the outward-from-the-Earth journey of the Moon! First we must locate the Moon-source of the glow, and render it incapable of further forcing itself away! For do you realize that, unless we do so, we will never again see home?"

Jaska said nothing, but her eyes were troubled for a moment. Then she smiled again.

"What care I if I become a prisoner on the Moon, if you are with me?"

Sarka was just now realizing the wonder of this raven-haired woman whom, knowing her for half a century as he had, he had just known so little after all.

"If we seem in danger of discovery, Jaska," he said to her, "drop down instantly into the ashes, for if we are discovered by Dalis...."

He left it there and, with a deep intake of breath, started away for the nearest and highest hill. They desired to walk, yet found walking almost impossible, as they could not keep their feet on the ground save by the exercise of a really incredible effort of will. So, despairing of keeping their feet in contact with the ashes, they flew just above them, heading for the nearest weird-looking ridge.

* * * * *

In the strange light, which was oddly like moonlight in some painted desert of Earth, shapes were distorted and somehow menacing, colors were raw, almost bleeding--and distances that seemed but a step required hours to traverse.

Ever and anon, as they traveled they looked back up at the Earth which was their home. It still was visible, though plainly smaller with distance, and for a time Sarka's heart misgave him; but he only clasped tighter the hand of Jaska and moved on.

They were just at the base of the first hill, which had now become a mountain of gloomy, forbidding aspect, when the first sound they had heard on the moon came to them. A sound that was a commingling of the laughter of Dalis, the barking of jackals of the olden times, the humming of a million Beryls revolving at top speed, and a strident buzzing such as neither had ever heard.

Had they been discovered? Was the sound a warning? They could not know; but as they stared at the crest of the hill, two long, snaky, waving things appeared above the crest, undulating, waving to and fro, as though questing for something. They crouched low in the white ashes at the base of the mountain, and waited, scarcely breathing.

CHAPTER XIII

The Lunar Cubes

For a long time Sarka and Jaska remained still, like sentinels, listening to the strange discord which seemed to emanate from behind the hill at whose base they crouched.

"Look!" said Sarka at last. "There against the sky, beyond and between those two waving tentacles! Note that column of light, scarcely lighter than the light which surrounds it everywhere? It looks like a massive column just lighter than everything around it, yet so little lighter that you have to watch closely to see it at all?"

Jaska stared for all of a minute, before she thought back her answer.

"I see it," she said.

"Note now whether it goes, as it reaches outward into Space!"

Jaska followed the mighty height of the thing, outward and outward, and then gasped.

"Sarka," she said, "its end touches the Earth in the very heart of that strange glow we spoke about!"

"Exactly! And people of Earth know nothing about it, because it is invisible to them! It is only from Outside that the glow it makes against the Earth is visible! If we can divert its direction, or render it useless in any way, the Moon will no longer be thrust away by its force!"

A pause of indecision, then Sarka thought again:

"Let us go, Jaska! Keep behind me, right on my heels!"

Slowly, fighting against something that seemed determined to pull, or hurl, them outward from the surface of the Moon with each forward movement they made, they essayed the side of the hill, pausing at the end of what seemed like hours in a sort of hollow just large enough to mask their bodies and stared over its edge into one of the craters of the Moon. Out of the depths of that crater came the discordant sounds, which now were almost deafening, and out of that crater too came the almost invisibly bluish column whose outer tip touched the Earth.

* * * * *

Right before them, so close that they all but rested in its shadow, was one of those monster aircars, its tentacles moving to and fro as though wafted into motion by some vagrant breeze. But since neither Sarka nor Jaska could feel the breeze, Sarka knew that it was life which caused the waving motion of those tentacles of terror.

"Note," he said to Jaska, "that there is a tiny trap-door in the bottom of the aircar, and that the thing rests on a half-dozen of those tentacles!"

"I see," came Jaska's reply.

Jaska went on:

"Note the gleaming thing on the ground, right below the aircar? I wonder what it is?"

They studied the thing there, which seemed to be a huge jewel of some sort that glittered balefully in the eery light of the Moon. It was, perhaps, twice the size of an average man's torso, and was almost exactly cubical in shape. As Sarka studied the thing, he sensed that feeling flowed out of it--that the cube, whatever it was, was alive!

He tore his glance away from it, and realized that he accomplished the feat with a distinct effort of will--as though the cube had willed to hold his gaze, knew he was there. His eyes, peering around the inner slope of the crater--which dipped over, some hundreds of feet down, and plunged downward to some unknown depth--noted a broad, flat stone, off to his right; and around the rim of the crater he counted a full hundred of the aircars, all with their tentacles waving as if they belonged to sentient creatures.

* * * * *

Below each one, as he studied them and strained his eyes to make out details, he caught the baleful gleam of other cubes like the first he had seen. The aircars, it seemed, were either sentinels, at the lip of the crater, or were the dwelling places of sentinels--and the cubes were those sentinels!

It seemed absurd, but it came to Sarka in a flash that that was the answer, and his eyes came back to the first cube, because it was nearer and more easy to study.

"I will not be swayed by the will of the thing," Sarka told himself. "Nor will I allow it to analyze me! Jaska, do you do likewise!"

Beside him, Jaska shivered. He turned to look at her. Her face was coldly white, and her eyes were big with terror and fascination as she stared at that first cube, resting so balefully there under the first aircar.

He shook her, and she seemed to bring her eyes to his with a terrific, will-straining effort.

"Look at me!" he told her, telepathically. "Keep your eyes on me, for to look at the cube spells danger!"

But his own eyes went back to the thing, and he studied it closely. A cold chill raced through his body as he noted that its gleam was becoming dull, fading slowly out. It had gleamed brightly at first, and now was losing its sheen, fading away to invisibility. He thought he should be able, regardless of gleam or color, to see its outline; but its outline, too, seemed to be becoming faint, indistinct.

* * * * *

Then, in a trice, it was gone, and a feeling of uneasiness, more compelling than he had ever known before, coursed through the soul of Sarka. Where had the cube gone? What was it? What was its purpose? He tore his eyes away from the spot where he had last seen it, and stared away to the shadow beneath the second nearest aircar, where he had glimpsed another of the cubes.

The cube there, too, was fading out.

"Sarka! Sarka! Look!" came to his brain the thoughts of Jaska.

Sarka turned and stared at her, and a feeling of fear for which he could not account at all took fast hold of him. The eyes of Jaska, wide and staring as they had been when he commanded her to look away from the cube under the aircar, were staring at that flat, table-like rock, off to his right.

There, almost in the center of the rock, a gleaming something was taking shape! Just a dull spot, in the center of the yellow glow; then the beginning of the outline of a cube. Then, all at once, the cube itself, gleaming and baleful!

Sarka gasped in terror. He had seen the cube vanish, its glow disappear, and now here it was, almost close enough to touch, on a rock beside him, gleaming and baleful as before! That it was the same cube he had seen under the first aircar, he somehow knew without being told. That it was a sentient _thing_ he also knew, for now there was no mistaking the fact that, but for the presence in the little hollow of Jaska and Sarka, the cube would not have moved.

* * * * *

Swift as light, Sarka's right hand darted to his belt, where his ray director should be nestled against his need of it. And with his first movement, the cube's brilliance vanished instantly, the cube disappeared, and appeared again right before the face of Sarka, so close he could touch it! Yet he did not turn the ray director against it, nor did he extend his hand to touch the thing--because he was afraid to do so!

Even as the cube appeared before his eyes, thrice baleful and menacing in its close proximity, his eyes darted back to that broad flat rock, where the second gleaming cube now appeared!

"Great God, Jaska!" he sent mentally, "what does it mean?"

"These," she answered bravely back, "are Moon-soldiers! And, unless we manage not to appear furtive, we are undone!"

Still Sarka made no move, while other gleaming cubes appeared on the flat rock. Five other cubes appeared beside the first, at the rim of the hollow which held the forms of Jaska and Sarka. The cubes were closing on them, oddly like a squad of Earthlings in the olden times, advancing by rushes against an entrenched enemy!

The buzzing sound which they had first heard now seemed accentuated, but, instead of being outside of the listeners, seemed inside them, hammering against their very brains! Messages were being sent to them, or passed back and forth between and among the cube-men about them--and they hadn't the slightest idea how to make answer, know whether an answer was expected of them, or what the cube-men thought about them!

Since there was nothing else to do, they lay there, hands clasped, as children in the dark clasp hands, and waited for what might transpire.

* * * * *

Suddenly the discord from the inside of the crater ceased, and all was still, while it came to Sarka that the cube-men who stood before him were in grim communication with something invisible to Sarka and Jaska, somebody, perhaps, deep in the bowels of the Moon, over inside the crater.

They knew, those two, that the cube-soldiers were reporting their presence, and asking instructions; that the Moon had gone silent to listen, and that within a few moments their fate would be decided. What should they do?

In his hand Sarka held his ray director, with which he knew he could blast one or all of the cubes into nothingness. But still he held his hand, made no move.

Something, however, had to be done, for the discord was starting again, growing in volume. It made Sarka think, oddly enough, of a deaf mute fighting for speech! Then came the first intelligible sound....

A burst, from the depths of the crater, of sardonic laughter!

"Dalis!" said Sarka, and moved. While Sarka moved, Jaska held fast to his arm. Casting her fear to the winds, furious because of the laughter of Dalis, Sarka thrust his ray director back into his belt and stood upright.

Bending over he seized the first of the gleaming cubes and hurled it over the edge of the crater, saw it start plummeting down. But even before it fell out of sight within the crater its gleam had dulled until it was almost impossible to see the thing. Racing as though racing against time, Sarka caught up cube after cube and hurled them all after the first.

* * * * *

Out of the crater there came no sound of heavy objects striking, though Sarka felt there should have, for the cubes were almost as heavy as a man.

Then his hair almost stood on end under his helmet, for under that first aircar, where he had first seen it, the initial cube was again gleaming into life!

The thing had dissolved while being hurled over the rim, and reformed in its proper place, its station as silent sentinel under the aircar!

These cubes then, were indeed sentinels--sentinels impossible to injure. Though no force had been used against Sarka and Jaska, Sarka had the feeling that they were powerless, and that here on the edge of a crater of the Moon awful forces were being mustered against them. Mustered slowly, sluggishly, yet surely, as though the mentality which mustered them knew them helpless, and that there was no need to hurry!

As for Jaska, she merely clung to Sarka and waited--trusting him no matter what might transpire.

On a blind chance, Sarka brought out his ray director again, turned its muzzle toward that invisibly-blue column, pressed with his fingers, moving the director back and forth.

Instantly the blue column seemed to break short off, while the broken upper portion started racing outward toward the Earth. Sarka watched it, and noted that the yellowish glow on the Earth, even as he watched, was fading out--disappearing!

"If the ray will smash the blue column, Jaska," he said, "it will also destroy its source! Come! We will go look for it!"

And, holding her hand tightly, he rose to his feet and strode boldly down the inner slope of the vast crater.

CHAPTER XIV

The Crater Gnomes

It seemed to Sarka, as he moved down the inner slope of the crater, that the cubes were somehow making sport of him, laughing at him, though no hint of laughter or anything resembling laughter emanated from them.

But, shutting his lips grimly, holding fast to Jaska's hand, he proceeded on, reached the lower portion of the inner slope, where it dropped off into a seeming black abyss, and dropped, keeping to a safe speed because of the fact that both he and Jaska were attired for movement in the air--though their manner of aerial transportation could scarcely be called flying.

The anti-gravitational ovoids simply rendered ineffectual the law of gravity.

Down they dropped, endlessly it seemed, while all about them, growing gradually, a bluish glow began to make itself manifest. Sarka turned and looked at the face of Jaska and noted that it--all her being--was glowing with this strange radiance.

He smiled at her, and she smiled back.

Looking down now, to what seemed still a vast depth, they could see figures moving, tiny, almost infinitesimal, about a great circular cone, out of the depths of which came that strange bluish column whose outer tip touched the Earth.

* * * * *

Some inner sense warned Sarka not to touch that column, or to permit Jaska to do so. They dropped down beside it, while Sarka, for no reason that he could assign, once more took his ray director in his free hand and held it in readiness. It seemed so tiny and futile--so foolish for two people, one of them a woman--to go into the very heart of an alien world, against an unknown enemy,

armed with such a tiny weapon. Two people against unguessed myriads, whose very nature was an enigma, even to Sarka.

Closer now appeared the bottom of the crater, whose floor seemed to be covered with something that looked like blue sand, or rock. From this bluish substance the glow which bathed the two Earthlings seemed to emanate.

The funnel of the crater had now given away to the immensities of space, in all directions, and the cold of outside was being replaced by a warmth which promised soon to be even uncomfortable.

Then, without a jar, the two landed at the bottom of the crater, side by side, close enough almost to that great cone to touch it. Out of the cone came that bluish column, to shoot up through the funnel down which the two had lightly dropped ... and the motion of the--whatever it was--was accompanied by a muted moaning sound, like that of a distant waterfall.

They paused there, in amazement, taking stock of their surroundings. Huge tunnels, whose roofs were lost to invisibility in the bluish haze, whose extremities could only be guessed at, reached off in all directions. As far as the two could tell they were the only living souls within the crater, though both knew better.

Sarka had the feeling, and he knew Jaska shared it with him, that innumerable eyes were studying them, innumerable intellects were cataloguing them. And somehow he sensed the presence, somewhere near, of the traitor Dalis!

* * * * *

Then that discordant sound again, breaking so swiftly that it fell upon the eardrums of Sarka and Jaska like the crack of doom. Out of the many tunnels, from all directions, came hordes of beings which would have made the nightmares of Paracelsus--first of the scientists of Earth--pale to insignificance.

Paracelsus had written and illustrated his nightmares. Had hinted of strange acts of flesh-grafting--as the grafting of legs on the head of man. He had spoken, and written about, ghastly operations, from which men came forth as part men, part spiders; part men, part scorpions, dogs, cats, crocodiles....

Sarka thought, as his mind went back to those ancient books of his people in which still remained vestiges of the theories of Paracelsus, that somehow, in his dreams, Paracelsus must have visited the craters of the Moon.

These people ... if they could be called people....

They had heads like the heads of Earthlings, broad-domed of brow, lacking eyelashes or lids, so that their eyes were perpetually staring. They possessed no bodies at all, and their legs, thin and attenuated to the size of the wrists of average men, seemed to support the massive heads with difficulty!

From all directions they came, looking like spiders such as Sarka the First had described to Sarka, when Sarka had been a mere boy. They came on the floor, out of the tunnels; they dropped from the walls of the tunnels, and down from the invisible roofs, landing on the floor as lightly as feathers--and all converged on Jaska and Sarka.

They seemed to have no fear at all, but only a vast curiosity.

Closer and closer they came.

* * * * *

Jaska's grip tightened on the hand of Sarka, for one of the creatures, with a spiderish leap, had jumped upon her, fastening its legs in her tight-fitting costume, where he hung, his face within an inch or two of hers. His lidless eyes, unblinking, stared deeply into hers.

Others jumped up beside the first, and still others clambered over Sarka, until both Sarka and Jaska were covered by them like beetles attacked by ants. But these strange gnomelike creatures, who did not fear these strangers, apparently meant them no harm.

Then, after a thorough scrutiny, began the strangest talking Sarka had ever heard. The crater-Gnomes seemed to communicate by making strange clucking sounds with their tongues, sounds which were unmusical and discordant, and which, as the Gnomes who stood back from them, because already the two were covered until no more could cling to Jaska or Sarka, joined in the speech--mounted in the cavern to a vast crescendo of sound.

Sarka knew then that this was the sound which had come out to them while they crouched at the crater rim. These were people of the Moon: but if these were Moon-men, what, or who, were those gleaming cubes?

"Stand perfectly still," Sarka mentally admonished Jaska, "they apparently mean us no harm!"

He had not spoken aloud, had not allowed his thought to reach any but Jaska; yet instantly the discordant clucking ceased, and the Gnomes were quiet, as though they politely listened to someone who had interrupted them, yet whose interruption they resented, or were curious about.

* * * * *

Wondering how the creature would regard his action, Sarka reached forth and plucked away the first Gnome which had jumped upon Jaska, and placed him gently on the ground. The thing merely stared at Sarka with his lidless eyes, as though wondering at Sarka's meaning. Then his lips, which were triangular, rather than straight as those of Earthlings, began again that strange clucking.

Immediately the Gnomes which clung to Jaska and Sarka dropped away, and scuttled into the midst of the myriads that stood and watched. They did not understand the speech of these Earthlings, but they were unusually clever in comprehending the meaning of gestures.

"Hold fast to me, Jaska," thought Sarka toward her--and wondered anew as the Gnomes instantly ceased their clucking sounds--"for I am going to try an experiment."

Holding her hand still, he turned and strode straight toward the huge cone out of which rose the bluish column.

Instantly the Gnomes broke into a frightful clucking of tongues, a sound that mounted to ear-drum-breaking intensity, and in a trice, climbing over one another to get into position, they moved in between Sarka and the cone. So eager were they to bar his further progress that they stood atop one another, until the depth of them was as tall as Sarka standing upright.

Yet, though they plainly said to Sarka: "You must not approach the cone," they did not seem to be angry with their visitors, but only curious. Sarka looked at Jaska, noted how wanly she smiled.

Then he turned, and headed for the nearest of the monster tunnels.

* * * * *

Instantly he detected a surprising eagerness in the renewed clucking of tongues, while the Gnomes raced ahead, behind, all about the two, capering like pet animals, showing these strangers the way into the tunnel.

As they entered it, Sarka tried to discover whence came the bluish glow. The floor seemed to be of bluish sandstone, though its color, too, might have been caused by the glow. It was warm, too, so warm that perspiration was breaking out on the cheeks of Sarka.

Whence came the glow? Apparently from the very walls of the tunnel, or its roof; but surely from somewhere, surely from some secret place, whence it was diffused all over.

"And Jaska," said Sarka, "the Moon, according to my father's researches, is literally honeycombed with craters like this one!"

Again, as he thought, that strange, sudden cessation of the clucking of the Gnomes. Whither were they leading them? It was plain to be seen that the Gnomes were heading for some destination, almost herding Sarka and Jaska toward it. Capering creatures, who behaved witlessly, yet were far from witless. If Sarka were not sadly mistaken, these were Moon-men--and women, too, perhaps, since he could not tell the sex of them--and those gleaming cubes were their outer guards, perhaps slaves.

If the cubes were really of metal--they had felt warm to Sarka's touch--then these Moon-men had gone further in science than Earthlings, as they had imbued at least some metals, or stones, with intelligence sufficiently advanced for them to perform actions independently of their masters' wills.

* * * * *

Sarka, too, was remembering another thing: that he had touched one of these Gnomes, to remove it from Jaska--and had felt a distinct shock that was patently electrical!

The bluish glow was increasing, becoming more soft and mellow, shading gradually into golden, as they advanced--shading still as they preceded until it was almost white, almost blinding, in its radiance.

Then, of a sudden, the clucking of the Gnomes ended, and the creatures ceased their capering, fell into something that might have been an ordered military formation, and with Jaska and Sarka in the midst of them, moved straight toward a broad expanse of the tunnel wall, in the face of which appeared three long lines, deeply cut in the shape of a triangle.

The Gnome who had first leaped upon Jaska advanced to the wall, paused with his face almost against the lower line of the triangle, and remained there, intently staring, while the other Gnomes remained mute and unmoving.

Stronger and stronger appeared the blinding light. Slowly the inner portion of the triangle began to give inward, like a door. And out of the opening came that blinding radiance.

As the triangular door stood entirely open, Sarka and Jaska stood in thunderstruck silence, staring like people bereft of their senses. For there, standing in the opening, the now white radiance itself a mantle to cover her, was a woman, unclothed save for the radiance, who might have been of the Earth, save that she was more beautiful than any woman of Earth.

Beside her the radiant beauty of Jaska paled, became wan and sickly.

But Sarka noted immediately her eyes, whose depths bewildered, amazed him. For in them he could see no expression, no feeling, but only abysmal cruelty. That she was Sarka's master, and Jaska's master, and master of all these Gnomes, became instantly apparent for telepathically she addressed Sarka.

"I am busy now. The Moon-people will hold you prisoners in the Place of the Blue light, until I am ready to give you to the Cone!"

CHAPTER XV

The Place of the Blue Light

So the Gnomes were Moon-people, masters of the Moon cubes! And people and cubes were ruled by a woman who resembled a woman of Earth!

The Gnomes took them back the way they had come.

Where, Sarka wondered, were the people of the Gens of Dalis? And where was Dalis himself! Sarka was sure that, in those first discords which had come out of the crater, he had heard at least a hint of the laughter of Dalis.

And this woman clothed in radiance--who was she? And what? That she was a creature of the Moon, and yet resembled in all ways a woman of Earth, save that she was more beautiful than any woman Sarka had ever seen, seemed almost impossible to believe. Yet he had seen her. So had Jaska, and as Sarka and Jaska, with the capering Gnomes still about them, were led away to a fate at which they could only guess, Sarka wondered at Jaska's silence and at the strange lack of expression on her face.

He pressed her hand, but somehow she failed to return the pressure, mystifying more than ever. This sudden coldness was not like Jaska.

Back they went through the vast cavern where the cone of the bluish column still moaned and murmured. Sarka moved as close to the cone as the Gnomes would permit, and peered up along the mighty length of the column. At its tip was still the Earth, like a star viewed from the bottom of a deep well.

Smaller, too, it seemed, which proved that Sarka's breaking of the blue column had been but momentary, that the column had almost instantly regained its contact with the Earth. What was its source, what the composition of the column?

* * * * *

At the moment there could be no answer to the question. Now the Gnomes were escorting them into another tunnel, whose glow was even bluer than that which the two had experienced in the other tunnels. And the deeper they penetrated, the more distant from the cavern of the Cone, the deeper in color became that light.

Finally the Gnome who had mentally asked permission of the Radiant Woman to show her Jaska and Sarka passed before another expanse of wall, identical in appearance with that of the wall of the triangle from which the Radiant Woman had appeared.

This time the Gnome managed ingress by a strange clucking sound, with his triangular lips held close to the base-line of the triangle.

Now the door swung open; but the radiance which now came out was not clear white, as in the case of the outer door, but deeply, coldly blue. For the first time the Gnomes used force with their prisoners, thus proving to them that they were indeed prisoners. Their tiny feet caught at Sarka and at Jaska, and forced them through the door, which swung shut behind them.

Sarka looked at Jaska who, in this strange new light, had taken on the color of indigo, and smiled at her. She did not return his smile, but her eyes looked deeply, somewhat sorrowfully, into his. As though she asked him a question he could not understand, to which he could therefore give no answer.

* * * * *

Sarka was now conscious of the fact that the heat of their prison-house--whose character they did not as yet know--was becoming almost unbearable. They were alone, too, for the Gnomes had not entered the door of triangle. Sarka partially removed his life mask, and testing the atmosphere of the place, found it capable of being breathed without the mask. He signalled mentally to Jaska to remove her mask, and when the girl had done so he took her in his arms and kissed her on the lips.

She accepted his caress, but did not return it, and her eyes still peered deeply into his.

"Well, beloved," he said. "I am terribly sorry. But I did not want you to come because I was afraid that something of this sort would happen."

She did not answer.

"What is it, Jaska?" he said at last.

"What did you think of that woman?" she asked softly.

"Beautiful!" he said enthusiastically. "Fearfully beautiful! But did you see her eyes? She had no more mercy in her heart than if she were made of stone! And she hated us both the moment she saw us!"

"And you, Sarka--did you hate her, too?"

Sarka stared at her, not comprehending.

"I feel," he said, "that if we are ever to escape her, we must kill her, or render her incapable of retaining us!"

Then, of her own accord, Jaska placed her arms around Sarka, and gave him her lips. Her new behavior was as incomprehensible to Sarka as her former enigmatic expression had been. Wise in the ways of science was Sarka, but he knew nothing of women!

* * * * *

Now hand in hand again, they began a survey of their prison house. The bluish glow was unbearable to the eyes, and tears came unbidden and ran down the cheeks of the prisoners. In a minute or two, perspiration was literally bathing the bodies of the two. After a questioning exchange of glances, Sarka swiftly divested himself of his costume, stripping down to the gray toga of Earth's manhood. With a shrug, Jaska removed her clothing to her own toga, and the two suits Sarka carried under his arm.

They started ahead, exploring, then sprang back with a cry of fright. Sarka did not know whether it was Jaska or himself who had cried out; for just as they moved forward, a rent opened in the floor at their feet, and their eyes for a moment--they could stand no longer--peered into a bluely flaming abyss which, save for the color, reminded Sarka of the word pictures of Hell he had read in Earth's books of antiquity!

As the two stepped back, the rent in the floor closed instantly. Sarka had noted where the end of it had been, and started to detour, his eyes on the floor.

Over to his left the bluely glowing wall reached up to invisible immensity. But as he would have passed along the wall, the rent opened again, effectually barring his way.

Beyond the rent he could see a vast continuation of the cavern, and he felt that, could they only pass the rent, they might reach a place where the heat was not so unbearable, and they could stay and talk in comfort.

* * * * *

Releasing Jaska, he stepped back and prepared to leap the spot where the rent had been. High he jumped, and far, surprised at the length of his own leap. He landed lightly, far beyond the area where the rent had been, and even as he landed, a rent opened again at his feet, thus effectually barring further progress!

"It could just as easily," he told himself, "have opened under my feet, and dropped me into the abyss!"

From behind him came the sudden sound of screaming. He whirled to look back, to see Jaska standing there, arms outstretched toward him, her eyes wide with fear and horror, and as he stood watching, she raced to him, unmindful of abysses that might open under her feet, and flung herself into his arms.

"Come back!" she moaned. "Come back! Don't you see? _They_ don't wish you to explore further! We are in their power, and must simply await their pleasure, whoever or whatever they are! They see all we do!"

So they turned back, and stood against the door which held them prisoners; and the heat of the place seemed to enter into them, to gnaw at their very vitals. After a time Sarka found himself almost tearing at his throat, fighting for breath.

* * * * *

Gasping, the tears bathing their cheeks until even their tears and their perspiration would flow no more, they huddled now just inside the massive stone door, arms about each other, and almost prayed for death. Sarka at least prayed for death for both of them; but Jaska prayed for a way of deliverance, prayed that herself and Sarka might somehow win free, and be together again.

Sarka, who knew little of women, marveled at the grandeur of her courage, and wondered that he really knew this radiant woman so little. He compared her in his mind with the unclothed woman who had ordered them here as prisoners, and it came to him that Jaska was all perfection, all tender womanhood, while the Radiant Woman was a monster, without soul or compassion--a creature of horror who mocked God with her outward seeming of perfection.

Jaska read his thoughts, and smiled wanly to herself, and Sarka wondered how, suffering as he knew she must be suffering, she could find the courage to smile.

Then, for a time, the two became comatose, mastered by the blue heat, and in dreamlike imaginings wandered in strange fields which could only, to these two, have been racial memories, since neither had ever seen such fields. There were cool streams, all a-murmur, and breezes which cooled their sun-tanned cheeks. Water touched their tongues, and cooled their whole bodies as they gratefully imbibed it.

* * * * *

In their wanderings, in which Sarka was a faun and Jaska a nymph, they talked together in a language which only these two comprehended--a language which dealt in figures of speech, a language which depended upon handclasps for periods, glances of the eyes for commas, and the singing of their hearts for complete understanding.

Then a cool breeze, cool by comparison, caressed their pain-distorted cheeks, and the Gnomes came in, found them lying there, and clucked endlessly as though wondering what to do with them.

From hand to tiny hand, their feet serving as hands, the Gnomes passed garments--garments of the Gens of Dalis, and clothed again the two whom the Place of the Blue Light had all but slain. Of that ghastly experiment Sarka retained but one real memory....

That bluish light, in the midst of the abyss, shifting and swaying like blue serpents swimming in Hades ... that bluish light of the Cone, which he had broken up for a brief moment by the use of his ray director. Was this bluish light in the abyss the source of the light in the Cone? If one were to destroy it at its source....

The two regained consciousness completely as the triangular door closed behind Sarka and Jaska and the Gnomes, and they were taken into the refreshing coolness of the tunnel, led back again in the direction of the room where they had seen the Radiant Woman. Both Jaska and Sarka noticed that they were clothed in new clothing, and a shy blush tinged the cheeks of Jaska as her eyes met those of Sarka.

* * * * *

This time they entered the vast chamber of radiance behind the first triangular door, and were forced to their knees to do obeisance to the Radiant Woman, who sat on a gleaming yellow stone for dais! The guards who forced Sarka and Jaska to their knees, were clothed in the green of the Gens of Dalis, and Dalis himself, his face stern, but bearing no sign of recognition of these two, stood at the right hand of the Radiant Woman!

"You come to us as spies," the thought of the Radiant Woman impinged upon the brains of Sarka and of Jaska, "and as spies you should be given to the Cone. But if you swear eternal allegiance to me, to obey me in all things, to forego your allegiance to Earth, your lives will be spared! What say you?"

Boldly Sarka stared into the almost opaque eyes of the woman. Then his glance went to the face of Dalis.

"What," he asked boldly, in the language of Earth, "does the traitor Dalis say?"

"I have sworn allegiance to Luar, who addresses you, and am her ally in all things! I have but one addition to make to what she says: Jaska belongs to me!"

The sudden leering grin of Dalis was hideous.

Sarka peered at Jaska, framing his answer. But Jaska spoke first.

"For myself, O Dalis," she said swiftly, "I can answer in but one way. Return me to the Place of the Blue Light, and forget me there!"

Sarka smiled, while his heart leaped with joy.

"And I, O Luar," he said mentally to the Radiant Woman, "prefer death with Jaska, at the Place of the Blue Light, than life as a traitor to the world of my nativity!"

Instantly Luar began the clucking sound which was the language of the Gnomes, at the same time allowing her thoughts as she spoke to impress themselves upon the brains of the prisoners.

"Take them away! Take them to the Cavern of the Cone, and when they have suffered as much as such inferior beings are capable of suffering, thrust them into the base of the Cone!"

CHAPTER XVI

Cavern of the Cone

The Gnomes had been bidden to take the prisoners to the Cavern of the Cone, but to the surprise of Sarka and Jaska, they were taken back to the Place of the Blue Light! This time the Gnomes entered the place with them, closing and securing the door behind them.

But the Place of the Blue Light had changed!

Now it had no floor of blue, as it had had before, but only a corridor perhaps wide enough to allow the passage of four grown men, walking side by side, while the abyss of which the two had got but the merest hint through the opening and closing rents filled all the center of the place!

The Gnomes seemed impervious to the unendurable heat, and these, moving together, one behind the other, one beside the other, one atop the other, formed a living wall between Sarka and Jaska and the rim of the flaming blue abyss, to protect them from the heat.

Yet through the bodies of this living wall of Gnomes, a wall which was higher than the heads of Sarka and Jaska, the heat forced its way to the prisoners, and burned them anew with its agony.

To what dread rendezvous were they going? Where, save for the few guards at the house of Luar, were the people of the Gens of Dalis? Sarka felt, somehow, that the answers to all these questions would soon be made manifest, and a feeling of exaltation he could not explain was possessing him as he advanced. Around the corridor, whose one side was the wall reaching up to invisibility, whose other side dropped off into the abyss, the Gnomes herded the prisoners.

* * * * *

The leader of the Gnomes was again the Gnome who had first leaped upon Jaska to examine her curiously. Now, watching the lidless eyes of this being, Sarka fancied he could detect a hint of some expression. The Gnome was excited at some prospect, some climax which they were approaching. What? On and on they moved. The blue flames from the abyss, roaring in a way that neither of the prisoners had ever experienced, reached upward in searing tongues toward the invisible roof of this place.

Then, when they had progressed far from the door of entry, Sarka gasped at a new manifestation. Out of the abyss, some distance ahead, came a gleaming thing, something that had apparently evolved itself out of the flames of the abyss. Blue of color it was, because of the flames from the pit; but Sarka recognized it with a start which he could not suppress nor understand.

It was one of those cubes, such as he and Jaska had seen at the lip of the Moon-crater! As they approached, guided by the Gnomes, other cubes appeared out of the abyss, others in numbers swiftly augmented, until a veritable battalion of them had marshalled itself, there at the lip of the abyss.

* * * * *

Straight toward these cubes the Gnomes led Sarka and Jaska, and when they had reached the center of the group, they halted, forming a circle, still a wall to mask the prisoners from the heat of the abyss. The leader of the Gnomes stopped with his face, his lidless eyes, close to one of the cubes.

For a moment he paused thus, and Sarka felt sure that somehow the Gnome was holding thought converse with the cube; but, try as he might, he could find no meaning in the weird conversation for himself. It was oddly like listening to a conversation in a code beyond his knowledge.

Then the Gnome turned back to Sarka and Jaska. By a pressure of tiny feet, he tried to indicate that Sarka and Jaska should unclasp their hands. But they only clung the tighter, and now threw their arms about each other.

The Gnome desisted, much to the joy of the lovers, while Sarka studied the cubes, wondering what their mission was with Jaska and himself.

Slowly, together, the cubes began to lose their bluish glow, their cube shape--to vanish utterly.

In a trice, still locked in each other's arms, Sarka and Jaska saw the Gnomes through what appeared to be an even bluer haze. Besides, the heat of the abyss no longer tortured them, and their bodies were cooling in a way that was unbelievably refreshing.

"What is it, beloved?" whispered Jaska. "What is it?"

* * * * *

Sarka stared at the Gnomes, now in retreat, capering as they had first capered when the two had fallen into their hands, toward the door by which all had entered. Mystified, Sarka put forth his hand. It came in contact with something solid, and oddly warm, which stirred an instantly responsive chord in the brain of Sarka.

This feeling was the same as he experienced when he had lifted those cubes and hurled them into the crater--where they had dissolved in falling, and instantly reappeared, each under its own aircar!

"Jaska!" he explained. "Jaska! The cubes have dissolved themselves, and have reformed in the shape of a globe, as a protective covering about us, to protect us from the heat of the abyss! Apparently we are not to be killed at once! These cubes are slaves of the Gnomes, of whom Luar is ruler!"

They were indeed locked inside a globe, a globe whose integral parts were the cubes of their acquaintance; and the atmosphere of the interior was not uncomfortable, but otherwise. Sarka and Jaska were feeling normal for the first time since they had landed on the Moon. But what was the meaning of this strange imprisonment?

They were soon to know!

For the globe which enclosed them, moved to the edge of the flaming abyss, and dropped into the bluish glow! It did not drop heavily, like a falling object on Earth, but rather floated downward, right into the heart of the flames. At this new manifestation of the strangeness of science on the Moon, Sarka was at once all scientist himself, striving to find adequate answers for things which, from cause to effect, were entirely new to him. With Jaska still clasped close against him, he seated himself in the base of the globe and studied the area through which they were passing.

Blue flames which seemed to be born somewhere, an infinite distance below them; blue flames which he knew to be the element that, shot outward from the great cone, had forced the Moon away from the Earth.

No sound of the roaring flames came through the globe, but every movement of them was visible.

* * * * *

Sarka turned and peered through the bottom of the globe; but all he could see below were the flames, a molten indigo lake of them. Now, as they floated downward, the glow was giving away to lighter blue, to white, almost pure white, like the radiance which covered Luar like a mantle.

Sarka felt himself on the eve of vast important discoveries, and the scientist in him made him, for the moment, almost forget the woman at his side. Jaska, unbothered about anything, now that Sarka was at her side, regarded his expression of deep concentration with a tolerant smile.

Whiter now was the light, and faster fell the globe which held the two.

The color of the globe, now fallen below the area of blue, had taken on, chameleonlike, the color of the white flames that bathed it.

Then, apparently right in the center of a lake of white flames, though Sarka could see no solid place on which the globe had landed, the globe came to rest.

Now everything was plain to see, and Sarka studied his surroundings with new interest. He felt a mounting sensation of scalp-prickling horror.

For, scattered throughout the lake of white flames, in all directions, as far as the eye could reach--standing alone, suffering untold agonies, from the expressions on their faces--were people of the Gens of Dalis!

* * * * *

No longer were they clothed in green and wearing on breast and back the yellow stars of their Gens. Now they were nude as they had come into the world and standing there, each was holding out hands in horror, to hold back myriads of the Gnomes, who would have forced them to submerge themselves in the white flames of the lake!

Was the Gens of Dalis being burned alive? What was the meaning of this?

For a moment, filled with horror, Sarka looked away from the spectacle. Off to his right, as he sat, he noted that the flames, which here seemed lighter than they had in high levels, were converging on a single spot toward the side of the lake of white flames--as smoke converges on the base of a chimney leading outward to the air!

He knew as he stared that he was gazing at the spot where the bluish column of the cone was born!

Shaking his head, he turned back to the mighty spectacle of this horrible thing that was being done to the people of the Gens of Dalis.

In his brain there suddenly crashed a thought whose source he could only guess at, whose meaning mystified him more than anything yet experienced. The thought might have emanated from Luar, or from Dalis. But the more he thought of the matter, the more he thought how the phrasing of the thought was like the telepathy of Sarka the Second, now thousands of miles away, upon the Earth. And this was the thought:

"If they fight the flames, the flames will destroy them! If they go into them freely, voluntarily, they will be rendered immune to heat and to cold, to life and to death. But it is better that they die, for Earth's sake!"

What did it mean?

* * * * *

Sarka thought of the radiant white light which perpetually bathed the person of Luar, and thought that he had somehow been given a hint of its source. If the Gens of Dalis were voluntarily bathed in the lake of white flames, would they become as Luar?

Somehow, though he knew that such bathing would save their lives, the idea filled him anew with horror. He found himself torn between two duties. If he sent his thought out there to the Gens of Dalis, people of Earth, his people, they would be saved, but might forever become allies of the people of the Moon. If Sarka did not tell them, they would die--and there were millions of them.

But his science had always been a science of Life, and it still was.

"Enter the flames!" he telepathically bade his people. "Enter the flames!"

But they did not heed him, and for the first time the atmosphere of the interior of the globe seemed filled with savage, abysmal menace! Plain to Sarka was the meaning of that menace: The cubes which composed this globe were loyal to their masters, the masters to a mistress, Luar, and would countenance no meddling.

Likewise it was impossible, if the Gnomes willed it to the cubes, for Sarka to transmit his thoughts to the Gens of Dalis through the transparent walls of the globe!

They were prisoners, indeed, of Dalis and of Luar!

* * * * *

But could Sarka and Jaska turn their new-found knowledge to their own use? Sarka was thinking back, back to one of the ancient tomes of his people. It spoke, someplace, of a man who had got trapped in the heart of a seething volcano, where the heat of it had cured him of his illnesses, made him whole again, given him new youth and freshness.

But since the cubes could forestall his transmission of thought, and perhaps could read and understand thoughts, how was he to tell Jaska? How show her that a way of deliverance had been given into their hands, if they only possessed the courage to use it!

Again came that thought, which Sarka recognized as the telepathy of his father:

"Courage! You will win, and Jaska with you!"

Thoughts could come in to them then, but could not go out. Or did it mean that the cubes, or the masters of the cubes, did not care if the prisoners received messages from outside, because they knew themselves capable of frustrating anything the prisoners planned? Perhaps. More than likely that was it.

But, looking through the bottom of the globe, into the sea of white flames below, Sarka gripped more tightly his ray director, and tried to marshal the forces of his courage. There was surely some way of escape. Some way out of their strange predicament.

CHAPTER XVII

Casting the Die

Somehow Sarka believed that this white radiance of the abyss held the secret of the omnipotence of Luar, if omnipotence she possessed. That she did seemed sure, else Dalis would not have been with her. Besides, she had asked Sarka and Jaska to swear allegiance to her. Yes the secret was here, in the heart of the lake of white flames.

It might have been the Moon Fountain of Youth, or of omnipotence. There was no telling, unless Sarka tried an experiment.

His fury at Dalis now knew no bounds, and he was conscious of a desire, too poignant almost to be borne, in some way to circumvent the arch-traitor. For here in the craters of the Moon Dalis was working out a strange amplification of the scheme which he had, centuries before, proposed to Sarka the First. He was subjecting the people of his Gens to the white flames.

If they immersed themselves voluntarily, they became as Luar was, but still subservient to the will of Dalis--and, in his hands, invincible instruments of war! Dalis had doubtless already been bathed in the flames. Sarka was not sure, for in the home of Luar

the white light was so blinding it would have been impossible to make sure that the white radiance clothed the others with Luar.

"That's it!" said Sarka to himself. "That's it! Dalis and those guards at the dais of Luar have already been subjected to the white flames! The rest who immerse themselves, voluntarily, come forth as Luar and Dalis! Who do not, die. Dalis' manner of forcing the survival of the fittest! His idea of the flood in grandfather's time, only now he causes his selection by flames instead of flood! He believes that only those worthy to survive, and to stand at his back in whatever he conceives to be his need, will guess the secret of the immersion. The others will die!"

* * * * *

What a terrible alternative, when Dalis could as easily have given the secret to all his people! Could have told them how to save themselves! But it was not Dalis' way. Here, in the beginning of what was to become a dual sovereignty of the Moon, Dalis had already taken thought on the matter of over-population, and was destroying the many that the few--the strongest, most ruthless--might survive! Hundreds of thousands, millions of the Gens of Dalis, stood at the door of life, and did not know how to enter, merely because Dalis withheld the key! And, pausing in terror before the flames, they died, when a step and a plunge would have saved them all!

"If he lives to be a million, if he lives through everlasting life," said Sarka to himself, "and does penance through a thousand reincarnations, Dalis can never atone for this wholesale destruction of humanity! But I ... I wonder!"

Sarka realized the nicety of the revenge of Dalis upon Jaska and himself. Dalis had not given the secret to the prisoners, but by his use of the cubes, he had plunged them into the very heart of the horror, where they could see the suffering of the people of the Gens. Then, when they had seen and appreciated the horror of it all, they would follow the people of the Gens to death!

But Luar had spoken of thrusting them into the base of the Cone!

* * * * *

Then they were not for the flames after all! How could it be done? The globe composed of the cubes had but to transport the prisoners to the base of the Cone, press against that base, and open to let the prisoners free--and in the heart of the white-blue column they would be hurled outward from the Moon, into space. The mere prospect of such horror caused the perspiration to break forth anew on the body of Sarka.

But there might be a way.

"I wonder," he asked himself, "if the Earth people in _this_ crater could read my thoughts in spite of their agonies, if I could get my thought to them through the globe? I wonder if, reading my thoughts, they would obey?"

Bit by bit, as parts of a puzzle fall into place, he made his plan, and his heart beat high with excitement. Jaska bent before him to look into his eyes, and he knew that she was trying to read his face. She knew, wise Jaska, that this brilliant lover of hers was making a plan, and she believed in the sure success of it because it would be _his_!

She smiled at him, her courage high, and waited!

Holding the ray director between his body and that of Jaska, he took a terrible, ghastly chance. Dalis had known the secret sign manual of these two; but would the intelligence of the cubes comprehend it? He must take the chance, slender as it seemed. His free hand began to spell out, with all speed, the mad plan he had conceived.

"The white flames are harmless if one plunges into them voluntarily. Are you afraid to attempt it? No? Then unfasten your clothing, and have it so arranged that you can drop entirely out of it when I give you the signal, which will be a mere widening of the eyes, like this! You understand? We must go nude into the flames, so that they will bathe our whole bodies! But, when you slip out of your clothing, tear your anti-gravitational ovoid from the skull-pan of your helmet, and hold it in your mouth! Then depend upon me, and have no fear!"

"I have no fear," replied the fingers of Jaska. "I go to death with you if you wish--or to Life!"

* * * * *

Feeling the menace of the cubes almost gripping at his throat as he got into action, Sarka unfastened his own clothing, ripped the ovoid from his helmet, placed it in his mouth. Then, looking at Jaska, he gave her the signal.

Instantly, at her nod, he brought forth the ray director, pressed it with his fingers, directing its muzzle toward the curve of the globe, swinging it around in a circle, cutting out the bottom of the globe of cubes.

The action must have been one of untold surprise to the cubes which made up the globe, for before anything could be done to stay the hand of Sarka, his ray director had cut out the bottom of the globe, and Jaska and himself, divested now of all clothing, had fallen from the globe.

Unbearable heat slashed and tore at them. They still held hands, and when their feet touched upon something solid, they were gasping with the unbelievable heat; and it was ripping at their lungs like talons of white hot steel. But, pausing not at all, Sarka raced ahead with Jaska, and dived straight into the lake of white flames.

As he dived he directed his thoughts toward the people of the Gens who stood, undecided, dying by slow inches, on their little oases in the lake. And this was the thought, which was a command.

"Plunge into the flames! They will not hurt you! Plunge in, and obey my commands, O people of the Gens of Dalis! I, Sarka, command that you obey me! Jaska, who commanded you at the will of Dalis, also commands. Gather with Jaska and me at the base of the Cone! You have but to follow the converging of the flames!"

* * * * *

Together the two plunged in, and it seemed all at once as though the fire had gone out of the white flames, for they were cool and soothing to the touch. Sarka could feel new life being borne in him, could feel himself revitalized, exalted, lifted to the heights. He suddenly experienced the desire to run, and shout his joy for all to hear. But reason held him. Not thus easily would Luar and Dalis, the traitor, give over their designs against these two.

But in the heart of the flames, they dropped down, while they turned their faces toward the base of the Cone, or where they thought the base to be, even as Sarka gave another command to the now invisible people of the Gens of Dalis.

"Hold your ovoids in your mouths and follow! Obey my will!"

They dropped now to what seemed to be cool flagstones, while above them showed an orifice in a wall, into which those tongues of flame were darting. They paused there, side by side, their faces radiant, and looked back the way they had come.

Coming out of the white flames, like battalions on parade, were the people of the Gens of Dalis--scores and hundreds of them, who had sensed and heeded the mental commands of Sarka. Like genii appearing out of the flames they came, to muster about Sarka and Jaska.

Then, when it seemed that no more were coming, Sarka turned to the base of the Cone, his face high shining with courage and confidence, and stepped straight into the flames that led into the Cone. Beside him came Jaska, while behind him came the people of the Gens of Dalis who dared to do as he had commanded.

They were sucked into the Cone like chips sucked into a whirlpool, and Sarka willed a last command as they entered:

"Quit the column at the lip of the crater, and muster about the aircars!"

CHAPTER XVIII

The People of Radiance

The exaltation of Sarka knew no bounds, and looking into the eyes of Jaska, he knew she felt it, too. For her face was shining, and all of her, the wondrous shining brilliance of her, was bathed in the white radiance that mantled Luar. And now, since Jaska too knew that radiance, her beauty was greater even than that of Luar. Sarka thrilled anew at the glory of her.

But even as he stepped into the base of the Cone, he stepped out of the blue column at the lip of the Moon-crater. Swift as light, and swifter, had been the flight upward from the Cavern of the Cone; yet, so keen were his perceptions, he knew when he had passed through the chamber of the bluish glow, into which he and Jaska had first dropped upon arrival.

Now they were on the lip of the crater, and the people of the Gens who had followed him, were slipping out of the blue column, like insects out of a flame, and converging on the aircars whose tentacles still waved as they had when Sarka had last seen them.

Sarka looked at these people in amazement. To him there was a divinity now about their nudeness which nudity never before had suggested to him. For the people shone, and there was something glorious in those divinely white bodies. They reminded Sarka of his people's books of antiquity, and his childhood's pictures of angels....

But the effect of those white flames!...

* * * * *

There was no explaining it. But Sarka felt that whatever he willed to do he could do; that whatever he wished for was his, whether it was his by right or no. He felt that he could move mountains, with only the aid of his hands. Looking at Jaska he conceived all sorts of new beauty in her, for she was the brightest, to him, of all the people who had passed through the lake of white flames, and been cleansed in their heat.

"No wonder Luar has mastered the Moon!" he cried to Jaska. "For when she was bathed in the white flames, her will is paramount!"

"But how, if she passes the people of the Gens of Dalis through the flames, will she retain her sovereignty?"

"Because Dalis, too, has passed through, and his will is the will of the Gens! They will obey him, and he has sworn allegiance to Luar, or given some sort of oath of fealty!"

"How strange that but one person on the Moon has been bathed in the white flames!"

"How do we know," Sarka almost whispered it, "that she is, originally, of the Moon? Does she not look too much like our people, to be from another world entirely?"

"I do not know, but ... you mean ... you mean...?"

"I scarcely know; but Dalis would swear allegiance to no man, much less to a woman, unless he knew that man, or woman, far better than he has had opportunity, in a matter of hours only, to know Luar!"

He left it there then, as he strode boldly, with Jaska by his side, to the nearest of the aircars.

* * * * *

As he approached the car, the gleam cube beneath it seemed to gleam brighter and brighter, as though it echoed the radiance of Sarka. Sarka knew, studying this phenomenon, that he possessed at least a hint of the secret of Luar's omnipotence. There had been a hint before, but by now its meaning was clearer. The white flames, out of the heart of the dying Moon, gave new life, exaltation, not only to the bodies but to the brains of those who passed through it, and with their brains quickened, they possessed such knowledge as men of Earth, for ages, had wished to possess.

Transmutation of metals ... the ability, at will, to endow the higher, more selective metals with intelligence ... and the ability to retain command of the intelligences thus endowed. This explained the power of Luar over the Gnomes, and the power of the Gnomes over the cubes--if they possessed that power.

But the Gnomes, what of them? What were they?

But for a space Sarka must await the answer to that question, for there was little time. Already he knew that the tale of his escape, and his taking over of a portion of the Gens of Dalis, must have gone like wildfire through all the crater, and from this crater, perhaps, had been transmitted to all the craters of the Moon. All the craters....

* * * * *

That explained to him the absence from the lake of white flames, where he had seen so few, comparatively, of the people of Dalis' Gens. The Moon was honeycombed by such craters, and perhaps the white flame connected them all, made them all one. And Luar commanded all from her dais in this crater Sarka and his people were escaping. The millions of the Gens had been swallowed by the craters of the Moon, at command of Luar, acceded to by Dalis--and all over the Moon the very things which Sarka and Jaska had witnessed were taking place.

Even now, as Sarka raced for the aircar, and Jaska with him, he could feel a backward pulling that was well-nigh invincible. Someone was willing him to return, willing the Gnomes to pursue him, willing the cubes to refuse obedience to him; but he laughed and stepped to the aircar, passing by the nearest writhing tentacle as though he knew it possessed no power to harm him. The tentacle swept aside, and did not try to bar him, while he sent his will crashing against that brightly gleaming cube. "Into the aircar! We enter with you!"

The cube vanished instantly, and it seemed to Sarka that invisible hands caught at his feet, lifting him up through the trap-door in the belly of the aircar, up and inside. The door swung shut, and in the forward end of the vast aircar gleamed the cube which had obeyed his command!

* * * * *

Sarka sent one thought careening outward from the aircar, a command to the cubes which stood watch beneath the other aircars.

"Obey the Radiant People, and through them, _me_!"

The light of the cube made the interior of the aircar as light as day, and Sarka was struck at once with another phenomenon. He could see through the sides of the car in any direction.

And what he saw filled him with a sudden fear!

Out of the crater poured myriads of the Gnomes, and up the sides of it came myriads of the gleaming cubes, all racing toward the cars.

"Get back! Get back!" he commanded the Gnomes and the cubes.

At the same time he issued his commands to the cube within his own car, and to the cubes which by now were inside the other aircars, realizing that the cubes themselves were the motive power of the aircars--and that his will was the will of these individual cubes.

"Fly at once! Fly outward at top speed toward the Earth!"

Instantly, as though a single signal had started all the cars, a dozen aircars rose majestically from the crater, while Sarka studied the Gnomes and the cubes in turmoil on the rim. He noted then, a strange circumstance: that when he commanded the Gnomes and the pursuing cubes to keep back, they hesitated, dazedly, as though they did not know whether to advance or to retreat; that when he merely watched them, they came on.

He laughed aloud at this measuring of mental swords with Luar, and with Dalis. For he could sense the conflict very plainly. She commanded the Gnomes and the cubes to attack, he commanded them to retreat, and they remained undecided, like people drawn between two extremities, and uncertain which direction to take.

Upward, side by side now, floated the aircars of the Moon, and in the forepeak of each, one of the gleaming cubes, like--like anti-gravitational ovoids of the Moon! At the fast falling rim of the crater boiled the Gnomes and the cubes, stirring and tumbling, hampered by their very numbers, as they tried to attack at will of Luar and retreated in confusion at the will of Sarka.

Then there was Jaska beside Sarka, her face fearful, as he pointed off across the gloomy expanse of the Moon.

From all sides, from all directions, from other craters which these two had not even seen, came scores and hundreds of the monster cars!

They had beaten Luar and Dalis but for a moment, then! Now, at her command, the countless other aircars were coming in to head them off, to fight them back to the surface of the Moon. It would be a race against time, and against death. But of at least a dozen of the aircars, Sarka was master, and he did not fear the issue. That strange exaltation which the white flames had given him filled him with a confidence that nothing could shake.

He shot a thought at the gleaming cube in the forepeak.

"Faster! Faster! There is no limit to your speed! Faster! Faster! Even faster!"

Instantly the Moon seemed literally to drop away beneath the dozen aircars which carried the Radiant People, while the aircars of Luar and of Dalis fell hopelessly behind.

Sure that they would win in this race now, since he was just beginning to realize the vastness of his power--the all-encompassing, all-mastering power of the human mind and will, which the white flames of the Moon had made almost god-like--Sarka turned his eyes toward a coldly gleaming sphere in the star-spangled heavens ahead.

* * * * *

It was the Earth, and it seemed ringed in flames! From its edges there seemed to shoot long streamers of yellow or golden flames, which broke into sunlike pinwheels of radiance at their tips. Something, there on the precious Earth, was decidedly wrong!

Instantly, telepathically, he sought to gain mental contact with his father.

"Father, we are coming!" he said, across those countless miles. "What is happening?"

For a full minute there was no answer. Then it came, feeble, broken, weighted with fear; but it was a thought-message, unmistakably, of Sarka the Second.

"Hurry, son! Hurry! For Dalis has indeed betrayed us! I could not maintain control of the Earth with the Beryls, for some strange catastrophe has destroyed all the Beryls in the area Dalis ruled! The shifting of positions of the Earth and the Moon has so altered the relative effects of the pull of gravity exerted by the planets that Mars has been brought into dangerous proximity to us and is already so close that her ether-lights are playing over us! Surely you must be able to see them! We have received messages, but as yet I have only been partially able to decode them! What I have decoded, however, presages catastrophe--for I am sure that Mars and the Moon are in confederation, and that the Moon-people have deliberately forced us into contact with her ally!"

Cold fear clutched at the throat of Sarka as he caught the message. He decided not to tell Jaska for the moment. He looked to right and left, at the aircars on either side of him, then issued his commands.

"Faster! Faster! Be prepared to land in the area of the Gens of Cleric, as close as possible to my laboratory!"

A strange, awesome sight, that flight of the rebels of Dalis' Gens from the Moon to the Earth--like gleaming stars across the void. Far out in Space they fled at terrific speed through almost utter darkness, but their light was still blinding, lighting the way.

Murder Madness

CONCLUSION OF A FOUR-PART NOVEL

By Murray Leinster

[Illustration: _The deck was covered with panic-stricken folk who had come in awful terror to watch. And all were slaves to The Master._]

[Sidenote: Bell has fought through tremendous obstacles to find and kill The Master, whose diabolical poison makes murder-mad snakes of the hands; and, as he faces the monster at last--his own hands start to writhe!]

CHAPTER XV

The door of the car swung wide, and Ortiz's pale grim face peered in behind the blue steel barrel of his automatic. He smiled queerly as Jamison, with a grunt of relief, tapped Bell's wrist in sign to put away his weapon.

"Ah, very well," said Ortiz, with the same queer smile upon his face. "One moment."

He disappeared. On the instant there was the thunderous crashing of a weapon. Bell started up, but Jamison thrust him back. Then Ortiz appeared again with smoke still trickling from the barrel of his pistol.

"I have just done something that I have long wished to do," he observed coolly. "I have killed the chauffeur and his companion. You may alight, now. I believe we will have half an hour or more. It will do excellently."

He offered his hand to Paula as she stepped out. She seemed to shudder a little as she took it.

"I do not blame you for shuddering, Senorita," he said politely, "but men who are about to die may indulge in petty spites. And the chauffeur was a favorite with the deputy for whom I am substituting. Like all favorites of despots, he had power to abuse, and abused it. I could tell you tales, but refrain."

* * * * *

The car had come to a stop in what seemed to be a huge warehouse, and by the sound of water round about, it was either near or entirely built out over the harbor. A large section near the outer end was walled off. Boxes, bales, parcels and packages of every sort were heaped all about. Bell saw crated air engines lying in a row against one wall. There were a dozen or more of them. Machinery, huge cases of foodstuffs....

"The Buenos Aires depot," said Ortiz almost gaily. "This was the point of receipt for all the manufactured goods which went to the _fazenda_ of Cuyaba, Senor Bell. Since you destroyed that place, it has not been so much used. However, it will serve excellently as a tomb. There are cases of hand grenades yonder. I advise you to carry a certain number with you. The machine guns for the air-craft, with their ammunition, are here...."

He was hurrying them toward the great walled-off space as he talked, his automatic serving as a pointer when he indicated the various objects.

"Now, here," he added as he unlocked the door, "is your vessel. The Master bought only amphibian planes of late. Those for Cuyaba were assembled in this little dock and took off from the water. Your destruction up there, Senor Bell, left one quite complete but undelivered. I think another, crated, is still in the warehouse. I have been very busy, but if you can fuel and load it before we are attacked...."

They were in a roofed and walled but floorless shed, built into the warehouse itself. Water surged about below them, and on it floated a five passenger plane, fully assembled and apparently ready to fly, but brand new and so far unused.

* * * * *

"I'll look it over," said Bell, briefly. He swung down the catwalk painted on the wings. He began a swift and hasty survey. Soot on the exhaust stacks proved that the motors had been tried, at least. Everything seemed trim and new and glistening in the cabin. The fuel tanks showed the barest trace of fuel. The oil tanks were full to their filling-plugs.

He swung back up.

"Taking a chance, of course," he said curtly. "If the motors were all right when they were tried, they probably are all right now. They may have been tuned up, and may not. I tried the controls, and they seem to work. For a new ship, of course, a man would like to go over it carefully, but if we've got to hurry...."

"I think," said Ortiz, and laughed, "that haste would be desirable. Herr Wiedkind--No! _Amigo mio_, it was that damned Antonio Calles who listened to us last night. I found pencil marks beside the listening instrument. He must have sat there and eavesdropped upon me many weary hours, and scribbled as men do to pass the time. He had a pretty taste in monograms.... I gave all the orders that were needful for you to take off from the flying field. I even went there myself and gave additional orders. And Calles was there. Also others of The Master's subjects. My treason would provoke a terrible revenge from The Master, so they thought to prove their loyalty by permitting me to disclose my plan and foil it at its beginning.

"I would have made the journey with you to The Master, but as a prisoner with the tale of my treason written out. So I returned and changed the orders to the chauffeur, when all the Master's loyal subjects were waiting at the flying field. But soon it will occur to them what I have done. They will come here. Therefore, hasten!"

"We want food," said Bell evenly, "and arms, but mostly we want fuel. We'll get busy."

* * * * *

He shed his coat and picked up a hand-truck. He rammed it under a drum of gasoline and ran it to the walkway nearest to the floating plane. Coiled against the wall there was a long hose with a funnel at its upper end. In seconds he had the hose end in one of the wing fuel-tanks. In seconds more he had propped the funnel into place and was watching the gasoline gurgling down the

hose.

"Paula," he said curtly, "watch this. When it's empty roll the drum away so I can put another in its place."

She moved quickly beside it, throwing him a little smile. She set absorbedly about her task.

Jamison arrived with another drum of gas before the first was emptied, and Bell was there with a third while the second still gurgled. They heaped the full drums in place, and Jamison suddenly abandoned his truck to swear wrathfully and tear off his spectacles and fling them against the wall. The bushy eyebrows and beard peeled off. His coat went down. He began to rush loads of foodstuffs, arms, and other objects to a point from which they could be loaded on the plane. Ortiz pointed out the things he pantingly demanded.

In minutes, it seemed, he was demanding: "How much can we take? Any more than that?"

"No more," said Bell. "All the weight we can spare goes for fuel. See if you can find another hose and funnel and get to work on the other tank. I'm going to rustle oil."

He came staggering back with heavy drums of it. A thought struck him.

"How do we get out? What works the harbor door?"

* * * * *

Ortiz pointed, smiling.

"A button, Senor, and a motor does the rest." He looked at his watch. "I had better see if my fellow subjects have come."

He vanished, smiling his same queer smile. Bell worked frantically. He saw Ortiz coming back, pausing to light a cigarette, and taking up a hatchet, with which he attacked a packing case.

"They are outside, Senor," he called. "They have found the signs of the car entering, and now are discussing."

He plucked something carefully from the packing box and went leisurely back toward the door. Bell began to load the food and stores into the cabin, with sweat streaming down his face.

There was the sound of a terrific explosion, and Bell jumped savagely to solid ground.

"Keep loading! I'll hold them back!" he snapped to Jamison.

But when he went pounding to the back of the warehouse he found Ortiz laughing.

"A hand grenade, Senor," he said in wholly unnatural levity. "Among the subjects of The Master. I believe that I am going mad, to take such pleasure in destruction. But since I am to die so shortly, why not go mad, if it gives me pleasure?"

* * * * *

He peered out a tiny hole and aimed his automatic carefully. It spurted out all the seven shots that were left.

"The man who poisoned me," he said pleasantly. "I think he is dead. Go back and make ready to leave, Senor Bell, because they will probably try to storm this place soon, and then the police will come, and then.... It is amusing that I am the one man to whom those enslaved among the city authorities would look for The Master's orders."

Bell stared out. He saw a small horde of people, frantically agitated, milling in the cramped and unattractive little street of Buenos Aires' waterfront. Sheer desperation seemed to impel them, desperation and a frantic fear. They surged forward--and Ortiz flung a hand grenade. Its explosion was terrific, but he had perhaps purposely flung it short. Bell suddenly saw police uniforms, fighting a way through to the front of the crowd and the source of all this disturbance.

"Go back," said Ortiz seriously. "I shall die, Senor Bell. There is nothing else for me to do. But I wish to die with Latin melodrama." He managed a smile. "I will give you ten minutes more. I can hold off the police themselves for so long. But you must hasten, because there are police launches."

* * * * *

He held out his hand. Bell took it.

"Good luck," said Ortiz.

"You can come--" began Bell, wrenched by the gaiety on Ortiz's face.

"Absurd," said Ortiz, smiling. "I should be murder mad within three days. This is a preferable death, I assure you. Ten minutes, no more!"

And Bell went racing back and found Jamison rolling away the last of the fuel drums and Paula looking anxiously for him.

"Tanks full," said Jamison curtly. "Everything set. What next?"

"Engines," said Bell.

He swung down and jerked a prop over. Again, and again.... The motor caught. He went plunging to the other. Minutes.... They caught. He throttled them down to the proper warming up roaring, while the air in the enclosed space grew foul.

* * * * *

Once more to the warehouse. Ortiz shouted and waved his hand. He was filling his pockets with hand grenades. Bell made a gesture of farewell and Ortiz seemed to smile as he went back to hold the entrance for a little longer.

"We're going," said Bell grimly. "Get your guns ready, Jamison, for when the door goes up."

He pressed on the button Ortiz had pointed out. There were more explosions and the rattle of firearms from the front of the warehouse. There was a sudden rumble of machinery and the blank front of the little covered dock rose suddenly. The sunlit waters of Buenos Aires harbor spread out before them. To Bell, who had not looked on sunlight that day, the effect was dazzling. He blinked, and then saw a fast little launch approaching. There were uniformed figures crowded about its bows.

"All set!" he snapped. "I'm going to give her the gun."

"Go to it," said Jamison. "We're--"

The motors bellowed and drowned out the rest. The plane shuddered and began to move. The sound of explosions from the back of the warehouse was loud and continuous, now. Out into the bright sunlight the plane moved, at first heavily, then swiftly....

Bell saw arms waving wildly in the launch with the uniformed men. Sunlight glittered suddenly on rifle barrels. Puffs of vapor shot out. Something spat through the wall beside Bell. But the roaring of the motors kept up, and the pounding of the waves against the curved bow of the boat-body grew more and more violent.... Sweat came out on Bell's face. The ship was not lifting....

* * * * *

But it did lift. Slowly, very slowly, carrying every pound with which it could have risen from the water. It swept past the police launch at ninety miles an hour, but no more than five feet above the waves. A big, clumsy tramp flying the Norwegian flag splashed up river with its propeller half out of water. Bell dared to rise a little so he could bank and dodge it. He could not rise above it.

He had one glimpse of blonde, astonished beards staring over the stern of the tramp as he swept by it, his wing tips level with its rail and barely twenty feet away. And then he went on and on, out to sea.

He began to spiral for height fully four miles offshore, and looked back at the sprawling city. Down by the waterfront a thick, curling mass of smoke was rising from one spot abutting on the water. It swayed aside and Bell saw the rectangular opening out of which the plane had come.

"Ortiz's in there," he said, sick at heart. "Dying as he planned."

But there was a sudden upheaval of timbers and roof. A colossal burst of smoke. A long time later the concussion of a vast explosion. There was nothing left where the warehouse had been.

Bell looked, and swore softly to himself, and felt a fresh surge of the hatred he bore to The Master and all his works. And then filmy clouds loomed up but a little above the rising plane, and Bell shot into them and straightened out for the south.

* * * * *

For many long hours the plane floated on to southward, high above a gray ocean which seemed deceptively placid beneath a canopy of thin clouds. The motors roared steadily in the main, though once Bell instructed Jamison briefly in the maintenance of a proper course and height, and swung out into the terrific blast of air that swept past the wings. He clung to struts and handholds and made his way out on the catwalk to make some fine adjustment in one motor, with six thousand feet of empty space below the swaying wing.

"Carburetter wrong," he explained when he had closed the cabin window behind him again and the motors' roar was once more dulled. "It was likely to make a lot of carbon in the cylinders. O.K., now."

Paula's hand touched his shyly. He smiled abstractedly at her and went back to the controls.

And then the plane kept on steadily. Time and space have become purely relative in these days, in startling verification of Mr. Einstein, and the distance between Buenos Aires and Magellan Strait is great or small, a perilous journey or a mere day's travel, according to the mind and the transportation facilities of the voyager. Before four o'clock in the afternoon the coast was low and sandy to the westward, and it continued sterile and bare for long hours while the plane hung high against the sky with a following wind driving it on vastly more swiftly than its own engines could have contrived.

* * * * *

It was little before sunset when the character of the shore changed yet again, and the sun was low behind a bank of angry clouds when the stubby forefinger of rock that Magellan optimistically named the Cape of the Eleven Thousand Virgins reached upward from the seemingly placid water. Bell swept lower, then, much lower, looking for a landing place. He found it eight or nine miles farther on, on a wide sandy beach some three miles from a lighthouse. The little plane splashed down into tumbling sea and, half supported by the waves and half by the lift remaining to its wings, ran for yards up upon the hard packed sand.

The landing had been made at late twilight, and Bell moved stiffly when he rose from the pilot's seat.

"I'm going over to that lighthouse," he said curtly. "There won't be enough men there to be dangerous and they probably haven't frequent communication with the town. I'll learn something, anyway. You two stay with the plane."

Jamison lifted his eyebrows and was about to speak, but looked at Bell's expression and stopped. Leadership is everywhere a matter of emotion and brains together, and though Jamison had his share of brains, he had not Bell's corroding, withering passion of hatred against The Master and all who served him gladly. All the way down the coast Bell had been remembering things he had seen of The Master's doing. His power was solely that of fear, and the deputies of his selection had necessarily been men who would spread that terror with an unholy zest. The nature of his hold upon his subjects was such that no honorable man would ever serve him willingly, and for deputies he had need of men even of enthusiasm. His deputies, then, were men who found in the assigned authority of The Master full scope for the satisfaction of their own passions. And Bell had seen what those passions brought about, and there was a dull flame of hatred burning in his eyes that would never quite leave them until those men were powerless and The Master dead.

* * * * *

"You'll look after the ship and Paula," said Bell impatiently. "All right?"

Jamison nodded. Paula looked appealingly at Bell, but he had become a man with an obsession. Perhaps the death of Ortiz had cemented it, but certainly he was unable to think of anything, now, but the necessity of smashing the ghastly hold of The Master upon all the folk he had entrapped. Subconsciously, perhaps, Bell saw in the triumph of The Master a blow to all civilization. Less vaguely, he foresaw an attempt at the extension of The Master's rule to his own nation. But when Bell thought of The Master, mainly he remembered certain disconnected incidents. The girl at Ribiera's luxurious _fazenda_ outside of Rio, who had been ordered to persuade him to be her lover, on penalty of a horrible madness for her infant son if she failed. Of a pale and stricken _fazendiero_ on the Rio Laurenço who thought him a deputy and humbly implored the grace of The Master for a moody twelve year old girl. Of a young man who kept his father, murder mad, in a barred room in his house and waited despairingly for that madness to be meted out upon himself and on his wife and children. Of a white man who had been kept in a cage in Cuyaba, with other men....

* * * * *

Bell trudged on through the deepening night with his soul a burning flame of hatred. He clambered amid boulders, guided by the tall lighthouse of Cape Possession with the little white dwelling he had seen at its base before nightfall. He fell, and rose, and forced his way on and upward, and at last was knocking heavily at a trim and neatly painted door.

He was so absorbed in his rage that his talk with the lighthouse keeper seemed vague in his memory, afterward. The keeper was a wizened little Welshman from the Chibut who spoke English with an extraordinary mixture of a Spanish intonation and a Cimbrian accent. Bell listened heavily and spoke more heavily still. At the end he went back to the plane with a spindle-shanked boy with a lantern accompanying him.

"All settled," he said grimly, when Jamison came out into the darkness with a ready revolver to investigate the approaching light. "We get a boat from the lighthouse keeper to go to Punta Arenas in. He's a devout member of some peculiar sect, and he's seen enough of the hell Punta Arenas amounts to, to believe what I told him of its cause. His wife will look after Paula, and this boy will hitch a team to the plane and haul it out of sight early in the morning. With the help of God, we'll kill Ribiera and The Master before sunset to-morrow."

CHAPTER XVI

But they did not kill The Master before nightfall. It was not quite practicable. Bell and Jamison started out well before dawn with a favorable wind and tide, in the small launch the wizened Welshman placed at their disposal. His air was one of dour piety, but he accepted Bell's offer of money with an obvious relief, and criticized his Paraguayan currency with an acid frankness until Jamison produced Argentine pesos sufficient to pay for the boat three times over.

"I think," said Jamison dryly, "that Pau--that Miss Canalejas is safe enough until we come back. The keeper is a godly man and knows we have money. She'll be in no danger, except of her soul. They may try to save that."

Bell did not answer. He could think of nothing but the mission he had set himself. He tinkered with the engine to make it speed up, and set the sails with infinite care to take every possible advantage of the stiff breeze that blew. During the day, those sails proved almost as much of a nuisance as a help. The fiendish, sullen williwaws that blow furiously and without warning about the Strait required watching, and more than once it was necessary to reef everything and depend on the motor alone.

Bell watched the horizon ahead with smouldering eyes. Jamison watched him almost worriedly.

"Look here, Bell," he said at last, "you'll get nowhere feeling like you do. I know you've done The Master more damage than I have, but you'll just run your head into a trap unless you use your brains. For instance, you didn't ask about communications. There's a direct telegraph wire from Cape Virgins to Buenos Aires, and there's telephonic communication between the Cape and Punta Arenas. Do you imagine that the plane wasn't seen when it came in the Cape? And do you imagine The Master doesn't know we're here?"

* * * * *

Bell turned, then, and frowned blackly.

"I hadn't thought of it," he said grimly, "but I put some hand grenades in the locker, there."

"You damned fool!" said Jamison angrily. "Stop being bloodthirsty and use your head! You haven't even asked what I've done! I've done something, anyhow. That bundle I chucked in the bow has a couple of sheepmen's outfits in it. Lots of sheep raised around here. We'll put 'em on before we land. And like a good general, I arranged a method of retreat before we left B. A. There'll be a naval vessel here in two or three days. She's carrying a party of Government scientists. She'll anchor in Punta Arenas harbor and announce a case of some infectious disease on board. No shore leave, you see, and nobody from shore permitted on board her. And she has one or two damned good analytical chemists with a damned good laboratory on board her, too. It's a long gamble, but if we can get hold of some of The Master's poison.... Do you see?"

"Yes," said Bell heavily. "I see. But you haven't been through what I've been through. What I've done, fighting that devil, has caused men to be deserted after being enslaved. There's one place, Cuyaba...."

His face twitched. That place was in his dreams, now. That place and others where human beings had watched their bodies go mad, and had been carried about screaming with horror at the crimes those bodies committed....

"I'm going to kill The Master," he rasped. "That's all."

He settled down to his grim watch for the city. All during the cloudy, overcast day he strained his eyes ahead. Jamison could make nothing of him. In the end he had to leave Bell to his moody waiting.

* * * * *

The morning passed, and midday, and a long afternoon. Three times Bell came restlessly back to the engine and tried to coax more speed out of it. But when darkness fell the town was still not in sight. They kept on, then, steering by the stars with the motor putt-putt-putting sturdily away in the stern. The water splashed and washed all about them. The little boat rose, and fell, and rose and fell again.

"That's the town," said Bell grimly.

It was eleven at night, or later. Lights began to appear, very far away, dancing miragelike on the edge of the water. They grew nearer with almost infinite slowness. Two wide bands of many lights, with a darker space in which a few much brighter lights showed clearly. Presently a single red light appeared, the Punta Arenas harbor light, twenty-five feet up on an iron pole. They passed it.

"Bell," said Jamison curtly, "it's time you showed some sense, now. We're going to find out some things before we get reckless. This town isn't a big one, but it always was a hell on earth. No extradition from here. It's full of wanted men. It's dying, now, from the old days when all ships passed the Straits before the Panama Canal opened up, but it ought to be still a hell on earth. And we're going to put on these sheepmen outfits, and put up at some low caste sailors' and sheepmen's hotel on shore, and find out what is what. In the morning, if you like--"

"In the morning," said Bell coldly, "I'm going to settle with The Master."

* * * * *

They found a small and filthy hotel, in a still filthier street where the houses were alternately black and silent and empty, and filled with the squalid hilarity most seaport towns can somehow manage to support. The street lamps were white and cold. The dirt and squalor showed the more plainly by their light. There were sailors from the few ships in harbor, and women so haggard and bedraggled that shrill laughter and lavish endearments remained their only allure. And Bell and Jamison plodded to the reeking place in which a half-drunk sheepman pointed, and there Bell sat grimly in the vermin infested room while Jamison, swearing wryly, went out.

He came back later, much later. His breath was strong of bad whiskey and he looked like a man who feels that a bath would be very desirable. He looked like a man who feels unclean.

"Give me a cigarette," he said shortly. "I found out most of what we want to know."

* * * * *

Bell gave him a cigarette and waited.

"Good thing you stayed behind," said Jamison. "I want to vomit. Why people go in hell holes for fun.... But I was very drunk and very amorous. Picked up a woman and fed her liquor. Young, too. Damnation! She got crying drunk and told me everything she knew. I gave her money and left. Punta Arenas is The Master's, body and soul."

"One could have guessed it," said Bell grimly.

"Nothing like it is," said Jamison. "Every living creature, man, woman, and child, has been fed that devilish poison of his. The keepers of the dives go fawning to the local officials for the antidote. The _jefe politico_ is driven in his carriage to be cured when red spots form before his eyes. The damned place is full of suicides, and women, and--oh, my God! It's horrible!"

A humming, buzzing noise set up off in the night somewhere. It kept up for a long time, throttled down. Suddenly it seemed to grow louder, changed in pitch, and dwindled as if into the far, far distance.

"That's one of The Master's planes now, no doubt," said Jamison savagely, "going off on some errand for him. He uses this place practically as an experiment station. The human beings here are his guinea pigs. The deputies get a standardized form of the stuff, but he's got it worked out in different doses so he can make a man go mad in hours, if he chooses, instead of after a delay. I don't know how. And The Master--"

* * * * *

He checked himself sharply. There were shuffling footsteps in the hall outside. A timid tap on the door. Jamison opened it, while Bell dropped one hand inconspicuously to a weapon inside his shapeless clothing.

The toothless and filthy old man who kept the hotel beamed in at them.

"_Senores_," he cackled. "_Vdes son de Porvenir, no es verdad?_"

Jamison hiccoughed, as one who has been out and been drunken ought to do.

"_No, viejo_," he rumbled tipsily, "_somos de la estancia del Señor Rubio. Vaya._"

The old man seemed to mourn that they did not come from the sheep ranches about Porvenir Bay. But he produced a bottle with a shaking hand, still beaming.

"_Tengo muchos amigos en Porvenir_," he chirped amiably. "_Y questa botella--_"

"_Démela_," rumbled Jamison. He reached out his hand.

"_No mas que poquito!_" said the old man, beaming but anxious as Jamison tilted it to his lips. "_Es visky de gentes...._"

He beamed upon Bell, and Bell swallowed a spoonful and seemed to swallow vastly more. He lay back lazily while Jamison in the part of a tipsy sheepherder bullied the old man amiably and eventually chased him out.

"You're amused?" asked Jamison sardonically, when there were no more sounds outside. "Because I said you didn't want to meet the young senorita who loved you when she saw you downstairs? Well, Bell, if you used your brain you didn't swallow any of that stuff."

Bell started up. Jamison caught him by the shoulder.

"I'm not sure," he said sharply. "Of course not. But it's damned funny for a Spanish hotel keeper to give something for nothing, even when he seemed just to want to gossip about his friends. Here. Drink this water. It looks vile enough to take the place of mustard...."

* * * * *

Next morning the hotel keeper beamed upon them both as they went out of the place. A slatternly, dark haired girl who leaned on his shoulder smiled invitingly at Bell. And Bell, in his character of a loutish sheepman from one of the ranches that dot the shores of the Strait, grinned awkwardly back. But he went on with Jamison.

"We separate," said Jamison under his breath. "We want to find where The Master lives, mostly, and then we want to find the laboratory where his stuff is mixed. We don't want to do any killing until that's settled. After all, the Trade has something to say!"

Bell codded indifferently and began to wander idly about the streets, turning here and there as if moved by nothing more than the vaguest curiosity. But gradually he was working through the sections in which the larger buildings stood. Concrete structures, astonishingly modern, dotted the business section. But none of them had the air that would surround a place where a man with power of life or death would be. In a town the size of Punta Arenas there would be unmistakable evidences about The Master's residence, even if it were only that those who passed it did so hurriedly and with a twinge of fear.

* * * * *

There were prosperous men in plenty on the streets, mingled with deserting sailors, stockmen and farmers from the villages along the Strait, and even a few grimy men who looked like miners. But there is a lignite mine not far from the city, and a narrow gauge railroad running to it. Of the prosperous-seeming men, however, Bell picked out one here and there toward whom all passersby

adopted a manner of cringing respect. Bell lounged against a pole and studied them thoughtfully. Men with an air of amused and careless scorn which only men with unlimited power may adopt. He saw one grossly fat man with hard and cruel eyes. The uniformed policemen drove all traffic abjectly out of the way of his carriage, and stood with lifted hat until he had passed. The fat man gave no faintest sign of acknowledgment.

"I wonder," said Bell slowly, and very grimly, "if that's The Master?"

And then a passerby dodged quickly past his shoulder, brushing against him, and waited humbly in the street. Bell turned. A party of men were taking up nearly all the sidewalk. There were half a dozen of them in all. And nearly in the middle was the bulky, immaculate, pigmented Ribiera.

Bell stiffened. But to move, beyond clearing the way, would be to attract attention. He backed clumsily off the curbing as if making way....

And Ribiera looked at his face.

* * * * *

Bell's hand drifted near his hidden weapon. But Ribiera looked neither surprised nor alarmed. He halted and chuckled.

"Ah, the Senhor Bell!"

Bell said nothing, looking as stupid as possible, merely because there was nothing else to do.

"Ah, do not deny my acquaintance!" said Ribiera. He laughed. "I advise you to go and look at the view, over the harbor. Good day, Senhor Bell."

Laughing, he went off along the street. And Bell felt a cold horror creeping over him as he realized what Ribiera might mean. Ribiera had entirely too much against him to greet him only, in a town where even the dogs dared not bark without The Master's express command. He had guards with him, men who would have shot Bell down at a nod from Ribiera.

Bell burst into a mad run for the waterfront. When the bay spread out before his eyes he saw what Ribiera meant, and something seemed to snap in his brain.

The plane in which he and Jamison and Paula had escaped in was floating out in the harbor. It was unmistakable. A larger, bulkier seaplane floated beside it. The buzzing in the air the night before.... The arrival of the plane had been telephoned from Cape Virgins. Through a glass, perhaps, even its alighting had been watched. And a big seaplane had gone out to bring it back. Footprints in the sand would lead toward the lighthouse. There would be plenty of men to storm that, if necessary, to take the three fugitives. But they would have found only Paula. It was quite possible that the plane had only been sent for after Bell and Jamison had been seen to land in Punta Arenas. And Paula in The Master's hands would explain Ribiera's amusement perfectly.

* * * * *

Bell found Jamison looking unhurriedly for him. And Jamison glanced at his utterly white face and said softly:

"We want to get where we can't be seen, to talk. There's the devil to pay."

"No use hiding," said Bell. His lips seemed stiff. "Paula--"

"Hide anyway," snapped Jamison. He fairly thrust Bell into an alleyway between two houses and thrust two rounded objects beneath his loose fitting coat. "Two grenades. I have two more. The boat we came in is taken--"

"So is the plane," said Bell emotionlessly.

"And there is a sign, in English, posted where we tied it up. The sign says, '_The Senores Bell and Jamison may recover their boat on application to The Master, and may also receive news of a late traveling companion from him._"

"We're known," Bell told him--and amazingly found it possible to smile faintly--"Ribiera met me on the street and spoke to me and laughed and went on."

Jamison stared. Bell's manner was almost entirely normal again. Then Jamison shrugged.

"The sense of what you're saying," he observed wryly, "is that we're licked. Let us, then, go to see The Master. I confess I feel some curiosity to know just what he's like."

* * * * *

Bell was smiling. Being in an entirely abnormal state, he had a curious certitude of the proper course to adopt. He went up to a policeman and said politely, in Spanish:

"I am desired to report to The Master, himself. Will you direct me?"

The policeman abased himself instantly and trotted with them as a guide. And Bell walked naturally, now, with his head up and his shoulders back, and smoked leisurely as he went, and the policeman's abasement became abject. All who walked with that air of amused superiority in Punta Arenas were high in the service of The Master. Obviously, the two men in these dejected clothes must also be high in the service of The Master, and had adopted their disguise for purposes into which a mere policeman and a slave of The Master should not dare enquire.

Jamison was rather grim and still. Jamison thought he was walking to his death. But Bell smiled peculiarly and talked almost gaily and--as Jamison thought--almost irrationally.

* * * * *

They came to a house set in a fairly spacious lawn behind a rather high wall. There were greenhouses behind it, and there were flowers growing as well as any flowers can be expected to grow in such high altitudes. It was an extraordinarily cheerful dwelling to be found in Punta Arenas, but the shuddering fear with which the little policeman removed his hat as he entered the gateway was instructive.

They were confronted by four other policemen, on guard inside the gate.

"_Estos Señores_--" began the abject one.

"Take us to The Master," commanded Bell in a species of amused and superior scorn.

"It is required, Senor," said the leader of the four on guard, very respectfully, "it is required that none enter without being searched for weapons."

Bell laughed.

"Does The Master manage things so?" he asked scornfully. "Now, where I am deputy no man would dare to think of a weapon to be used against me! If it is The Master's rule, though...."

The policeman cringed. Bell scornfully thrust an automatic out.

"Take it," he snapped. "And go and tell The Master that the Senores Bell and Jamison await his pleasure, and that they have given up their weapons."

The policeman scuttled toward the house. Bell smiled at his cigarette.

"Do you know, Bell," said Jamison dryly, in English, "I'd hate to play poker with you."

"I'm not bluffing," said Bell. "Not altogether. I've a four card flush, with the draw to come."

* * * * *

Almost instantly the policeman returned, more abject still. He had stammered out Bell's message, just as it was given him. And the slaves of The Master did not usually disobey orders, especially orders designed to prevent any danger of a doomed man or woman trying to assassinate The Master before madness was complete. Bell and Jamison were received by liveried servants in utter silence and conducted through a long passageway, too long to have been contained entirely in the house as seen from the front. Indeed, they came out into a great open greenhouse, in which the smell of flowers was heavy. There were flowers everywhere, and a benign, small old man with a snowy beard and hair, sat at a desk as if chatting of amiable trivialities with the frock-coated men who stood about him. The white haired old man lifted a blossom delicately to his nostrils and inhaled its perfume with a sensitive

delight. He looked up and smiled benignly upon the two.

It was then that Jamison got a shock surpassing all the rest. Bell's hands were writhing at the ends of his wrists, writhing as if they were utterly beyond his control and as if they were longing to rend and tear....

And Bell suddenly looked down at them, and his expression was that of a man who sees cobras at the ends of his arms.

CHAPTER XVII

There was a long pause. Bell was very calm. He seemed to tear his eyes from the writhing hands that were peculiarly sensate, as if under the control of in intelligence alien to his own.

"I believe," said Bell steadily, "that The Master wishes to speak to me."

With an apparent tremendous effort of will, he thrust his hands into his pockets. Jamison cursed softly. Bell had taken the direction of things entirely out of his hands. It only remained to play up.

"To be sure," said a mild, benevolent voice. The man with the snowy beard regarded Bell exactly in the fashion of an elderly philanthropist. "I am The Master, Senor Bell. You have interested me greatly. I have grown to have a great admiration for you. Will you be seated? Your companion also pleases me. I would like"--and the mild brown eyes beamed at him--"I would like to have your friendship, Senor Bell."

"Pull out a chair for me, Jamison," said Bell in a strained voice. "And--I'd like to have a cigarette."

Jamison, cursing under his breath, put a chair behind Bell and stuck a cigarette between his lips. He held a match, though his hands shook.

"You might sit down, too," said Bell steadily. "From the manner of The Master, I imagine that the conversation will take some time."

* * * * *

He inhaled deeply of his cigarette, and faced the little man again. And The Master looked so benevolent that he seemed absolutely cherubic, and there was absolutely no sign of anything but the utmost saintliness about him. His eyes were clear and mild. His complexion was fresh and translucent. The wrinkles that showed upon his face were those of an amiable and a serene soul filled with benevolence and charity. He looked like one of those irritatingly optimistic old gentlemen who habitually carry small coins and stray bits of candy in their pockets for such small children as they may converse with under the smiling eyes of nurses.

"Ah, Senor Bell," he said gently. "You do cause me to admire you. May I see your hands again?"

Bell held them out. He seemed to have conquered their writhing to some extent. But he could not hold them quite still. Sweat stood out on his forehead. He thrust them abruptly out of sight again.

"Sad," said The Master gently. "Very sad." He sighed faintly and laid down the rose he had been toying with. His fingers caressed the soft petals delicately. "Fortunately," he said benevolently, "it is not yet too late for me to relieve the strain under which you labor, Senor. May I send for a certain medicine which will dispose of those symptoms in a very short time?"

"We'll talk first," said Bell harshly. "I want to hear what you have to say."

* * * * *

The Master nodded, his fingers touching the rose petals as if in a sensitive pleasure in their texture.

"Always courageous," he said benignly. "I admire it while I combat it. But the Senor Jamison...."

Jamison had been looking fascinatedly at his own hands, opening and closing the fingers with a savage abruptness. They obeyed him, though they trembled.

"I didn't drink the damned stuff that hotel keeper brought us last night," he growled. "Bell did. And I--"

"Wait a minute, Jamison," said Bell evenly. "Let's talk to The Master for a while. I swore, sir," he said grimly, "that I'd kill you. I've seen what your devilish poison does, in the hands of the men you've chosen to distribute it. I've seen"--he swallowed and said

harshly--"I've seen enough to make me desire nothing so much as to see you roast in hell! But you wanted to talk to me. Go ahead!"

* * * * *

The Master beamed at him, and then glanced about at the frock-coated men who had been attending him. Bell glanced at them. Ribiera was there, chuckling.

"I told you, _tio mio_," he said familiarly, "that he would not be polite. You can do nothing with him. Better have him shot."

Francia, of Paraguay, nodded amusedly to Bell as their eyes met. But The Master shook his really rather beautiful head. An old man can be good to look at, and with a saintly aureole of snow-white hair and the patriarchal white beard, The Master was the picture of benign and beautiful old age.

"Ah, you do not understand," he protested mildly. "The more the Senor Bell shows his courage, _hijo mio_, the more we must persuade him." He turned to Bell. "I realise," he said gently, "that there are hardships connected with the administration of my power, Senor. It is inevitable. But the Latin races of the continent which is now nearly mine require strong handling. They require a strong man to lead them. They are comfortable only under despotism. The task I have chosen for you is different, entirely. _Los Americanos del Norte_ will not respond to the treatment which is necessary for those _del Sud_. Their governments, their traditions, are entirely unlike. If you become my deputy and viceroy for all your nation, you shall rule as you will. A benevolent, yet strong, rule is needed for your people. It may even be--I will permit it--that the democratic institutions of your nation may continue if you so desire. I am offering you, Senor, the position of the absolute ruler of your nation. You may interfere with the present government not at all, if you choose, provided only that my own commands are obeyed when relayed through you. I choose you because you have courage, and resource, and because you have the _Yanqui_ cleverness which will understand your nation and cope with it."

* * * * *

Bell inhaled deeply.

"In other words," he said bitterly, "you're saying indirectly that you offer me a chance to be the sort of ruler Americans will submit to without too much fuss, because you think one of Ribiera's stamp would drive them to rebellion."

The fine dark eyes twinkled.

"You have much virtue, Senor. My nephew--though he is to be my successor--has a weakness for a pretty face. Would you prefer that I give him the task of subduing your nation?"

"You might try it," said Bell. His eyes gleamed. "He'd be dead within a week."

The Master laughed softly.

"I like you, Senor. I do like you indeed. I have not been so defied since another _Americano del Norte_ defied me in this same room. But he had not your resource. He had been enslaved with much less difficulty than yourself. I do not remember what happened to him...."

"He was taken, Master," said a fat man with hard eyes, obsequiously, "he was taken in Bolivia." It was the man whom Bell had seen earlier that morning in a carriage. "You gave him to me. He had insulted me when I ordered him sent to you. I had him killed, but he was very obstinate."

"Ah, yes," said The Master meditatively. "You told me the details." He seemed to recall small facts in benevolent retrospection. "But you, Senor Bell, I have need of you. In fact, I shall insist upon your friendship. And therefore--"

He beamed upon Bell.

"I give you back the Senorita Canalejas."

* * * * *

He shook his head reproachfully at the utterly grim look in Bell's eyes.

"I shall give you one single portion of the antidote to the medicine which makes your hands behave so badly. You may take it when you please. The Senor Jamison I shall keep and enslave. I do not think he will be as obstinate as you are, but he has excellent qualities. If you prove obdurate, I may yet persuade him to undertake certain tasks for me. But you and the Senorita Canalejas are free. Your boat has been reprovisioned and provided with fuel. You may go from here where you will."

Ribiera snarled.

"_Tio mio_," he protested angrily, "you promised me--"

"Your will in many things," said The Master gently, "but not in all. Remember that you have much to learn, _hijo mio_. I have taught you to prepare my little medicine, it is true. That is so you can take my place if age infirmity shall carry me away." The Master folded his hands with an air of pious resignation. "But you must learn policy. The Senorita Canalejas belongs to the Senor Bell."

Jamison was staring, now, but Bell's eyes had narrowed to mere slits.

"You see," said The Master gently, to him, "I desire your friendship. You may go where you will. You may take the Senorita Canalejas with you. You will have enough of the antidote to my little medicine to keep you sane for perhaps a week. In one week you may go far, with her. You may do many things. But you cannot find a place of safety for her. I still have a little power, Senor. If you take her with you, your hands will writhe again. Your body will become uncontrollable. Your eyes, staring and horror-struck, will observe your own hands rending her. While your brain is yet sane you will see this body of yours which now desires her so ardently, tearing at and crushing that delicate figure, gouging out her eyes, battering her tender flesh, destroying her.... Have you ever seen what a man who has taken my little medicine does to a human being at his mercy?"

* * * * *

The figures about The Master were peculiarly tense. The fat man with the hard eyes laughed suddenly. It was a horrible laugh. Francia of Paraguay took out his handkerchief and delicately wiped his lips. He was smiling. Ribiera looked at Bell's face and chuckled. His whole gross figure shook with his amusement.

"And of course," said The Master benignly, "if you prefer to commit suicide, if you prefer to leave her here--well, my nephew knows little expedients to reduce her will to compliance. You recall _Yagué_, among others."

Bell's face was a white mask of horror and fury. He tried to speak, and failed. He raised his hand to his throat--and it tore at the flesh, insanely.

"Let--let me see her," croaked Bell, as if strangling.

Jamison stiffened. Bell seemed to be trying to get his hands into his pockets. They were apparently uncontrollable. He thrust them under his coat as there was a stirring at the door.

* * * * *

And Paula was brought in, as if she had been waiting. She was entirely colorless, but she smiled at Bell. She came quickly to his side.

"I heard," she said in a clear and even little voice. "We will go together, Charles. If there is a week in which we can be together, it will be so much of happiness. And when you are--The Master's victim, we will let the little boat sink, and sink with it. I do not wish to live without you, Charles, and you do not wish to live as his slave."

Bell gave utterance to a sudden laugh that was like a bark. His hands came out from under his coat. Dangling from each one was a small, pear-shaped globule of metal. A staff projected upward from each one, and he held those staffs in his writhing hands. About each wrist was a tiny loop of cord that went down to a pin at the base of the staffs.

"Close to me, Paula," he said coldly. She clung to his arm. He moved forward, with half-a-dozen revolver muzzles pointed at his breast.

"If one of you damned fools fires," he said harshly, "I'll let go. When I let go--these are Mills grenades, and they go off in three seconds after they leave the hand. Stand still!"

* * * * *

There was a terrible, frozen silence. Then a movement from behind Bell. Jamison was rising with a grunt.

"Some day, Bell," he observed coolly, "I'll be on to all of your curves. This is the best one yet. But you're likely to let go at any second, aren't you?"

"Like hell!" raged Bell. "I drank some of your poison," he snarled at The Master. "Yes! I was fool enough to do it! But I took what measures any man will take who finds he's swallowed poison. I got it out of my stomach at once. And if you or one of these deputies tries to move...."

Ribiera had blanched to a pasty gray. The Master was frozen. But Bell saw Ribiera's eyes move in swift calculation. There was a solid wall behind The Master. It seemed as if the greenhouse were a sort of passageway between two larger structures. And there was a door almost immediately behind Ribiera. Ribiera glanced right--left--

He flung himself through that door. He knew the secret of The Master's power. He was The Master's appointed successor. If The Master and all his deputies died, Ribiera....

But Bell snapped into action like a bent spring released. His arm shot forward. A grenade went hurtling through the door through which Ribiera had fled. There was an instantaneous, terrific explosion. The solid wall shook and shivered and, with a vast deliberation, collapsed. The greenhouse was full of crushed plaster dust. Panes of glass shivered....

But Bell was upon The Master. He had struck the little man down and stood over him, his remaining automatic replacing the grenade he had thrown.

"Ribiera's dead," he snapped, "and if I'm shot The Master dies too and you all go mad! Stand back!"

The deputies stood frozen.

"I think," said Jamison composedly, "I take a hand now. I'll pick him up, Bell.... Right. I've got him. With a grenade hanging down his back. If he jerks away from me, or I from him, it will blow his spine to bits."

"Hold him so," said Bell coldly.

* * * * *

He went coolly to where he could look over the heap of the collapsed wall. He saw a bundle of torn clothing that had been a man. It was flung against a cracked and tottering chimney.

"Right," he said evenly. "Ribiera's dead, all right."

He turned to the deputies, whose revolvers were still in their hands.

"The Master's carriage, please," he said politely. "To the door. You may accompany us if you please, but in other carriages. I am working for the release of all the Master's slaves, and you among them if you choose. But you can see very easily that there is no hope of the release of The Master without the meeting of my terms."

The Master spoke, softly and mildly and without fear.

"It is my order that the Senor Bell is to be obeyed. I shall return. You need have no fear of my death. My carriage."

A man went stiffly, half-paralyzed with terror, to where chattering scared servants were grouped in the awful fear that came upon the slaves of The Master at any threat to his rule.

But Bell and Paula and Jamison went slowly and cautiously--though they held the whip hand--to the entrance door of the house, and out to the entrance gate. A carriage was already before the door when they reached it, and others were drawing up in a line behind it.

"Get in," said Bell briefly. "Down to the waterfront."

He turned to the group of frock-coated, stricken men who had followed.

"Some of you men," he said coldly, "had better go on ahead and warn the police and the public generally about the certainty of The Master's death if any attempt is made to rescue him."

Francia, of Paraguay, summoned a swagger and raised his hand to the second carriage. It drew in to the curb.

"I will attend to it, Senor Bell," he said politely. "Ah, when I think that I once raised my revolver to shoot you and refrained!"

He drove off swiftly.

* * * * *

Bell's eyes were glowing. He got into the carriage, and such a procession drove through the streets of Punta Arenas as has rarely moved through the streets of any city in the world. The long line of carriages moved at a funereal pace amid a surging, terrified mob. The Master beamed placidly as he looked out over white, starkly agonized faces. Some of the people groaned audibly. A few cursed The Master in their despair. More cursed Bell, not daring to strike or fire on him. But he would have been torn to bits if he had stepped from the carriage for an instant.

"Bell," said Jamison dryly, "considering that I'm prepared to be blown apart on three seconds notice, it is peculiar that this mob frightens me."

The Master's eyes twinkled benignly. He seemed totally insensible to fear.

"You need not be afraid," he said gently. "They will not touch you unless I order them."

Jamison stared down at the little man whose collar he held firmly, with a Mills grenade dangling down at the base of his neck.

"I wouldn't order them to attack, if I were you," he said coldly. "I haven't Bell's brains, but I have just as much dislike for you as he has."

* * * * *

They came to the harbor. Bell spoke again.

"The carriage is to drive out to the end of one of the docks, and no one else is to go out on that dock."

The Master relayed the order in his mild voice, but as the coachman obeyed him he clucked his tongue commiseratingly.

"Senor Bell," he protested gently. "You do not expect to escape! Not after killing me! Why that is absurd!"

Bell said nothing. He alighted from the carriage, his face set grimly, and stared ashore at the long, long row of terrified faces staring out at him. The whole waterfront seemed to be lined with staring faces. Wails came from that mass of enslaved human beings.

"Hold him here, Jamison," he said drearily. "I'm going out to look at that big plane. There's a rowboat tied to the dock, here."

He swung down the side into the dock and rowed off into the harbor, while the horses attached to The Master's carriage pawed impatiently at the wooden flooring of the dock. Bell reached the two planes anchored on the still harbor water. The smaller one had brought them down from Buenos Aires. The larger one had gone after the beached amphibian and brought it and Paula on to the city. Bell, from the shore, was seen to be investigating the larger one. He came rowing back.

His head appeared above the dock edge.

"All right," he said tiredly. "The Master has a rule requiring all his ships ready for instant flight. Very useful. The big plane is fueled and full of oil. We'll go out to it and take off."

* * * * *

Jamison lifted The Master to his feet and with a surge of muscles swept him down to the flooring of the dock.

"Paula first," said Bell, "and then The Master, and then you, Jamison."

"One moment," said The Master reproachfully. "It would be cruel not to let me reassure my subjects. I will give an order."

Bell and Jamison listened suspiciously. But he spoke gently to the coachman.

"You will tell the deputies," said The Master in Spanish, "that a month's supply of medicine for all my subjects will be found in my laboratory. And you may tell them that I shall return before the end of that time."

The coachman's eyes filled with a passionate relief.

"Now," said The Master placidly, "I am ready for our little jaunt."

Paula descended the ladder and seated herself in the bow of the boat. Bell covered The Master grimly with his automatic as he descended, with surprising agility. Jamison came down last, and resumed his former grip on The Master's collar. Bell rowed out to the big plane.

* * * * *

Jamison kept close watch while Bell started the four huge motors and throttled them down to warming up speed, and while he hauled up the anchor with which the huge seaplane was anchored.

The dock was covered with a swarm of panic stricken folk. Everywhere, all the inhabitants of the city who were slaves to The Master had come in awful terror to watch. And all the inhabitants of the city were slaves to The Master. Some of them fell to their knees and held out imploring arms to Bell, begging him for mercy and the return of The Master. Some cursed wildly.

But, with his jaws set grimly, Bell gave the motors the gun.

The big plane moved heavily, then more swiftly through the water. It lifted slowly, and rose, and rose, and dwindled to a speck high in the air.

And all through the streets and ways of Punta Arenas, fear stalked almost as a tangible thing. Panic hovered over the housetops, always ready to descend. Terror was in the air that every man breathed, and every human being looked at every other human being with staring, haunted eyes. Punta Arenas was waiting for its murder madness to begin.

CHAPTER XVIII

There were four motors to pull the big plane through the air, and their roaring was a vast thundering noise which the earth re-echoed. But inside the cabin that tumult was reduced to a not intolerable humming sound.

"What'll I do with this devil, Bell?" asked Jamison. "Now that we're aloft, I confess this grenade makes me nervous. I'm holding it so tightly my fingers are getting cramped."

"Tie him up," said Bell, without looking. "He'll talk presently."

Movements. The plane flew on, swaying slightly in the way of big sea-planes everywhere. A williwaw began in the hills ahead and swept out and set the ship to reeling crazily in its erratic currents. The Strait vanished and there were tumbled hills below them. Minutes passed.

"Got him fixed up," said Jamison coolly, "I'll guarantee he won't break loose. Got any plans, Bell?"

"No time," said Bell. "I haven't had time to make any. The first thing is to get where his folk will never find us. Then we'll see what we can do with him."

Paula looked at the now bound figure of The Master. And the little old man beamed at her.

"He--he's smiling!" said Paula, in a voice that was full of a peculiar horrified shock.

* * * * *

Bell shrugged. Punta Arenas was all of twenty-five miles behind, and the earth over which they flew began to take on the shape of an island. Water appeared beyond it, and innumerable small islands. Bell began to rack his brain for the infinitesimal scraps of knowledge he had about this section of the world. It was pitifully scanty. Punta Arenas was the southernmost point of the continental mass. All about it was an archipelago and a maze of waterways, thinly inhabited everywhere and largely without any inhabitants at all. The only solid ground between Cape Horn and the Antarctic ice pack was Diego Ramirez and the South Shetlands....

Nothing to go on. But any sufficiently isolated and desolate spot would do. Almost anywhere along the southern edge of the continental islands should serve.

The plane roared on monotonously, while Bell began to wrestle with another and more serious problem. In three days--two, now--an American naval vessel would turn up, with scientists and chemists on board. It was to be doubted whether anything like an overt act would be risked by that vessel. If all the governments of South America were under The Master's thumb, then cabled orders from his deputies would race three navies to the spot. And the government of the United States does not like to start war, anywhere. Certainly it would not willingly enter into a conflict with the whole southern continent for the solution of a problem that so far affected that continent alone. The Master's kidnapping had solved nothing, so far.

* * * * *

Jamison tapped his shoulder.

"No pursuit, so far," he observed coolly. "I've looked." Bell nodded.

"They don't dare. Not yet, anyhow. They're depending on The Master. How is he?"

"Smiling peacefully to himself, damn him!" snarled Jamison. "Do you know what we're up against?"

"Ourselves," said Bell coldly. "But I'm nearly licked. He's got to talk!"

Jamison moved away again. The earth below looked as if it had been torn to shreds in some titanic convulsion of ages past. The sea was everywhere, and so was land! There were little threads of silver interlacing and crossing and wavering erratically in every conceivable direction. And there were specks of islands--rocks only yards in extent--and islands of every imaginable size and shape, with their surfaces in every possible state of upheaval and distortion. A broader mass of land appeared ahead and to the left.

"Tierra del Fuego again," muttered Bell. "If we cross it...."

For fifteen minutes the plane thundered across desolate, rocky hills. Then the maze of islets again. Bell scanned them keenly, and saw a tiny steamer traveling smokily, for no conceivable reason, among the scattered bits of stone. The sea appeared, stretching out toward infinity.

Bell rose, to survey a wider space. He swung to the left, so that he was heading nearly southeast, and went on down toward that desolation of desolations, the stormy cape which faces the eternal ice of the antarctic. He was five thousand feet up, then, and scanning sea and earth and sky....

And suddenly he swung sharply to the right and headed out toward the open sea. He felt a small figure pressing against his shoulder. Presently fingers closed tightly upon his sleeve. He glanced down at Paula and managed to smile.

"There are some rocks out there," he told her quietly. "Islands, I think, and Diego Ramirez, at a guess."

* * * * *

They were specks, no more, but they were vastly more distinct from the plane than from Mount Beaufoy. That is on Henderson Island in New Year Sound, and its seventeen-hundred-foot peak was almost below Bell when he sighted the islands. But the islands have been seen full fifty miles from there.

It took the plane nearly forty minutes to cover the space, but long before that the islands had become distinct. Two tiny groups of scattered rocks, the whole group hardly five miles in length and by far the greater number no more than boulders surrounded by sheets of foam from breakers. Two of them merited the name of islands. The nearer was high and bare and precipitous. No trace of vegetation showed upon it. The farther was smaller, and at its northern corner a little cove showed, nearly land-locked.

Bell descended steeply. The big plane plunged wildly in the air eddies about the taller island at five hundred feet, but steadied and went winging on down lower, and lower.... The waves between the two islands were not high, but the seaplane alighted with a mighty, a tremendous splashing, and Bell navigated it grimly though clumsily into the mouth of the cove. There a small beach showed. He went very slowly toward it. Presently he swung abruptly about. A wing tip float grounded close to the shore.

The motors cut off and left a thunderous silence. Bell climbed atop the cabin and let go the anchor.

"We're here," he said shortly. "Bring The Master and we'll go ashore."

* * * * *

The catwalk painted on the lower wing guided them. Bell jumped to the rocks first, and stumbled, and then rose to lift Paula down and take The Master's small, frail body from Jamison's arms.

"You looked for a gun?" asked Bell

"He'd nothing to fight with," said Jamison heavily. He had been facing the same problem Bell had worked on desperately, and had found no answer. But he shuddered a little as he looked about the island.

There was nothing in sight but rock. No moss. No lichens. Not even stringy grass or the tufty scrub bushes that seemed able to grow anywhere.

Bell untied The Master, carefully but without solicitude. The little man sat up, and brushed himself off carefully, and arranged himself in a comfortable position.

"I am an old man," said The Master in mild reproach. "You might at least have given me a cushion to sit upon."

Bell sat down and lighted a cigarette with fingers that did not tremble in the least.

"Suppose," he said hardly, "you talk. First, of what your poison is made. Second, of what the antidote is made. Third, how we may be sure you tell the truth."

* * * * *

The Master looked at him with bright, shrewd, and apparently kindly old eyes.

"_Hijo mio_," he said mildly, "I am an old man. But I am obstinate. I will tell you nothing."

Bell's eyes glowed coldly.

"Does it occur to you," he asked grimly, "that it's too important a matter for us to have any scruples about? That we can--and will--make you talk?"

"You may kill me," said The Master benignly, "but that is all."

"And," said Bell, still more grimly, "we have only to get back in the plane yonder, and go away...."

The Master beamed at him. Presently he began to laugh softly.

"_Hijo mio_," he said gently, "let us stop this little byplay. You will take me back in my airplane, and you will land me at Punta Arenas. And then you will fly away. I concede you freedom, but that is all. You cannot leave me here."

"Paula," said Bell coldly, "get in the plane again. Jamison--"

Paula rose doubtfully. Jamison stood up. The Master continued to chuckle amiably.

"You see," he said cherubically, "you happen to be a gentleman, Senor Bell. Every man has some weakness. That is yours. And you will not leave me here to die, because you have killed my nephew, who was the only other man who knew how to prepare my little medicine. And you know, Senor, that all my subjects will wish to die. Those who do, in fact," he added mildly, "will be fortunate. The effect of my little medicine does not make for happiness without its antidote."

* * * * *

Bell's hands clenched.

"You know," said The Master comfortably, "that there are many thousands of people whose hands will writhe, very soon. The city of Punta Arenas will be turned into a snarling place of maniacs within a very little while--if I do not return. Would you like, Senor, to think in after days of that pleasant city filled with men and women tearing each other like beasts? Of little children, even, crouching,

and crushing and rending the tender flesh of other little children? Of lisping little ones gone--"

"Stop!" snarled Bell, in a frenzy. "Damn your soul! You're right! I can't! You win--so far!"

"Always," said The Master benevolently. "I win always. And you forget, Senor. You have seen the worst side of my rule. The revolutions, the rebellions that have made men free, were they pretty things to watch? Always, _amigo_, the worst comes. But when my rule is secure, then you shall see."

* * * * *

He waved a soft, beautifully formed hand. From every possible aspect the situation was a contradiction of all reason. The bare, black, salt encrusted rocks with no trace of vegetation showing. The gray water rumbling and surging among the uneven rocks at the base of the shore, while gulls screamed hoarsely overhead. The white haired little man with his benevolent face, smiling confidently at the two grim men.

"The time will come," said The Master gently, and in the tone of utter confidence with which one states an inescapable fact, "the time will come when all the earth will know my rule. The taking of my little medicine will be as commonplace a thing as the smoking of tobacco, which I abhor, Senores. You are mistaken about there being an antidote and a poison. It is one medicine only. One little compound. A vegetable substance, Senor Bell, combined with a product of modern chemistry. It is a synthetic drug. Modern chemistry is a magnificent science, and my little medicine is its triumph. Even my deputies have not heard me speak so, Senores."

Bell snarled wordlessly, but if one had noticed his eyes they would have been seen to be curiously cool and alert and waiting. The Master leaned forward, and for once spoke seriously, almost reverently.

"There shall be a forward step, Senores, in the race of men. Do you know the difference between the brain of a man and that of an anthropoid ape? It consists only of a filmy layer of cortex, a film of gray nerve cells which the ape has not. And that little layer creates the difference between ape and man. And I have discovered more. My little medicine acts upon that film. Administered in the tiny quantities I have given to my slaves, it has no perceptible effect. It is merely a compound of a vegetable substance and a synthetic organic base. It is not excreted from the body. Like lead, it remains always in solution in the blood. But in or out of the blood it changes, always, to the substance which causes murder madness. Fresh or changed, my little medicine acts upon the brain."

* * * * *

He smiled brightly upon them.

"But though in tiny quantities it has but little effect, in larger quantities--when fresh it makes the functioning of the gray cells of the human brain as far superior to the unmedicated gray cells, as those human gray cells are to the white cells of the ape! That is what I have to offer to the human race! Intelligence for every man, which shall be as the genius of the past!"

He laughed softly.

"Think, Senores! Compare the estate of men with the estate of apes! Compare the civilization which will arise upon the earth when men's brains are as far above their present level as the present level is above the anthropoid! The upward steps of the human race under my rule will parallel, will surpass the advance from the brutish caveman to intellectual genius. But I have seen, Senores, the one danger in my offering."

There was silence. Jamison shook his head despairingly. The Master could not see him. He formed the word with his lips.

"Crazy!"

* * * * *

But Bell said coldly:

"Go on."

"I must rule," said The Master soberly. "It is essential. If my little secret were known, intelligences would be magnified, but under many flags and with many aims. Scientists, with genius beside which Newton's pales, would seek out deadly weapons for war. The world would destroy itself of its own genius. But under my rule--"

"Men go mad," said Bell coldly.

The Master smiled reproachfully.

"Ah, you are trying to make me angry, so that I will betray something! You are clever, Senor Bell. With my little medicine, in such quantities as I would administer it to you...."

"You describe it," said Bell harshly and dogmatically, "as a brain stimulant. But it drives men mad."

"To be sure," said The Master mildly. "It does. It is not excreted from the body save very, very slowly. But it changes in the blood stream. As--let us say--sugar changes into alcohol in digestion. The end-product of my little medicine is a poison which attacks the brain. But the slightest bit of unchanged medicine is an antidote. It is"--he smiled amiably--"it is as if sugar in the body changed to alcohol, and alcohol was a poison, but sugar--unchanged--was an antidote. That is it exactly. You see that I have taken my little medicine for years, and it has not harmed me."

"Which," said Bell--and somehow his manner made utter silence fall so that each word fell separately into a vast stillness--"which, thank God, is the one thing that wins finally, for me!"

* * * * *

He stood up and laughed. Quite a genuine laugh.

"Paula," he said comfortably, "get on the plane. In the cabin. Jamison and I are going to strip The Master."

Paula stared. The Master looked at him blankly. Jamison frowned bewilderedly, but stood up grimly to obey.

"But Senor," said The Master in gentle dignity, "merely to humiliate me--"

"Not for that," said Bell. He laughed again. "But all the time I've been hearing about the stuff, I've noticed that nobody thought of it as a drug. It was a poison. People were poisoned. They did not become addicts. But you--you are the only addict to your drug."

He turned to Jamison, his eyes gleaming.

"Jamison," he said softly, "did you ever know of a drug addict who could bear to think of ever being without a supply of his drug--_right on his person_?"

Jamison literally jumped.

"By God! No!"

The Master was quick. He was swarming up the plane-wing tip before Jamison reached him, and he kicked frenziedly when Jamison plucked him off. But then it was wholly, entirely, utterly horrible that the little white haired man, whose face and manner had seemed so cherubic and so bland, should shriek in so complete a blind panic as they forced his fingers open and took a fountain pen away from him.

"This is it," said Bell in a deep satisfaction. "This is his point of weakness."

* * * * *

The Master was ghastly to look at, now. Jamison held him gently enough, considering everything, but The Master looked at that fountain pen as one might look at Paradise.

"I--I swear," he gasped. "I--swear I will give you the formula!"

"You might lie," said Jamison grimly.

"I swear it!" panted The Master in agony. "It--If the formula is known it--can be duplicated! It--the excretion can be hastened! It can all be forced from the body! Simply! So simply! If only you know! I will tell you how it is done! The medicine is the cacodylate of--"

Bell was leaning forward, now, like a runner breasting the tape at the end of a long and exhausting race.

"I'll trade," he said softly. "Half the contents of the pen for the formula. The other half we'll need for analysis. Half the stuff in the pen for the formula for freeing your slaves!"

The Master sobbed.

"A--a pencil!" he gasped. "I swear--"

Jamison gave him a pencil and a notebook. He wrote, his hands shaking. Jamison read inscrutably.

"It doesn't mean anything to me," he said soberly, "but you can read it. It's legible."

Bell smiled faintly. With steady finger he took his own fountain pen from his pocket. He emptied it of ink, and put a scrupulous half of a milky liquid from The Master's pen into it. He passed it over.

"Your medicine," said Bell quietly, "may taste somewhat of ink, but it will not be poisonous. Now, what do we do with you? I give you your choice. If we take you with us, you will be held very secretly as a prisoner until the truth of the information you have given us can be proven. And if your slaves have all been freed, then I suppose you will be tried...."

* * * * *

The Master was drawn and haggard. He looked very, very old and beaten.

"I--I would prefer," he said dully, "that you did not tell where I am, and that you go away and leave me here. I--I may have some subjects who will search for me, and--they may discover me here.... But I am beaten, Senor. You know that you have won."

Bell swung up on the wing of the plane. He explored about in the cabin. He came back.

"There are emergency supplies," he said coldly. "We will leave them with you, with such things as may be useful to allow you to hope as long as possible. I do not think you will ever be found here."

"I--prefer it, Senor," said The Master dully. "I--I will catch fish...."

Jamison helped put the packages ashore. The Master shivered. Bell stripped off his coat and put it on top of the heap of packages. The Master did not stir. Bell laid a revolver on top of his coat. He went out to the plane and started the motors. The Master watched apathetically as the big seaplane pulled clumsily out of the little cove. The rumble of the engines became a mighty roar. It started forward with a rush, skimmed the water for two hundred yards or so, and suddenly lifted clear to go floating away through the air toward the north.

* * * * *

Paula was the only one who looked back.

"He's crying," she said uncomfortably.

"It isn't fear," said Bell quietly. "It's grief at the loss of his ambition. It may not seem so to you two, but I believe he meant all that stuff he told me. He was probably really aiming, in his own way, for an improved world for men to live in."

The plane roared on. Presently Bell said shortly:

"That stuff he has won't last indefinitely. I'm glad I left him that revolver."

Jamison stirred suddenly. He dug down in his pocket and fished out a cigar.

"Since I feel that I may live long enough to finish smoking this," he observed dryly, "I think I'll light it. I haven't felt that I had twenty minutes of life ahead of me for a long time, now. A sense of economy made me smoke cigarettes. It wouldn't be so much waste if you left half a cigarette behind you when you were killed."

* * * * *

The tight little cabin began to reek of the tobacco. Paula pressed close to Bell.

"But--Charles," she asked hopefully, "is--is it really all right, now?"

"I think so," said Bell, frowning. "Our job's over, anyhow. We go up the Chilean coast and find that navy boat. We turn our stuff over to them. They'll take over the task of seeing that every doctor, everywhere in South America, knows how to get The Master's poison out of the system of anybody who's affected. Some of them won't be reached, but most of them will. I looked at his formula. Standard drugs, all of them. There won't be any trouble getting the news spread. The Master's slaves will nearly go crazy with joy. And," he added grimly, "I'm going to see to it that the Rio police take back what they said about us. I think we'll have enough pull to demand that much!"

He was silent for a moment or so, thinking.

"I do think, Jamison," he said presently, "we did a pretty good job."

Jamison grunted.

"If--if it's really over," said Paula hopefully, "Charles--"

"What?"

"You--will be able to think about me sometimes," asked Paula wistfully, "instead of about The Master always?"

Bell stared down at her.

"Good Lord!" he groaned. "I have been a brute, Paula! But I've been loving you--" He stopped, and then said with the elaborate politeness and something of the customary idiotic air of a man making such an announcement. "I say, Jamison, did you know Paula and I were to be married?"

Jamison snorted. Then he said placidly:

"No. Of course not. I never dreamed of such a thing. When did this remarkably original idea occur to you?"

He puffed a huge cloud of smoke from his cigar. It was an unusually vile cigar. Bell scowled at him helplessly for a moment and then said wrathfully:

"Oh, go to hell!"

And he bent over and kissed Paula.

(_The End._)

The Flying City

By H. Thompson Rich

[Illustration: The ray shot down--and squadrons of planes frizzled like moths in the air.]

[Sidenote: From Space came Cor's disc-city of Vada--its mighty, age-old engines weakening--its horde of dwarfs hungry for the Earth!]

In the burning solitude of the great Arizona desert, some two miles south of Ajo, a young scientist was about to perform an experiment that might have far-reaching results for humanity.

The scientist was Gordon Kendrick--a tall, tanned, robust chap who looked more like a prospector in search of gold than a professor of physics from the State University of Tucson.

Indeed, he was in a way, a prospector, since it was gold he sought--some practical method of tapping the vast radio-energetic treasure of the sun--and it was an apparatus designed to accomplish just this that he was about to test.

The primary unit of the mechanism comprised a spheroidal vacuum-tube measuring a little over a foot across its long axis, mounted in a steel bracket that held it horizontal with the ground. Down through its short axis ran a shaft on which was centered a light cross of aluminum wire, carrying four vanes of mica, one face of each coated with lampblack. A flexible cable led from the bottom of this shaft to the base of the bracket, where it was geared to a small electric motor driven by two dry cells. A rheostat-switch for delivering and controlling the current was mounted nearby.

[Illustration]

At the wide arc of the egg-shaped tube was a concave platinum cathode, at the narrow arc a nib of some sort, ending in a socket. From this socket, two heavy insulated wires extended sixty feet or so across the sand to the secondary unit of the mechanism, which was roughly a series of resistance coils, resembling those in an ordinary electric heater.

* * * * *

As Kendrick prepared to test this delicate apparatus that represented so much of his time and thought, held so much of his hope locked up in it, a turmoil was in his heart, though his brown face was calm.

If his theories were right, that revolving cross would tap and draw into its vanes radio-energetic waves of force, much as the whirling armature of a dynamo draws into its coils electro-magnetic waves of force. For the blackened sides of the vanes, absorbing more radiation than the bright sides, would cause the molecules to rebound from the warmer surfaces with greater velocity, setting up an alternate pressure and bringing the rays to a focus on the cathode, where they would be reflected to the nib as waves of _heatricity_, to use the word he had coined.

Those were Kendrick's theories, and now he moved to put them to the supreme test. Switching on the current, he set the motor going. In response, the cross began to revolve, slowly at first--then faster, faster, as he opened the rheostat wider.

Eyes fixed on his resistance coils, he gave a sudden cry of triumph. Yes, there was no doubt about it! They were growing red, glowing brightly, whitely, above the intense desert sunlight.

Here was a means of convening solar radiation into heat, then, that offered tremendous commercial possibilities!

But even as he exulted, there came a blinding flash--and the overtaxed coils burst into flame.

* * * * *

Shielding his eyes from the glare, he reached for the rheostat, shut off the current, rushed to his secondary unit--where he beheld an amazing sight. Not only had this part of the apparatus completely disintegrated, but the sand of the desert floor under it as well. On the spot quivered a miniature lake of molten glass!

As Kendrick stood ruefully beside that fiery pool, meditating on the spectacular but not altogether gratifying results of his experiment, a peculiar low humming sound reached his ears. Rushing back to his primary unit, with the thought that perhaps by some chance he had not fully closed the rheostat, he looked at the cross. But no, the vanes were still.

The humming increased, however--grew into a vibration that made his eardrums ache.

Puzzled, he looked around. What on earth could it be? Had his unruly experiment called into play some tremendous, unsuspected force of the universe. Was he to bring the world to ruin, as a result of his blind groping after this new giant of power?

Such predictions had often been made by the ignorant, to be dismissed by scientists as the veriest nonsense. But was there some truth in the universal fear, after all? Was he to be the Prometheus who stole fire from Olympus, the Samson who toppled down the temple?

Chilled, dizzied with the pain of the ever-increasing vibration, he gritted his teeth, awaiting he knew not what.

Then it came--a spectacle so staggering that he went rigid with awe as he regarded it, all power of motion utterly numbed for the moment. The vibration ceased. The thing appeared.

It was a city--a city in the air--a flying city!

* * * * *

As Kendrick stood staring at this phenomenon, he could scarcely credit his senses.

Had the magic carpet of Bagdad suddenly materialized before him, he would not have been more astounded. And indeed, it was in a way a magic carpet--a great disclike affair, several miles in diameter, its myriad towers and spires glinting like gold under the noonday sun, while its vast shadow fell athwart the desert like the pall of an eclipse.

The lower portion, he noted, was in the main flat, though a number of wartish protuberances jutted down from it, ejecting a pale violet emanation. Whatever this was it seemed to have the effect of holding the thing motionless in the air, for it hovered there quite easily, a hundred yards or so above the ground.

But what was it? Where was it from? What had brought it?

Those were the questions he wanted answered; and they were to be, sooner than he knew.

As he stood there speculating, a device like a trap-door opened in the base of the disc, and creatures resembling human beings began descending. Began floating down, rather.

Whereupon Kendrick did what any sensible man would have done, under similar circumstances. He reacted into motion. In short, he ran.

* * * * *

Glancing back over his shoulder after a minute or two, however, he drew up sheepishly. Of that strange apparition and those who had descended from it there was not a trace, not a shadow!

But the peculiar humming had recommenced, he realized in the next breath--and at the same instant he felt himself seized by invisible hands.

There was a struggle, but it was brief and futile. When it was over his captors became visible once more. They were singular little beings about four feet tall, with strange, wise, leathery faces, their heads grotesquely bald.

The humming had ceased again. The disc, too, was once more visible.

What happened next was something even more astounding, if there could be any further degrees of wonder possible for the utterly baffled young scientist. He felt himself lifted up, leaving the desert floor, whirling away toward that incredible phenomenon hovering there.

Another moment or two and he had been borne up through its trap-door opening, was standing in a dark space bounded by solid metal walls. Then he was thrust into a cylinder with several of his tiny guards, shot swiftly upward.

* * * * *

A door opened as they came to rest, and he was led out into a vast court of gleaming amber crystal. Something like a taxi slid up, with irridescent planes, and he was bundled into it, whirled away again.

Down broad, gleaming avenues they passed, where similar traffic flowed densely, but under marvelous control. Towering skyscrapers loomed to right and left. Tier on tier of upper and lower boulevards revealed themselves, all crowded with automotive and pedestrian activity.

At length a stupendous concourse was reached. Thousands of these taxis and similar vehicles were parked along its broad flanks, while literal swarms of diminutive individuals circulated to and fro.

Assisted from the vehicle that had brought him to this obvious center of the disc's activities. Kendrick was led into a monumental structure of jade-green stone that towered a full hundred, stories above the street level. There he was escorted into another of

those projectilelike elevators, shot up, up--till at length it came to rest. The door opened and he was led out into a small lobby of the same amber crystal he had observed before.

By now his guards had diminished to two, but he no longer made any effort to escape. Wherever this amazing adventure might lead, he was resolved to follow it through.

One of the guards had advanced to a jewelled door and was pressing a button. In response, the door opened. A golden-robed, regal creature stood there.

* * * * *

Though dwarfed to four feet, like his fellow, he was obviously their mental superior to a prodigious degree. Not only was his symmetrical bald head of large brain content, but the finely-cut features of his parchment face bore the unmistakable stamp of a powerful intellect.

"_Ao-chaa!_" commanded this evident monarch of the disc, addressing the guards.

They bowed and departed, abruptly.

"My dear Kendrick!" the regal personage now said, in thin, precise English. "It is indeed a pleasure to welcome you to my humble quarters. Pray enter and make yourself comfortable."

Whereupon he ushered him into a dazzling apartment that was one vast mosaic of precious gems, indicated a richly carved chair, into which the young scientist dropped wonderingly.

"Now then, Professor," continued the mighty little dwarf, when he was seated in a chair even more sumptuous, "suppose we have a friendly little discussion. I have been much interested in your experiments on heat radiation. What you demonstrated this morning, in particular, was most absorbing. You have hit upon a rather profound scientific principle, yes?"

"Possibly," Kendrick admitted, quite conscious that he was being patronized.

"Oh, don't be modest, my dear fellow!" smiled the dwarf. "I am the last one to belittle your achievement. Indeed, it is because of it that I have invited you here to-day. Permit me to introduce myself, and to make clear one or two possibly perplexing matters. Then I am sure we shall have a most agreeable chat."

* * * * *

His name was Cor, he said, and he was in truth the monarch of this strange realm. His people had come from the one-time planet of Vada, far distant in the universe. A thousand years ago, this planet had been doomed by the approach of an alien star. Their great scientist, Ravv, had met the emergency by inventing the disc, into whose construction they had poured all their resources. The pick of their populace had been salvaged on this giant life-raft. The rest had perished when that destroying star had crashed down on the doomed Vada.

Since then these survivors and their descendants had been voyaging through space on their marvelous disc. For hundreds of years they had given no thought to the future, content to drift on and on in the interstellar void, breathing an atmosphere produced artificially. But at length the inevitable had happened. This superb piece of mechanism devised by their super-genius, Ravv, was beginning to show signs of wear. Some of its mighty engines were nearing the exhaustion point. Either they must soon find a planet comparable with the one they had once known, where they could pause and rehabilitate their machinery, or they must disintegrate and pass into oblivion.

Faced with that crisis, Cor had long been seeking such a planet. He had found it, at last, in the earth--and had resolved that this was where they were going to alight and transplant the civilization of ancient Vada, pending such time as they could take to space again.

* * * * *

For some months now they had been hovering over various portions of the earth, studying its geography and its peoples, with the result that they had concluded the United States offered the most logical point for launching the attack. Once this country was subdued, they were in possession of the richest and most advanced section of the planet. The conquest of the rest of it could await

their leisure.

With such an invasion in view, their scientists had mastered the language of the country. This had been accomplished very easily, since in addition to their power of mingling with the populace in an invisible form, they had the principles of radio developed to a high degree and were able to tune in on any station they wanted.

Kendrick sat there, stunned, as Cor followed his astounding revelation of their origin with this calm plan for the conquest of America, of the world. Why, of all people on earth, had he alone been singled out for this disclosure?

He asked the question now.

"My dear Professor, can't you really guess?" replied Cor, with that leathery smile. "Hasn't it dawned that you were a little too near our own field with that machine of yours? A trifle more research, a slightly different application--and you would have become a dangerous enemy."

"You--you mean--?"

"I mean there isn't a great deal of difference between the experiments you have been making and those our great Ravv once made. For instance, had you broadcast your heatricity, as you call it, instead of trying to transmit it on wires--well, picture a receiving apparatus in each home of the land, like your commercial radio sets. You would have become a billionaire, don't you see?"

* * * * *

Kendrick saw indeed. It was simple, so simple! Fool--why hadn't he thought of it?

"But your invention will never make you wealthy now, my dear fellow," Cor went on, tauntingly. "You will be our guest, here, until we have taken over your interesting country. After that, if there is any need for the broadcasting of heat, we will furnish it ourselves. We have those facilities, among others, fully developed. Would you care to see our plant?"

Kendrick naturally admitted that he would, so the dwarf led him through a rear door and up a winding flight of stairs. They emerged presently into a great laboratory housed in the glass-roofed pinnacle of the tower.

There he beheld a sight that left him breathless. Never before had he seen such an assemblage of scientific apparatus. Its vastness and strangeness were fairly overpowering, even to a man as well versed in physio-chemical paraphernalia as he was.

Before his eyes could take in a tenth part of the spectacle, Cor had led him to the left wall.

"There," he said, "you will observe a development of your heat generator."

Kendrick looked--to see a long bank of large vacuum-tubes, each about three feet high and a foot wide, connected by a central shaft that caused series of little vanes in each of them to revolve at lightning speed.

Around the apparatus moved numerous small attendants, oiling, wiping, adjusting its many delicate parts.

"Well, what do you think now?" asked Cor.

Kendrick made no reply, though he was thinking plenty.

"You see, it is your invention, my dear Professor," the dwarf went on in his taunting voice, "only anteceded by a thousand years--and rather more perfected, you must admit."

* * * * *

He walked now to the center of the laboratory, where stood a huge dial of white crystal, ranked with many levers and switches, all capped with the same material.

"Behold!" he said, throwing over one.

Instantly there came again that peculiar low humming that had so puzzled him a few minutes before--and the entire room, its engines, its attendants, Cor himself, leapt into invisibility. Only Kendrick remained, facing the faintly visible crystal dial.

Then he saw a switch move, as though automatically. But no, for the dwarf's hand was on it now. Visibility had returned. The vibration ceased.

"That is the central control," said Cor. "Our city and all its inhabitants become invisible when that switch is thrown. Only the dial remains, for the guidance of the operator, and even that cannot be seen at a distance of more than fifty feet. But now behold!"

He raised his hand, touched a watch-like device strapped to his wrist--and was instantly invisible. But the laboratory and every machine and person in it remained in plain view. Nor was there any vibration now.

* * * * *

The next moment, having touched that curious little device again, Cor reappeared.

"That is the local control," he said. "Every one of our inhabitants, except those under discipline, has one of these little mechanisms. It enables us to make ourselves invisible at will. A convenience at times, you must admit."

"Decidedly," Kendrick agreed. "And the principle?"

"Quite simple. One of those, in fact, that lies behind your researches. Doubtless you would have hit upon it yourself in time. Your own scientist, Faraday, you may recall, held the opinion that the various forms under which the forces of matter manifest themselves have a common origin. We of the disc, thanks to our great Ravv, have found that common origin."

It was the origin of matter itself, Cor said, which lay in the ether of interstellar space--energy, raw, cosmic--vibrations, rays.

By harnessing and controlling these various rays, his people had been able to accomplish their seeming miracles--miracles that the people of earth, too, were beginning to achieve--as in electricity, for instance, and its further application, radio.

But the people of Vada had long since mastered such simple rays, and now, in possession of vastly more powerful ones, had the elemental forces of the universe at their disposal.

* * * * *

The disc was propelled through space by short rays of tremendously high frequency, up above the ultra-violet. The same rays, directed downward instead of outward, enabled them to overcome the pull of gravity when in a planet's influence, as at present. And the escalator rays, by which they could proceed to and from the disc, were also of high frequency, as were their invisibility rays.

"But you, Professor, are more interested in low frequency rays, the long ones down below infra-red," continued Cor. "You have seen our development of the heat-dynamo principle. It utilizes, I might add, not only solar radiation but that of the stars as well. There being a billion and a half of these in the universe, many of them a thousand times or more as large as your own sun, we naturally have quite an efficient little heating plant here. It provides us with our weapon of warfare, as well as keeping us warm. Permit me to demonstrate."

He led the way to a gleaming circle of glass like an inverted telescope, about a yard in diameter, mounted in the floor.

"Look!" said the dwarf.

Kendrick did so--and there, spread below him, lay the floor of the desert. His camp, his apparatus, were just as he had left them.

Cor now moved toward the dial.

"Behold!" he said, pulling a lever.

Instantly the scene below was an inferno. Stricken by a blast of stupendous heat, the whole area went molten, lay quivering like a lake of lava in the crater of an active volcano.

"Suppose, my dear Professor," smiled the dwarf, strolling back from the dial, "just suppose, for instance, that instead of the lonely camp of an obscure scientist, your proud city of New York had been below there!"

* * * * *

Kendrick shuddered.

Well he knew now the terrible power, the appalling menace of this strange invader.

"I would prefer not to make such a supposition," he said, quietly, with a last thoughtful glance at that witches' caldron below.

"Then let us think of pleasanter things. You are my guest of honor, sir--America's foremost scientist, though she may never realize it," with a piping chuckle. "To-night there will be a great banquet in your honor. Meanwhile, suppose I show you to your quarters."

Nettled, fuming, though outwardly calm, Kendrick permitted himself to be escorted from the laboratory to an ornate apartment on one of the lower floors.

There Cor left him, with the polite hint that he would find plenty of attendants handy should he require anything.

Alone now, in the midst of this vast, nightmarish metropolis, he paced back and forth, back and forth--knowing the hideous fate that threatened the world but powerless to issue one word of warning, much less avert it.

* * * * *

Kendrick was still thinking and brooding along these lines when he saw the door of the apartment swiftly open and close again.

Someone had entered, invisible!

Backing away, he waited, tense. Then, suddenly, his visitor materialized. With a gasp, he saw standing before him a beautiful girl.

She was a young woman, rather, in her early twenties. Not one of these pigmies of the disc either, but a tall, slender creature of his own world.

Her hair was dark, modishly bobbed. Her eyes were a deep, clear brown, her skin a warm olive. And she was dressed as though she had just stepped off Fifth Avenue--which indeed she had, not so long ago, as he was soon to learn.

"I hope I haven't startled you too much, Mr. Kendrick," she said, in a rich, husky murmur, "but--well, there wasn't any other way."

"Oh, I guess I'll get over it," he replied with a smile. "But you have the advantage of me, since you know my name."

Hers was Marjorie Blake, she told him then.

"Not the daughter of Henderson Blake?" he gasped.

"Yes," with a tremor, "his only daughter."

Whereupon Kendrick knew the solution of a mystery that had baffled the police for weeks. The newspapers had been full of it at the time. This beautiful girl, whose father was one of America's richest men and president of its largest bank, had disappeared as though the earth had swallowed her. She had left their summer estate at Great Neck, Long Island, on a bright June morning, bound for New York on a shopping tour--and had simply vanished.

* * * * *

Suicide had been hinted by some of the papers, but had not been taken seriously, since she had no apparent motive for ending her life. Abduction seemed to be the more logical explanation, and huge rewards had been offered by her frantic parents--all to no avail.

What had happened was, she now explained, that after visiting several shops and making a number of purchases, she had stepped into Central Park at the Plaza for a breath of fresh air before lunching at the Sherry-Netherlands, where she planned to meet some friends.

But before advancing a hundred yards along the secluded path, she had been seized by invisible hands--had felt something strapped to her wrist, before anyone came in sight--and then, invisible too, had been lifted up, whirled away into a vast, humming vibration that sounded through the air.

Once on the disc, it had swept off into space at incredible speed, pausing only when some hundreds of miles above the earth and invisible from below without mechanical aid. When its vibration finally ceased that amazing city had leapt before her eyes.

Then, her own visibility restored, she had been led into the presence of that mighty little monarch, Cor, who explained that she had been seized as a hostage and would be held as an ace in the hole, pending conquest of her country. Since when she had been a prisoner aboard the disc.

* * * * *

Learning of Kendrick's capture, from gossip among the women, she had taken the first opportunity of coming to him, in the hope that between them they might devise some means of escape.

Indeed, that was his own fondest hope--their imperative need, if the people of America and of the earth were to be saved from this appalling menace. But what basis was there for such a fantastic hope? Just one, that he could see.

"That thing on your wrist," he said, voicing it. "I'm surprised they let you wear one of those."

"They don't," she smiled. "I stole it!--from one of the maids in my apartment. It was the only way I could get here without being seen. I felt I must see you at once. We've got to do something, soon, or it'll be too late. I felt that, as a scientist, you might have some idea how we could get off."

"How do the people themselves get off?" he asked. "That escalator ray--do you know how they use it?"

"No, I've never been able to find out. They don't let me go near that part of the city."

Kendrick reflected a moment.

"Let's have a look at that invisibility affair," he said.

She removed it from her wrist, handed it to him. Somewhat in awe, he examined it.

* * * * *

The mechanism portion, which was linked in a strap of elastic metal, resembled only superficially a watch, he now saw. Rather it had the appearance of some delicate electric switch. Rectangular in shape, it was divided into two halves by a band of white crystal. In each of these halves were two little buttons of the same material, those on one side round, on the other square.

"Which buttons control the invisibility?" he asked.

"The square ones," she replied. "One's pushed in now, you see. If you should push the other, the first would come out--and you'd pass out of the picture, so to speak."

Kendrick was half tempted to try the thing then and there, but deferred the impulse.

"What are the round buttons for?" he inquired instead.

Marjorie didn't know, but thought they were probably an emergency pair, in case something went wrong with the square ones. In any event, nothing happened when you pushed them.

Kendrick pushed one, just to see. It was true. Nothing happened--but he seemed to sense a faint, peculiar vibration and a wave of giddiness swept over him. On pushing the other, which released the first, it stopped.

* * * * *

He handed the device back to Marjorie.

"There's your bracelet. Now, if I can just get one like it, I think we'll get down to earth all right."

"Oh, Mr. Kendrick!" Her eyes lit up eagerly. "Then you've thought of a way?"

"Not exactly. I think I've discovered their own way. I can't be certain, but I'm willing to gamble on it, if you are."

"Then you--you think those round buttons are connected with the escalator rays?"

"Exactly! I think they control individual descent and ascent, just as the square ones control individual visibility and invisibility. At any rate, it's the hunch I'm going to act on right now, if you're with me."

"Oh, I'm with, you!" she breathed. "Anything, death almost, would be preferable to this."

"Then stand by, invisible. I'm going to get one of my jailors in here and relieve him of his wrist-watch."

Marjorie touched that little square button on her own. She instantly became invisible.

Kendrick touched a button too, a button he had noticed beside the door. As he had supposed, it brought one of the Vadans.

Shutting the door quietly, he seized the fellow before he could move his hand to his wrist. Thwarted in his attempt to vanish from sight, the diminutive guard attempted an outcry. But Kendrick promptly throttled him.

* * * * *

Marjorie had reappeared by now and together they bound him to a chair with a gilded cord torn from the drapery.

Removing the precious mechanism from his wrist, Kendrick slipped it on his own.

"Now let's go!" he said, pressing the protruding square button of the device. "We haven't a minute to--my golly, what a peculiar sensation!"

"It is rather odd, isn't it?" she laughed, pressing her own and joining him in that invisible realm.

"Feels like a combination electric massage and cold shower! Where are you, anyway? I can't see you."

"Of course you can't!" came an unseen tinkle. "Here!"

He felt her brush him.

"Better hold hands," he suggested, then gave an invisible flush he was glad she couldn't see.

"All right. A good idea."

Her delicate hand came into his, soft, warm. Heart vibrating even faster than his body, his whole being a-quiver with a strange exaltation, Kendrick opened the door, and they left the apartment.

* * * * *

The next half-hour was the tensest either of then had ever experienced. Every foot of the way was fraught with peril.

Not only did they have to carefully avoid the visible swarms of little people who hurried everywhere, but had to be on their guard as well against any who might be moving about like themselves under cover of invisibility.

Nor could they use any elevator or public conveyances, but were obliged to make their way down to the concourse by heaven knew how many flights of stairs, and cross heaven knew how many teeming streets on foot, before they reached the amber court, below which the trap-door and their hope of freedom.

They got there at last, however, descended, and peered down from that yawning brink upon the desert floor--to draw back with gasps of dismay. For the area still gleamed semi-molten from the stupendous blast that had wiped out Kendrick's camp.

"W-what is it?" she gasped.

Swiftly he told her.

"But isn't there any way around it? Look, over there to the left. One edge of the crater seems to end almost underneath us."

It was true that the center of the caldron was far to the right of where they stood, and that its left rim was only a little within their direct line of descent. But to land even one foot inside that inferno would be as fatal as to alight in its very midst.

* * * * *

Kendrick was thinking fast.

"There's just a chance," he said. "It all depends upon how wide the zone of these escalator rays is, and whether we can tune in on them. At least, I can probably answer the latter question."

Pushing the protrudent round button on his mysterious bracelet as he spoke, he leaned over the edge of the trap-door and awaited results.

They were not long in coming. The vibration he was already under from the invisibility rays seemed to double. Alternate waves of giddiness and depression, of push and pull, swept over him.

A minute of it was enough. He pressed the round button that now protruded, ending this influence, and faced Marjorie, stating:

"I'm positive now that these things control descent and ascent. As nearly as I can figure, the rays work on the principle of an endless belt. If you're up here, you get carried down, and vice versa. As to how wide the belt is, and whether you can move sideways on it, remains to be seen. Anyway, I'm going to take a chance. I'll go first. If my guess is wrong, you--well, needn't follow."

"No, I'm going with you!" she declared resolutely. "We've come this far together. I shan't be left alone now. Let's go!"

And again her soft, warm hand was in his.

Lord, what a girl! How many would be brave enough to take a gamble like that, on a fellow's mere supposition?

"All right--go it is!" he said. "Push your round button, like this." He showed her the way he thought was right, pushed his own. "Ready?"

"Ready!"

* * * * *

Their voices were grave. It was a grim prospect, stepping off into space like that, with only a guess between them and death.

"Then jump!"

They jumped, gripping each other's hands tightly--and instead of dropping like plummets were caught in a powerful field of force and whirled gently downward.

"Oh, you were right!" gasped Marjorie, awed. "See, we--"

Then she paused, horror-stricken, for it was obvious that they were to descend within that lake of molten glass, unless they could change their course at once.

"Quick!" he called. "Hold fast! Now--run!"

Breathless, they raced to the left, across that invisible descending belt.

Too far, Kendrick knew, and they would plunge outside its zone, fall crushed and mangled. Not far enough, and they would meet cremation. It was a fearful hazard, either way, but it had to be taken.

They were almost down, now, and still not quite far enough to the left. The heat of that yawning crater rose toward them.

"Faster--_faster_!" he cried, fairly dragging her along with him.

A last dash--a breathless instant--and they stood there on the ground, not three feet from the edge of doom.

Swooning with the heat, Marjorie swayed against him, murmured an incoherent prayer.

"Take heart!" he whispered, lifting her bodily and bearing her some yards away. "We're down--safe!"

* * * * *

Their safety was but relative, however, Kendrick well knew. Until they could put miles between them and this monstrous disc, they were not really safe. No telling how soon their escape might be discovered. No telling what terrible means Cor might take of curbing their flight.

So as soon as Marjorie had recovered sufficiently to proceed, they headed off across the desert at a fast walk toward Ajo, where he hoped to catch the afternoon train for Gila Bend. From there, they could board the limited for Tucson and points east, when it came through from Yuma that night.

They had tuned out on the escalator rays, but continued on still invisible--for the disc hung above them in plain view and it would have been suicide to let themselves be seen.

Even so, Kendrick soon began to have an uneasy feeling of being followed. He looked around from time to time, but could see nothing. Were some of those invisible little creatures on their trail?

He said nothing to Marjorie of his anxiety, but presently she too began glancing backward uneasily, every few steps.

"They are near us!" she said at length, in a whisper. "I can sense them."

It was more than sense, they soon discovered. Little paddings became quite audible, and once or twice they saw the sand scuffed up, not twenty feet away, as though by a foot passing over it.

* * * * *

Meanwhile they were climbing a rise of ground, broken by many small hummocks and dotted with thorny shrubs. On the other side, at the foot of a long down-slope, lay Ajo.

Once they reached the summit, Kendrick felt sure they could outdistance their pursuers on the descent. Already, if his watch was right, the train was preparing to pull out. It would be a breathless dash, but he was confident they could make it.

So he reassured Marjorie as best he could, and helped her on up the slope.

They were practically on the summit and already in view of the little railroad station and huddle of shacks below--when suddenly he felt himself tripped and flung violently to the ground. At the same instant, his companion emitted a scream, as she felt herself seized by invisible hands.

Leaping to his feet, Kendrick flailed out with solid fists at their attackers. Groans answered the impacts and he knew his blows were taking effect.

* * * * *

Free for a moment he dashed to Marjorie, felt for the midgets who swarmed around her. Seizing one of the invisible forms, he lifted it and flung it crashing to the ground. Another, likewise, and another.

Then he threshed his legs, where two of the creatures clung, trying to drag him down again. They flew through the air, with cries of fright.

"Well, so far, so good!" he exclaimed. "We won't wait to see if there are any more. Come on--let's go!"

"Right!"

Reaching for each other's hands, they raced down the slope.

Halfway there they saw a warning blast of steam rise from the engine, followed by a whistle.

"They'll be pulling out in a minute now!" he gasped, increasing speed. "We've got to make it!--our only chance!"

"We _will_ make it!" she sobbed through clenched teeth, meeting his pace.

Glancing over his shoulder, after another fifteen seconds, Kendrick saw that the disc was no longer visible. Since there was no vibration he realized with relief that it was now hidden behind the slope they were descending.

"Quick--push your button!" he said, pushing his own.

They came out of the influence of the invisibility rays, raced breathless on down the slope--gained the station platform just as the train was getting under way.

Helping the exhausted girl aboard, he mounted the steps himself, led her through the vestibule into its single passenger coach.

Dropping into a seat, they sat there panting as the train gathered speed.

* * * * *

By the time the decrepit but life-saving little local drew into Gila Bend they had somewhat recovered from their harrowing experience.

Marjorie was still pale, however, as Kendrick helped her from the train.

"I may recover," she said with a wan smile, "but I'll never look the same! An old saying, but I know what it means now."

He thought better of a sudden impulse to tell her she looked quite all right to him. Instead, he said grimly:

"I know now what a lot of things mean!"

The Tucson limited would not be through for over an hour, they learned. That would give them time to hunt up the authorities and sound a warning of the ominous invader that was in the vicinity. Perhaps, by prompt military action, it might be destroyed, or at least crippled.

But first they went to the telegraph office, where Marjorie got off a message that would bring joy to her grieved family.

While standing there outside the barred window, odors of food wafting to them from a nearby lunch-room.

"Um-m!" she sniffed. "That smells good to me! I haven't tasted any earthly cooking for ages. Everything on that horrible disc was synthetic."

"Then I suggest we have ham and eggs, at once," he said. "Or would you prefer a steak?"

"I think I'll have both!"

* * * * *

As they walked into the lunch-room, Kendrick told her of the banquet in his honor Cor had promised for that night.

"I guess I didn't miss much," he ended.

"You certainly didn't!" she assured him, with a smile. "It would have opened with a purée of split-molecule soup, continued with an entrée of breaded electrons, and closed with an ionic café."

He laughed.

"I'm just as well satisfied. I was unable to attend! Humble as it is, I think this will prove to be much more wholesome food."

Night had fallen by the time they left the lunch-room. Glancing at his watch, Kendrick saw that they still had better than a half-hour before the limited was due, so they betook themselves to the police station.

It was only a block away and in consequence they weren't long reaching it.

The chief had gone home, the officer at the desk informed them, but if there was anything they cared to report, he would be glad to make note of it.

A big raw-boned westerner, he shifted his quid as he spoke and spat resoundingly in a cuspidor at his feet.

"All right, then--get your pencil ready!" said Kendrick with a smile. "This is Miss Marjorie Blake, daughter of Henderson Blake, of New York. Perhaps you read of her disappearance, a few weeks ago. And I...."

As he introduced himself and told briefly of their astounding experience, the officer's eyes bulged with amazement.

"Say, what yuh-all tryin' to hand me?" he snorted finally. "D'yuh think I was born simple?"

"Press your button!" whispered Marjorie. "Show him how the invisibility ray works. It'll save a lot of argument."

"Right!"

* * * * *

He held up his wrist.

"See this? Now watch!"

Whereupon he pressed the button. But to their dismay, nothing happened.

"Wa-al. I'm still watchin'!" drawled the officer. "Who's loony now?"

Kendrick examined the mechanism in impatience, pressed that little button repeatedly: but still nothing happened.

"Try yours!" he told Marjorie finally.

She did so, with similar results--or lack of them, rather.

"Something's wrong," he said at length. "The ray isn't working."

"Wrong is right!" declared the officer with a contemptuous flood of tobacco juice. "Yuh folks better go catch yuhr train 'fore yuh ferget where it is."

Chagrined, embarrassed, they took their leave, headed back toward the railroad station.

"Of all the utterly silly things!" declared Marjorie, as they walked along. "Why do you suppose it didn't work?"

Kendrick didn't reply at once. When he did, his voice was grave.

"Because the disc has gone!" he said. "We are outside its zone of influence. That's my hunch, at least, and I think we'd better act on it."

"You mean...?"

"I mean our escape has probably caused them to hurry their plans. They're probably over New York right now. I think we'd better get there the quickest possible way."

* * * * *

The result was that when the train came, they remained on it only to Tucson. There they chartered a fast plane and started east at once.

At sunset the following day the plane swooped out of the sky and slid to rest on the broad grounds of the Blake estate at Great Neck.

As Kendrick stepped from the cabin and helped Marjorie down, a tall, distinguished-looking man with graying hair and close-cropped mustache came hurrying toward them.

"Daddy!" she cried, rushing into his arms. "Oh, Daddy--Daddy!"

Even without this demonstration. Kendrick would have recognized Henderson Blake from pictures he had seen recently in the papers.

Now he was introduced, and Blake was gripping his hand warmly.

"I don't quite know what this is all about, Professor," he heard the great financier say. "Marjorie's telegram last night was as cryptic as it was over-joying. But I do know that I owe you a deep debt of gratitude."

"Yes, and you owe our pilot about a thousand dollars, too!" put in the daughter of the house, clinging to her father's arm. "Please give him a check--then we'll go inside and I'll explain all about it."

"A matter very much easier dispatched than my debt to Professor Kendrick," said Blake, complying.

The check was for two thousand, not one, the pilot saw when he received it.

"Thank you very much, sir!" he said, saluting.

"Don't mention it. Good night--and good luck to you!"

* * * * *

The pilot returned to his plane, it lifted from the lawn, droned off into the twilight.

Then they approached the cool white villa that stood invitingly a hundred yards or so away beyond sunken gardens.

As they neared it, a handsome, well-preserved woman whose face reflected Marjorie's own beauty came toward them. Lines of suffering were still evident around her sensitive mouth, but her dark eyes were radiant.

"Mother!"

"My poor darling!"

They rushed into each other's arms, clung, sobbing and laughing.

Kendrick was glad when these intimate greetings were over and he had met Mrs. Blake.

They were in the drawing-room now, listening to a somewhat more lucid account of their daughter's experiences and those of her rescuer. Marjorie was doing most of the talking, but every now and again she would turn to Kendrick for verification.

"Heavens!" gasped Mrs. Blake, finally. "Can such things be possible?"

"Almost anything seems possible nowadays, my dear," her husband told her. "And you say, Professor, that you have brought back samples of this invisibility device?"

"Yes, we have, but I can't promise they'll work. I'll try, however."

Whereupon, sceptically, he pressed that little square button--and instantly faded out of sight.

"Good Lord!" cried Blake, leaping to his feet. "That proves it! Why, this is positively--"

* * * * *

His remarks were cut short by a scream of terror from his wife.

"Marjorie--Marjorie!" she shrieked.

Wheeling, he faced the chair where his daughter had sat. It was empty, so far as human eyes could see.

"Don't worry Mother--Daddy!" came a calm voice from it. "I'm quite all right--coming back--steady."

And back she came, as did Kendrick, from the empty chair beside her.

His face was grave. The success of the demonstration, which had proved their story to practical-minded Henderson Blake, had proved to him something altogether more significant. The disc, as he had surmised, had rushed eastward immediately on learning of their escape, and was now probably hovering right over New York.

"Marvelous--marvelous!" declared Blake. "But that heat ray, Professor. That sounds bad. You are convinced it is as powerful as they make out!"

"Positively! That blast they let go in the desert would have utterly destroyed New York."

"Hm! Yes, no doubt you're right. I fully realize how the fearful menace of this thing. Do you think the military authorities will be able to cope with it?"

"I don't know. Perhaps, if they are prompt enough."

"And is there no other way--no scientific way?"

* * * * *

Kendrick grew thoughtful.

"I wonder," he said at last. "There's just a possibility--something running through my mind--an experiment I'd like to make, if I had the facilities of some large electrical laboratory."

"You shall have them to-morrow!" Blake promised. "I'm one of the directors of Consolidated Electric. Their experimental laboratory in Brooklyn is the finest of its kind in America. I'll see that you have the run of it."

"That will be very kind," said Kendrick. "But don't expect anything to come from it, necessarily. It's just a theory I want to work out."

A butler entered at this moment and announced dinner.

"Well, theories are mighty these days!" beamed Blake, as they rose, clapping the younger man on the shoulder. "You go ahead with your theories--and I'll bring a few facts to bear. To-morrow noon I'll escore some military men and others of my friends over to the laboratory to hear and see something of this menace direct. Meanwhile, and during this crisis, it will honor me to have you as my guest."

"Our guest!" amended Marjorie, with a warm smile.

* * * * *

Next morning Blake motored Kendrick out to the Brooklyn Laboratory of the Consolidated Electric Utilities Corporation and installed him there.

Then he left--to return at noon with the promised delegation of generals, admirals, statesmen and financiers.

They were all frankly sceptical, though realizing that Henderson Blake was not a man given to exaggeration. Nor did their scepticism altogether vanish when Kendrick had ended his bizarre story with a demonstration of the invisibility device.

Murmurs of amazement ran around the laboratory, it is true, but the more hard-headed of his spectators charged him with having invented the apparatus himself. Though they didn't come right out and say so, they seemed to imply that he was seeking publicity.

Annoyedly, Kendrick tried to refute their charges. But even as he was summoning words, refutation utter and complete came from the air.

A low, humming vibration sounded, grew in volume till it filled the room--and as suddenly ceased: The light of midday faded to twilight.

"_The disc!_" gasped Kendrick, rushing to the west windows.

They followed, tense with awe. And there, between earth and sun, its myriad towers and spires refracting a weird radiance, hovered that vast flying city.

"My God!" muttered a famous general, staring as though he had seen a ghost.

A great statesman opened his lips, but no words came.

"Appalling! Incredible!" burst from others of that stunned assemblage.

* * * * *

Their comments were cut short by a broadcast voice, thin and clear, tremendously amplified, a voice Kendrick recognized at once as that of Cor.

"People of America!" it said. "We of the planet Vada have come to conquer your country. You will be given forty-eight hours to lay down your arms. If complete surrender has not been made by high noon, two days from now, New York will be destroyed."

The voice ceased. The humming recommenced--waned in volume till it died away. Twilight turned once more to midday.

Peering fixedly through the west windows of the laboratory, the little assemblage saw the disc swallowed up in the clear blue sky.

Then they turned, faced one another gravely.

Outside, on the streets, confusion reigned. In newspaper plants, presses were whirling. In telegraph and cable offices, keys were ticking. From radio towers, waves were speeding.

Within an hour, the nation and the world knew of this planetary invader and its staggering ultimatum.

Naturally, the government at Washington refused to meet these shameful terms. Military and naval forces were rushed to the threatened metropolis. The Atlantic Fleet steamed up from Hampton Roads under forced draught and assembled in the outer harbor. Thousands of planes gathered at Mitchell Field and other nearby aerodromes.

* * * * *

But where was the enemy? He must be miles up in space, Kendrick knew, as he toiled feverishly in the laboratory over his experiment after a sleepless night. For had that flying city been nearer earth, it could not have maintained invisibility without that peculiar humming vibration.

Scout planes urged on by impatient squadron commanders, climbed till they reached their ceilings, searching in vain. They could encounter nothing, see nothing of the invader.

Thus passed a morning of growing tension.

But by noon of that day, with a bare twenty-four hours left before the expiration of the ultimatum, the disc came down, showed itself boldly.

There followed stunning disasters.

One salvo, and the ray shot down--the Atlantic Fleet, the pride of America, burst and melted in flaming hell. Squadrons of planes, carrying tons of bombs, frizzled like moths in the air. Mighty projectiles hurled by land batteries were deflected off on wild trajectories.

Appalled, the nation and the world followed in lurid extras these crushing defeats.

By nightfall of that day, all seemed lost. All opposition had been obliterated. America must capitulate or perish. It had until the next noon to decide which.

* * * * *

Meanwhile, in that great Brooklyn laboratory, Kendrick was working against time, besieged by frantic delegations of the nation's leaders. They knew now that their one hope lay in him. Was he succeeding? Was there even any hope?

Face haggard, eyes bloodshot from lack of sleep, he waved them away, went on with his work.

"I will tell you--as soon as I know."

That was all he would say.

Followed a night that was the blackest in all history, though the myriad stars of heaven shone tauntingly brilliant in the summer sky.

At length, as dawn was breaking. Kendrick paused in his labors.

"There!" he said, grimly, surveying an apparatus that seemed to involve the entire facilities of the laboratory. "It is done! Now then--will it work?"

The delegation were called to witness the test.

Henderson Blake was among them, as was Marjorie. She stepped forward, as he prepared to make the demonstration.

"I _know_, somehow, you're going to be successful!" she murmured, pressing his hand, meeting his eyes with a smile of confidence.

"I hope you're right--Marjorie!" he replied, letting slip the last word almost unconsciously.

Her face colored warmly as the stepped back and rejoined her father.

Kendrick's heart was beating fast as he turned to his instruments. How could he fail, with faith like that behind him?--love, even, perhaps! He mustn't fail--nor would he, if his theories were sound.

* * * * *

Addressing the assemblage, he explained briefly the complicated apparatus.

"These towers," he said, pointing to four steel structures about ten feet high, arranged at the corners of a square roughly twenty feet across, "are miniature radio masts. The area enclosed by them, we will assume, is the city of New York. That metal disc suspended above the area represents the invader. It contains a miniature heat-generator such as I was experimenting with recently in the Arizona desert."

He paused, threw a switch. Somewhere in the laboratory a dynamo began to whir.

"I am now sending electro-magnetic waves from the four towers," he resumed. "But instead of broadcasting them in every direction. I am bending them in concave cathode of force over the city. You may picture this cathode as an invisible shield, if you choose, but it is more than that. It it a reflector. If my theories are right, the radio-energetic ray I am about to project upon it from my miniature disc will be flung back to its source as though it had been a ray of light falling on a mirror. The success of the experiment depends upon what the result will be."

* * * * *

Kendrick ceased, moved toward a rheostat.

As he made ready to touch it, a breathless tension settled upon the assemblage. Upon the outcome of what was now to happen rested the fate of America--and the world.

Calmly, though every fiber of his being was at breaking stress, the young scientist opened the rheostat.

For an instant, the ray seared down--then, as it boomeranged back, the disc burst into flame, dissolved, disintegrated. A thin dust, like carbon, slowly settled to the laboratory floor.

Cutting off the current from the radio towers, Kendrick faced them, a light of triumph in his tired eyes.

"You see--it works," he said.

They saw. Beyond a doubt, it worked!

And what Kendrick saw, as his eyes met Marjorie's, made him forget his fatigue.

* * * * *

The rest was a mad scramble of preparation. Only a few brief hours remained, and much was to be done.

The application of the principle that had just been demonstrated involved a hook-up from the Consolidated Electric laboratory with every broadcasting station in the metropolitan area, power being supplied by commandeering every generating plant within a radius of fifty miles.

The city, moreover, had to be evacuated of all but the few brave hundreds who volunteered to stand by their posts at radio stations and generating plants.

As for Kendrick, it was the busiest, most hectic morning he had ever experienced. Only the realization of a girl's love and a nation's trust enabled him to overcome the exhaustion of two sleepless nights.

At length, a little before eleven, all was in readiness. Just two questions troubled the young scientist's mind. Had the people of the disc learned of their preparations to counter the attack? And would the improvised broadcasting apparatus of the area stand the stupendous strain that would be placed upon it if the ray came down?

The first of these questions was answered, staggeringly, at a quarter after eleven.

"Kendrick--oh, my God!" cried Blake, bursting into the laboratory. "Marjorie--they've got her again! Look! Read this!"

He thrust out a piece of paper. Kendrick took it, read:

Your daughter will be my queen, after this noon.

"Where'd you get it?" he gasped.

"One of the invisible devils thrust it into my hand right out in the street, not five minutes ago," Blake explained, trembling with anguish. "Do you realize what this means, Kendrick? She's on the disc now--and in a scant three-quarters of an hour...."

"Yes, I realize!" his voice came grimly. "And I realize, too, that they don't know their fate. They'll stay. There's forty-five minutes yet. We can't abandon our defense against the ray, not even for Marjorie. But I'll go, I'll rescue her--or die with her!"

And even as Blake mutely reached out his hand to grip that of the determined young man who stood before him. Kendrick touched his wrist mechanism and went invisible.

* * * * *

Once on the street, he pressed the escalator button as well--and by the strength of the vibrations that followed, he knew he must be very close within that mysterious lifting zone.

Running west a block, he found it growing stronger.

Fairly racing now, he continued on toward the river, progress unhampered in the deserted streets. Suddenly, with a thrill of exultation, he felt himself swept up, whirled away toward that great shimmering hulk against the sun.

"What hope?" he was thinking. "What possible hope?" And the answer came: Cor!

Reaching the disc, he switched out the escalator influence and hastened across the city to that monumental structure of jade-green stone.

The mighty little dwarf would be up there in his glittering mosaic apartment, or in his pinnacle laboratory, perhaps, ready to pull the lever that would release that stupendous blast of heat.

Gaining the jewelled door of the monarch's quarters at last, after escaping detection by a hair's breadth more than once, he pressed the button outside, just as the guard had done that first time.

In response, the door opened--and there stood Cor.

* * * * *

He stood there an instant, that is, while the expression on his leathery face went from inquiry to alarm. Then, as Kendrick burst into the room and shut the door, he went invisible.

In that same instant, the young scientist's eyes beheld a sight that caused his heart to leap. There sat Marjorie, bound in a chair, an expression half of hope, half of dejection, on her face.

"It's I--Gordon!" he called. "Take courage!"

"Oh, I prayed so you'd come--and you came!" she murmured as her face lighted. Then, tensely, she added, "The door--look out!"

Kendrick wheeled, and just in time. The door was opening.

"Not so fast!" he called, lunging.

His hands gripped the dwarf, yanked him back, throttled him before he could emit a cry, pushed the door shut.

Cor struggled like a madman, but it was futile. Kendrick's hands cut into his throat like a vice. After a moment or two, he gasped, relaxed.

Releasing his grip then, Kendrick felt for his wrist, stripped off his bracelet--whereupon the dwarf became visible. His face was putty-white. He was either dead or unconscious.

Restoring his own visibility then, he advanced to Marjorie, swiftly freed her.

"Take this!" he said, handing her Cor's bracelet.

She slipped it on.

"Now let's tie him and get out of here. He may be dead, but we can't take any chances."

* * * * *

The dwarf wasn't dead, however, for he groaned and opened his eyes as they lifted him into the chair.

"You win, Professor--but it avails you nothing!" He smiled maliciously. "My capture, my death even, will not prevent the ray. The orders have been given. It will be projected sharp at twelve. You but go to your doom!"

"That," said Kendrick, "is a matter of opinion."

Swiftly they bound him, gagged him.

"And now," he added, "we wish you good day--and such fate as you deserve!"

Then, turning to Marjorie:

"Your hand again!"

There was a new tenderness in its soft warmth that thrilled him.

They touched their buttons, went invisible.

Silently, then, they stole from the apartment. Swiftly they made their way down to the concourse, raced across the city to the amber court, descended to the trap-door.

It must be nearly twelve, Kendrick knew. He couldn't look at his watch, for it as well as himself was invisible. Indeed, even as they stood there, poised for the plunge, a faint whistle rose from below.

Marjorie trembled.

"Steady!" he spoke. "Some of them always blow a minute or two before. Are you ready?"

"Yes!"

"Then press your button--jump!"

Even as they leapt, the sickening thought came that perhaps the escalator ray was no longer running. But the fear was unwarranted. They were caught up, whirled gently downward.

Moving along laterally, as they descended, they were able to land without difficulty in the middle of a deserted street near the Consolidated Electric laboratory.

"Thank heaven!" she sighed, as their feet touched solid ground. They pressed off both buttons, becoming visible once more.

"Echo!" he agreed. "So let's--"

* * * * *

But Kendrick never completed that sentence--for now whistles all over the metropolitan area, rising from the generating plants, announced the ominous hour.

It was high noon. The ultimatum had expired.

Lifting tense faces to the disc, they waited. Would that stupendous ray be hurled back upon itself? Or would it sear through their makeshift defense, plunging them and the whole great metropolis into oblivion?

Suddenly, cataclysmically, the answer came.

There burst a withering whirlwind from the disc. It struck that mighty concave cathode of interlaced waves above the city. There followed an instant's clash of titanic forces. Then the cathode triumphed, hurled it back.

Rocked by a concussion as of two worlds in impact, blinded by a glare that made the sunlight seem feeble in comparison. Marjorie and Kendrick clung together, while the disc grew into a satellite of calcium fire in the sky.

Presently, as the conflagration waned, they opened their eyes. Gravely, but with deep thanksgiving, they searched each other's faces. In them they read deep understanding, too, and a new hope.

"I think we'd better go and find father," she said at length, quietly.

"I think so too!" he agreed.

As they headed toward the laboratory, a fine, powdery dust, like volcanic ash was falling.

It continued to fall until the city streets were covered to a depth of an inch or more.

Thus passed the menace of Vada.

"Come Over In 'THE READERS' CORNER'"

And join in the general discussion of stories, authors, likes, dislikes--everything pertaining to

ASTOUNDING STORIES

And Science-Fiction]

The Readers' Corner

A Meeting Place for Readers of Astounding Stories

[Illustration:]

To the Rescue

Dear Editor:

I hope you can see fit to print this letter in the July issue of Astounding Stories. This letter is written in defence of Ray Cummings and in reply to the letter of C. Harry Jaeger, 2900 Jordan Road, Oakland, California.

Following is an extract of Mr. Jaeger's letter: "Also I like my authors to make an original contribution to whatever theory of science they develop fictionally. This, Ray Cummings does not do in his very interesting story, "Phantoms of Reality." His beginning is palpably borrowed from Francis Flagg's story, "The Blue Dimension," which appeared in a Science Fiction magazine in 1927." Another paragraph is devoted to explaining his claim. He claims that Cummings' method of transporting his characters from one dimension or planet to another is practically copied from Flagg's story. The method, that is, not the narration. I hope to prove that if any borrowing was done, it was done by Flagg. Incidentally, Flagg's story "The Blue Dimension" was printed in 1928, not 1927, as Mr. Jaeger says.

I have in my possession a story by Ray Cummings named "Into the Fourth Dimension" and published in another magazine during the last month of 1926 and first ones of 1927. And in this story--printed two years before Flagg's story--Cummings uses almost the same apparatus of passing from one dimension to another as is used in "Phantoms of Reality." I will not discuss whether this procedure is to be approved or not.

This letter is not to be construed as an attack on Mr. Jaeger, or Mr. Flagg, or on either of the two stories under discussion.

If Mr. Jaeger will let me know I will send him Ray Cumming's story "Into the Fourth Dimension," as clipped from the magazines.

I write this letter to the magazine, instead of Mr. Jaeger, so that if any one was misled by Mr. Jaeger's well meant but mistaken criticism they will be straightened out.--Donald Coneyon, Petoskey, Michigan.

A Wish for Success

Dear Editor:

I have read both of your first issues. I am writing to say that I wish you success with your new magazine, which I know will succeed.

Also to say I wish you would get more of the "Carnes and Dr. Bird Stories" by Captain S. P. Meek, for I think everybody, including myself, likes them. I also enjoyed "Creatures of the Light."--Thomas D. Taylor, 415 So. 7th St., Boise, Idaho.

No Kick Any More

Dear Editor:

I have been a reader of Astounding Stories ever since you started it, and I guess I'm getting too particular as I don't get the kick out of it any more that I did out of the first issues. That is, I don't get the kick out of ALL of the stories as I did at first. However, "Murder Madness" sure is a hot one. Why not print a story by Sax Rohmer, H. G. Wells, or some of them?--H. Elsworth Jones, Box 340, R. R. 6, Battle Creek, Mich.

Via Postcard

Dear Editor:

Astounding Stories is an astounding magazine. It has really astounding stories. It couldn't be better. There's hardly room for improvement. May Astounding Stories be more astounding yet. I like it!--Monroe Hood Stinson, 1742, 12th Ave., Oakland, California.

Only Fiction!

Dear Editor:

I have just finished a story in the February, 1930, issue of Astounding Stories entitled "Into Space," by Sterner St. Paul.

I would like to know if it is a true story, if the actions described in it really happened, or is it merely a story of fiction.--Dan S. Scherrer, Shawneetown, Ill.

Perhaps--Soon

Dear Editor:

I have just finished reading your new magazine, Astounding Stories. It is the best magazine I have ever read. Keep up the good work and you will find me a constant reader. I have only one suggestion to make: Let Astounding Stories come out every other Thursday.--Harold Kulko, 433 Palmer E., Detroit, Michigan.

More Preferences

Dear Editor:

I have read with great interest the second issue of Astounding Stories and note your invitation for readers to express themselves.

I enjoyed the whole magazine, finding the literary quality surprisingly high. Especially good were "Spawn of the Stars," and "Creatures of the Light." Harl Vincent's tale was the best of his I have read; and Captain Meek's are always good. "The Corpse on the Grating," however, was merely Poe's "Fall of the House of Usher" done over, and not half so well.

As for the sort of tales I like, here they are in order of preference:

1. Tales of weird mystery--Merritt's "Moon Pool" and his others; Taine's "White Lily."

2. Interplanetary Adventure--"A Columbus of Space," by Serviss; "The Skylark of Space," by Smith.

3. "Different stories," that defy classification, based on new ideas of science--most of Wells' short stories are examples. 4. Detective, Fourth Dimension, and air adventure--only well done.--Jack Williamson, Box 661 Canyon, Texas.

A Brick or Two

Dear Editor:

For the last three years we have been reading any and all of the various Science Fiction magazines which have appeared upon the market. We therefore feel that we are as well qualified as anyone to offer the criticism and advice that follows.

First, the stories. We feel that it would be a good idea to get your stories from the same authors whose work has been and is being accepted by the other magazines in this field. In one case you have already done this, and I consider his stories to be the best in each issue. I believe that you will be forced to do this eventually, anyhow, because the people who read this magazine will naturally be readers of the others also, and will therefore, be used to the standards set by those publications. Then, you should have someone who is well qualified to pass upon the science in the stories.

Second, the cover design and the pictures at the beginning of each story. Up to this time the cover and inside pictures have contained many mistakes. The cover of the March issue was especially atrocious. In the first place a voyager in outer space would find it jet black and studded with stars, instead of blue and apparently empty, except for a few tremendously oversize planets, a moon with entirely too many craters, and a total eclipse of the sun with a very much distorted corona visible beside the earth. Illustrations by your cover artist also appear in another publication, but these are much superior to the ones in Astounding Stories. Here also a scientific advisor would be welcome.

Third, I think it would be a good idea to have a department in which readers could write their opinions of the stories and suggest improvements in the conduct of the magazine.

Fourth, I think there should be a scientific editorial in each issue by some eminent scientist. This is also a feature in the other magazines.

We hope that you take these criticisms and suggestions, as they were offered, in good faith. We also hope that the circulation will increase as the magazine becomes better.--George L. Williams and Harry Heillisan, 5714 Howe St., Pittsburgh, Pa.

"_Wonderful_"

Dear Editor:

I received your magazine last week, Astounding Stories, and I think it is wonderful. I am very glad that I subscribed for it. I can hardly wait to get the latest one which I hoped to receive to-day and was very much disappointed when it did not arrive. I hope you will consider a quarterly or at least an annual in the near future.

I wish you success with this magazine, and hope you will forgive my writing you so often in reference to your magazine--Louis Wentzler, 1935, Woodbine St., Brooklyn, New York.

--_But We Made Our Bow Only Last January!_

Dear Editor:

Last month my boy brought one copy of this magazine home, and I want to ask you if you would send me the copies from last January, 1929, up to December, 1929. If you charge no more than $3.00 would you send them C. O. D.? Do you have the issues for 1928, too?

I never knew there was a magazine like that on the market. I never bought one because most of them are no good, and when one has children one has to be doubly careful.

But this magazine is just right. No silly love stories and mushy stuff in them. It sure keeps your mind from unpleasant things. We can get them from the newsstand but I would like to subscribe for them.

Keep up the good work and please send me the last year's copies and let me know if I could get 1928, too.--Mrs. M. Ristan, 4684, No. Broadway, Denver, Colorado.

"_Best One Yet_"

Dear Editor:

The April issue is the best one you have put out yet. Arthur J. Burks is GOOD. I hope to see much of him in the future. "Brigands of the Moon," by Ray Cummings, is getting better with each instalment. The stories of Dr. Bird are always interesting. I would like to see one in each issue, if you could arrange for it.

As long as the other readers like the size of Astounding stories, I will, too, but please cut all edges smooth like the latest issue of Five Novels Monthly. I would like to see a full-page illustration with each story, and if possible by Wesso.

I am glad that you are starting another serial in the May issue of Astounding Stories. I like serials and I hope that you will always have two in each issue.

Your schedule for the May issue looks good, and I'm sure it will be, with such authors as Murray Leinster, Victor Rousseau, Ray Cummings, Harl Vincent and Sewell P. Wright.

I am still waiting for a different colored cover.--Jack Darrow, 4225, N. Spaulding Ave., Chicago, Illinois.

An Enthusiastic Reader

Dear Editor:

As a reader of long standing of Science Fiction I feel I am qualified to make some remarks and give my opinion of the wonderful Astounding Stories magazine lately put out. Although I read three other Science Fiction magazines none of them have aroused in me such a wonderful enthusiasm as Astounding Stories. Before I forget it I want to mention that I read two quarterlies also.

The reason, or rather reasons, for my enthusiasm I will now enumerate. (1) The stories are wonderful. (2) The binding is very strong and efficient. (3) The print is just right, and soothing to the eyes of one who reads much. The paper is good, and the size and price of the magazine is just right. The covers are excellent, and with the addition of "The Readers' Corner" the magazine becomes absolutely perfect. Truly a wonderful start. See that it is kept up. The only thing that can still spoil the magazine is poor stories. Science Fiction stories that contain no science.

In "Vampires of Venus" the plot was rather weak. Even if the Venerians knew nothing of entomology, they should have brains enough to get rid of the vampires the way Leslie Larner did without having to call an Earthman to help them. Another thing: the Venerians kept only insects that were not harmful to the crops. On Earth there are such insects who help the farmer by eating harmful insects. If the harmful insects were exterminated--an almost impossible and gigantic task--the harmless insects would change their diet and become harmful too. And it seems funny, too, that such a highly civilized planet as Venus should still depend on domesticated animals for food, drink and clothing instead of manufacturing what they need synthetically.

The April cover on your magazine was wonderful.

Before I close I wish to say a word about the Science Correspondence Club of which I am a proud member. There is little to say, however, after reading Conrad Ruppert's letter in the April issue. The membership has increased to over 300 now, numbering among them quite a number of famous scientists and authors. All I can say is that I hope every scientifically inclined person of whatever nationality, creed, color or sex they may be, will join this wonderful and rapidly progressing club. I will now close thanking the publishers of Astounding Stories for issuing such a wonderful magazine--Stan Osowski, E2, Railroad St., Central Falls, R. I.

But--Conniston Was An Impostor!

Dear Editor:

I read with interest Mr. Ray Cummings' story, "Brigands of the Moon," in the March number of Astounding Stories. The tale was a worthy one from the pen of so clever a writer. I do think, however, that the author might have left out the point about Sir Arthur Conniston, an English gentleman, turning traitor. This sort of thing is hardly calculated to bring about a friendly feeling between England and America, the two greatest countries in the world. I have the greatest admiration for the United States, and though we may have a little fun at each other's expense, there is no ill feeling meant, but I really hope you will not publish any other story like that one.--An Englishman, Montreal, Canada.

Likes the Romance

Dear Editor:

I have just finished my second copy of Astounding Stories and I wish to say I have enjoyed every story.

For some time I have been a reader of Science Fiction, but none will compare to Astounding Stories. These stories seem to have the proper amount of romance in them to make them really interesting, and it adds the proper touch.

I have no criticism to make. May I wish you a great success with this magazine--Frank I. Sontag, 825 Prescott Ave., Scranton, Pa.

High Praise

Dear Editor:

Allow me to congratulate you upon the establishment of "The Readers' Corner." I do not know which was the first issue of your delightful magazine, but I have been buying it regularly for quite a few months.

I may not be an experienced critic, but it can be easily seen by anyone that this magazine is one of the best on sale. I, for one, enjoy your stories more than any other stories I have ever read.

I have just finished the second part of the four-part serial entitled "Brigands of the Moon." I thing Ray Cummings is the best author I have ever met up with in stories. The drawings are fine, the print is excellent, but I think the paper could be improved. But by no means change the size of your little magazine. The size is just right.

In your April issue I read in "The Readers' Corner" about a Science Correspondence Club. Believe me when I say I'm sending immediately for an application blank. I think the idea of this club is excellent.

Truly you have contributed a great gift to Science Fiction readers in offering this magazine to the receptive public.--Theodore L. Page, 2361 Los Angeles Ave., Pittsburgh, Pa.

"_Don't Do It!_"

Dear Editor:

This afternoon I saw Astounding Stories for the first time and immediately grabbed a copy, as I have read others of the Clayton group, and moreover am a Science Fiction fan.

The newsstand has no back numbers, and I simply must have the March 1930 issue, as I wish to read "Brigands of the Moon," so here is 25¢, in stamps to cover purchase price and cost of mailing me a copy of that issue.

Have you a complete file since Vol. 1, No. 1? If so, what is the cost including charges? I'm sorry that I missed this magazine before, but you can rest assured that I'll miss no more.

In the "Readers' Corner" I notice a call from Stephen Takacs for a change in size. DON'T DO IT! The size and shape are O. K., and to make it the awkward size of most magazines (including two of the Science Fiction magazines that I am now a confirmed reader of), would not improve it a bit.

You have two of my favorite authors in the April number; no, I see it is three--Burks, Cummings and Meek. They are O. K., but don't forget a few others, such as Burroughs, Verrill, Hamilton, Coblentz, Keller, Quinn, Williamson, Leinster, Repp, Vincent, Flagg--oh, why continue; you certainly know all the good authors of OUR kind of fiction; try them all. Of course, the other Science Fiction magazines that I take are full of stories by my favorites, but you can get stories by them too.

From this one issue that I have read I can see only praise for your publication. Here's to a long life and a happy one.

Don't forget to send me the March issue as fast as the mail can get it here--Robert J. Hyatt, 1353 Kenyon St., N. W., Washington D. C.

"_Worst Ever Read_"

Dear Editor:

Since you invite criticism as well as praise, I am impelled to state that by far the worst story I ever read in any Science Fiction magazine was "Vampires of Venus," by Anthony Pelcher, which appeared in your April issue. It was so idiotic, so flat and inane, that it might have passed for a burlesque rather than a straight story, were it not painfully evident that the author was serious. The yarn was unworthy of Astounding Stories and did not belong in this magazine.

The other stories, except for an amateurish attempt called "The Man Who Was Dead," were deeply engrossing and of unusual merit.--Sears Langell, 1214 Boston Road, New York.

"_The Readers' Corner_"

All Readers are extended a sincere and cordial invitation to "come over in 'The Readers' Corner'" and join in our monthly discussion of stories, authors, scientific principles and possibilities--everything that's of common interest in connection with our Astounding Stories.

Although from time to time the Editor may make a comment or so, this is a department primarily for _Readers_, and we want you to make full use of it. Likes, dislikes, criticisms, explanations, roses, brickbats, suggestions--everything's welcome here; so "come over in 'The Readers' Corner'" and discuss it with all of us!

--_The Editor._

The Fundamental Principles

Of

Old and New World Civilizations

A Comparative Research Based on a Study of the Ancient Mexican Religious, Sociological, and Calendrical Systems.

By

Zelia Nuttall

Honorary Special Assistant of the Peabody Museum; Fellow of the American Association for the Advancement of Science; Member of the Philosophical Society, Philadelphia; Honorary Member of the Archaeological Association, Univ. of Pennsylvania; Corresponding Member of the Antiquarian and Numismatic Society of Philadelphia; of the Anthropological Society of Washington; of the Societá Italiana d'Antropologia; of the Société de Géographie de Genève; of the Sociedad Cientifico "Antonio Alzate," Mexico; and of the Société des Américanistes de Paris.

Archaeological and Ethnological Papers

Of The

Peabody Museum

Harvard University

Vol. II.

Cambridge, Mass.

Peabody Museum of American Archaeology and Ethnology.

March, 1901.

CONTENTS

Editorial Note. Author's Preface. The Fundamental Principles Of Old And New World Civilizations. Appendix I. Comparative Table of some Quechua, Nahuatl and Maya Words. Appendix II. A Prayer-meeting of the Star-worshippers. Appendix III. Comparative Lists of Words. Index. Note. Footnotes

EDITORIAL NOTE.

The author of this volume explains in her preface how she came to be led beyond her special field of research into a comparative study of the early civilizations of the Old World; and how she traced the origin of the swastika, in Mexico, to an astronomical source and, in all countries alike, found its use as a sacred symbol accompanied by evidences of a certain phase of culture based on pole-star worship, and the recognition of the fixed laws of nature, which found expression in the ideal of celestial kingdoms or states organized on a set numerical plan and regulated by the apparent revolutions of circumpolar constellations.

The results of the author's researches seem to justify her summary of conclusions; but she distinctly states that she does not wish to propound any theory. She invites further study and discussion by Orientalists and Americanists before drawing final conclusions from the facts she has gathered. The publication of this paper will open anew the consideration of pre-Columbian visits to the New World, shown, as many have believed, by identities too many and too close to be considered as mere resemblances or as the natural results of independent intellectual development.

The illustrations are nearly all from drawings by the author. The analytical Index has been prepared by Miss Mead. It will be seen, by the numbering at the bottom of each page, that it was at first intended to include this paper in Volume I of the Archaeological and Ethnological Papers of the Museum; but the addition of the text relating to the Old World made too bulky a volume, and it is therefore issued as Volume II of the series.

To Mrs. Nuttall for the gift of her work, the results of years of research, and to the several generous friends who have provided the means for publishing this volume, the editor expresses his gratitude in behalf of the Museum.

F. W. PUTNAM, Curator of the Peabody Museum. Harvard University, March 1, 1901.

AUTHOR'S PREFACE.

In February, 1898, while engaged upon the translation and commentary of the anonymous Hispano Mexican MS. of the Biblioteca Nazionale Centrale Library, of Florence, my interest was suddenly and unexpectedly diverted from my self-imposed task by the circumstances described in the opening pages of the present publication.

Laying my work aside, as I then supposed, for a few days only, I seized the new thread of investigation with a keen and enthusiastic interest, little knowing that it, in turn, was not only to hold me fast for nearly three years, but was to lead me out of my original field of research, into distant, and to me, hitherto untrodden realms, in close pursuit of facts relating to the oldest forms of religion, social organization, and symbolism.

The first portion of the present publication was planned as a short monograph of forty-one pages, treating of the origin of the native swastika or cross symbols, and was written in July, 1898, its outcome being the unforeseen conclusion that the cosmical conceptions of the ancient Mexicans were identical with those of the Zuñis. I next traced the same fundamental set of ideas in Yucatan, Central America and Peru and formed the wish to add this investigation to the preceding. The result has been the portion of the work extending from page 41, paragraph 2, to page 284, which was printed in 1899.

Having once launched into a course of comparative research, the deep interest I have always taken in the question of Asiatic contact led me to carry my investigation of the same subject into China. It then seemed impossible not to extend researches from Eastern to Western Asia, and from Asia Minor to Egypt, Greece, Rome and Western Europe. It is in this unpremeditated way that the scope of the present investigation enlarged itself of its own accord, for the simple reason that the most interesting and precious facts fell into my way as I advanced and all I had to do was to pick them up and add them to my collection of evidence.

One serious disadvantage, arising from the circumstance that the present investigation has been in press for nearly three years, is my inability to make any alteration, amendment, or addition, in the earlier portions, which stand as written at different times. It is a matter of regret to me that I was not acquainted with O'Neil's "Night of the Gods" and Hewitt's "Ruling Races of Prehistoric Times," at an earlier stage of my investigation, as through them my publication would have been enriched by many valuable additions which I could have incorporated in the body of my work without unduly sacrificing its unity of form.

In the line of Maya investigation notable advances have been made since I wrote (on page 221), about the "septenary set of signs" described by Mr. A. P. Maudslay in 1886, and about the inscription on the tablet of the Temple of the Cross at Palenque (pp. 237-39). Since that time an important publication on the Tablet of the Cross, to which I should have liked to refer, has been issued by the much esteemed Nestor of Maya investigations, Herr Geheimrath Dr. Förstemann. My attention has also been drawn by the best versed of American students of the Maya Codices, Mr. Charles P. Bowditch, to the fact that Mr. Maudslay now recognizes the general recurrence of an eighth sign in combination with the septenary group, causing this to consist of an initial glyph, followed by seven instead of six signs. Referring the reader to pp. 221 and 222, I point out that the employment of an initial glyph, representing the synopsis of a whole, followed by seven signs, appears even more strongly to corroborate my view that the inhabitants of Copan were acquainted with the septenary, cosmical division I have traced.

My fellow archaeologists will understand the disadvantage of issuing an investigation partly written a few years previously, and will realize that, had I, at the outset, been in possession of all the facts I have since learned, the present work would have been very differently planned and executed. On the other hand, as it partakes somewhat of the nature of a log-book, the reader is able to follow closely my blundering course, and will recognize and appreciate some of its perils and difficulties. It being, unfortunately, impossible to re-write the book. I shall have to be resigned to incur some criticism and blame for omissions, which could have been averted. I shall, however, be content if my prolonged study of ancient Mexican archaeology and the present research open out new

lines of investigation, and conclusively prove that primitive cross-symbols and the swastika are universally accompanied by vestiges of a certain set of cosmical conceptions and schemes of organization, which can be traced back to an original pole-star worship. I can but think that the material I have collected will also lead to a recognition that the rôle of the Phœnicians, as intermediaries of ancient civilization, was greater than has been supposed, and that it is imperative that future research be devoted to a fresh study and examination of those indications which appear to show that America must have been intermittently colonized by the intermediation of Mediterranean seafarers.

To me the most interesting result of the present investigation is the fact that, having once started on an unpremeditated course of study, I found an unsuspected wealth of material and finally attained one main, totally undreamed-of conclusion, concerning the law governing the evolution of religion and civilization. This leads me to think that, as I groped in darkness, searching for light, I unwittingly struck the true key-note of that great universal theme which humanity, with a growing perception of existing, universal harmony, has ever been striving to seize and incorporate into their lives. The fact that many of the transcriptions of the original harmony have been and are discordant, and that they temporarily obscure, instead of rendering, its sublime grandeur, unity and noble simplicity, appears as the inevitable result of the mental activity, ingenuity and creative imagination to which mankind also owes its intellectual and spiritual progress.

In conclusion I regret my inability to express adequately my grateful appreciation of the unfailing loyalty of those true friends, in particular Prof. F. W. Putnam, who, trusting in the earnestness of my purpose and endeavor, have constantly encouraged and cheered me as they patiently awaited the long-delayed completion of my work.

Z. N. CAMBRIDGE, MASS., DECEMBER 31, 1900.

THE FUNDAMENTAL PRINCIPLES OF OLD AND NEW WORLD CIVILIZATIONS.

One evening, in February, 1898, I left my desk and, stepping to the window, looked out at Polaris and the circumpolar region of the sky, with a newly awakened and eager interest.

For thirteen years I had been studying and collecting material with the hope of obtaining some understanding of the calendar, religion and cosmogony of the ancient Mexicans, but had hitherto purposely refrained from formulating or expressing any conclusions on the latter subjects having felt unable to extract a clear and satisfactory understanding of the native beliefs from the chaotic mass of accumulated data under which they lay like the ruin of an ancient temple. Though frequently discouraged, I had, however, never ceased to pursue my research and to note carefully the slightest indication or suggestion which might prove of ultimate value. Becoming utterly absorbed in the collection of such notes, I found no time to publish anything during the past four years, though realizing, with regret, that those interested in my work might be disappointed at my delay in issuing the papers announced, in 1894, as speedily forthcoming. Slowly but steadily, however, I was gaining ground. Various excursions along new lines of research increased my experience and, in crossing and re-crossing the field of ancient Mexico, I frequently had occasion to observe certain familiar landmarks, from a new point of view, and illuminated by rays of fresh light proceeding from recently acquired sources. It was remarkable how often facts, which had seemed so hopelessly complicated, finally appeared to be quite simple and comprehensible. This was noticeably the case with the Aztec deities which, for years, had seemed to me as numberless. After closely studying their respective symbols, attributes and names, during several consecutive months, and subjecting them to a final minute analysis, I found that their number dwindled in a remarkable way and also verified the truth of the statement made by the anonymous author of the Biblioteca Nazionale manuscript which I was editing, that the Mexicans painted one and the same god under a different aspect “with different colours,” according to the various names they gave him in each instance.

It was particularly interesting to find that, in assuming that certain names designated different native deities, the early Spanish writers had committed a mistake as great as though someone, reading the litany of the Virgin in a Catholic prayer-book, for the first time, inferred that it was a series of invocations addressed to distinct divinities, amongst whom figured the “morning star,” a “mirror of justice,” and a “mystical rose,” etc. An examination of the texts of several native prayers preserved, established that the Mexicans addressed their prayers to a supreme Creator and ruler, whom they termed “invisible, incomprehensible and impalpable,” and revered as “the father and mother of all.” Some of their so-called idols were, after all, either attempts to represent in objective form, the attributes of the divine power, the forces of nature, the elements, etc., or rebus figures. As these “gods” or “idols” are enumerated farther on and are exhaustively treated in my commentary of the Biblioteca Nazionale manuscript, now in press, it suffices for my present purpose merely to mention here that the most mysterious figure of Mexican cosmogony, Tezcatlipoca,

whose symbolical name literally means “shining mirror,” proved to be identical with Mictlantecuhtli, the lord of the underworld, whose title may also be interpreted as “the ruler or regent of the North,” since Mictlampa is the name of this cardinal point.

The Codex Fuenleal (Anales del Museo Nacional, Mexico, tomo II, p. 88) preserves an important myth relating how Tezcatlipoca, after having been the sun, was cast down from this supreme position by Huitzilopochtli, “descended to the water,” but had arisen again in the shape of an ocelot, and transformed himself into the constellation of Ursa Major.

According to Sahagun the native name of this star-group was Citlal-Colotl or “star scorpion.” Reference to Nahuatl dictionaries revealed that this insect had doubtlessly been named colotl on account of its habit of recurving its tail when enraged.

The Nahuatl verb coloa means, to bend over or twist something, the adjective coltic is applied to something bent over or recurved. The noun colotli, which is almost identical with colotl, means “the cross-beams, the mounting, branch or handle of a cross” (“armadura de manga de cruz.” See Molina’s dictionary).

The above facts show that the idea underlying the name for Ursa Major is primarily that of “something bent over or recurved.” It is obvious that the form of the constellation answers to this description. It is, moreover, extremely significant to find, in the Maya language also, a certain resemblance between the words for scorpion and for a cross. This, in Maya, is zin-che and that for a scorpion is zin-au. The above data justify the induction that the native conception of a cross was connected with the idea of its arms being bent over or recurved, as in the Mexican calendar-swastika.

It is important to find the scorpion figured as one of several symbols of Mictlantecuhtli, the lord of the North, in his sculptured effigy preserved at the National Museum of Mexico (fig. 19).

It is more significant that the verb coloa, besides meaning “to bend over or twist something,” also expressed the action “of describing or performing a circle by walking around something.” Now this is precisely what Tezcatlipoca (the Ursa Major) is represented as doing on page 77 of the B.N. manuscript, since he figures there, surrounded by a circle of footsteps. I could but note that this fact showed that the name of Colotl, applied to the constellation, was not incompatible with its identification with Tezcatlipoca. Once my attention had been drawn to the action of walking, performed by this god, I naturally considered, with fresh interest, the peculiar fact that he is usually represented with one foot only. The circumstances under which he had been deprived of this member are set forth in several of the Codices wherein we see that, after he “descended to the water,” he had an encounter with an alligator, who had viciously bitten off his foot and carried it away. (See Féjérvary Codex, pp. 3 and 74. Vatican, II, p. 74.) Pictures representing Tezcatlipoca, after this event, display the broken end of the tibia exposed and the transverse section of the bone forming a ring, usually painted either white or red. Special pains seem to have been taken to accentuate the hollowness of the bone ring, since its centre is usually painted blue, the symbolical color of air, and conventionalized puffs of breath or air are shown as issuing from it (fig. 1). In some cases, as on the sculptured monolith called “the Stone of Tizoc,” these symbols of breath, issuing from the broken tibia, are figured in such a way that modern writers, ignoring what they were meant to represent, were led to identify them as some animal’s tail attached to the foot of the deity. The hollow circle and puffs of air, constantly associated with the god, frequently figure as his ear ornament when his broken tibia is concealed (fig. 2, no. 3). Besides certain fanciful interpretations which have been given to this symbol, it has been explained as being a hieroglyph conveying the name Tezcatlipoca, and consisting of an obsidian mirror=tezcatl, and smoke=poctli. A possible objection to this assertion might be that in Mexican pictography, the mirror is invariably represented as jet-black, in a white or red frame. In the Codex Telleriano Remensis, a combination of symbols (of water, fire and a serpent) are figured as issuing from the base of the bone (fig. 1, nos. 5, 6). Having taken particular pains to collect all representations of the footless god, I was specially interested in one (Féjérvary, p. 1) in which he is figured as standing on the cross-shaped symbol ollin, the accepted meaning of which is Four Movements. The most remarkable and puzzling picture I found, however, is that (fig. 1, no. 2) in which the jaws of a tecpatl, the symbol of the North, are represented as holding one of Tezcatlipoca’s ankles in a tight grip and practically fastening him thus to the centre of a diagonal cross. In this and other pictures (Codex Féjérvary, 41, 43 and 96) it is obvious that the artists had endeavored to convey the idea of a person permanently attached to one spot by one foot. The only form of locomotion possible to him would be to describe a circle by hobbling on one foot around the other, which would serve as an axis or pivot. The association of this peculiarity with the symbols of the North impressed me deeply and involuntarily caused me to think of a title bestowed in the Codex Fuenleal upon the supreme divinity, namely, “The Wheel of the Winds;” as well as of an expression employed by Tezozomoc (Cronica, p. 574). Referring to the constellations revered by the natives, he mentions “the North and its wheel.”

[Illustration.]

Figure 1

Realizing that some definite and important meaning must underlie the remarkable representations of Tezcatlipoca, I resorted to all possible means to gain an understanding of them. Referring to Nahuatl dictionaries, I found a variety of synonymous names for a person who limped or was lame or maimed. Amongst them was Popoztequi from poztequi, the verb, “to break a leg.” Other names were xopuztequi, xotemol and Icxipuztequi (icxitl=foot). The latter name happened to be familiar to me, for the commentator of the Vatican Codex, Padre Rios, gives it as the name of a god and translates it as “the lame devil.” He records it immediately after Mictlantecuhtli, the lord of the North, and designates it as the name of one of the four principal and primitive gods of the Mexicans.

The commentator of the Telleriano-Remensis Codex, moreover, records that these four gods were “said to have been stars and had fallen from the heavens. At the present time there are stars in the firmament named after them” (Kingsborough, vol. v, pp. 132 and 162).

Other synonymous terms for lame persons were icxinecuiltic and xonecuiltic. Tzimpuztequi, on the other hand, besides meaning lame, also signified something crooked, bent or incurvated. The second name furnished me with an important clue, for Sahagun distinctly records that the native name for the constellation Ursa Minor was Xonecuilli and that it was figured as an S (Historia, 1. VII, cap. 3). Besides, the Academia MS. of his monumental work contains the native drawing of this star-group reproduced as fig. 16, no. 1. He also states that S-shaped loaves of bread named xonecuilli were made at a certain festival in honor of this constellation, while the B.N. MS. records that a peculiar recurved weapon, figured in the hands of deities, was named xonequitl (fig. 16, nos. 2 and 3).

The above data furnished me with indisputable evidence of the existence, in ancient Mexico, of a species of star cult connected with the circumpolar constellations and with Tezcatlipoca, the lord of the North, the central figure of the native cosmogony. It was puzzling to find this god connected not only with the Ursa Major but also with Ursa Minor, but an indication suggesting a possible explanation or reconciliation of these apparent inconsistencies is furnished by the descriptions of the strange ritual performance, which was annually repeated at the festival Tlacaxipehualiztli and was evidently the dramatization of a sacred myth.

As an illustration and a description of this rite are contained in the B.N. MS. and the subject is fully treated in my commentary, I shall but allude here to its salient features. It represented a mortal combat between a prisoner, attached by a short piece of cord to the centre of a large circular stone, and five warriors, who fought him singly. The fifth, who was masked as an ocelot and always obtained victory in the unequal contest, fought with his left hand, being “left-handed,” a peculiarity ascribed to Huitzilopochtli. It was he who subsequently wore the skin of the flayed victim, an action which obviously symbolized a metamorphosis. One point is obvious: this drama exhibits the victor as a warrior who was able to circumscribe the stone freely and was masked as an ocelot—Tezcatlipoca—the Ursa Major, but was endowed, at the same time, with the left-handedness identified with Huitzilopochtli. This mythical personage vanquishes and actually wears the skin of the man attached to the stone; becomes his embodiment, in point of fact, and obtains the supremacy for which he had fought so desperately. In the light shed by the Codex Fuenleal, before cited, it was easy to see that the entire performance dramatized the mythical combat between Tezcatlipoca and Huitzilopochtli for the position of the ruling power, in the heavens—the sun. At the same time it was decidedly puzzling to find celestial supremacy personified by a man, firmly fastened to one spot, the centre of a stone circle. It was impossible not to perceive the identity of thought underlying the representation of this prisoner and the pictures of Tezcatlipoca, the one-footed or lame god—Xonecuilli the Ursa Minor. It was moreover of extreme interest to note the existence of traditional records, preserved in the native myths, of changes in the relative positions of celestial bodies and of the Ursa Major in particular.

Whilst dwelling upon the striking analogy existing between the representations of Tezcatlipoca held fast by the symbol of the North and the prisoner attached to what is described either as “a temalacatl, stone whorl” or “an image of the sun,” my gaze fell on a small model of the calendar-stone of Mexico, hanging above my desk, and rested on the symbol Ollin in its centre. The learned director of the National Museum of Mexico, Señor Troncoso (Anales del Museo Nacional, vol. II), had expressed his view that this symbol was an actual figurative representation of the annual apparent movements of the sun, and recorded its positions at the solstitial and equinoctial periods. I had, moreover, submitted a drawing of this same figure to the eminent English astronomer, Prof. Norman Lockyer, and he had corroborated this view and established its correctness. On the other hand, I had long noted that the _Ollin_ was usually figured with an eye, the symbol for star, in its centre (fig. 2, nos. 1, 3), and had also paid particular attention to the fact that the Mexicans had conceived the ideas of two suns, a young day sun and an ancient night or black sun. In the B. N. MS., on the mantas worn at their respective festivals, the day sun is depicted in a somewhat fanciful manner, in blue and red on a white field. The black sun is, however, represented in classical style, so to speak, as on the sculptured calendar-stone, with four larger and four

smaller V-shaped rays issuing from it. In this connection it is well to recall here that the Mexicans had no specific name for the sun, beyond _Tonatiuh_, which merely means “that which sheds light” and could equally apply to the stars. In the picture-writings the image of the sun was employed to convey the word _Teotl_. But we find that this word, assumed to be equivalent to their “Dios” by the Spaniards, was also a reverential title bestowed upon chieftains and superiors and was constantly employed in the composition of words to signify something divine, supremely beautiful, etc. Whilst I was pondering on the possibility that the symbol _Ollin_ might have represented the movements of the luminaries of night as well as the orb of day, my attention became fixed upon the four numerals in each of the ends of the symbol and I was struck by a certain resemblance between their positions and those of the four stars which form the body of the bear in the constellation of Ursa Major. It was then that it occurred to me, as mentioned in the opening sentence of this introduction, to look at the familiar constellations, with a view to verifying the resemblance noted above. As my gaze sought “the pointers” in Ursa Major, and then mechanically turned to Polaris, I thought of some passages I had recently re-read, in Professor Lockyer’s Dawn of Astronomy, realizing that his observations, dealing with the latitude 26° (taking Thebes as representing Egypt), could equally apply to Mexico as this country stretches from latitude 15° to 31°.

[Illustration.]

Figure 2

“The moment primitive man began to observe anything, he must have taken note of the stars, and as soon as he began to talk about them he must have started by defining, in some way or other, the particular star he meant.... Observers would first consider the brightest stars and separate them from the dimmer ones; they would then discuss the stars which never set (the circumpolar constellations) and separate them from those which did rise and set. Then they would naturally, in a northern clime, choose out the constellation of the Great Bear or Orion, and for small groups, the Pleiades (_op. cit._ p. 132).... A few years’ observation would have appeared to demonstrate the absolute changelessness of the places of the rising and setting of the same stars. It is true that this result would have been found to be erroneous when a long period of time had elapsed and when observation became more accurate, but for hundreds of years the stars would certainly appear to represent fixity, while the movements of the sun, moon and planets would seem to be bound by no law ... would appear erratic, so long as the order of their movements was not known.”

The reflection that Ursa Major was probably the first constellation which made any deep impression upon the mind of prehistoric man in America, as elsewhere, lent an additional interest to the star-group, as I concentrated my mind upon its form and endeavored to imagine it in four equidistant positions, corresponding to the numerals in the symbol _Ollin_ of the calendar-stone of Mexico (fig. 2, no. 2).

I succeeded in obtaining, in succession, mental images of the constellation in four opposite positions. This effort led to an unforeseen result which surprised me. In a flash of mental vision I perceived a quadrupled image of the entire constellation, standing out in scintillating brilliancy from the intense darkness of the wintry sky (fig. 3, no. 3). At the same moment I saw that it bore the semblance of a symmetrical swastika of giant proportions. This fact, so unexpectedly realized, gave rise to such an absorbing train of new ideas and interpretations of the data I had accumulated, that I left my window, on that memorable night, with a growing perception of the deep and powerful influence the prolonged observation of Polaris and the circumpolar constellations would naturally have exerted upon the mind of primitive man. Deeply impressed with the striking resemblance between the composite image of Polaris, Ursa Major, and certain forms of the swastika, I started on a fresh line of investigation, and devoted myself to the study of primitive astronomy and its influence upon the intellectual development of mankind in general and the American races in particular. After having worked, during thirteen years, without any preconceived ideas about the ancient Mexican civilization and without formulating any general conclusion concerning it, I saw all the knowledge I had slowly acquired fall into rank and file and organize itself into a simple and harmonious whole.

[Illustration.]

Figure 3

Realizing this I perceived how, with the origin of the swastika, I had found the origin of the set of primeval ideas which had governed the human race from its infancy and which, in Mexican and Central American civilizations, ultimately developed into their ingenious system of government and social organization.

Figure 4

The sequel to the above episode was that, with the aid of my movable star-chart, I made the following notes of the apparent positions of the circumpolar constellations at the times of sunrise, midnight and sunset, choosing the periods of the solstices and equinoxes in order to obtain an exact division of the year (pl. I). Whilst studying these I realized that the midnight position was the only stable one, since the actual visibility of the constellations before dawn and after dusk would be subject to considerable variation, according to seasons, latitudes and atmospherical conditions. Having noted these positions, I next combined them separately, obtaining the remarkable results given in fig. 4. The combined midnight positions of the Ursa Major or Minor, at the four divisions of the year, yielded symmetrical swastikas, the forms of which were identical with the different types of swastika or cross-symbols (the normal, ogee and volute, etc.), which have come down to us from remote antiquity and are reproduced here for comparison (pl. II, _a-f_). Reflection showed me that such composite pictures of the Ursa constellations constituted an exact record of their annual rotation, and afforded a perfect sign for the period of a year. I moreover perceived how the association of rotatory motion with the advance of time, and its division into fixed periods or cycles, would be the natural outcome of the recognition of the annual rotation of the star-groups.

The Calendar-Swastika, or cross of ancient Mexico (pl. II, _g_) constitutes an absolute proof of the native association of the cross-symbol with the ideas of rotatory motion and the progress of time, and furnishes an indication that, in an analogous manner, the swastika may have been primarily and generally employed by primitive races, as a sign for a year or cycle. A close scrutiny of the respective forms of the crosses yielded by Ursæ Major and Minor shows that the normal swastika and suavastika may be explained as the separate representations of the two constellations—the angular break in the outline of Ursa Major suggesting the direction of the bend to the right of the arms of the normal swastika, whilst the form of Ursa Minor obviously suggests the bend to the left which is characteristic of the suavastika.

[Illustration.]

Figure 5

My growing conviction that the Bear constellations had furnished the archetype of the different forms of swastika and cross-symbols, found subsequent support when I referred to the map showing the geographical distribution of the ancient symbol published by Prof. Thomas Wilson in his valuable and comprehensive monograph on the subject,(1) to which I am indebted for much information and several illustrations (pl. II, _a-f_, etc.). The map, reproduced here (fig. 5), proves that, with two exceptions, which can be attributed to a migration southward, the employment of the swastika has been confined to the northern hemisphere, _i. e._, precisely to that portion of our globe from which the circumpolar constellations are visible.

[Illustration.]

Figure 6. Star-Map, Representing The Precessional Movement Of The Celestial Pole From The Year 4000 B.C. To The Year 2000 A.D. (_From Piazzi Smyth_.)

The interesting possibility of being able to determine, approximately, the date in the world’s history when the swastika began to be employed as a symbol, next occurred to me. Piazzi Smyth’s star-map, discussed and reproduced in Professor Lockyer’s work already cited (fig. 6), illustrates the changes of direction of the earth’s axis in space, which gives rise to what is called the precession of the equinoxes and has a cycle of something like 25,000 or 26,000 years. Reference to this star-map (fig. 6) proved that the observations, leading to the adoption of the swastika as a symbol, could not possibly have been made until after Ursa Major had become circumpolar, about 4,000 B.C. At that period, when Draconis was the pole-star, the circle described about it by Ursa Major was considerably closer than it is at present. The accompanying illustrations (fig. 7), subject to correction, demonstrate the relative distance of the constellation about 2,770 B.C., 1,800 B.C., and 2,000 A.D., and show how much more strikingly impressive the polar region of the heavens was in remote antiquity.

[Illustration.]

Figure 7.

Let us now briefly review some of the ideas which would naturally suggest themselves to the mind of the primitive observer, after he had recognized the apparent immovability of the polar-star, concentrated his attention upon this feature, and contrasted it with the varying motions of all other celestial bodies in general and with the rotation of the circumpolar star-groups in particular.

This recognition would lead to his gradually learning to utilize Polaris as a means of ascertaining direction. His appreciation of valuable guidance rendered in perilous wanderings would develop feelings of trust, dependence and gratitude towards the one changeless star which permanently rendered valuable services and under whose guidance difficult and essential nocturnal expeditions could be safely undertaken. Superiority and, eventually, extensive supernatural power would more and more be attributed to it, as knowledge was gained of the laws of motion from which it alone seemed to be exempt. This exemption would cause it to be viewed as superior to all other heavenly bodies and even to the sun, and it is easy to see how this idea, becoming predominant, might cause the cult of the pole-star to disestablish an organized sun-cult amongst some tribes. Historical evidence, to which I shall revert more fully proves, indeed, that a native American ruler and reformer actually employed the following reasoning in order to convert his council and people from the worship of the sun to that of a superior divinity which could have been no other but Polaris: “It is not possible that the sun should be the God who created all things, for if so he would sometimes rest and light up the whole world from one spot. Thus it cannot be otherwise but that there is someone who directs him and this truly is the true Creator.”

These words shed a whole flood of light upon primitive religious ideas at an early stage of development. They prove that the association of repose and immovability with the supreme power signified a radical change of thought, based upon prolonged astronomical observation, and indicated intellectual advancement. Attempts to render the new idea objective, to express it and impress it upon the multitude, would naturally end in the production of images of the supernatural power, representing or typifying immovability, changelessness, strength combined with absolute repose.

It is thus rendered evident what a deep significance may be embodied in the rudest images of supernatural beings in attitudes of repose, since a prolonged course of astronomical observation and reasoning may have preceded their production.

Simultaneously with the recognition of Polaris as an immutable centre of axial energy, the rotatory movement of Ursa Major must have excited interest and observation. It was inevitable that star-gazers should gradually recognize a constant agreement between certain positions of Ursa Major and Cassiopeia after dusk for instance, and the annual recurrence of rain, verdure and bountiful food-supplies.

The members of a tribe who, more observant than others, had learned to associate certain positions of these constellations with the seasons and, as a consequence, were able to decide when expeditions to distant localities, in quest of game or fruit, might be successfully undertaken, would naturally assume leadership and command obedience and respect.

The sense of responsibility, superiority and, possibly, rivalry would act upon such individuals as a powerful incentive to further observation and thought and it is evident that, as their mental faculties expanded and one generation transmitted its store of accumulated knowledge to the next, a regular caste of astronomer-leaders would develop, with a tendency to conceal the secrets of their power from the ignorant majority. A broken line, carved on a rock by one of these primitive observers, would have constituted a valuable secret note of the position of Ursa Major on a memorable occasion and would be looked upon as a mystic or magical sign by the uninitiated. A series of such inscriptions might represent the store of astronomical knowledge accumulated by several generations of observers, and it is interesting to recognize that such astronomical records as these were probably the first which men were impelled to perpetuate in a lasting form; since it was absolutely necessary that they should be permanently available for reference at prolonged intervals of time. What is more, the mere fact of being obliged to refer to these inscriptions would cause the astronomers to reside permanently in one locality. The habit of consulting the prophet or oracle before undertaking important steps, involving the welfare of the tribe, would gradually cause the rocks or cavern in which he resided to be invested with a certain sacredness.

It is thus evident that the first men, who rudely scratched the outline of Ursa Major or Minor on a rock, took what was probably one of the most momentous steps in the history of the human race, and it is easy to see how a variety of combinations of circumstances would have led many men, in widely-separated localities and at different periods of the world’s history, to perform precisely the

same action. In some cases, under favorable surroundings, the rudimentary attempt would mark the starting point for a long line of patient observation and study, which would inevitably lead to the creation of centres of intellectual growth, to the association of the different positions of the constellation with the seasons and culminate in the habitual employment of a swastika as the sign for a year, or cycle of time.(2)

The idea of rotation, associated with calendar signs and periods, finds its most striking and convincing exemplification in the following description of the ancient Mexican game “of those who fly,” translated from Clavigero (op. et ed. cit. p. 236). This performance, which furnished a diversion to the Spaniards after the Conquest, had evidently been, originally, connected with religious ideas. “The Indians selected a tall, stout and straight tree, and, lopping off its branches, planted it firmly in the centre of the great square” (which was always situated in the centre of the city and had four roads leading to it from the four quarters). “On the summit they placed a large cylinder of wood, the shape of which was compared by the Spaniards to that of a mortar. Four strong ropes hung from this and supported a square frame composed of four wooden beams. Four other ropes were fastened by one end to the pole itself and wound around it thirteen times. Their loose ends were passed through holes in the middle of each beam and hung from these. Four Indians, masked as eagles or other birds, ascended the pole singly, by means of certain loops of cord, and mounting on the cylinder they performed in this perilous position a few dance-like movements. Each man then attached himself to the loose end of one of the hanging ropes, and then, with a violent jerk and at the same moment, the four men cast themselves into space from their positions on the beams. This simultaneous movement caused the frame and cylinder to revolve and uncoil the ropes to which the men were fastened and these descended to the ground after performing a series of widening circles in the air. Meanwhile a fifth individual, who had mounted the wooden cylinder after the others, stood on this as it revolved, beating a small drum with one hand, whilst he held a banner aloft with the other.” Whilst it is obvious that this peculiar and dangerous performance clearly symbolized axial rotation, typified by the revolving pivot and the four men in aërial motion, its full meaning and intention are only made clear by the following explanation recorded by Clavigero. “The essential point in this game was to calculate so exactly the height of the pole and the length of the ropes, that the men should describe precisely thirteen circles each before reaching the ground, so as to represent the cycle (of 4×13=)52 years.”

This passage constitutes absolute proof that the Mexican Calendar system was intimately associated with axial rotation and ideas such as could only have been derived from observation of Polaris and of the circumpolar constellations. The game itself was a beautiful and well-conceived illustration of the flight of time, typified by the aërial circles performed by the men masked as birds, and of its methodical division into fixed periods.

Leaving the subject of the calendar for the present we must revert to my tables recording the apparent annual and nocturnal axial rotation of the circumpolar constellations.

Whilst studying these the reflection naturally arose, that the people who observed Ursa Major must have paid equal attention to Cassiopeia and noticed that these constellations ever occupied opposite positions to each other as they circled around the pole. Dwelling on the fact that in ancient Mexico Ursa Major was associated with an ocelot, I remembered the many representations in which an ocelot is represented as confronting an eagle, usually in mortal combat. Mexican war-chiefs were classed into two equally honorable grades, designated as the “ocelots and the quauhtlis, _i. e._, eagles.” The constellation of Cassiopeia presents to me, a marked resemblance to the image of a bird with outspread wings, whose head is turned toward Polaris. The fact that when this star-group seems to be above, Ursa Major seems to be below, and _vice versa_, would obviously suggest the idea of an eternal combat between two adversaries who alternately succumbed and resuscitated. It was interesting on reasoning further, to note that once the above idea had taken root it must have been impossible not to associate in course of time, the quadruped and the bird with the elements to which they seemed to pertain, and gradually to conceive the idea of an everlasting antagonism between the powers of the sky and of the earth, or light and darkness, and other opposites which suggested themselves naturally, or were artificially created, by the fertile mind of man. In this connection it should be observed that the mythical adversary of Tezcatlipoca, the ocelot, designated as Ursa Major, is Huitzilopochtli, whose idol, in the Great Temple of Mexico, represented him masked as a hummingbird (see Atlas Duran). The special reason why this bird became associated with the god is explained by the following passage in Gomara (Histoire générale des Indes. Paris, 1584, chap. 96, p. 190): “This bird died, or rather fell asleep in the month of October and remained attached by its feet to a twig. It awakened again in April when the flowers blossomed. For this reason, in the language of the country it is named Huitzitzilin, the resuscitated.” We therefore see that whilst it is stated in the myth that the ocelot arose again after having been cast down from the sky by Huitzilopochtli, the very name of the latter betokened that the bird-god had also only just “resuscitated” from a presumably similar defeat.

[Illustration.]

Figure 8.

As one and the same object may suggest several resemblances at the same time or consecutively, and thus give rise to a group of associations around a single figure, I venture to point out that the zigzag form of Cassiopeia may well have been compared to forked lightning and caused the idea of lightning and thunder to become indissolubly connected with the conception of a great celestial bird. Again there is the possibility that the same star-group may have more strikingly suggested, to other people, the idea of the winding body of a serpent describing a perpetual circle around a central star. In Mexico, as elsewhere, we find the serpent closely associated with the idea of time. It is represented as encircling the calendar wheel published by Clavigero (fig. 8). Four loops, formed of its body, mark the four divisions of the year. Twin serpents, whose heads and tails almost meet, are sculptured around the famous calendar-stone of Mexico. Four serpents whose bent bodies form a large swastika and whose heads are directed towards a central figure, are represented in the Codex Borgia in association with calendar-signs (fig. 9, _cf._ Féjérvary, p. 24). I shall have occasion to refer in detail to Mexican serpent-symbolism further on.

Meanwhile I would submit the interesting results obtained on combining the positions apparently assumed by the circumpolar constellations during a single night. The tables exhibit four composite groups representing the positions at the solstitial and equinoctial periods (fig. 10).

[Illustration.]

Figure 9.

[Illustration.]

Figure 10.

The night of the winter solstice, the longest of the year, yielded alone a symmetrical figure. It resembled the well-known triskelion, the companion-symbol of the swastika (figs. 10 and 11). Just as this had proved to be the most natural of year symbols, so the triskelion revealed itself as a natural sign of the winter solstice, the period recognized and celebrated by most inhabitants of the northern hemisphere as the turning-point of the year. In a climate like that of Mexico and Central America, however, where the year divided itself naturally into a dry and a rainy season, it is evident that the winter solstice would be less observed and that the ardently-desired recurrence of the rainy season, after a long and trying period of drought, should be regarded as the annual event of utmost importance. Indeed, if carefully looked into, the entire religious cult of these people seems to express but one great struggling cry to the God of Nature for life-giving rain, and a hymn of thanksgiving for the annual, precious, but uncertain gift of water.

[Illustration.]

Figure 11.

To these supplicants the winter solstice betokened little or nothing and it is not surprising to find no proofs of the employment of the triskelion as a sacred symbol in ancient Mexico. On the other hand, it has been traced by Mr. Willoughby on pottery from Arkansas, and in Scandinavia, where the circumpolar constellations have doubtlessly been observed from remote times, and the winter solstice has ever been hailed as the herald of coming spring, the triskelion is often found associated with the swastika.

[Illustration.]

Figure 12.

I am indebted to Prof. Thomas Wilson’s work already cited for the two following illustrations of objects exhibiting this association. The first is a spearhead found in Brandenburg, Germany (fig. 12). The second is a bronze brooch from Scandinavia, to which I shall presently revert (fig. 13). It exhibits, besides the triskelion, swastika and circle, the S-shaped figure which was, as I shall show further on, the sign actually employed by the ancient Mexicans and Mayas as the image of the constellation Ursa Minor, whose outline it indeed effectually reproduces.

Before referring to the Mexican and Maya representations of the star-group, I would next demonstrate that the sacred numbers of Mexico, and of other countries situated in the northern hemisphere, coincide exactly with the number of stars in the circumpolar

constellations themselves and in simple combinations of the same.

Ursa Major and Ursa Minor each contains seven stars, and the number seven is the most widely-spread sacred number. Ancient traditions record that the race inhabiting Mexico consisted of seven tribes who traced their separate origins to seven caves, situated in the north. In memory of these, at the time of the Conquest, there were seven places of sacrifice in the city of Mexico. I shall recur to the number seven further on, in discussing the native social organization, and now direct attention to the five stars of Cassiopeia and to the fact that the combination of the stars in this constellation with Polaris and Ursa Major yields the number thirteen. This result is specially interesting since the entire Calendar-system of Mexico and Yucatan is based on the combination of the numerals 13+7=20, the latter again being 4×5.

[Illustration.]

Figure 13.

On the other hand the same number, 13, is also obtained by the combination of the Ursæ star-groups with Polaris. The number 5 is constantly yielded by Cassiopeia and the four-fold repetitions of the groups supply the suggestion of the number 4. The combination of Ursa Minor and Cassiopeia yields 12. The accompanying figure exhibits swastikas composed of Ursa Minor accompanied by Ursa Major and Cassiopeia separated and combined (fig. 14). I next direct attention to the peculiar difference in the numerical values of the Ursæ swastikas.

In the first, the central star, surrounded by four repetitions of the seven-star constellation, yielded a total of twenty-nine stars—4x5+9. Further combinations will be seen by a glance at the Ursa Major swastika (fig. 4). The analysis of the Ursa Minor swastika is not so simple and occasions a certain perplexity.

When I had first combined the four positions of this constellation, I had, naturally, and without further thought, figured Polaris but once, as the fixed centre, whereas I had repeated the other stars of the compact group four times. It was not until I began to count the stars in the swastika that I realized how I had, unconsciously, made one central star stand for four, and thus deprived the composite group of the numerical value of three stars. On the other hand, if I repeated the entire constellation four times, I obtained a swastika with four repetitions of Polaris in the middle. In this way, however, Polaris became displaced, and the idea of a fixed centre was entirely lost. A third possible method of composing the swastika was to allow one central star for each cross-arm. But this gave two central stars, each of which would represent two stars. Unless enclosed in a circle and considered as a central group by themselves, the four and the two repetitions of Polaris could not convey the idea of a pivot or fixed centre. The three respective numerical values obtained from these experimental combinations were 4×6+1=25, 4×7=28, and finally 2×13 or 4×6+2=26. In each swastika the central star forcibly stood for and represented two or four (fig. 15).

[Illustration.]

Figure 14.

In the triskelions the same perplexity arose: if Polaris was repeated, the idea of a fixed centre was lost (fig. 15); if figured singly, it nevertheless necessarily and inevitably stood as an embodiment of three stars. Reasoning from my own experience, I could but perceive, in the foregoing facts, a fruitful and constant source of mental suggestions, the natural outcome of which would be the association of the central star with an enhanced numerical value, and a familiarity with the idea of one star being an embodiment of two, three or four.

[Illustration.]

Figure 15.

As the evolution of religious thought and symbolism progressed, this idea would obviously lead to the conception of a single being uniting several natures in his person. In this connection it is certainly extremely interesting to find the serpent associated with the Calendar in Mexico and Yucatan, its Nahuatl name being homonymous for twin, _i. e._ two, and the Maya for serpent, _can_ or _cam_, being homonymous for the number four. The serpent was, therefore, in both countries the most suggestive and appropriate symbol which could possibly have been employed in pictography, to convey the idea of dual or quadruple natures embodied in a single figure.(3) Added to this the circumstance that, to the native mind, the serpent, upon merely shedding its skin, lived again, we can understand why the ancient Mexicans not only employed it as a symbol of an eternal renewal or continuation of time and of life,

but also combined it with the idea of fecundity and reproductiveness. In Yucatan where the Maya for serpent, _can_, is almost homonymous with _caan_=sky or heaven and the adjective _caanlil_=celestial, divine, the idea of a divine or celestial serpent would naturally suggest itself. It is therefore not surprising to find, in both countries, the name of _serpent_ bestowed as a title upon a supreme, celestial embodiment of the forces of nature and its image employed to express this association in objective form. In Yucatan one of the surnames of Itzamná, the supreme divinity, was Canil, a name clearly related to _caanlil_=divine and _can_=serpent.

In Mexico the duality and generative force implied by the word “coatl” are clearly recognizable in the native invocations addressed to “Our lord Quetzalcoatl the Creator and Maker or Former, who dwells in heaven and is the lord of the earth [Tlaltecuhtli]; who is our celestial father and mother, great lord and great lady, whose title is Ome-Tecuhtli [literally, two-lord=twin lord] and Ome-Cihuatl [literally, two-lady=twin lady”] (Sahagun, book VI, chaps. 25, 32 and 34).

The following data will suffice to render it quite clear that the Mexicans and Mayas employed the serpent as an expressive symbol merely, signifying the generative force of the Creator to whom alone they rendered homage. It is no less an authority than Friar Bartholomew de las Casas who maintained that “in many parts of the [American] Continent, the natives had a particular knowledge of the true God; they believed that He created the Universe and was its Lord and governed it. And it was to Him they addressed their sacrifices, their cult and homage, in their necessities...” (Historia Apologetica, chap. 121).

Friar Bartholomew specially adds that this was the case in Mexico according to the authority of Spanish missionaries and no one can doubt that this was the case when they read that in the native invocations, preserved by Sahagun, the supreme divinity is described as “invisible and intangible, like the air, like the darkness of night,” or as the “lord who is always present in all places, who is [as impenetrable as] an abyss, who is named the wind [air or breath] and the night.” “All things obey him, the order of the universe depends upon his will—he is the creator, sustainer, the omnipotent and omniscient.” He is termed “the father and mother of all,” “the great god and the great goddess,” “our lord and protector who is most powerful and most humane,”—“our lord in whose power it is to bestow all contentment, sweetness, happiness, wealth and prosperity, because thou alone art the lord of all things.” One prayer concludes thus: “Live and reign forever in all peace and repose thou who art our lord, our shelter, our comfort, who art most kind, most bountiful, invisible and impalpable!” (Sahagun, book VI, on the rhetoric, moral philosophy and theology of the Mexicans, chaps. 1-40). It is related that, in gratitude for the birth of a son, the ruler of Texcoco, Nezahual-coyotl erected a temple to the Unknown God.... It consisted of nine stories, to symbolize the nine heavens. The exterior of the tenth, which formed the top of the nine other stories, was painted black with stars. Its interior was encrusted with gold, precious stones and feathers and held “the said god, who was unknown, unseen, shapeless and formless” (Ixtlilxochitl, Historia Chichimeca ed. Chavero, p. 227; see also p. 244). A passage in Sahagun (book VI, chap. VII) states that “the invisible and imageless god of the Chichimecs was named Yoalli-ehecatl [literally, night-air or wind], which means the invisible and impalpable god ... by whose virtue all live, who directs by merely exerting his wisdom and will.” In the Codex Fuenleal (chap. 1) the remarkable title of “wheel of the winds=Yahualliehecatl,” is recorded as “another name for Quetzalcoatl.” This undeniably proves that the Mexicans not only figured the Deity by the image of a serpent but also thought of him as a wheel which obviously symbolized centrical force, rotation, lordship over the four quarters, _i. e._, universal rulership.

[Illustration.]

Figure 16.

Returning from these ideas of later development to the primitive source of their suggestion, let us now examine the native picture of Xonecuilli, Ursa Minor, preserved in the unpublished Academia MS. of Sahagun’s Historia, in Madrid (fig. 16, no. 1). It is an exact representation of the star-group. The fact that the seven stars are figured of the same size in accurate relation to each other, either proves that the eyesight of the native astronomers was extremely keen and their atmosphere remarkably clear, or that possibly, the minor stars of the group were more brilliant in ancient times, than they are now. Astronomers tell us, for instance, that as late as the seventeenth century the star in the body of Ursa Major nearest to the tail, was as bright as the others, while it is now of the fourth magnitude only.

It must be admitted that the shape of the constellation resembles an S. An SS sign is mentioned by Sahagun (Historia, book VIII, chap. 8) as occurring frequently, as a symbolical design on native textile fabrics. It figures as such, in the black garments of the female consort of Mictlantecuhtli in the Vienna Codex, pp. 23 and 33. He denounces it as suspect and hints that it was intimately connected with the ancient religion.

S-shaped sacred cakes, called Xonecuilli, were made during the feast of Macuilxochitl=five flowers, and are figured (fig. 16, no. 2) in the B. N. MS. (p. 69) with a four-cornered cross-shaped cake of a peculiar form (fig. 20, III), which is found associated with five dots or circles in the Codices and also with the Tecpatl-symbol of the North (fig. 20, I and II).

A recurved staff, which is held in the hand of a deity in the B. N. MS. is designated in the text as a _xonoquitl_ (fig. 16, no. 3). Amongst the insignia of the "gods," sent as presents by Montezuma to Cortés upon his landing at Vera Cruz, were three such recurved "sceptres," the descriptions of which I have collated and translated in my paper on the Atlatl or Spear-thrower of the Ancient Mexicans (Peabody Museum Papers, vol. 1, no. 3, Cambridge, 1891, p. 22). In this work I presented my reasons for concluding that these recurved sceptres were ceremonial forms of the atlatl. I now perceive that they were endowed with deeper significance and meaning. The Nahuatl text of Sahagun's Laurentian MS. of the Historia de la Conquista (lib. XII, chap. IV) records the name of one of these staffs as "hecaxonecuilli," literally "the curved or bent over, air or wind," and describes it as made of "bent or curved wood, inlaid with stars formed of white jade=chalchihuite." This passage authorizes the conclusion that four representations in the B. N. MS. of black recurved sceptres, exhibiting a series of white dots, are also heca-xonoquitl, inlaid with stars, and that all of these are none other but conventional representations of the constellation Xonecuilli, the Ursa Minor. In each case the deity, carrying the star-image, also displays the ecacozcatl the "jewel of the wind," the well-known symbol of the wind-god. In one of these pictures (p. 50) he not only bears in his hand the star-image, but also exhibits a star-group on his head-dress, consisting of a central-star, on a dark ground, surrounded by a blue ring. Attached to this against a dark ground, six other stars are depicted, making seven in all. In connection with this star-group it is interesting to note that the hieroglyph, designated by Fra Diego de Landa as "the character with which the Mayas began their count of days or calendar and named Hun-Imix," furnishes a case of an identical though inverted group (Relacion de las Cosas de Yucatan, ed. B. de Bourbourg, p. 237). Enclosed in a black ring, the glyph displays, above, a large black dot with six smaller ones grouped in a semicircle about it, and below, four perpendicular bars.

Subject to correction, I am inclined to interpret this glyph as a hieratic sign for the constellation Ursa Minor and its four movements, and to consider it as furnishing a valuable proof of the origin of the Maya Calendar.

The seemingly inappropriate procedure of figuring shining stars by black dots actually furnishes the strongest proof that a star group is thus represented; for, in the Maya language, "ek" is a homonym for star and black, and a black spot was, in consequence, the most expressive sign for a star. This fact affords a valuable explanation of the reason why the ocelot, whose skin is spotted with black, was employed as the figure of the nocturnal sky, and clearly proves that the Mexicans adopted this symbol and its meaning from the Mayas.

[Illustration.]

Figure 17.

We will now revert to the S-shaped sign. Its association with images of star is further exemplified in Mexican Codices. It occurs on the wall of a temple, in combination with symbols for stars and the North-Mictlan, which consist in this case, of skulls and cross-bones (fig. 17, II).

In the Dresden Codex, of Maya origin, there is an extremely important page on which the S-sign occurs in connection with twin deities, besides rain and cross symbols (fig. 17, I). A careful examination of the group shows that one of the seated figures is accompanied by a downpour of water (painted blue in the original), besides the S-symbol which is also repeated above the head of his companion. Higher up, on the same page, the S occurs again in a group of glyphs alongside of twin-seated figures. These, as well as the single-seated form beneath them, have an eye or a large black spot surmounted by dots instead of a head (Vocabulaire de l'écriture hiératique de Yucatan, p. 38). Monsieur Léon de Rosny has identified this figure, which also occurs in the Codex Troano, as the image of the supreme divinity of the Mayas, of whom more anon, one of whose titles was Kin-ich-ahau, literally Sun-eye lord.

A similar sign consisting of the lower half of a human body seated, with a large eye on its knees is repeated several times in the Borgian Codex. This form is also figured as seated in a temple, without the eye-star, but three stars are on the roof and the S-sign is on the lower wall of the building (Borgian Codex, p. 16).

The above facts demonstrate that, in both MSS. derived from different sources, the same association of ideas is expressed.(4) The S sign appears in connection with twin- or single-seated forms, surmounted by a symbol for star. It is unnecessary for me to lay further stress upon the obvious facts: that the only celestial body which could possibly have been associated with a seated form,

suggesting repose, was Polaris. It is, moreover, only by assuming that the sign of the seated star represents the stationary pole-star that its combination in the Codices with the S-sign—Xonecuilli—Ursa Minor, can be understood. I likewise draw attention to the possibility that the S, or single representation of the constellation, may well have been employed as a sign for the summer solstice, since, in some localities, during the shortest night of the year, Ursa Minor may have been visible in one position only. Assuming that the triskelion was the sign for the winter solstice we should thus have natural signs for the two nights marking the turning-points of light and darkness in the year.

Reverting to fig. 17, I, from the Codex Dresdenis, I draw attention that it furnishes definite proof that the Mayas associated the idea of the immovable seated star with twin deities and that they connected the S-symbol with cross and rain symbols. A striking combination of the latter symbols is represented under the principal seated figures. It consists of a diagonal cross traversed perpendicularly by a band of blue water.

[Illustration.]

Figure 18.

Further Maya cross-symbols should be cursorily examined here, viz: fig. 18, I, II, III, VI, VII and VIII. They will be found to consist of variations of two fundamental types, often figured alongside of each other and enclosed in a square, or circle. One type consists of two diagonally crossed bars, plain or representing cross bones (I). A rectilinear cross with interlaced circle (II) is also found. The other type exhibits a small cross, square, circle or dot in the centre of the square with a circle in each corner. In some cases these are united by a series of dots to the central circle and thus form a diagonal cross (VI and VIII) which is sometimes figured as contained in a flower with four petals, such as is also found in Mexican symbolism. The diagonal, dotted cross is frequently combined with four pairs of black bars, placed in the middle of each side of the square, pointing towards the centre. Similar pairs of black bars are figured in the B. N. MS. (p. 3) on the manta of Mictlantecuhtli, with stars, around one of his symbols, a spider. They likewise recur on two of several sacrificial papers on p. 69, amongst which one exhibits a diagonal cross, another the S-sign, while others display realistic drawings of stars with six or eight points.

The pairs of bars figure in the hieroglyph designated by Maya scholars as the sign for _Kin_, the sun, which may be seen in the centre of large diagonal cross-symbols in fig. 18, VII, VIII, from the Dresden Codex: The cross, of fig. 18, VII, is composed of two bones and two arrowpoints, a particularly interesting combination considering that in the Maya a bone is _bak_, an arrow is _kab-cheil_ and the name given to the gods of the four quarters “the sustainers of the world,” is _Bakab_. It cannot be denied that the phonetic elements of this name occur in the words for bones and arrows which form the cross, symbolic of the four quarters. In fig. 18, VIII, the cross may be composed of four bones, but of this I am not certain. In both cases, however, the crosses rest on a curious double and parti-colored symbol and are associated with serpent signs, in which the open jaws and teeth are prominent features. It is noteworthy that while “can” or “cam” is the Maya for serpent, the word “camach” means jaw. The figure consisting of the upper jaw only of a serpent, in the left hand corner of the band above, fig. 18, VIII, proves, therefore, to be a cursive phonetic sign for serpent.

The parti-colored symbol combined with the cross obviously signifies a duality, such as light and darkness, the Above and the Below and a series of dualities—possibly the two divisions of the year, the dry and rainy seasons. In Mexico we are authorized by documentary evidence, to give a wider and deeper interpretation to the symbol of duality, for it can be absolutely proven that the Mexican philosophers divided the heavens into two imaginary portions, and respectively identified these with the male and female principles.

In Nahuatl the West was designated as Cihuatlampa, “the place or part of the women.” The souls of the women who had earned immortality were supposed to dwell there, whilst the souls of the men resided in the East. In the appendix to book III of Sahagun’s Historia, it is described how, according to the native belief, the souls of the male warriors hailed the daily appearance of the sun above the eastern horizon, and escorted it to Nepantla, the zenith. Here the souls of the women awaited it and assumed the duty of escorting the sun to the western horizon, the symbol for which was calli=the house. The above passage indicates that the native philosophers imagined across the middle of the sky a line of demarcation, separating the portions of the heaven respectively allotted to the male and female souls. For four years after death these souls retained their human form, and then, after passing through nine successive heavens, entered into the celestial paradise where they assumed the forms of different kinds of butterflies and humming-birds. The names of these are enumerated in the Nahuatl text of Sahagun’s Laurentian MS. (book III).(5) The symbolism of the humming-bird has already been explained by a passage cited from Gomara’s Historia. In this connection it is

extremely interesting to find the humming-bird represented in the B. N. MS., as sucking honey from a flower, which is attached by a cord, covered with bird's down, to a bone, the symbol of death.

This peculiar but expressive group of symbols figures only on the head-dresses of deities wearing certain other symbols, amongst which we find the Eca-cozcatl and Eca-xonequilli the image of Ursa Minor, already described.

The merest indication of the association of a circumpolar constellation with the idea of death (disappearance) and resurrection (re-appearance) is of special interest, since the ancient Mexicans located the Underworld, the "place of the dead," in the North. Reflection showed, however, that such an association could only have suggested itself to the minds of star-observers living in southern latitudes, approximate to the equator, or in localities where the northern horizon was more or less shut off from view by intervening mountains. In such places Polaris would appear comparatively close to the boundary-line of the northern sky so that the Ursa constellations and Cassiopeia would be invisible to the local astronomers at midnight during that period of the year when one or the other of the star-groups seemingly stretched between Polaris and the northern horizon. A glance at plate I shows that, at the present time, it is about the period of the autumnal equinox that Ursa Minor would be invisible at midnight, in such localities, while Ursa Major would gradually disappear from view towards midnight, during a certain number of nights, according to latitude and locality, between the autumnal equinox and the winter solstice whilst Cassiopeia would seem to hover above the horizon. The total or partial alternate periodical disappearance of the two most familiar star-groups in the extreme North and their re-appearance after sometimes regular intervals of time could but have made a profound impression upon primitive astronomers and thinkers. Whilst the mere periodical reversal of the positions of Cassiopeia and Ursa Major suggested alternate victory and defeat, the actual though brief and partial disappearance of either star-group must have appeared to be a descent into an under-ground space, associated with darkness and death, followed by a resurrection. In his Cronica, Tezozomoc records, besides Mictlan (the land of the dead), another name for the underworld, Opochcal-ocan, literally, the place of the house to the left. This appellation can only be understood when it is realized that, in a sufficiently southern latitude, an observer, watching the setting of a circumpolar constellation below the horizon, would always see it disappear to his left and subsequently rise to his right. It is evident that in time this fact would give rise to the association of the left with the underworld, the lower region, and the right with the region above. The native idea of a dwelling in the underworld is further demonstrated by the bestowal of the symbol _calli_=house, upon the western horizon below which all heavenly bodies were seen to disappear. A definite connection between the West and one half of the North being thus established, it would naturally result that a corresponding union of the South and East would be thought of in time, and that these quarters would become associated with the rising of celestial bodies, _i. e._, with light, the Above, while the opposite quarters became identified with their setting, _i. e._, with darkness, the Below.

Pausing to review the foregoing conclusions, which I have shown to be the natural and inevitable result of simple but prolonged astronomical studies, observation and plain reasoning, we see that they led to a conception of the Cosmos as divided into seven parts, _i. e._, the fixed Centre, the pivot, primarily suggested by Polaris who was regarded as the creative, generative and ruling power of the universe; the Four Quarters, seemingly ruled by the central force and associated with the elements; the Above and the Below, suggested by the rising and setting of celestial bodies and associated with light and darkness, sky and earth, etc., etc.

Many of my readers will doubtless recognize at once that the above organization of the Cosmos into the Centre or Middle, the Above and the Below, and the Four Quarters, is precisely that which the Zuñi priests taught Mr. Frank Cushing, when they initiated him into their secret beliefs. Other explorers have recorded the same conception amongst different native American tribes and with these proofs that this set of ideas is still held on our Continent at the present time, I point out the fact that the Maya figures (fig. 18, VII and VIII, from the Dresden Codex) become perfectly intelligible only when interpreted as representing the Centre, the Four Quarters, the Above and the Below, the latter figured by the dark and light halves of the dual sign. Furthermore, I can demonstrate that this fundamental set of elementary, abstract ideas, furnishing the first principles of organization, is plainly visible under the surface of the ancient Mexican civilization and can be traced not only in Yucatan and Central America, but also in Peru. In these countries, as I shall show, it assumed an absolute dominion over the minds of the native sages, directly suggesting the forms of government and social organization existing at the time of the Conquest and faintly surviving to the present day. It entirely controlled the development of aboriginal religious cult and philosophical speculations and pervaded not only the native architecture and decorative art, but also all superstitious rites and ceremonies, and entered into the very games and pastimes of the people.

The following table presents the bare outline of the scheme of organization exposed in the preceding text. In making it I have, after due consideration, definitely adopted the assignment of the Mexican symbols and colors to the cardinal points given by Friar Duran in the Calendar-swastika contained in his atlas and reproduced (pl. II, _g_).

Each of these is North; West; South; then East. Symbols: Tecpatl, Flint; Calli, House; Acatl, Cane; Tochtli, Rabbit. Colors: Red; Yellow; Blue; Green. Elements: Fire; Earth; Air; Water. Warmth; Darkness; Breath; Rain.

Together, North and West are The Below, the “female” region. TEZCATLIPOCA=MICTLANTECUHTLI.

South and East are The Above, the “male” region, HUITZILOPOCHTLI.

Combined, they are The Centre. The dual, generative, ruling and directive Force. QUETZALCOATL. The Divine Twin.

Before proceeding to examine more closely the great edifice of human thought which was reared, in the course of centuries, on the ground plan designated above, we must retrace our steps and consider what a deep impression the gradual realization of the changes in the relative positions of Polaris and certain familiar star-groups must have produced upon those who were the first to realize them. Transporting ourselves back to the gray dawn of civilization, let us endeavor to understand the position of the native priest astronomers who, having received and transmitted a set of religious and cosmical ideas, based on the assumption of the absolute and eternal immutability of the centre of the heaven, Polaris, gradually became aware that it also was subject to change, evidently obeyed an unseen higher power and that the ancient order of things, recorded by their predecessors, had actually passed away.

It is obvious that, in all centres of astronomical observation and intellectual culture, a complete revolution of fundamental doctrine or thought must have taken place. A period of painful misgivings and doubt must have been passed through, during which an earnest and anxious observation of all celestial bodies must have seemed imperative and obligatory. Under such circumstances astronomy must have made great strides and astronomical observation become the foremost and highest duty of the intellectual leaders of the native races. Pyramids and temples would be built for the purpose of verifying and recording the positions of sun, moon, planets and stars, and the orientation of these buildings would be carefully planned accordingly. Before obtaining glimpses of the great evolution of religious thought which progressed on our Continent in olden times, it is well to realize, by means of Piazzi Smyth’s map (fig. 6) that the world ceased to possess a brilliantly conspicuous, absolutely immovable pole-star for a prolonged period of time, stretching somewhere between 500 B.C. and 1200 A.D.

The ancient native chronicles record that under “divine” leadership great migrations of tribes took place within this period, the purpose of which was to find a locality which fulfilled certain ardently-desired conditions connected with religious cult.

From various centres of civilization in Mexico and Central America we also hear different accounts of how, at different times, small bands of earnest men, under a leader of superior intelligence, bent on a peaceable but unexplained errand, arrived from distant regions and departed for an unknown goal, after delaying just long enough to teach social organization and impart a higher civilization to the tribes encountered on their passage.

These preserved the memory of the _title_ of the leader, in their different languages and he became the culture-hero of their tribe. The fact that, in each case, these sages taught the ignorant tribes the division of time and instituted the calendar, proves that they were skilled in astronomy.

From a sentence uttered by Montezuma to the native astronomers whom he termed “the Sons of the Night,” we learn that it was their custom “to climb mountains” so as “to study the stars.” When one considers the full import of the problems which had to be faced by these ancient sages, who earnestly endeavored to account for the great changes which had taken place in the heavens, within the memory of man, it seems natural to suppose that many an expedition was undertaken for the purpose of acquiring further astronomical knowledge, of finding, perhaps, the immovable star which had been revered in past ages by the ancestors of the native race.

The cult of Polaris may well have made such expeditions assume the aspect of an imperative religious duty and sacred pilgrimage. As all expeditions across Mexico and Central America would necessarily be limited by the oceans and be fruitless as far as Polaris was concerned, it is obvious that the line of exploration which would be ultimately adopted, would run from south to north and _vice versa_. A small band of enthusiasts, setting forth under the leadership of some of the most advanced thinkers of the time, would undoubtedly have been prepared to devote their entire lives to the object in view. As long as a single member of such an expedition existed, he would be a powerful and active agent in spreading the fundamental set of ideas derived from the observation of Polaris. In lapse of time, by transmission, its influence might travel to a region too remote perhaps for direct contact to have taken place.

If I have indulged in the foregoing line of conjecture and surmise, it is because it is my purpose also to demonstrate, by absolute proof, that the dominion of the above set of ideas extended over Yucatan, Honduras, Guatemala and even reached Peru, where its influence is distinctly visible.

It also extended far to the north in prehistoric times, for certain carved shell-gorgets which have been found in prehistoric graves in Illinois, Missouri and Tennessee exhibit emblems which have definite meanings in the Maya language, spoken in Yucatan.

In order to maintain this assertion I must make a slight digression from the main subject and revert to the myth already cited, recording the casting down from heaven of Tezcatlipoca who arose and ascended again in the form of an ocelot. There are interesting native pictures of this combat and the fall of the ocelot in the Vatican Codex II, p. 34, the Féjérvary Codex, p. 56, and others equally important, representing the fall or descent of an eagle from the sky, to which I shall revert.

It is moreover recorded by Mendieta (p. 82) that Tezcatlipoca likewise descended or let himself down from the sky by a spider's thread, and in the Bodleian MS. (p. 12) there are two curious pictures one of an ocelot and a cobweb, the other of an ocelot, descending head foremost from stars. The same incident is also pictured in the Vienna Codex (p. 9) where the ocelot, attached by the tail, is connected by a cord with star-emblems.

There are two facts of special interest in regard to the above descent of Tezcatlipoca by a spider's thread. The first is that the title Tzontemoc="he who descends head foremost" is recorded in the Codex Fuenleal immediately after the name Mictlantecuhtli. The second is that the spider is figured on the manta of Mictlantecuhtli in the B. N. MS. and is sculptured in the centre, above his forehead, in his sculptured image, identified as such by Señor Sanchez (Anales del Museo Nacional III, p. 299) and reproduced here (fig. 19). It represents "the lord of the North or Underworld" descending, head foremost, with a tecpatl or flint knife issuing from his mouth and with outspread limbs, the outlines of which are almost lost under the multitude of symbols which are grouped around him. These symbols are carefully analyzed in my commentary on the B. N. MS. in which I also describe other known carved representations of the same conception and point out analogous pictures in the Maya Codices. The position of the limbs of the descending figure is best understood by a glance at fig. 20, II, from the Dresden Codex. It represents a bar with cross symbols from which a human body is descending. The feet rest on dual symbols, about which more could be written than the scope of the present paper allows. A tecpatl or flint knife, attached to the body by a double bow with ends, may be seen between the dual symbols, and its presence is of utmost importance since it proves that the Mayas also associated the flint with the same figure. Instead of a head the body exhibits a sort of equidistant cross with four circles. Strange to say, the only analogous cross-figures I have been able to find in all the Codices are those reproduced in fig. 20, I, III, and IV. The latter exhibits a curious, conventionalized flower growing on the top of a pyramid. Its stem and leaves are painted brown and are spotted, resembling the skin of an ocelot. As there is a Mexican flower, the Tigridia, of which the native name was ocelo-xochitl, it may be that it is this which is thus represented. Fig. 20, III, from the B. N. MS., figures as a sacred cake, alongside of the S-shaped xonecuilli breads which were made in honor of Ursa Minor at a certain feast. Finally, fig. 20, I, represents a certain kind of ceremonial staff which is inserted between the two peaks of a mountain—a favorite method employed by the native scribes, to convey the idea that the object figured was in the exact centre. This kind of staff occurs frequently in certain Codices, sometimes being carried by a high priest. It invariably exhibits a flower-like figure with five circles and is surmounted by a tecpatl or flint knife. Without pausing to discuss the subject fully I merely point out here that, collectively, these symbols explain each other and convey the idea of the Centre and the Four Quarters evidently associated with the tecpatl, the symbol of the north, and the ocelot and xonecuilli=Ursa Minor. It is particularly interesting to note that the outspread human body is made to serve as a sort of cross-symbol. A careful study of the conventional representation of the face of "the lord of the North," in fig. 19, gives the impression that it was also used to convey the idea of duality, or the union of two in one. The upper half of the face exhibits a numeral on either cheek under the eyes, seeming to convey the idea of dualities. The two circular ear ornaments, united by a band above the head, and the two nostrils united in one nose, seem to convey the idea of the union of the dualities, whilst the lower half of the face, which is rendered strikingly different to the upper, by being in higher relief and marked with perpendicular lines, exhibits a mouth from which a flint knife, with symbolical eye and fangs carved on it, is hanging like a tongue. I have already shown that the flint knife was regarded as the sacred producer of the "vital spark." I may add here that I have also found, in the Codices, tecpatl-symbols on which the curved symbol of air or breath was figured. To my idea the sculptured face is meant to symbolize the dual creator, the dispenser of the spark and breath of life, whilst the human skull on his back betokens that he is also the giver of death. Though unable to enter fully into the subject here, I would nevertheless state that I can produce further data to prove that the human face was frequently employed for a symbolical purpose by the native American races who were evidently entirely under the dominion of the idea of duality, of the Above and Below and the life-producing union of both.

Figure 20.

The question why the spider, named “tocatl” in Nahuatl, should have been adopted as the chief symbol of Mictlantecuhtli, occupied me much until I found the clue to its significance in the Maya language. In this the word for North is _Aman_ and the name for “the spider whose bite is mortal,” is _Am_. This striking fact may be interpreted as a positive proof that the spider-symbol, employed by the Mexicans, must have originated in Yucatan, from the mere homonymy of two Maya words.

On the other hand shell-gorgets exhibiting the effigy of a spider, and obviously intended to be worn with its head turned downwards, have not only been found in Illinois but also in Tennessee and Missouri. On the gorgets from the latter States a cross is carved on the body of the spider (fig. 22, _a_). As certain spiders exhibit cross-markings, it is, of course, possible that it was chosen as a cross-symbol for this reason only, in some localities, just as the butterfly was evidently adopted in Mexico, as an apt image of the Centre and the Four Quarters on account of its shape and its possession of four wings. The conventionalized figure of a butterfly, with a star on its body and four balls, painted with the colors of the quarters, was a sacred symbol which is minutely described by Sahagun and is figured on a manta in the B. N. MS. A glance at its reproduction (fig. 21, no. 13) shows how the form of the insect has been conventionalized so as to resemble the ollin (no. 12) and other Mexican cross-symbols (nos. 2, 4, 11, 14 etc.). The eye or star in its centre, like that in the ollin, and circle (no. 4), signify Polaris; the conventionalized head and antennæ are obviously made to convey the idea of “two in one,” of the Above and Below united in the Centre.

[Illustration.]

Figure 21.

I venture to suggest that the dragon-fly was employed as a cross-symbol in an analogous manner, on the Algonquin garment preserved at the Riksmuseum, Stockholm, and described by Dr. Hjalmar Stolpe in his admirable study on American art (Amerikansk Ornamentik, Stockholm, 1896, p. 30). As I shall revert to it later on, I now draw special attention to the circumstance that instead of the cross, on a spider-gorget from Tennessee, there is a round hole which, when the shell-disc is held aloft, lets a ray of light shine through and furnishes an apt presentation of a star. This and the cross furnish analogies to the Mexican and Maya symbols of Polaris which are too obvious to need to be emphasized. Nor do these gorgets alone furnish an undeniable indication that an identical symbolism extended from Yucatan to Illinois. Other gorgets, also figured in Mr. Wm. H. Holmes’ monograph “Art in Shell,” several of which are in the Peabody Museum, from the stone graves in Tennessee, exhibit variously carved representations of a serpent. In all specimens the identical idea is carried out: the eye of the serpent forms the centre of the design on the disc and four circles on the body of the reptile, or four solid bars, interrupting a hollow line encircling the central motif, emphasized a division of the disc into four equal parts. The idea of the Serpent in repose, the Centre and the Four Quarters is thoroughly carried out and the true meaning of the design is only appreciated by the light of the Maya and Mexican symbolism which has already been so fully discussed.

[Illustration.]

Figure 22.

The third Tennessee gorget reproduced here (fig. 22, _c_), from Mr. Holmes’ work, exhibits a combination of numerals which is particularly interesting if confronted with the sacred numbers of the Mexicans and Mayas. From a central circle three curved lines issue in a fashion resembling those on fig. 21, no. 2, but the fact that the circular band exhibits seven double circles and the outer edge is divided into thirteen parts, is of special moment. Still another design, on a shell-gorget from Tennessee, not only exhibits the peculiarity, pointed out by Mr. Holmes, of a square with loops, resembling certain figures in Mexican Codices, but also other significant details which I shall point out (fig. 22, _b_). The cross in the centre occupies the centre of a star with eight rays and the four birds’ heads at the sides of the square illustrate rotation from right to left. I am inclined to view in this gorget an emblem of Polaris with Cassiopeia in rotation around it, figured as a bird, but whether this is the case or not it must be conceded that it is indeed remarkable to find a set of symbols, consisting of the spider, the cross, the serpent and the bird, carved on prehistoric

gorgets found in the United States whilst the deep meaning of these identical symbols is furnished by Maya and Mexican records. I venture to remark here that no more expressive and appropriate ornament than these shell-gorgets could have been designed, or worn by the ancient Maya or Mexican priests, prophets and leaders who, in a remote past, had guided themselves by the light of Polaris and instituted its cult as the basis of their native religion.

On realizing the above-mentioned identity of symbolism, it is impossible not to conclude that the prehistoric race which inhabited certain parts of the United States was under the dominion of the same ideas as were the Mexicans and Mayas. The indications point, in fact, to the probability that the origin of the employment of the spider-symbol originated in Yucatan, and if this be admitted then there is no reason to deny the possibility that the serpent-symbol came from there also, since the Maya language suggests an affinity between the serpent, _can_, and the sky=_caan_, and the numeral 4=_can_. I refrain, for the present, from expressing any final conclusion on this subject, which will doubtless afford ample food for reflection and argument to all interested in the important problem as to where the cradle of ancient American civilization was situated. But these symbolic gorgets go far towards substantiating Professor Putnam's oft-expressed conclusions that the ancient peoples of the central and southern portions of the United States were, to a certain extent, offshoots of the ancient Mexicans.

[Illustration.]

Figure 23.

Before abandoning the subject of native symbolism and star-emblems I should like to present, as a curiosity, with an appeal to specialists to enlighten me as to the astronomical knowledge of the Eskimos, an Eskimo drawing from Professor Wilson's instructive and useful monograph. It is said to represent a "flock of birds," but so closely resembles Cassiopeia and Polaris that I am tempted to view it as an indication that the Eskimos may also have associated the idea of a celestial bird, or birds, wheeling around a central point, with the constellation and the pole-star (fig. 23). Having once ventured so far afield, I cannot refrain from presenting here an interesting set of aboriginal star-symbols, reproduced from Professor Wilson's comprehensive work (fig. 24), each composed of a cross combined, with a single exception, with a circle. I draw attention to the striking resemblance of some of these signs to those painted on the finely decorated pottery found on the hacienda of Don José Luna, in Nicaragua, and described by J. F. Brandsford, M.D. (Archaeological Researches in Nicaragua, Smithsonian Inst., 1881, p. 30, B), and suggest that, in both localities, the symbol may be a rudimentary swastika, and represent Polaris and circumpolar rotation.

Plate III. 1. Shell gorget, Missouri. 2, 5-14. Pottery vessels, Arkansas. 3, 4, 15-17, 19-28. Pottery vessels, Missouri. 18. Pottery vessel, Kentucky. 6. National Museum. 3, 16, 17, 21, 24, 25. St. Louis Academy. All others Peabody Museum. Willoughby, "Pottery from the Mississippi Valley." Journal of American Folk-lore, January-March, 1897.

In conclusion I refer the reader to Mr. C. C. Willoughby's valuable and most interesting "Analysis of the decorations upon pottery from the Mississippi Valley" (Journal Amer. Folk-lore, vol. X, 1897), in which he figures the remarkable specimens preserved in the Peabody Museum, Cambridge, the designs on which, as he states, "are mostly of symbolic origin and have been in use among various tribes within the historic period from the Great Lakes to Mexico." With the kind permission of the editor of the Journal, I reproduce some of Mr. Willoughby's illustrations on Plate III.

Figure 24. Crosses And Circles Representing Star Symbols, Arizona.

Returning to consider the probable result of the gradual diffusion of star-cult owing to natural causes and of the consequent divergence from the idea of the Centre, which had so deeply influenced the minds of primitive men during many centuries, with earnest, and extended astronomical observation, keeping pace with the development of the idea of the Above and Below, it is obvious that the utmost attention would be next given to the conspicuous star groups and planets which are visible at certain times and then seem to have departed or descended into the under world. Any one who has read the interesting communications by Herr Richard Andree (Globus. bd. LXIV, nr. 22), On the relation of the Pleiades to the beginning of the year amongst primitive people, followed by a note by Herr Karl von den Steinen on the same subject, will realize that widely-separated tribes of men, by dint of simple observation, knew the exact length of the periodical appearance and disappearance of this star group and regulated their year accordingly. Herr Andree cites, for instance, that "in the Society islands, the year was divided into two portions, the first of

which was named Matari-i-inia=the Pleiades above. It began and lasted during the time when these constellations were visible close to the horizon after sunset. The second period, named Matarii-i-raro=the Pleiades below, began and lasted for the time during which the star-group was invisible after sunset" (W. Ellis, Polynesian Researches, vol. II, p. 419, London 1829). That the ancient Mexicans had likewise observed the Pleiades and been deeply impressed by them is proven by the well-known fact that the ceremony of the kindling of the sacred fire, which betokened the commencement of a new cycle, was performed "when the Pleiades attained the zenith at midnight precisely." In my complete monograph in the ancient Mexican calendar-system it will be my endeavor to present all the data I have collected concerning the degree of elementary astronomical knowledge attained by the native astronomers. I shall, therefore, content myself with pointing out here that besides the foregoing testimony about the Pleiades, the native name for which was the miec=the many, or the tianquiztli=the marketplace, there are records proving that the cult of the planet Venus was a firmly established feature of the native religion at the time of the Conquest. Sahagun records that the Nahuatl names for this planet were citlalpul or hueycitlallin both signifying "the great star." "In the great temple of Mexico an edifice named ilhuicatitlan [literally, the land of the sky] consisted of a great, high column, on which the morning star was painted.... Captives were sacrificed in front of this column annually, at the period when the star re-appeared" (_op. cit._ appendix to book II).

With regard to the connection of the Pleiades with the beginning of the Mexican cycle, it is interesting to note Herr Andree's statements that the most intimate connection of the star-group with the thoughts of primitive people, would naturally take place in such localities where its periodical movements coincided with the changes of season, wind and weather which affected agriculture. A survey of the data presented by Herr Andree shows that the cult of the Pleiades attained its greatest development amongst tribes inhabiting a southerly latitude. It was in South America, indeed, that the Peruvians, alongside of their highly developed sun-cult, rendered homage and offered sacrifices to the Pleiades. In Mexico, the cult of the Pleiades appears as intimately associated with that of the sun and to have assumed importance only in historical and comparatively recent times, probably when the periodicity of the sun's movements had been taught or recognized and the sign _ollin_, which is an exact presentation of the annual course of the sun, had been invented and adopted as a symbol. I have already pointed out that this sign occurs on the calendar-stone, for instance, which has a human face in its centre, bearing two numerals on the forehead and obviously symbolizing the union of two in one. In other instances the centre displays the eye, or star symbol and conveys the suggestion that the "four movements" of the circumpolar constellations were thereby symbolized. It may be that, in ancient Mexico, the two symbols, respectively referring to the movements of the sun and of the circumpolar star-groups, were emblematic of the two different cults or religions which existed alongside of each other. The first, the cult of the Above, of the Blue Sky, was directed towards the sun and the planets and stars intimately associated with sunrise and sunset, amongst them the Pleiades. The cult of the Below, of the Nocturnal Heaven, was directed towards the moon, Polaris and the circumpolar constellations—also to the stars and planets during the period of their disappearance and possibly in the same way to the enigmatical "Black Sun," figured in the B. N. MS. which may have been the sun during its nightly stay in the House of the Underworld, whose door was in the west. In order to obtain an idea of the immense proportions ultimately assumed by these two diverging cults and the enormous influence they exerted upon the entire native civilization, it will be necessary to examine the form of the social organization in Montezuma's time.

In order to comprehend this, however, it is first necessary to study carefully the myths relating to its origin. Torquemada (lib. VI, chap. 41) cites the authority of Friar Andreas de Olmos for the following native account of the creation of man, which was differently recounted to him in each province. He states that the majority of the natives, however, agreed that "there was in heaven a god named 'Shining Star' (Citlal-Tonac) and a goddess named 'She of the starry skirt' (Citlal-Cue), who gave birth to a flint knife (Tecpatl). Their other children, startled at this, cast the flint down from the sky. It fell to earth at the place named 'Seven caves' and 'produced 1,600 gods and goddesses,' " a figure of speech which evidently expressed the idea that, in coming in forcible contact with the soil the flint gave forth sparks innumerable which conveyed vitality to numberless beings. It is evidently the same idea of "life sparks" being called into existence by the union of heaven and earth which underlies the Texcocan version of the creation of man recorded as follows by Torquemada (_op. et loc. cit._). "The sun ... shot an arrow towards the land of Acolma near the boundary of Texcoco. This made a hole in the ground whence issued the first man...."

[Illustration.]

Figure 25.

The illustrated version of the above myths, given in the Vatican Codex I, designates the celestial progenitor of human life as Quetzalcoatl, also named Tonaca-Tecuhtli=the lord of our subsistence, Chicome-xochitl="Seven roses or flowers" and Citlalla-Tonalla="The Milky Way," literally, The shining stars. The dual divinity is figured (fig. 25, no. 4) as two persons with the shaft

of an arrow over each of their heads and with the symbol Tecpatl=flint, between them as the issue of their union. In the Borgian Codex (fig. 25, no. 1), a barbed arrowpoint, instead of the Tecpatl, figures between the celestial parents. Their union is symbolized by a covering, the shape of which, in further representations (fig. 25, nos. 3 and 5) in the same MS., offers resemblance to the tau-shaped windows which are such a common feature in Maya and also in Pueblo architecture (fig. 25, no. 2_b_). The preceding data, which could be amplified, seem to show that the natives associated the tau-shape not merely with the idea of the Male and Female principl This eBook is for the use of anyone anywhere in the United States and most other parts of the world at no cost and with almost no restrictions whatsoever. A FRIEND

Wenn im Unendlichen dasselbe Sich wiederholend ewig fliesst, Das tausendfältige Gewölbe Sich kräftig ineinander schliesst; Strömt Lebenslust aus allen Dingen, Dem kleinsten wie dem grössten Stern, Und alles Drängen, alles Ringen Ist ewige Ruh in Gott dem Herrn. —GOETHE.

TRANSLATOR'S PREFACE

It must be left to critics to say whether it was Destiny or Incident— using these words in the author's sense—that Spengler's "Untergang des Abendlandes" appeared in July, 1918, that is, at the very turning-point of the four years' World-War. It was conceived, the author tells us, before 1914 and fully worked out by 1917. So far as he is concerned, then, the impulse to create it arose from a view of our civilization not as the late war left it, but (as he says expressly) as the _coming_ war would find it. But inevitably the public impulse to read it arose in and from post-war conditions, and thus it happened that this severe and difficult philosophy of history found a market that has justified the printing of 90,000 copies. Its very title was so apposite to the moment as to predispose the higher intellectuals to regard it as a work of the moment—the more so as the author was a simple Oberlehrer and unknown to the world of authoritative learning.

Spengler's was not the only, nor indeed the most "popular," philosophical product of the German revolution. In the graver conjunctures, sound minds do not dally with the graver questions—they either face and attack them with supernormal resolution or thrust them out of sight with an equally supernormal effort to enjoy or to endure the day as it comes. Even after the return to normality, it is no longer possible for men—at any rate for Western men—not to know that these questions exist. And, if it is none too easy even for the victors of the struggle to shake off its sequelæ, to turn back to business as the normal and to give no more than amateur effort and dilettantish attention to the very deep things, for the defeated side this is impossible. It goes through a period of material difficulty (often extreme difficulty) and one in which pride of achievement and humility in the presence of unsuccess work dynamically together. So it was with sound minds in the post-Jena Germany of Jahn and Fichte, and so it was also with such minds in the Germany of 1919-1920.

To assume the rôle of critic and to compare Spengler's with other philosophies of the present phase of Germany, as to respective intrinsic weights, is not the purpose of this note nor within the competence of its writer. On the other hand, it is unconditionally necessary for the reader to realize that the book before him has not only acquired this large following amongst thoughtful laymen, but has forced the attention and taxed the scholarship of every branch of the learned world. Theologians, historians, scientists, art critics—all saw the challenge, and each brought his _apparatus criticus_ to bear on that part of the Spengler theory that affected his own domain. The reader who is familiar with German may be referred to Manfred Schroeter's "Der Streit um Spengler" for details; it will suffice here to say that Schroeter's index of critics' names contains some 400 entries. These critics are not only, or even principally, general reviewers, most of them being specialists of high standing. It is, to say the least, remarkable that a volcanically assertive philosophy of history, visibly popular and produced under a catchy title (Reklamtitel) should call forth, as it did, a special number of _Logos_ in which the Olympians of scholarship passed judgment on every inaccuracy or unsupported statement that they could detect. (These were in fact numerous in the first edition and the author has corrected or modified them in detail in the new edition, from which this translation has been done. But it should be emphasized that the author has not, in this second edition, receded in any essentials from the standpoint taken up in the first.)

The conspicuous features in this first burst of criticism were, on the one hand, want of adequate critical equipment in the general critic, and, on the other, inability to see the wood for the trees in the man of learning. No one, reading Schroeter's book (which by the way is one- third as large as Spengler's first volume itself), can fail to agree with his judgment that notwithstanding paradoxes, overstrainings, and inaccuracies, the work towers above all its commentators. And it was doubtless a sense of this greatness that led many scholars—amongst them some of the very high—to avoid expressing opinions on it at all. It would be foolish to call their silence a "sitting on the fence"; it is a case rather of reserving judgment on a philosophy and a methodology that challenge all the canons and carry with them immense implications. For the very few who combine all the necessary depth of learning with all the necessary freedom and breadth of outlook, it will not be the accuracy or inaccuracy of details under a close magnifying-glass that will be decisive. The very idea of accuracy and inaccuracy presupposes the selection or acceptance of co-ordinates of reference, and therefore the selection or acceptance of a standpoint as "origin." That is mere elementary science—and yet the scholar-critic

would be the first to claim the merit of scientific rigour for his criticisms! It is, in history as in science, impossible to draw a curve through a mass of plotted observations when they are looked at closely and almost individually.

Criticism of quite another and a higher order may be seen in Dr. Eduard Meyer's article on Spengler in the _Deutsche Literaturzeitung_, No. 25 of 1924. Here we find, in one of the great figures of modern scholarship, exactly that large-minded judgment that, while noting minor errors—and visibly attaching little importance to them—deals with the Spengler thesis fairly and squarely on the grand issues alone. Dr. Meyer differs from Spengler on many serious questions, of which perhaps the most important is that of the scope and origin of the Magian Culture. But instead of cataloguing the errors that are still to be found in Spengler's vast ordered multitude of facts, Eduard Meyer honourably bears testimony to our author's "erstaunlich umfangreiches, _ihm ständig präsentes, Wissen_" (a phrase as neat and as untranslatable as Goethe's "exakte sinnliche Phantasie"). He insists upon the fruitfulness of certain of Spengler's ideas such as that of the "Second Religiousness." Above all, he adheres to and covers with his high authority the basic idea of the parallelism of organically-living Cultures. It is not necessarily Spengler's structure of the Cultures that he accepts—parts of it indeed he definitely rejects as wrong or insufficiently established by evidences—but on the question of their being _an_ organic structure of the Cultures, _a_ morphology of History, he ranges himself frankly by the side of the younger thinker, whose work he sums up as a "bleibendez und auf lange Zeit hinaus nachhaltig wirkendes Besitz unserer Wissenschaft und Literatur." This last phrase of Dr. Meyer's expresses very directly and simply that which for an all-round student (as distinct from an erudite specialist) constitutes the peculiar _quality_ of Spengler's work. Its influence is far deeper and subtler than any to which the conventional adjective "suggestive" could be applied. It cannot in fact be described by adjectives at all, but only denoted or adumbrated by its result, which is that, after studying and mastering it, "one finds it nearly if not quite impossible to approach any culture-problem—old or new, dogmatic or artistic, political or scientific—without conceiving it primarily as 'morphological.'"

The work comprises two volumes—under the respective sub-titles "Form and Reality" and "World-historical Perspectives"—of which the present translation covers the first only. Some day I hope to have the opportunity of completing a task which becomes—such is the nature of this book—more attractive in proportion to its difficulty. References to Volume II are, for the present, necessarily to the pages of the German original; if, as is hoped, this translation is completed later by the issue of the second volume, a list of the necessary adjustments of page references will be issued with it. The reader will notice that translator's foot-notes are scattered fairly freely over the pages of this edition. In most cases these have no pretensions to being critical annotations. They are merely meant to help the reader to follow up in more detail the points of fact which Spengler, with his "ständig präsentes Wissen," sweeps along in his course. This being their object, they take the form, in the majority of cases, of references to appropriate articles in the Encyclopædia Britannica, which is the only single work that both contains reasonably full information on the varied (and often abstruse) matters alluded to, and is likely to be accessible wherever this book may penetrate. Every reader no doubt will find these notes, where they appertain to his own special subject, trivial and even annoying, but it is thought that, for example, an explanation of the mathematical Limit may be helpful to a student who knows all about the Katharsis in Greek drama, and _vice versa_.

In conclusion I cannot omit to put on record the part that my wife, Hannah Waller Atkinson, has taken in the work of translation and editing. I may best describe it by saying that it ought perhaps to have been recorded on the title page instead of in this place.

January, 1926.

PREFACE TO THE REVISED EDITION

At the close of an undertaking which, from the first brief sketch to the final shaping of a complete work of quite unforeseen dimensions, has spread itself over ten years, it will not be out of place to glance back at what I intended and what I have achieved, my standpoint then and my standpoint to-day.

In the Introduction to the 1918 edition—inwardly and outwardly a fragment—I stated my conviction that an idea had now been irrefutably formulated which no one would oppose, once the idea had been put into words. I ought to have said: once that idea had been understood. And for that we must look—as I more and more realize—not only in this instance but in the whole history of thought—to the new generation that is _born_ with the ability to do it.

I added that this must be considered as a first attempt, loaded with all the customary faults, incomplete and not without inward opposition. The remark was not taken anything like as seriously as it was intended. Those who have looked searchingly into the hypotheses of living thought will know that it is not given to us to gain insight into the fundamental principles of existence without conflicting emotions. A thinker is a person whose part it is to symbolize time according to his vision and understanding. He has no choice; he thinks as he has to think. Truth in the long run is to him the picture of the world which was born at his birth. It is that which he does not invent but rather discovers within himself. It is himself over again: his being expressed in words; the meaning of his personality formed into a doctrine which so far as concerns his life is unalterable, because truth and his life are identical. This symbolism is the one essential, the vessel and the expression of human history. The learned philosophical works that arise out of it are superfluous and only serve to swell the bulk of a professional literature.

I can then call the essence of what I have discovered “true”—that is, _true for me_, and as I believe, true for the leading minds of the coming time; not true in itself as dissociated from the conditions imposed by blood and by history, for that is impossible. But what I wrote in the storm and stress of those years was, it must be admitted, a very imperfect statement of what stood clearly before me, and it remained to devote the years that followed to the task of correlating facts and finding means of expression which should enable me to present my idea in the most forcible form.

To perfect that form would be impossible—life itself is only fulfilled in death. But I have once more made the attempt to bring up even the earliest portions of the work to the level of definiteness with which I now feel able to speak; and with that I take leave of this book with its hopes and disappointments, its merits and its faults.

The result has in the meantime justified itself as far as I myself am concerned and—judging by the effect that it is slowly beginning to exercise upon extensive fields of learning—as far as others are concerned also. Let no one expect to find everything set forth here. It is _but one side_ of what I see before me, a new outlook on _history and the philosophy of destiny_—the first indeed of its kind. It is intuitive and depictive through and through, written in a language which seeks to present objects and relations illustratively instead of offering an army of ranked concepts. It addresses itself solely to readers who are capable of living themselves into the word-sounds and pictures as they read. Difficult this undoubtedly is, particularly as our awe in face of mystery—the respect that Goethe felt—denies us the satisfaction of thinking that dissections are the same as penetrations.

Of course, the cry of “pessimism” was raised at once by those who live eternally in yesterday (_Ewiggestrigen_) and greet every idea that is intended for the pathfinder of to-morrow only. But I have not written for people who imagine that delving for the springs of action is the same as action itself; those who make definitions do not know destiny.

By understanding the world I mean being equal to the world. It is the hard reality of living that is the essential, not the concept of life, that the ostrich-philosophy of idealism propounds. Those who refuse to be bluffed by enunciations will not regard this as pessimism; and the rest do not matter. For the benefit of serious readers who are seeking a glimpse at life and not a definition, I have—in view of the far too great concentration of the text—mentioned in my notes a number of works which will carry that glance into more distant realms of knowledge.

And now, finally, I feel urged to name once more those to whom I owe practically everything: Goethe and Nietzsche. Goethe gave me method, Nietzsche the questioning faculty—and if I were asked to find a formula for my relation to the latter I should say that I had made of his “outlook” (_Ausblick_) an “overlook” (_Überblick_). But Goethe was, without knowing it, a disciple of Leibniz in his whole mode of thought. And, therefore, that which has at last (and to my own astonishment) taken shape in my hands I am able to regard and, despite the misery and disgust of these years, proud to call _a German philosophy_.

OSWALD SPENGLER.

Blankenburg am Harz, December, 1922.

PREFACE TO THE FIRST EDITION

The complete manuscript of this book—the outcome of three years’ work— was ready when the Great War broke out. By the spring of 1917 it had been worked over again and—in certain details—supplemented and cleared up, but its appearance in print was still delayed by the conditions then prevailing.

Although a philosophy of history is its scope and subject, it possesses also a certain deeper significance as a commentary on the great epochal moment of which the portents were visible when the leading ideas were being formed.

The title, which had been decided upon in 1912, expresses quite literally the intention of the book, which was to describe, in the light of the decline of the Classical age, one world-historical phase of several centuries upon which we ourselves are now entering.

Events have justified much and refuted nothing. It became clear that these ideas must necessarily be brought forward at just this moment and in Germany, and, more, that the war itself was an element in the premisses from which the new world-picture could be made precise.

For I am convinced that it is not merely a question of writing one out of several possible and merely logically justifiable philosophies, but of writing _the_ philosophy of our time, one that is to some extent a natural philosophy and is dimly presaged by all. This may be said without presumption; for an idea that is historically essential—that does not occur within an epoch but itself makes that epoch—is only in a limited sense the property of him to whose lot it falls to parent it. It belongs to our time as a whole and influences all thinkers, without their knowing it; it is but the accidental, private attitude towards it (without which no philosophy can exist) that—with its faults and its merits—is the destiny and the happiness of the individual.

OSWALD SPENGLER.

Munich, December, 1917.

CONTENTS OF VOLUME I

TRANSLATOR'S NOTE ix

AUTHOR'S PREFACE TO THE REVISED EDITION xiii

AUTHOR'S PREFACE TO THE FIRST EDITION xv

CHAPTER I. INTRODUCTION 1

Scope of the work, p. 3. Morphology of World-History, a new philosophy, p. 5. For whom is History? p. 8. Classical and Indian mankind ahistorical, p. 9. The Egyptian mummy and the burning of the dead, p. 13. The conventional scheme of World-History (ancient, mediæval, modern), p. 15. Its origin, p. 18. Its breakdown, p. 22. Europe not a centre of gravity, p. 23. The only historical method is Goethe's, p. 25. Ourselves and the Romans, p. 26. Nietzsche and Mommsen, p. 28. The problem of Civilization, p. 31. Imperialism the last phase, p. 36. The necessity and range of our basic idea, p. 39. Its relation to present-day philosophy, p. 41. Philosophy's last task, p. 45. The origin of this work, p. 46.

CHAPTER II. THE MEANING OF NUMBERS 51

Fundamental notions, p. 53. Numbers as the sign of delimitation, p. 56. Every Culture has its own Mathematic, p. 59. Number as magnitude in the Classical world, p. 64. Aristarchus, p. 68. Diophantus and Arabian number, p. 71. Number as Function in the Western Culture, p. 74. World-fear and world-longing, p. 78. Geometry and arithmetic, p. 81. The Limit idea, p. 86. Visual limits transcended; symbolical space worlds, p. 86. Final possibilities, p. 87.

CHAPTER III. THE PROBLEM OF WORLD-HISTORY. (1) PHYSIOGNOMIC AND SYSTEMATIC 91

Copernican methods, p. 93. History and Nature, p. 94. Form and Law, p. 97. Physiognomic and Systematic, p. 100. Cultures as organisms, p. 104. Inner form, tempo, duration, p. 108. Homology, p. 111. What is meant by "contemporary," p. 112.

CHAPTER IV. THE PROBLEM OF WORLD-HISTORY. (2) THE DESTINY-IDEA AND THE CAUSALITY-PRINCIPLE 115

Logic, organic and inorganic, p. 117. Time and Destiny, p. 119. Space and Causality, p. 119. The problem of Time, p. 121. Time a counter-conception to Space, p. 126. The symbols of Time—tragedy, time reckoning, disposal of the dead, p. 130. Care (sex, the State, works), p. 136. Destiny and Incident, p. 139. Incident and Cause, p. 141. Incident and Style of existence, p. 142. Anonymous and personal epochs, p. 148. Direction into the future and Image of the Past, p. 152. Is there a Science of History? p. 155. The new enunciation of the problem, p. 159.

CHAPTER V. MAKROKOSMOS. (1) THE SYMBOLISM OF THE WORLD-PICTURE AND THE PROBLEM OF SPACE 161

The Macrocosm as the sum total of symbols referred to a Soul, p. 163. Space and Death, p. 165. “Alles vergängliche ist nur ein Gleichnis,” p. 167. The space problem (only Depth is space- forming), p. 169. Depth as Time, p. 172. The world-idea of a Culture born out of its prime symbol, p. 174. Classical Body, Magian Cavern, Western Infinity, p. 174.

CHAPTER VI. MAKROKOSMOS. (2) APOLLINIAN, FAUSTIAN, AND MAGIAN SOUL 181

Prime symbol, architecture, divinities, p. 183. The Egyptian prime symbol of the path, p. 188. Expression-language of art: Ornamentation and Imitation, p. 191. Ornament and early architecture, p. 196. The window, p. 199. The grand style, p. 200. The history of a Style as organism, p. 205. On the history of the Arabian style, p. 207. Psychology of art-technique, p. 214.

CHAPTER VII. MUSIC AND PLASTIC. (1) THE ARTS OF FORM 217

Music one of the arts of form, p. 219. Classification of the arts impossible except from the historical standpoint, p. 221. The choice of particular arts itself an expression-means of the higher order, p. 222. Apollinian and Faustian art-groups, p. 224. The stages of Western Music, p. 226. The Renaissance an anti- Gothic and anti-musical movement, p. 232. Character of the Baroque, p. 236. The Park, p. 240. Symbolism of colours, p. 245. Colours of the Near and of the Distance, p. 246. Gold background and Rembrandt brown, p. 247. Patina, p. 253.

CHAPTER VIII. MUSIC AND PLASTIC. (2) ACT AND PORTRAIT 257

Kinds of human representation, p. 259. Portraiture, Contrition, Syntax, p. 261. The heads of Classical statuary, p. 264. Portrayal of children and women, p. 266. Hellenistic portraiture, p. 269. The Baroque portrait, p. 272. Leonardo, Raphael and Michelangelo overcome the Renaissance, p. 273. Victory of Instrumental Music over Oil-Painting, corresponding to the victory of Statuary over Fresco in the Classical, p. 282. Impressionism, p. 285. Pergamum and Bayreuth, p. 291. The finale of Art, p. 293.

CHAPTER IX. SOUL-IMAGE AND LIFE-FEELING. (1) ON THE FORM OF THE SOUL 297

Soul-image as function of World-image, p. 299. Psychology of a counter-physics, p. 302. Apollinian, Magian and Faustian soul-image, p. 305. The “Will” in Gothic space, p. 308. The “inner” mythology, p. 312. Will and Character, p. 314. Classical posture tragedy and Faustian character tragedy, p. 317. Symbolism of the drama-image, p. 320. Day and Night Art, p. 324. Popular and esoteric, p. 326. The astronomical image, p. 329. The geographical horizon, p. 332.

CHAPTER X. SOUL-IMAGE AND LIFE-FEELING. (2) BUDDHISM, STOICISM, AND SOCIALISM 339

The Faustian morale purely dynamic, p. 341. Every Culture has a form of morale proper to itself, p. 345. Posture-morale and will-morale, p. 347. Buddha, Socrates, Rousseau as protagonists of the dawning Civilizations, p. 351. Tragic and plebeian morale, p. 354. Return to Nature, Irreligion, Nihilism, p. 356. Ethical Socialism, p. 361. Similarity of structure in the philosophical history of every Culture, p. 364. The Civilized philosophy of the West, p. 365.

CHAPTER XI. FAUSTIAN AND APOLLINIAN NATURE-KNOWLEDGE 375

Theory as Myth, p. 377. Every Natural Science depends upon a preceding Religion, p. 391. Statics, Alchemy, Dynamics as the theories of three Cultures, p. 382. The Atomic theory, p. 384. The problem of motion insoluble, p. 388. The style of causal process and experience, p. 391. The feeling of God and the knowing of Nature, p. 392. The great Myth, p. 394. Classical, Magian and Faustian _numina_, p. 397. Atheism, p. 408. Faustian physics as a dogma of force, p. 411. Limits of its theoretical (as distinct from its technical) development, p. 417. Self- destruction of Dynamics, and invasion of historical ideas; theory dissolves into a system of morphological relationships, p. 420.

INDEX _Following page_ 428

TABLES ILLUSTRATING THE COMPARATIVE _At end of volume_ MORPHOLOGY OF HISTORY

CHAPTER I INTRODUCTION

CHAPTER I

INTRODUCTION

I

In this book is attempted for the first time the venture of predetermining history, of following the still untravelled stages in the destiny of a Culture, and specifically of the only Culture of our time and on our planet which is actually in the phase of fulfilment—the West-European-American.

Hitherto the possibility of solving a problem so far-reaching has evidently never been envisaged, and even if it had been so, the means of dealing with it were either altogether unsuspected or, at best, inadequately used.

Is there a logic of history? Is there, beyond all the casual and incalculable elements of the separate events, something that we may call a metaphysical structure of historic humanity, something that is essentially independent of the outward forms—social, spiritual and political—which we see so clearly? Are not these actualities indeed secondary or derived from that something? Does world-history present to the seeing eye certain grand traits, again and again, with sufficient constancy to justify certain conclusions? And if so, what are the limits to which reasoning from such premisses may be pushed?

Is it possible to find in life itself—for human history is the sum of mighty life-courses which already have had to be endowed with ego and personality, in customary thought and expression, by predicating entities of a higher order like “the Classical” or “the Chinese Culture,” “Modern Civilization”—a series of stages which must be traversed, and traversed moreover in an ordered and obligatory sequence? For everything organic the notions of birth, death, youth, age, lifetime are fundamentals—may not these notions, in this sphere also, possess a rigorous meaning which no one has as yet extracted? In short, is all history founded upon general biographic archetypes?

The decline of the West, which at first sight may appear, like the corresponding decline of the Classical Culture, a phenomenon limited in time and space, we now perceive to be a philosophical problem that, when comprehended in all its gravity, includes within itself every great question of Being.

If therefore we are to discover in what form the destiny of the Western Culture will be accomplished, we must first be clear as to what culture _is_, what its relations are to visible history, to life, to soul, to nature, to intellect, what the forms of its manifestation are and how far these forms—peoples, tongues and epochs, battles and ideas, states and gods, arts and craft-works, sciences, laws, economic types and world-ideas, great men and great events—may be accepted and pointed to as symbols.

II

The means whereby to identify dead forms is Mathematical Law. The means whereby to understand living forms is Analogy. By these means we are enabled to distinguish polarity and periodicity in the world.

It is, and has always been, a matter of knowledge that the expression- forms of world-history are limited in number, and that eras, epochs, situations, persons are ever repeating themselves true to type. Napoleon has hardly ever been discussed without a side-glance at Cæsar and Alexander—analogies of which, as we shall see, the first is morphologically quite inacceptable and the second is correct—while Napoleon himself conceived of his situation as akin to Charlemagne’s. The French Revolutionary Convention spoke of Carthage when it meant England, and the Jacobins styled themselves Romans. Other such comparisons, of all degrees of soundness and unsoundness, are those of Florence with Athens, Buddha with Christ, primitive Christianity with modern Socialism, the Roman financial magnate of Cæsar’s time with the Yankee. Petrarch, the first passionate archæologist (and is not archæology itself an expression of the sense that history is repetition?) related himself mentally to Cicero, and but lately Cecil Rhodes, the organizer of British South Africa, who had in his library specially prepared translations of the classical lives of the Cæsars, felt himself akin to the Emperor Hadrian. The fated Charles XII of Sweden used to carry Quintus Curtius’s life of Alexander in his pocket, and to copy that conqueror was his deliberate purpose.

Frederick the Great, in his political writings—such as his _Considérations_, 1738—moves among analogies with perfect assurance. Thus he compares the French to the Macedonians under Philip and the Germans to the Greeks. “Even now,” he says, “the Thermopylæ of Germany, Alsace and Lorraine, are in the hands of Philip,” therein exactly characterizing the policy of Cardinal Fleury. We find him drawing parallels also between the policies of the Houses of Habsburg and Bourbon and the proscriptions of Antony and of Octavius.

Still, all this was only fragmentary and arbitrary, and usually implied rather a momentary inclination to poetical or ingenious expressions than a really deep sense of historical forms.

Thus in the case of Ranke, a master of artistic analogy, we find that his parallels of Cyaxares and Henry the Fowler, of the inroads of the Cimmerians and those of the Hungarians, possess morphologically no significance, and his oft-quoted analogy between the Hellenic city- states and the Renaissance republics very little, while the deeper truth in his comparison of Alcibiades and Napoleon is accidental. Unlike the strict mathematician, who finds inner relationships between two groups of differential equations where the layman sees nothing but dissimilarities of outward form, Ranke and others draw their historical analogies with a Plutarchian, popular-romantic, touch, and aim merely at presenting comparable scenes on the world-stage.

It is easy to see that, at bottom, it is neither a principle nor a sense of historic necessity, but simple inclination, that governs the choice of the tableaux. From any _technique_ of analogies we are far distant. They throng up (to-day more than ever) without scheme or unities, and if they do hit upon something which is true—in the essential sense of the word that remains to be determined—it is thanks to luck, more rarely to instinct, never to a principle. In this region no one hitherto has set himself to work out a _method_, nor has had the slightest inkling that there is here a root, in fact the only root, from which can come a broad solution of the problems of History.

Analogies, in so far as they laid bare the organic structure of history, might be a blessing to historical thought. Their technique, developing under the influence of a comprehensive idea, would surely eventuate in inevitable conclusions and logical mastery. But as hitherto understood and practised they have been a curse, for they have enabled the historians to follow their own tastes, instead of soberly realizing that their first and hardest task was concerned with the symbolism of history and its analogies, and, in consequence, the problem has till now not even been comprehended, let alone solved. Superficial in many cases (as for instance in designating Cæsar as the creator of the official newspaper), these analogies are worse than superficial in others (as when phenomena of the Classical Age that are not only extremely complex but utterly alien to us are labelled with modern catchwords like Socialism, Impressionism, Capitalism, Clericalism), while occasionally they are bizarre to the point of perversity—witness the Jacobin clubs with their cult of Brutus, that millionaire-extortioner Brutus who, in the name of oligarchical doctrine and with the approval of the patrician senate, murdered the Man of the Democracy.

III

Thus our theme, which originally comprised only the limited problem of present-day civilization, broadens itself into a new philosophy—_the_ philosophy of the future, so far as the metaphysically-exhausted soil of the West can bear such, and in any case the only philosophy which is within the _possibilities_ of the West-European mind in its next stages. It expands into the conception of a _morphology of world history_, of the world-as-history in contrast to the morphology of the world-as- nature that hitherto has been almost the only theme of philosophy. And it reviews once again the forms and movements of the world in their depths and final significance, but this time according to an entirely different ordering which groups them, not in an ensemble picture inclusive of everything known, but in a picture of _life_, and presents them not as things-become, but as things-becoming.

The _world-as-history_, conceived, viewed and given form from out of its opposite the _world-as-nature_—here is a new aspect of human existence on this earth. As yet, in spite of its immense significance, both practical and theoretical, this aspect has not been realized, still less presented. Some obscure inkling of it there may have been, a distant momentary glimpse there has often been, but no one has deliberately faced it and taken it in with all its implications. We have before us two possible ways in which man may inwardly possess and experience the world around him. With all rigour I distinguish (as to form, not substance) the organic from the mechanical world-impression, the content of images from that of laws, the picture and symbol from the formula and the system, the instantly actual from the constantly possible, the intents and purposes of imagination ordering according to plan from the intents and purposes of experience dissecting according to scheme; and— to mention even thus early an opposition that has never yet been noted, in spite of its significance—the domain of _chronological_ from that of _mathematical number_.[1]

Consequently, in a research such as that lying before us, there can be no question of taking spiritual-political events, as they become visible day by day on the surface, at their face value, and arranging them on a scheme of “causes” or “effects” and following them up in the obvious and intellectually easy directions. Such a “pragmatic” handling of history would be nothing but a piece of “natural science” in disguise, and for their part, the supporters of the materialistic idea of history make no secret about it—it is their adversaries who largely fail to see the similarity of the two methods. What concerns us is not what the historical facts which appear at this or that time _are_, per se, but what they signify, what they point to, _by appearing_. Present-day historians think they

are doing a work of supererogation in bringing in religious and social, or still more art-history, details to “illustrate” the political sense of an epoch. But the decisive factor—decisive, that is, in so far as visible history is the expression, sign and embodiment of soul—they forget. I have not hitherto found one who has carefully considered the _morphological relationship_ that inwardly binds together the expression-forms of _all_ branches of a Culture, who has gone beyond politics to grasp the ultimate and fundamental ideas of Greeks, Arabians, Indians and Westerners in mathematics, the meaning of their early ornamentation, the basic forms of their architecture, philosophies, dramas and lyrics, their choice and development of great arts, the detail of their craftsmanship and choice of materials—let alone appreciated the decisive importance of these matters for the form- problems of history. Who amongst them realizes that between the Differential Calculus and the dynastic principle of politics in the age of Louis XIV, between the Classical city-state and the Euclidean geometry, between the space-perspective of Western oil-painting and the conquest of space by railroad, telephone and long-range weapon, between contrapuntal music and credit economics, there are deep uniformities? Yet, viewed from this morphological standpoint, even the humdrum facts of politics assume a symbolic and even a metaphysical character, and— what has perhaps been impossible hitherto—things such as the Egyptian administrative system, the Classical coinage, analytical geometry, the cheque, the Suez Canal, the book-printing of the Chinese, the Prussian Army, and the Roman road-engineering can, as symbols, be made _uniformly_ understandable and appreciable.

But at once the fact presents itself that as yet there exists no theory- enlightened art of historical treatment. What passes as such draws its methods almost exclusively from the domain of that science which alone has completely disciplined the methods of cognition, viz., physics, and thus we imagine ourselves to be carrying on historical research when we are really following out objective connexions of cause and effect. It is a remarkable fact that the old-fashioned philosophy never imagined even the possibility of there being any other relation than this between the conscious human understanding and the world outside. Kant, who in his main work established the formal rules of cognition, took _nature_ only as the object of reason’s activity, and neither he himself, nor anyone after him, noted the reservation. Knowledge, for Kant, is mathematical knowledge. He deals with innate intuition-forms and categories of the reason, but he never thinks of the wholly different mechanism by which historical impressions are apprehended. And Schopenhauer, who, significantly enough, retains but one of the Kantian categories, viz., causality, speaks contemptuously of history.[2] That there is, besides a necessity of cause and effect—which I may call the _logic of space_—another necessity, an organic necessity in life, that of Destiny—the _logic of time_—is a fact of the deepest inward certainty, a fact which suffuses the whole of mythological religions and artistic thought and constitutes the essence and kernel of all history (in contradistinction to nature) but is unapproachable through the cognition-forms which the “Critique of Pure Reason” investigates. This fact still awaits its theoretical formulation. As Galileo says in a famous passage of his _Saggiatore_, philosophy, as Nature’s great book, is written “in mathematical language.” We await, to-day, the philosopher who will tell us in what language history is written and how it is to be read.

Mathematics and the principle of Causality lead to a naturalistic, Chronology and the idea of Destiny to a historical ordering of the phenomenal world. Both orderings, each on its own account, cover the _whole_ world. The difference is only in the eyes by which and through which this world is realized.

Footnote 1:

Kant’s error, an error of very wide bearing which has not even yet been overcome, was first of all in bringing the outer and inner Man into relation with the ideas of space and time by pure scheme, though the meanings of these are numerous and, above all, not unalterable; and secondly in allying arithmetic with the one and geometry with the other in an utterly mistaken way. It is not between arithmetic and geometry—we must here anticipate a little—but between chronological and mathematical number that there is fundamental opposition. Arithmetic and geometry are _both_ spatial mathematics and in their higher regions they are no longer separable. _Time-reckoning_, of which the plain man is capable of a perfectly clear understanding through his senses, answers the question “When,” not “What” or “How Many.”

Footnote 2:

One cannot but be sensible how little depth and power of abstraction has been associated with the treatment of, say, the Renaissance or the Great Migrations, as compared with what is obviously required for the theory of functions and theoretical optics. Judged by the standards of the physicist and the mathematician, the historian becomes _careless_ as soon as he has assembled and ordered his material and passes on to interpretation.

IV

Nature is the shape in which the man of higher Cultures synthesizes and interprets the immediate impressions of his senses. History is that from which his imagination seeks comprehension of the living existence of the world in relation to his own life, which he thereby invests with a deeper reality. Whether he is capable of creating these shapes, which of them it is that dominates his waking consciousness, is a primordial problem of all human existence.

Man, thus, has before him two _possibilities_ of world-formation. But it must be noted, at the very outset, that these possibilities are not necessarily _actualities_, and if we are to enquire into the sense of all history we must begin by solving a question which has never yet been put, viz., _for whom_ is there History? The question is seemingly paradoxical, for history is obviously for everyone to this extent, that every man, with his whole existence and consciousness, is a part of history. But it makes a great difference whether anyone lives under the constant impression that his life is an element in a far wider life- course that goes on for hundreds and thousands of years, or conceives of himself as something rounded off and self-contained. For the latter type of consciousness there is certainly no world-history, no _world-as- history_. But how if the self-consciousness of a whole nation, how if a whole Culture rests on this ahistoric spirit? How must actuality appear to it? The world? Life? Consider the Classical Culture. In the world-consciousness of the Hellenes all experience, not merely the personal but the common past, was immediately transmuted into a timeless, immobile, mythically-fashioned background for the particular momentary present; thus the history of Alexander the Great began even before his death to be merged by Classical sentiment in the Dionysus legend, and to Cæsar there seemed at the least nothing preposterous in claiming descent from Venus.

Such a spiritual condition it is practically impossible for us men of the West, with a sense of time-distances so strong that we habitually and unquestioningly speak of so many years before or after Christ, to reproduce in ourselves. But we are not on that account entitled, in dealing with the problems of History, simply to ignore the fact.

What diaries and autobiographies yield in respect of an individual, that historical research in the widest and most inclusive sense—that is, every kind of psychological comparison and analysis of alien peoples, times and customs—yields as to the soul of a Culture as a whole. But the Classical culture possessed no _memory_, no organ of history in this special sense. The memory of the Classical man—so to call it, though it is somewhat arbitrary to apply to alien souls a notion derived from our own—is something different, since past and future, as arraying perspectives in the working consciousness, are absent and the “pure Present,” which so often roused Goethe’s admiration in every product of the Classical life and in sculpture particularly, fills that life with an intensity that to us is perfectly unknown.

This pure Present, whose greatest symbol is the Doric column, in itself predicates the _negation of time_ (of direction). For Herodotus and Sophocles, as for Themistocles or a Roman consul, the past is subtilized instantly into an impression that is timeless and changeless, _polar and not periodic_ in structure—in the last analysis, of such stuff as myths are made of—whereas for our world-sense and our inner eye the past is a definitely periodic and purposeful organism of centuries or millennia.

But it is just this background which gives the life, whether it be the Classical or the Western life, its special colouring. What the Greek called Kosmos was the image of a world that is not continuous but complete. _Inevitably_, then, the Greek man himself was not a series but a term.[3]

For this reason, although Classical man was well acquainted with the strict chronology and almanac-reckoning of the Babylonians and especially the Egyptians, and therefore with that eternity-sense and disregard of the present-as-such which revealed itself in their broadly- conceived operations of astronomy and their exact measurements of big time-intervals, none of this ever became _intimately_ a part of him. What his philosophers occasionally told him on the subject they had heard, not experienced, and what a few brilliant minds in the Asiatic- Greek cities (such as Hipparchus and Aristarchus) discovered was rejected alike by the Stoic and by the Aristotelian, and outside a small professional circle not even noticed. Neither Plato nor Aristotle had an observatory. In the last years of Pericles, the Athenian people passed a decree by which all who propagated astronomical theories were made liable to impeachment (ε■σαγγελ■α). This last was an act of the deepest symbolic significance, expressive of the determination of the Classical soul to banish distance, in every aspect, from its world-consciousness.

As regards Classical history-writing, take Thucydides. The mastery of this man lies in his truly Classical power of making alive and self- explanatory the events of the _present_, and also in his possession of the magnificently _practical outlook_ of the born

statesman who has himself been both general and administrator. In virtue of this quality of _experience_ (which we unfortunately confuse with the historical sense proper), his work confronts the merely learned and professional historian as an inimitable model, and quite rightly so. But what is absolutely hidden from Thucydides is perspective, the power of surveying the history of centuries, that which for us is implicit in the very conception of a historian. The fine pieces of Classical history-writing are invariably those which set forth matters within the political present of the writer, whereas for us it is the direct opposite, our historical masterpieces without exception being those which deal with a distant past. Thucydides would have broken down in handling even the Persian Wars, let alone the general history of Greece, while that of Egypt would have been utterly out of his reach. He, as well as Polybius and Tacitus (who like him were practical politicians), loses his sureness of eye from the moment when, in looking backwards, he encounters motive forces in any form that is unknown in his practical experience. For Polybius even the First Punic War, for Tacitus even the reign of Augustus, are inexplicable. As for Thucydides, his lack of historical feeling—in our sense of the phrase—is conclusively demonstrated on the very first page of his book by the astounding statement that before his time (about 400 B.C.) no events of importance had occurred (ο■ μεγ■λα γεν■σθαι) in the world![4]

Consequently, Classical history down to the Persian Wars and for that matter the structure built up on traditions at much later periods, are the product of an essentially mythological thinking. The constitutional history of Sparta is a poem of the Hellenistic period, and Lycurgus, on whom it centres and whose “biography” we are given in full detail, was probably in the beginning an unimportant local god of Mount Taygetus. The invention of pre-Hannibalian Roman history was still going on even in Cæsar’s time. The story of the expulsion of the Tarquins by Brutus is built round some contemporary of the Censor Appius Claudius (310 B.C.). The names of the Roman kings were at that period made up from the names of certain plebeian families which had become wealthy (K. J. Neumann). In the sphere of constitutional history, setting aside altogether the “constitution” of Servius Tullius, we find that even the famous land law of Licinius (367 B.C.) was not in existence at the time of the Second Punic War (B. Niese). When Epaminondas gave freedom and statehood to the Messenians and the Arcadians, these peoples promptly provided themselves with an early history. But the astounding thing is not that history of this sort was produced, but that there was practically none of any other sort; and the opposition between the Classical and the modern outlook is sufficiently illustrated by saying that Roman history before 250 B.C., as known in Cæsar’s time, was substantially a forgery, and that the little that we know has been established by ourselves and was entirely unknown to the later Romans. In what sense the Classical world understood the word “history” we can see from the fact that the Alexandrine romance-literature exercised the strongest influence upon serious political and religious history, even as regards its matter. It never entered the Classical head to draw any distinction of principle between history as a story and history as documents. When, towards the end of the Roman republic, Varro set out to stabilize the religion that was fast vanishing from the people’s consciousness, he classified the deities _whose cult was exactly and minutely observed by the State_, into “certain” and “uncertain” gods, i.e., into gods of whom something was still known and gods that, in spite of the unbroken continuity of official worship, had survived in name only. In actual fact, the religion of Roman society in Varro’s time, the poet’s religion which Goethe and even Nietzsche reproduced in all innocence, was mainly a product of Hellenistic literature and had almost no relation to the ancient practices, which no one any longer understood.

Mommsen clearly defined the West-European attitude towards this history when he said that “the Roman historians,” meaning especially Tacitus, “were men who said what it would have been meritorious to omit, and omitted what it was essential to say.”

In the Indian Culture we have the perfectly ahistoric soul. Its decisive expression is the Brahman Nirvana. There is no pure Indian astronomy, no calendar, and therefore no history so far as history is the track of a conscious spiritual evolution. Of the visible course of their Culture, which as regards its organic phase came to an end with the rise of Buddhism, we know even less than we do of Classical history, rich though it must have been in great events between the 12th and 8th centuries. And this is not surprising, since it was in dream-shapes and mythological figures that both came to be fixed. It is a full millennium after Buddha, about 500 A.D., when Ceylon first produces something remotely resembling historical work, the “Mahavansa.”

The world-consciousness of Indian man was so ahistorically built that it could not even treat the appearance of a book written by a single author as an event determinate in time. Instead of an organic series of writings by specific persons, there came into being gradually a vague mass of texts into which everyone inserted what he pleased, and notions such as those of intellectual individualism, intellectual evolution, intellectual epochs, played no part in the matter. It is in this _anonymous_ form that we possess the Indian philosophy—which is at the same time all the Indian history that we have—and it is instructive to compare with it the philosophy-history of the West, which is a perfectly definite structure made up of individual books and personalities.

Indian man forgot everything, but Egyptian man forgot _nothing_. Hence, while the art of portraiture—which is biography in the kernel—was unknown in India, in Egypt it was practically the artist’s only theme.

The Egyptian soul, conspicuously historical in its texture and impelled with primitive passion towards the infinite, perceived past and future as its _whole_ world, and the present (which is identical with waking consciousness) appeared to him simply as the narrow common frontier of two immeasurable stretches. The Egyptian Culture is an embodiment of _care_—which is the spiritual counterpoise of distance—care for the future expressed in the choice of granite or basalt as the craftsman's materials,[5] in the chiselled archives, in the elaborate administrative system, in the net of irrigation works,[6] and, necessarily _bound up therewith_, care for the past. The Egyptian mummy is a symbol of the first importance. The body of the dead man was _made everlasting_, just as his personality, his "Ka," was immortalized through the portrait- statuettes, which were often made in many copies and to which it was conceived to be attached by a transcendental likeness.

There is a deep relation between the attitude that is taken towards the historic past and the conception that is formed of death, and this relation is expressed in the _disposal of the dead_. The Egyptian denied mortality, the Classical man affirmed it in the whole symbolism of his Culture. The Egyptians embalmed even their history in chronological dates and figures. From pre-Solonian Greece nothing has been handed down, not a year-date, not a true name, not a tangible event—with the consequence that the later history, (which alone we know) assumes undue importance—but for Egypt we possess, from the 3rd millennium and even earlier, the names and even the exact reign-dates of many of the kings, and the New Empire must have had a complete knowledge of them. To-day, pathetic symbols of the will to endure, the bodies of the great Pharaohs lie in our museums, their faces still recognizable. On the shining, polished-granite peak of the pyramid of Amenemhet III we can read to-day the words "Amenemhet looks upon the beauty of the Sun" and, on the other side, "Higher is the soul of Amenemhet than the height of Orion, and it is united with the underworld." Here indeed is victory over Mortality and the mere present; it is to the last degree un-Classical.

Footnote 3:

In the original, these fundamental antitheses are expressed simply by means of _werden_ and _sein_. Exact renderings are therefore impossible in English.—_Tr._

Footnote 4:

The attempts of the Greeks to frame something like a calendar or a chronology after the Egyptian fashion, besides being very belated indeed, were of extreme _naïveté_. The Olympiad reckoning is not an era in the sense of, say, the Christian chronology, and is, moreover, a late and purely literary expedient, without popular currency. The people, in fact, had no general need of a numeration wherewith to date the experiences of their grandfathers and great-grandfathers, though a few learned persons might be interested in the calendar question. We are not here concerned with the soundness or unsoundness of a calendar, but with its currency, with the question of whether men regulated their lives by it or not; but, incidentally, even the list of Olympian victors before 500 is quite as much of an invention as the lists of earlier Athenian archons or Roman consuls. Of the colonizations, we possess not one single authentic date (E. Meyer. _Gesch. d. Alt._ II, 442. Beloch. _Griech. Gesch._ I, 2, 219) "in Greece before the fifth century, no one ever thought of noting or reporting historical events." (Beloch. I, 1, 125). We possess an inscription which sets forth a treaty between Elis and Heraea which "was to be valid for a hundred years from this year." What "this year" was, is however not indicated. After a few years no one would have known how long the treaty had still to run. Evidently this was a point that no one had taken into account at the time—indeed, the very "men of the moment" who drew up the document, probably themselves soon forgot. Such was the childlike, fairy-story character of the Classical presentation of history that any ordered dating of the events of, say, the Trojan War (which occupies in their series the same position as the Crusades in ours) would have been felt as a sheer solecism.

Equally backward was the geographical science of the Classical world as compared with that of the Egyptians and the Babylonians. E. Meyer (_Gesch. d. Alt._ II, 102) shows how the Greeks' knowledge of the form of Africa degenerated from Herodotus (who followed Persian authorities) to Aristotle. The same is true of the Romans as the heirs of the Carthaginians; they first repeated the information of their alien forerunners and then slowly forgot it.

Footnote 5:

Contrast with this the fact, symbolically of the highest importance and unparalleled in art-history, that the Hellenes, though they had before their eyes the works of the Mycenæan Age and their land was only too rich in stone, _deliberately reverted to wood_; hence the absence of architectural remains of the period 1200-600. The Egyptian plant-column was from the outset of stone, whereas the

Doric column was wooden, a clear indication of the intense antipathy of the Classical soul towards duration.

Footnote 6:

Is there any Hellenic city that ever carried out one single comprehensive work that tells of care for future generations? The road and water systems which research has assigned to the Mycenæan—i.e., the pre-Classical—age fell into disrepair and oblivion from the birth of the Classical peoples—that is, from the Homeric period. It is a remarkably curious fact, proved beyond doubt by the lack of epigraphic remains, that the Classical alphabet did not come into use till after 900, and even then only to a limited extent and for the most pressing economic needs. Whereas in the Egyptian, the Babylonian, the Mexican and the Chinese Cultures the formation of a script begins in the very twilight of dawn, whereas the Germans made themselves a Runic alphabet and presently developed that respect for writing as such which led to the successive refinements of ornamental calligraphy, the Classical primitives were entirely ignorant of the numerous alphabets that were current in the South and the East. We possess numerous inscriptions of Hittite Asia Minor and of Crete, but not one of Homeric Greece. (See Vol. II, pp. 180 et seq.)

V

In opposition to this mighty group of Egyptian life-symbols, we meet at the threshold of the Classical Culture the custom, typifying the ease with which it could forget every piece of its inward and outward past, of _burning the dead_. To the Mycenæan age the elevation into a ritual of this particular funerary method amongst all those practised in turn by stone-age peoples, was essentially alien; indeed its Royal tombs suggest that earth-burial was regarded as peculiarly honourable. But in Homeric Greece, as in Vedic India, we find a change, so sudden that its origins must necessarily be psychological, from burial to that burning which (the Iliad gives us the full pathos of the symbolic act) was the ceremonial completion of death and the denial of all historical duration.

From this moment the plasticity of the individual spiritual evolution was at an end. Classical drama admitted truly historical motives just as little as it allowed themes of inward evolution, and it is well known how decisively the Hellenic instinct set itself against portraiture in the arts. Right into the imperial period Classical art handled only the matter that was, so to say, natural to it, the myth.[7] Even the “ideal” portraits of Hellenistic sculpture are mythical, of the same kind as the typical biographies of Plutarch’s sort. No great Greek ever wrote down any recollections that would serve to fix a phase of experience for his inner eye. Not even Socrates has told, regarding his inward life, anything important in our sense of the word. It is questionable indeed whether for a Classical mind it was even possible to react to the motive forces that are presupposed in the production of a Parzeval, a Hamlet, or a Werther. In Plato we fail to observe any conscious evolution of doctrine; his separate works are merely treatises written from very different standpoints which he took up from time to time, and it gave him no concern whether and how they hung together. On the contrary, a work of deep self-examination, the _Vita Nuova_ of Dante, is found at the very outset of the spiritual history of the West. How little therefore of the Classical pure-present there really was in Goethe, the man who forgot nothing, the man whose works, as he avowed himself, are only fragments of a _single great confession_!

After the destruction of Athens by the Persians, all the older art-works were thrown on the dustheap (whence we are now extracting them), and we do not hear that anyone in Hellas ever troubled himself about the ruins of Mycenæ or Phaistos for the purpose of ascertaining historical facts. Men read Homer but never thought of excavating the hill of Troy as Schliemann did; for what they wanted was myth, not history. The works of Æschylus and those of the pre-Socratic philosophers were already partially lost in the Hellenistic period. In the West, on the contrary, the piety inherent in and peculiar to the Culture manifested itself, five centuries before Schliemann, in Petrarch—the fine collector of antiquities, coins and manuscripts, the very type of historically- sensitive man, viewing the distant past and scanning the distant prospect (was he not the first to attempt an Alpine peak?), living in his time, yet essentially not of it. The soul of the collector is intelligible only by having regard to his conception of Time. Even more passionate perhaps, though of a different colouring, is the collecting- bent of the Chinese. In China, whoever travels assiduously pursues “old traces” (Ku-tsi) and the untranslatable “Tao,” the basic principle of Chinese existence, derives all its meaning from a deep historical feeling. In the Hellenistic period, objects were indeed collected and displayed everywhere, but they were curiosities of mythological appeal (as described by Pausanias) as to which questions of date or purpose simply did not arise—and this too in the very presence of Egypt, which even by the time of the great Thuthmosis had been transformed into one vast museum of strict tradition.

Amongst the Western peoples, it was the Germans who discovered the mechanical _clock_, the dread symbol of the flow of time, and the chimes of countless clock towers that echo day and night over West Europe are perhaps the most wonderful expression of which a historical world- feeling is capable.[8] In the timeless countrysides and cities of the Classical world, we find nothing of the

sort. Till the epoch of Pericles, the time of day was estimated merely by the length of shadow, and it was only from that of Aristotle that the word ■ρα received the (Babylonian) significance of “hour”; prior to that there was no exact subdivision of the day. In Babylon and Egypt water-clocks and sun-dials were discovered in the very early stages, yet in Athens it was left to Plato to introduce a practically useful form of clepsydra, and this was merely a minor adjunct of everyday utility which could not have influenced the Classical life-feeling in the smallest degree.

It remains still to mention the corresponding difference, which is very deep and has never yet been properly appreciated, between Classical and modern mathematics. The former conceived of things _as they are_, as _magnitudes_, timeless and purely present, and so it proceeded to Euclidean geometry and mathematical statics, rounding off its intellectual system with the theory of conic sections. We conceive things as they _become_ and _behave_, as _function_, and this brought us to dynamics, analytical geometry and thence to the Differential Calculus.[9] The modern theory of functions is the imposing marshalling of this whole mass of thought. It is a bizarre, but nevertheless psychologically exact, fact that the physics of the Greeks—being statics and not dynamics—neither knew the use nor felt the absence of the time- element, whereas we on the other hand work in thousandths of a second. The one and only evolution-idea that is timeless, ahistoric, is Aristotle’s entelechy.

This, then, is our task. We men of the Western Culture are, with our historical sense, an exception and not a rule. World-history is _our_ world picture and not all mankind’s. Indian and Classical man formed no image of a world in progress, and perhaps when in due course the civilization of the West is extinguished, there will never again be a Culture and a human type in which “world-history” is so potent a form of the waking consciousness.

Footnote 7:

From Homer to the tragedies of Seneca, a full thousand years, the same handful of myth-figures (Thyestes, Clytæmnestra, Heracles and the like) appear time after time without alteration, whereas in the poetry of the West, Faustian Man figures, first as Parzeval or Tristan, then (modified always into harmony with the epoch) as Hamlet, Don Quixote, Don Juan, and eventually Faust or Werther, and now as the hero of the modern world-city romance, but is always presented in the atmosphere and under the conditions of a particular century.

Footnote 8:

It was about 1000 A.D. and therefore contemporaneously with the beginning of the Romanesque style and the Crusades—the first symptoms of a new Soul—that Abbot Gerbert (Pope Sylvester II), the friend of the Emperor Otto III, invented the mechanism of the chiming wheel- clock. In Germany too, the first tower-clocks made their appearance, about 1200, and the pocket watch somewhat later. Observe the significant association of time measurement with the edifices of religion.

Footnote 9:

Newton’s choice of the name “fluxions” for his calculus was meant to imply a standpoint towards certain metaphysical notions as to the nature of time. In Greek mathematics time figures not at all.

VI

What, then, _is_ world-history? Certainly, an ordered presentation of the past, an inner postulate, the expression of a capacity for feeling form. But a feeling for form, however definite, is not the same as form itself. No doubt we feel world-history, experience it, and believe that it is to be read just as a map is read. But, even to-day, it is only forms of it that we know and not _the_ form of it, which is the mirror- image of _our own_ inner life.

Everyone of course, if asked, would say that he saw the inward form of History quite clearly and definitely. The illusion subsists because no one has seriously reflected on it, still less conceived doubts as to his own knowledge, for no one has the slightest notion how wide a field for doubt there is. In fact, the _lay-out_ of world-history is an unproved and subjective notion that has been handed down from generation to generation (not only of laymen but of professional historians) and stands badly in need of a little of that scepticism which from Galileo onward has regulated and deepened our inborn ideas of nature.

Thanks to the subdivision of history into “Ancient,” “Mediæval” and “Modern”—an incredibly jejune and _meaningless_ scheme, which has, however, entirely dominated our historical thinking—we have failed to perceive the true position in the general history of higher mankind, of the little part-world which has developed on West-European[10] soil from the time of the German-Roman Empire, to judge of its relative importance and above all to estimate its direction. The Cultures that are to come will find it difficult to believe that the validity of such a scheme with its simple rectilinear progression and its meaningless proportions, becoming more and more preposterous with each century, incapable of bringing into itself the new fields of history as they successively come into the light of our knowledge, was, in spite of all, never whole- heartedly attacked. The criticisms that it has long been the fashion of historical researchers to level at the scheme mean nothing; they have only obliterated the one existing plan without substituting for it any other. To toy with phrases such as “the Greek Middle Ages” or “Germanic antiquity” does not in the least help us to form a clear and inwardly- convincing picture in which China and Mexico, the empire of Axum and that of the Sassanids have their proper places. And the expedient of shifting the initial point of “modern history” from the Crusades to the Renaissance, or from the Renaissance to the beginning of the 19th Century, only goes to show that the scheme _per se_ is regarded as unshakably sound.

It is not only that the scheme circumscribes the area of history. What is worse, it rigs the stage. The ground of West Europe is treated as a steady pole, a unique patch chosen on the surface of the sphere for no better reason, it seems, than because we live on it—and great histories of millennial duration and mighty far-away Cultures are made to revolve around this pole in all modesty. It is a quaintly conceived system of sun and planets! We select a single bit of ground as the natural centre of the historical system, and make it the central sun. From it all the events of history receive their real light, from it their importance is judged in _perspective_. But it is in our own West-European conceit alone that this phantom “world-history,” which a breath of scepticism would dissipate, is acted out.

We have to thank that conceit for the immense optical illusion (become natural from long habit) whereby distant histories of thousands of years, such as those of China and Egypt, are made to shrink to the dimensions of mere episodes while in the neighbourhood of our own position the decades since Luther, and particularly since Napoleon, loom large as Brocken-spectres. We know quite well that the slowness with which a high cloud or a railway train in the distance seems to move is only apparent, yet we believe that the _tempo_ of all early Indian, Babylonian or Egyptian history was really slower than that of our own recent past. And we think of them as less substantial, more damped-down, more diluted, because we have not learned to make the allowance for (inward and outward) distances.

It is self-evident that for the Cultures of the West the existence of Athens, Florence or Paris is more important than that of Lo-Yang or Pataliputra. But is it permissible to found a scheme of world-history on estimates of such a sort? If so, then the Chinese historian is quite entitled to frame a world-history in which the Crusades, the Renaissance, Cæsar and Frederick the Great are passed over in silence as insignificant. How, _from the morphological point of view_, should our 18th Century be more important than any other of the sixty centuries that preceded it? Is it not ridiculous to oppose a “modern” history of a few centuries, and that history to all intents localized in West Europe, to an “ancient” history which covers as many millennia—incidentally dumping into that “ancient history” the whole mass of the pre-Hellenic cultures, unprobed and unordered, as mere appendix-matter? This is no exaggeration. Do we not, for the sake of keeping the hoary scheme, dispose of Egypt and Babylon—each as an individual and self-contained history quite equal in the balance to our so-called “world-history” from Charlemagne to the World-War and well beyond it—as a _prelude_ to classical history? Do we not relegate the vast complexes of Indian and Chinese culture to foot-notes, with a gesture of embarrassment? As for the great American cultures, do we not, on the ground that they do not “fit in” (with what?), entirely ignore them?

The most appropriate designation for this current West-European scheme of history, in which the great Cultures are made to follow orbits round _us_ as the presumed centre of all world-happenings, is the _Ptolemaic system_ of history. The system that is put forward in this work in place of it I regard as the _Copernican discovery_ in the historical sphere, in that it admits no sort of privileged position to the Classical or the Western Culture as against the Cultures of India, Babylon, China, Egypt, the Arabs, Mexico—separate worlds of dynamic being which in point of mass count for just as much in the general picture of history as the Classical, while frequently surpassing it in point of spiritual greatness and soaring power.

Footnote 10:

Here the historian is gravely influenced by preconceptions derived from geography, which assumes a _Continent_ of Europe, and feels himself compelled to draw an ideal frontier corresponding to the physical frontier between “Europe” and “Asia.” The word “Europe” ought to be struck out of history. There is historically no “European” type, and it is sheer delusion to speak of the Hellenes as “European Antiquity” (were Homer and Heraclitus and Pythagoras, then, Asiatics?) and to enlarge upon their “mission” as such. These phrases express no realities but merely a sketchy interpretation of the map. It is thanks to this word “Europe” alone, and the complex of ideas resulting from it, that our historical consciousness has come to link Russia with the West in an utterly baseless unity—a mere abstraction derived from the reading of books—that has led to immense real consequences. In the shape of Peter the Great, this word has falsified the historical tendencies of a primitive human mass for two centuries, whereas the Russian _instinct_ has very truly and fundamentally divided “Europe” from “Mother Russia” with the hostility that we can see embodied in Tolstoi, Aksakov or Dostoyevski. “East” and “West” are notions that contain real history, whereas “Europe” is an empty sound. Everything great that the Classical world created, it created in pure denial of the existence of any continental barrier between Rome and Cyprus, Byzantium and Alexandria. Everything that we imply by the term European Culture came into existence between the Vistula and the Adriatic and the Guadalquivir and, even if we were to agree that Greece, the Greece of Pericles, lay in Europe, the Greece of to-day certainly does not.

VII

The scheme “ancient-mediæval-modern” in its first form was a creation of the Magian world-sense. It first appeared in the Persian and Jewish religions after Cyrus,[11] received an apocalyptic sense in the teaching of the Book of Daniel on the four world-eras, and was developed into a world-history in the post-Christian religions of the East, notably the Gnostic systems.[12]

This important conception, within the very narrow limits which fixed its intellectual basis, was unimpeachable. Neither Indian nor even Egyptian history was included in the scope of the proposition. For the Magian thinker the expression “world-history” meant a unique and supremely dramatic act, having as its theatre the lands between Hellas and Persia, in which the strictly dualistic world-sense of the East expressed itself not by means of polar conceptions like the “soul and spirit,” “good and evil” of contemporary metaphysics, but by the figure of a catastrophe, an epochal change of phase between world-creation and world-decay.[13]

No elements beyond those which we find stabilized in the Classical literature, on the one hand, and the Bible (or other sacred book of the particular system), on the other, came into the picture, which presents (as “The Old” and “The New,” respectively) the easily-grasped contrasts of Gentile and Jewish, Christian and Heathen, Classical and Oriental, idol and dogma, nature and spirit _with a time connotation_—that is, as a drama in which the one prevails over the other. The historical change of period wears the characteristic dress of the religious “Redemption.” This “world-history” in short was a conception narrow and provincial, but within its limits logical and complete. Necessarily, therefore, it was specific to this region and this humanity, and incapable of any _natural_ extension.

But to these two there has been added a third epoch, the epoch that we call “modern,” on Western soil, and it is this that for the first time gives the picture of history the look of a progression. The oriental picture was _at rest_. It presented a self-contained antithesis, with equilibrium as its outcome and a unique divine act as its turning-point. But, adopted and assumed by a wholly new type of mankind, it was quickly transformed (without anyone’s noticing the oddity of the change) into a conception of a _linear progress_: from Homer or Adam—the modern can substitute for these names the Indo-German, Old Stone Man, or the Pithecanthropus—through Jerusalem, Rome, Florence and Paris according to the taste of the individual historian, thinker or artist, who has unlimited freedom in the interpretation of the three-part scheme.

This third term, “modern times,” which in form asserts that it is the last and conclusive term of the series, has in fact, ever since the Crusades, been stretched and stretched again to the elastic limit at which it will bear no more.[14] It was at least implied if not stated in so many words, that here, beyond the ancient and the mediæval, something definitive was beginning, a Third Kingdom in which, somewhere, there was to be fulfilment and culmination, and which had an objective point.

As to what this objective point is, each thinker, from Schoolman to present-day Socialist, backs his own peculiar discovery. Such a view into the course of things may be both easy and flattering to the patentee, but in fact he has simply taken the spirit of the West, as reflected in his own brain, for the meaning of the world. So it is that great thinkers, making a metaphysical virtue of intellectual necessity, have not only accepted without serious investigation the scheme of history agreed “by common consent” but have made

of it the basis of their philosophies and dragged in God as author of this or that “world- plan.” Evidently the mystic number three applied to the world-ages has something highly seductive for the metaphysician’s taste. History was described by Herder as the education of the human race, by Kant as an evolution of the idea of freedom, by Hegel as a self-expansion of the world-spirit, by others in other terms, but as regards its ground-plan everyone was quite satisfied when he had thought out some abstract meaning for the conventional threefold order.

On the very threshold of the Western Culture we meet the great Joachim of Floris (c. 1145-1202),[15] the first thinker of the Hegelian stamp who shattered the dualistic world-form of Augustine, and with his essentially Gothic intellect stated the new Christianity of his time in the form of a third term to the religions of the Old and the New Testaments, expressing them respectively as the Age of the Father, the Age of the Son and the Age of the Holy Ghost. His teaching moved the best of the Franciscans and the Dominicans, Dante, Thomas Aquinas, in their inmost souls and awakened a world-outlook which slowly but surely took entire possession of the historical sense of our Culture. Lessing— who often designated his own period, with reference to the Classical as the “after-world”[16] (Nachwelt)—took his idea of the “education of the human race” with its three stages of child, youth and man, from the teaching of the Fourteenth Century mystics. Ibsen treats it with thoroughness in his _Emperor and Galilean_ (1873), in which he directly presents the Gnostic world-conception through the figure of the wizard Maximus, and advances not a step beyond it in his famous Stockholm address of 1887. It would appear, then, that the Western consciousness feels itself urged to predicate a sort of finality inherent in its own appearance.

But the creation of the Abbot of Floris was a _mystical_ glance into the secrets of the divine world-order. It was bound to lose all meaning as soon as it was used in the way of reasoning and made a hypothesis of _scientific_ thinking, as it has been—ever more and more frequently— since the 17th Century.

It is a quite indefensible method of presenting world-history to begin by giving rein to one’s own religious, political or social convictions and endowing the sacrosanct three-phase system with tendencies that will bring it exactly to one’s own standpoint. This is, in effect, making of some formula—say, the “Age of Reason,” Humanity, the greatest happiness of the greatest number, enlightenment, economic progress, national freedom, the conquest of nature, or world-peace—a criterion whereby to judge whole millennia of history. And so we judge that they were ignorant of the “true path,” or that they failed to follow it, when the fact is simply that their will and purposes were not the same as ours. Goethe’s saying, “What is important in life is life and not a result of life,” is the answer to any and every senseless attempt to solve the riddle of historical form by means of a _programme_.

It is the same picture that we find when we turn to the historians of each special art or science (and those of national economics and philosophy as well). We find:

“Painting” from the Egyptians (or the cave-men) to the Impressionists, or

“Music” from Homer to Bayreuth and beyond, or

“Social Organization” from Lake Dwellings to Socialism, as the case may be,

presented as a linear graph which steadily rises in conformity with the values of the (selected) arguments. No one has seriously considered the possibility that arts may have an allotted span of life and may be attached as forms of self-expression to particular regions and particular types of mankind, and that therefore the total history of an art may be merely an additive compilation of separate developments, of special arts, with no bond of union save the name and some details of craft-technique.

We know it to be true of every organism that the rhythm, form and duration of its life, and all the expression-details of that life as well, are determined by the _properties of its species_. No one, looking at the oak, with its millennial life, dare say that it is at this moment, now, about to start on its true and proper course. No one as he sees a caterpillar grow day by day expects that it will go on doing so for two or three years. In these cases we feel, with an unqualified certainty, a _limit_, and this sense of the limit is identical with our sense of the inward form. In the case of higher human history, on the contrary, we take our ideas as to the course of the future from an unbridled optimism that sets at naught all historical, i.e., _organic_, experience, and everyone therefore sets himself to discover in the accidental present terms that he can expand into some striking progression-series, the existence of which rests not on scientific proof but on predilection. He works upon unlimited possibilities—never a natural end—and from the momentary top-course of his bricks plans artlessly the continuation of his structure.

“Mankind,” however, has no aim, no idea, no plan, any more than the family of butterflies or orchids. “Mankind” is a zoological expression, or an empty word.[17] But conjure away the phantom, break the magic circle, and at once there emerges an

astonishing wealth of _actual_ forms—the Living with all its immense fullness, depth and movement— hitherto veiled by a catchword, a dryasdust scheme, and a set of personal “ideals.” I see, in place of that empty figment of _one_ linear history which can only be kept up by shutting one’s eyes to the overwhelming multitude of the facts, the drama of _a number_ of mighty Cultures, each springing with primitive strength from the soil of a mother-region to which it remains firmly bound throughout its whole life-cycle; each stamping its material, its mankind, in _its own image_; each having _its own_ idea, _its own_ passions, _its own_ life, will and feeling, _its own_ death. Here indeed are colours, lights, movements, that no intellectual eye has yet discovered. Here the Cultures, peoples, languages, truths, gods, landscapes bloom and age as the oaks and the stone-pines, the blossoms, twigs and leaves—but there is no ageing “Mankind.” Each Culture has its own new possibilities of self-expression which arise, ripen, decay, and never return. There is not _one_ sculpture, _one_ painting, _one_ mathematics, _one_ physics, but many, each in its deepest essence different from the others, each limited in duration and self-contained, just as each species of plant has its peculiar blossom or fruit, its special type of growth and decline. These cultures, sublimated life-essences, grow with the same superb aimlessness as the flowers of the field. They belong, like the plants and the animals, to the living Nature of Goethe, and not to the dead Nature of Newton. I see world-history as a picture of endless formations and transformations, of the marvellous waxing and waning of organic forms. The professional historian, on the contrary, sees it as a sort of tapeworm industriously adding on to itself one epoch after another.

But the series “ancient-mediæval-modern history” has at last exhausted its usefulness. Angular, narrow, shallow though it was as a scientific foundation, still we possessed no other form that was not wholly unphilosophical in which our data could be arranged, and world-history (as hitherto understood) has to thank it for filtering our classifiable solid residues. But the number of centuries that the scheme can by any stretch be made to cover has long since been exceeded, and with the rapid increase in the volume of our historical material—especially of material that cannot possibly be brought under the scheme—the picture is beginning to dissolve into a chaotic blur. Every historical student who is not quite blind knows and feels this, and it is as a drowning man that he clutches at the only scheme which he knows of. The word “Middle Age,”[18] invented in 1667 by Professor Horn of Leyden, has to-day to cover a formless and constantly extending mass which can only be defined, negatively, as every thing not classifiable under any pretext in one of the other two (tolerably well-ordered) groups. We have an excellent example of this in our feeble treatment and hesitant judgment of modern Persian, Arabian and Russian history. But, above all, it has become impossible to conceal the fact that this so-called history of the world is a limited history, first of the Eastern Mediterranean region and then,—with an abrupt change of scene at the Migrations (an event important only to us and therefore greatly exaggerated by us, an event of purely Western and not even Arabian significance),—of West-Central Europe. When Hegel declared so naïvely that he meant to ignore those peoples which did not fit into his scheme of history, he was only making an honest avowal of methodic premisses that every historian finds necessary for his purpose and every historical work shows in its lay- out. In fact it has now become an affair of scientific tact to determine which of the historical developments shall be _seriously_ taken into account and which not. Ranke is a good example.

Footnote 16:

The expression “antique”—meant of course in the dualistic sense—is found as early as the _Isagoge_ of Porphyry (c. 300 A.D.).

Footnote 17:

“Mankind? It is an abstraction. There are, always have been, and always will be, men and only men.” (Goethe to Luden.)

Footnote 18:

“Middle Ages” connotes the history of the space-time region in which _Latin was the language of the Church and the learned_. The mighty course of Eastern Christianity, which, long before Boniface, spread over Turkestan into China and through Sabæa into Abyssinia, was entirely excluded from this “world-history.”

VIII

To-day we think in continents, and it is only our philosophers and historians who have not realized that we do so. Of what significance to us, then, are conceptions and purviews that they put before us as universally valid, when in truth their furthest horizon does not extend beyond the intellectual atmosphere of Western Man?

Examine, from this point of view, our best books. When Plato speaks of humanity, he means the Hellenes in contrast to the barbarians, which is entirely consonant with the ahistoric mode of the Classical life and thought, and his premisses take him to conclusions that _for Greeks_ were complete and significant. When, however, Kant philosophizes, say on ethical ideas, he maintains the validity of his theses for men of all times and places. He does not say this in so many words, for, for himself and his readers, it is something that goes without saying. In his æsthetics he formulates the principles, not of Phidias’s art, or Rembrandt’s art, but of Art generally. But what he poses as necessary forms of thought are in reality only necessary forms of Western thought, though a glance at Aristotle and his essentially different conclusions should have sufficed to show that Aristotle’s intellect, not less penetrating than his own, was of different structure from it. The categories of the Westerner are just as alien to Russian thought as those of the Chinaman or the ancient Greek are to him. For us, the effective and complete comprehension of Classical root-words is just as impossible as that of Russian[19] and Indian, and for the modern Chinese or Arab, with their utterly different intellectual constitutions, “philosophy from Bacon to Kant” has only a curiosity-value.

It is _this_ that is lacking to the Western thinker, the very thinker in whom we might have expected to find it—insight into the _historically relative_ character of his data, which are expressions of one _specific existence and one only_; knowledge of the necessary limits of their validity; the conviction that his “unshakable” truths and “eternal” views are simply true for him and eternal for his world-view; the duty of looking beyond them to find out what the men of other Cultures have with equal certainty evolved out of themselves. That and nothing else will impart completeness to the philosophy of the future, and only through an understanding of the living world shall we understand the symbolism of history. Here there is nothing constant, nothing universal. We must cease to speak of the forms of “Thought,” the principles of “Tragedy,” the mission of “The State.” Universal validity involves always the fallacy of arguing from particular to particular.

But something much more disquieting than a logical fallacy begins to appear when the centre of gravity of philosophy shifts from the abstract-systematic to the practical-ethical and our Western thinkers from Schopenhauer onward turn from the problem of cognition to the problem of life (the will to life, to power, to action). Here it is not the ideal abstract “man” of Kant that is subjected to examination, but actual man as he has inhabited the earth during historical time, grouped, whether primitive or advanced, by peoples; and it is more than ever futile to define the structure of his highest ideas in terms of the “ancient-mediæval-modern” scheme with its local limitations. But it is done, nevertheless.

Consider the historical horizon of Nietzsche. His conceptions of decadence, militarism, the transvaluation of all values, the will to power, lie deep in the essence of Western civilization and are for the analysis of that civilization of decisive importance. But what, do we find, was the foundation on which he built up his creation? Romans and Greeks, Renaissance and European present, with a fleeting and uncomprehending side-glance at Indian philosophy—in short “ancient, mediæval and modern” history. Strictly speaking, he never once moved outside the scheme, not did any other thinker of his time.

What correlation, then, is there or can there be of his idea of the “Dionysian” with the inner life of a highly-civilized Chinese or an up- to-date American? What is the significance of his type of the “Superman”—for the world of Islam? Can image-forming antitheses of Nature and Intellect, Heathen and Christian, Classical and Modern, have any meaning for the soul of the Indian or the Russian? What can Tolstoi— who from the depths of his humanity rejected the whole Western world- idea as something alien and distant—_do_ with the “Middle Ages,” with Dante, with Luther? What can a Japanese do with Parzeval and “Zarathustra,” or an Indian with Sophocles? And is the thought-range of Schopenhauer, Comte, Feuerbach, Hebbel or Strindberg any wider? Is not their whole psychology, for all its intention of world-wide validity, one of purely West-European significance?

How comic seem Ibsen’s woman-problems—which also challenge the attention of all “humanity”—when, for his famous Nora, the lady of the North-west European city with the horizon that is implied by a house-rent of £100 to £300 a year and a Protestant upbringing, we substitute Cæsar’s wife, Madame de Sévigné, a Japanese or a Turkish peasant woman! But, for that matter, Ibsen’s own circle of vision is that of the middle class in a great city of yesterday and to-day. His conflicts, which start from spiritual premisses that did not exist till about 1850 and can scarcely last beyond 1950, are neither those of the great world nor those of the lower masses, still less those of the cities inhabited by non-European populations.

All these are local and temporary values—most of them indeed limited to the momentary “intelligentsia” of cities of West-European type. World- historical or “eternal” values they emphatically are not. Whatever the substantial importance of Ibsen’s and Nietzsche’s generation may be, it infringes the very meaning of the word “world-history”—which denotes the totality and not a selected part—to subordinate, to undervalue, or to ignore the factors which lie outside “modern” interests. Yet in fact they are so undervalued or ignored to an amazing extent. What the West has said and thought, hitherto, on the problems of space, time, motion, number, will, marriage, property, tragedy, science, has remained narrow and dubious, because men were always looking for _the_ solution of _the_ question. It was never seen that many questioners implies many answers, that any philosophical question is really a veiled desire to get an explicit affirmation of what is implicit in the question itself, that the great questions of any period are fluid beyond all conception, and that therefore it is only by obtaining a _group of historically limited solutions_ and measuring it by _utterly impersonal_ criteria that the final secrets can be reached. The real student of mankind treats no standpoint as absolutely right or absolutely wrong. In the face of such grave problems as that of Time or that of Marriage, it is insufficient to appeal to personal experience, or an inner voice, or reason, or the opinion of ancestors or contemporaries. These may say what is true for the questioner himself and for his time, but that is not all. In other Cultures the phenomenon talks a different language, for other men there are different truths. The _thinker_ must admit the validity of all, or of none.

How greatly, then, Western world-criticism can be widened and deepened! How immensely far beyond the innocent relativism of Nietzsche and his generation one must look—how fine one’s sense for form and one’s psychological insight must become—how completely one must free oneself from limitations of self, of practical interests, of horizon—before one dare assert the pretension to understand world-history, the _world-as- history_.

Footnote 19:

See Vol. II, p. 362, foot-note. To the true Russian the basic proposition of Darwinism is as devoid of meaning as that of Copernicus is to a true Arab.

IX

In opposition to all these arbitrary and narrow schemes, derived from tradition or personal choice, into which history is forced, I put forward the natural, the “Copernican,” form of the historical process which lies deep in the essence of that process and reveals itself only to an eye perfectly free from prepossessions.

Such an eye was Goethe’s. That which Goethe called _Living Nature_ is exactly that which we are calling here world-history, _world-as- history_. Goethe, who as artist portrayed the life and development, always the life and development, of his figures, the thing-becoming and not the thing-become (“Wilhelm Meister” and “Wahrheit und Dichtung”) hated Mathematics. For him, the world-as-mechanism stood opposed to the world-as-organism, dead nature to living nature, law to form. As naturalist, every line he wrote was meant to display the image of a thing-becoming, the “impressed form” living and developing. Sympathy, observation, comparison, immediate and inward certainty, intellectual _flair_—these were the means whereby he was enabled to approach the

secrets of the phenomenal world in motion. _Now these are the means of historical research_—precisely these and no others. It was this _godlike_ insight that prompted him to say at the bivouac fire on the evening of the Battle of Valmy: “Here and now begins a new epoch of world history, and you, gentlemen, can say that you ‘were there.’” No general, no diplomat, let alone the philosophers, ever so directly felt history “becoming.” It is the deepest judgment that any man ever uttered about a great historical act in the moment of its accomplishment.

And just as he followed out the development of the plant-form from the leaf, the birth of the vertebrate type, the process of the geological strata—_the Destiny in nature and not the Causality_—so here we shall develop the form-language of human history, its periodic structure, its _organic logic_ out of the profusion of all the challenging details.

In other aspects, mankind is habitually, and rightly, reckoned as one of the organisms of the earth’s surface. Its physical structure, its natural functions, the whole phenomenal conception of it, all belong to a more comprehensive unity. Only in _this_ aspect is it treated otherwise, despite that deeply-felt relationship of plant destiny and human destiny which is an eternal theme of all lyrical poetry, and despite that similarity of human history to that of any other of the higher life-groups which is the refrain of endless beast-legends, sagas and fables.

But only bring analogy to bear on this aspect as on the rest, letting the world of human Cultures intimately and unreservedly work upon the imagination instead of forcing it into a ready-made scheme. Let the words youth, growth, maturity, decay—hitherto, and to-day more than ever, used to express subjective valuations and entirely personal preferences in sociology, ethics and æsthetics—be taken at last as objective descriptions of organic states. Set forth the Classical Culture as a self-contained phenomenon embodying and expressing the Classical soul, put it beside the Egyptian, the Indian, the Babylonian, the Chinese and the Western, and determine for each of these higher individuals what is typical in their surgings and what is necessary in the riot of incident. And then at last will unfold itself the picture of world-history that is natural to us, men of the West, and to us alone.

X

Our narrower task, then, is primarily to determine, from such a world- survey, the state of West Europe and America as at the epoch of 1800- 2000—to establish the chronological position of this period in the ensemble of Western culture-history, its significance as a chapter that is in one or other guise necessarily found in the biography of every Culture, and the organic and symbolic meaning of its political, artistic, intellectual and social expression-forms.

Considered in the spirit of analogy, this period appears as chronologically parallel—“contemporary” in our special sense—with the phase of Hellenism, and its present culmination, marked by the World- War, corresponds with the transition from the Hellenistic to the Roman age. _Rome_, with its rigorous realism—uninspired, barbaric, disciplined, practical, Protestant, _Prussian_—will always give us, working as we must by analogies, the key to understanding our own future. The _break of destiny that we express by hyphening the words “Greeks = Romans” is occurring for us also, separating that which is already fulfilled from that which is to come_. Long ago we might and should have seen in the “Classical” world a development which is the complete counterpart of our own Western development, differing indeed from it in every detail of the surface but entirely similar as regards the inward power driving the great organism towards its end. We might have found the constant _alter ego_ of our own actuality in establishing the correspondence, item by item, from the “Trojan War” and the Crusades, Homer and the Nibelungenlied, through Doric and Gothic, Dionysian movement and Renaissance, Polycletus and John Sebastian Bach, Athens and Paris, Aristotle and Kant, Alexander and Napoleon, to the world-city and the imperialism common to both Cultures.

Unfortunately, this requires an interpretation of the picture of Classical history very different from the incredibly one-sided, superficial, prejudiced, limited picture that we have in fact given to it. We have, in truth been only too conscious of our near relation to the Classical Age, and only too prone in consequence to unconsidered assertion of it. Superficial similarity is a great snare, and our entire Classical study fell a victim to it as soon as it passed from the (admittedly masterly) ordering and critique of the discoveries to the interpretation of their spiritual meaning. That close inward relation in which we conceive ourselves to stand towards the Classical, and which leads us to think that we are its pupils and successors (whereas in reality we are simply its adorers), is a venerable prejudice which ought at last to be put aside. The whole religious-philosophical, art- historical and social-critical work of the 19th Century has been necessary to enable us, not to _understand_ Æschylus, Plato, Apollo and Dionysus, the Athenian state and Cæsarism (which we are far indeed from doing), but to begin to realize, once and for all, how immeasurably alien and distant these things are from our inner selves—more alien, maybe, than Mexican gods and Indian architecture.

Our views of the Græco-Roman Culture have always swung between two extremes, and our standpoints have invariably been defined for us by the “ancient-mediæval-modern” scheme. One group, public men before all else— economists, politicians, jurists—opine that “present-day mankind” is making excellent progress, assess it and its performances at the very highest value and measure everything earlier by its standards. There is no modern party that has not weighed up Cleon, Marius, Themistocles, Catiline, the Gracchi, according to its own principles. On the other hand we have the group of artists, poets, philologists and philosophers. These feel themselves to be out of their element in the aforesaid present, and in consequence choose for themselves in this or that past epoch a standpoint that is in its way just as absolute and dogmatic from which to condemn “to-day.” The one group looks upon Greece as a “not yet,” the other upon modernity as a “nevermore.” Both labour under the obsession of a scheme of history which treats the two epochs as part of the same straight line.

In this opposition it is the two souls of Faust that express themselves. The danger of the one group lies in a clever superficiality. In its hands there remains finally, of all Classical Culture, of all reflections of the Classical soul, nothing but a bundle of social, economic, political and physiological facts, and the rest is treated as “secondary results,” “reflexes,” “attendant phenomena.” In the books of this group we find not a hint of the mythical force of Æschylus’s choruses, of the immense mother-earth struggle of the early sculpture, the Doric column, of the richness of the Apollo-cult, of the real depth of the Roman Emperor-worship. The other group, composed above all of belated romanticists—represented in recent times by the three Basel professors Bachofen, Burckhardt and Nietzsche—succumb to the usual dangers of ideology. They lose themselves in the clouds of an antiquity that is really no more than the image of their own sensibility in a philological mirror. They rest their case upon the only evidence which they consider worthy to support it, viz., the relics of the old literature, yet there never was a Culture so incompletely represented for us by its great writers.[20] The first group, on the other hand, supports itself principally upon the humdrum material of law-sources, inscriptions and coins (which Burckhardt and Nietzsche, very much to their own loss, despised) and subordinates thereto, often with little or no sense of truth and fact, the surviving literature. Consequently, even in point of critical foundations, neither group takes the other seriously. I have never heard that Nietzsche and Mommsen had the smallest respect for each other.

But neither group has attained to that higher method of treatment which reduces this opposition of criteria to ashes, although it was within their power to do so. In their self-limitation they paid the penalty for taking over the causality-principle from natural science. Unconsciously they arrived at a pragmatism that sketchily copied the world-picture drawn by physics and, instead of revealing, obscured and confused the quite other-natured forms of history. They had no better expedient for subjecting the mass of historical material to critical and normative examination than to consider one complex of phenomena as being primary and causative and the rest as being secondary, as being consequences or effects. And it was not only the matter-of-fact school that resorted to this method. The romanticists did likewise, for History had not revealed even to their dreaming gaze its specific logic; and yet they _felt_ that there was an immanent necessity in it to determine this somehow, rather than turn their backs upon History in despair like Schopenhauer.

Footnote 20:

This is conclusively proved by the selection that determined survival, which was governed not by mere chance but very definitely by a deliberate tendency. The Atticism of the Augustan Age, tired, sterile, pedantic, back-looking, conceived the hall-mark “classical” and allowed only a very small group of Greek works up to Plato to bear it. The rest, including the whole wealth of Hellenistic literature, was rejected and has been almost entirely lost. It is this pedagogue’s anthology that has survived (almost in its entirety) and so fixed the imaginary picture of “Classical Antiquity” alike for the Renaissance Florentine and for Winckelmann, Hölderlin, and even Nietzsche.

[In this English translation, it should be mentioned, the word “Classical” has almost universally been employed to translate the German _antike_, as, in the translator’s judgment, no literal equivalent of the German word would convey the specific meaning attached to _antike_ throughout the work, “antique,” “ancient” and the like words having for us a much more general connotation.—_Tr._]

XI

Briefly, then, there are two ways of regarding the Classical—the materialistic and the ideological. By the former, it is asserted that the sinking of one scale-pan has its cause in the rising of the other, and it is shown that this occurs invariably (truly a striking theorem); and in this juxtaposing of cause and effect we naturally find the social and sexual, at all events the purely political, facts classed as causes and the religious, intellectual and (so far as the materialist tolerates them as facts at all) the artistic as effects. On the other hand, the ideologues show that the rising of one scale-pan follows from the sinking of the other, which they are able to prove of course with equal exactitude; this done, they lose themselves in cults, mysteries, customs, in the secrets of the strophe and the line, throwing scarcely a side-glance at the commonplace daily life—for them an unpleasant consequence of earthly imperfection. Each side, with its gaze fixed on causality, demonstrates that the other side either cannot or will not understand the true linkages of things and each ends by calling the other blind, superficial, stupid, absurd or frivolous, oddities or Philistines. It shocks the ideologue if anyone deals with Hellenic finance-problems and instead of, for example, telling us the deep meanings of the Delphic oracle, describes the far-reaching money operations which the Oracle priests undertook with their accumulated treasures. The politician, on the other hand, has a superior smile for those who waste their enthusiasm on ritual formulæ and the dress of Attic youths, instead of writing a book adorned with up-to-date catchwords about antique class-struggles.

The one type is foreshadowed from the very outset in Petrarch; it created Florence and Weimar and the Western classicism. The other type appears in the middle of the 18th Century, along with the rise of civilized,[21] economic-megalopolitan[22] politics, and England is therefore its birthplace (Grote). At bottom, the opposition is between the conceptions of culture-man and those of civilization-man, and it is too deep, too essentially human, to allow the weaknesses of _both standpoints alike_ to be seen or overcome.

The materialist himself is on this point an idealist. He too, without wishing or desiring it, has made his views dependent upon his wishes. In fact all our finest minds without exception have bowed down reverently before the picture of the Classical, abdicating in this one instance alone their function of unrestricted criticism. The freedom and power of Classical research are always hindered, and its data obscured, by a certain almost religious awe. In all history there is no analogous case of one Culture making a passionate cult of the memory of another. Our devotion is evidenced yet again in the fact that since the Renaissance, a thousand years of history have been undervalued so that an ideal “Middle” Age may serve as a link between ourselves and antiquity. We Westerners have sacrificed on the Classical altar the purity and independence of our art, for we have not dared to create without a side- glance at the “sublime exemplar.” We have projected our own deepest spiritual needs and feelings on to the Classical picture. Some day a gifted psychologist will deal with this most fateful illusion and tell us the story of the “Classical” that we have so consistently reverenced since the days of Gothic. Few theses would be more helpful for the understanding of the Western soul from Otto III, the first victim of the South, to Nietzsche, the last.

Goethe on his Italian tour speaks with enthusiasm of the buildings of Palladio, whose frigid and academic work we to-day regard very sceptically: but when he goes on to Pompeii he does not conceal his dissatisfaction in experiencing “a strange, half-unpleasant impression,” and what he has to say on the temples of Pæstum and Segesta—masterpieces of Hellenic art—is embarrassed and trivial. Palpably, when Classical antiquity in its full force met him face to face, he did not recognize it. It is the same with all others. Much that was Classical they chose not to see, and so they saved their inward image of the Classical—which was in reality the background of a life-ideal that they themselves had created and nourished with their heart’s blood, a vessel filled with their own world-feeling, a phantom, an idol. The audacious descriptions of Aristophanes, Juvenal or Petronius of life in the Classical cities—the southern dirt and riff-raff, terrors and brutalities, pleasure-boys and Phrynes, phallus worship and imperial orgies—excite the enthusiasm of the student and the dilettante, who find the same realities in the world-cities of to-day too lamentable and repulsive to face. “In the cities life is bad; there are too many of the lustful.”—_also sprach Zarathustra_. They commend the state-sense of the Romans, but despise the man of to-day who permits himself any contact with public affairs. There is a type of scholar whose clarity of vision comes under some irresistible spell when it turns from a frock-coat to a toga, from a British football-ground to a Byzantine circus, from a transcontinental railway to a Roman road in the Alps, from a thirty-knot destroyer to a trireme, from Prussian bayonets to Roman spears—nowadays, even, from a modern engineer’s Suez Canal to that of a Pharaoh. He would admit a steam-engine as a symbol of human passion and an expression of intellectual force if it were Hero of Alexandria who invented it, not otherwise. To such it seems blasphemous to talk of Roman central-heating or book-keeping in preference to the worship of the Great Mother of the Gods.

But the other school sees _nothing but_ these things. It thinks it exhausts the essence of this Culture, alien as it is to ours, by treating the Greeks as simply equivalent, and it obtains its conclusions by means of simple factual substitutions, ignoring altogether the Classical _soul_. That there is not the slightest inward correlation between the things meant by “Republic,” “freedom,”

“property” and the like then and there and the things meant by such words here and now, it has no notion whatever. It makes fun of the historians of the age of Goethe, who honestly expressed their own political ideals in classical history forms and revealed their own personal enthusiasms in vindications or condemnations of lay-figures named Lycurgus, Brutus, Cato, Cicero, Augustus—but it cannot itself write a chapter without reflecting the party opinion of its morning paper.

It is, however, much the same whether the past is treated in the spirit of Don Quixote or in that of Sancho Panza. Neither way leads to the end. In sum, each school permits itself to bring into high relief that part of the Classical which best expresses its own views—Nietzsche the pre- Socratic Athens, the economists the Hellenistic period, the politicians Republican Rome, poets the Imperial Age.

Not that religious and artistic phenomena are more primitive than social and economic, any more than the reverse. For the man who in these things has won his unconditional freedom of outlook, beyond _all_ personal interests whatsoever, there is no dependence, no priority, no relation of cause and effect, no differentiation of value or importance. That which assigns relative ranks amongst the individual detail-facts is simply the greater or less purity and force of their form-language, their symbolism, beyond all questions of good and evil, high and low, useful and ideal.

Footnote 21:

As will be seen later, the words _zivilisierte_ and _Zivilisation_ possess in this work a special meaning.—_Tr._

Footnote 22:

English not possessing the adjective-forming freedom of German, we are compelled to coin a word for the rendering of _grossstädtisch_, an adjective not only frequent but of emphatic significance in the author’s argument.—_Tr._

XII

Looked at in this way, the “Decline of the West” comprises nothing less than the problem of _Civilization_. We have before us one of the fundamental questions of all higher history. What is Civilization, understood as the organic-logical sequel, fulfilment and finale of a culture?

For every Culture has _its own_ Civilization. In this work, for the first time the two words, hitherto used to express an indefinite, more or less ethical, distinction, are used in a _periodic_ sense, to express a strict and necessary _organic succession_. The Civilization is the inevitable _destiny_ of the Culture, and in this principle we obtain the viewpoint from which the deepest and gravest problems of historical morphology become capable of solution. Civilizations are the most external and artificial states of which a species of developed humanity is capable. They are a conclusion, the thing-become succeeding the thing-becoming, death following life, rigidity following expansion, intellectual age and the stone-built, petrifying world-city following mother-earth and the spiritual childhood of Doric and Gothic. They are an end, irrevocable, yet by inward necessity reached again and again.

So, for the first time, we are enabled to understand the Romans as the _successors_ of the Greeks, and light is projected into the deepest secrets of the late-Classical period. What, but this, can be the meaning of the fact—which can only be disputed by vain phrases—that the Romans were barbarians who did not _precede_ but _closed_ a great development? Unspiritual, unphilosophical, devoid of art, clannish to the point of brutality, aiming relentlessly at tangible successes, they stand between the Hellenic Culture and nothingness. An imagination directed purely to practical objects—they had religious laws governing godward relations as they had other laws governing human relations, but there was no specifically Roman saga of gods—was something which is not found at all in Athens. In a word, Greek _soul_—Roman _intellect_; and this antithesis is the differentia between Culture and Civilization. Nor is it only to the Classical that it applies. Again and again there appears this type of strong-minded, completely non-metaphysical man, and in the hands of this type lies the intellectual and material destiny of each and every “late” period. Such are the men who carried through the Babylonian, the Egyptian, the Indian, the Chinese, the Roman Civilizations, and in such periods do Buddhism, Stoicism, Socialism ripen into definitive world-conceptions which enable a moribund humanity to be attacked and re-formed in its intimate structure. _Pure_ Civilization, as a historical process, consists in a progressive _taking-down_ of forms that have become inorganic or dead.

The transition from Culture to Civilization was accomplished for the Classical world in the 4th, for the Western in the 19th Century. From these periods onward the great intellectual decisions take place, not as in the days of the Orpheus-movement or the Reformation in the “whole world” where not a hamlet is too small to be unimportant, but in three or four world-cities that have absorbed into themselves the whole content of History, while the old wide landscape of the Culture, become merely provincial, serves only to feed the cities with what remains of its higher mankind.

World-city and province[23]—the two basic ideas of every civilization— bring up a wholly new form-problem of History, the very problem that we are living through to-day with hardly the remotest conception of its immensity. In place of a world, there is a _city, a point_, in which the whole life of broad regions is collecting while the rest dries up. In place of a type-true people, born of and grown on the soil, there is a new sort of nomad, cohering unstably in fluid masses, the parasitical city dweller, traditionless, utterly matter-of-fact, religionless, clever, unfruitful, deeply contemptuous of the countryman and especially that highest form of countryman, the country gentleman. This is a very great stride towards the inorganic, towards the end—what does it signify? France and England have already taken the step and Germany is beginning to do so. After Syracuse, Athens, and Alexandria comes Rome. After Madrid, Paris, London come Berlin and New York. It is the destiny of whole regions that lie outside the radiation-circle of one of these cities—of old Crete and Macedon and to-day the Scandinavian North[24]—to become “provinces.”

Of old, the field on which the opposed conception of an epoch came to battle was some world-problem of a metaphysical, religious or dogmatic kind, and the battle was between the soil-genius of the countryman (noble, priest) and the “worldly” patrician genius of the famous old small towns of Doric or Gothic springtime. Of such a character were the conflicts over the Dionysus religion—as in the tyranny of Kleisthenes of Sikyon[25]—and those of the Reformation in the German free cities and the Huguenot wars. But just as these cities overcame the country-side (already it is a purely civic world-outlook that appears in even Parmenides and Descartes), so in turn the world-city overcame them. It is the common intellectual process of later periods such as the Ionic and the Baroque, and to-day—as in the Hellenistic age which at its outset saw the foundation of artificial, land-alien Alexandria—Culture-cities like Florence, Nürnberg, Salamanca, Bruges and Prag, have become provincial towns and fight inwardly a lost battle against the world- cities. The world-city means cosmopolitanism in place of “home,”[26] cold matter-of-fact in place of reverence for tradition and age, scientific irreligion as a fossil representative of the older religion of the heart, “society” in place of the state, natural instead of hard- earned rights. It was in the conception of _money_ as an inorganic and abstract magnitude, entirely disconnected from the notion of the fruitful earth and the primitive values, that the Romans had the advantage of the Greeks. Thenceforward any high ideal of life becomes largely a question of money. Unlike the Greek stoicism of Chrysippus, the Roman stoicism of Cato and Seneca presupposes a private income;[27] and, unlike that of the 18th Century, the social-ethical sentiment of the 20th, if it is to be realized at a higher level than that of professional (and lucrative) agitation, is a matter for millionaires. To the world-city belongs not a folk but a mass. Its uncomprehending hostility to all the traditions representative of the Culture (nobility, church, privileges, dynasties, convention in art and limits of knowledge in science), the keen and cold intelligence that confounds the wisdom of the peasant, the new-fashioned naturalism that in relation to all matters of sex and society goes back far beyond Rousseau and Socrates to quite primitive instincts and conditions, the reappearance of the _panem et circenses_ in the form of wage-disputes and football-grounds—all these things betoken the definite closing-down of the Culture and the opening of a quite new phase of human existence—anti-provincial, late, futureless, but quite inevitable.

This is what has to be _viewed_, and viewed not with the eyes of the partisan, the ideologue, the up-to-date novelist, not from this or that “standpoint,” but in a high, time-free perspective embracing whole millenniums of historical world-forms, if we are really to comprehend the great crisis of the present.

To me it is a symbol of the first importance that in the Rome of Crassus—triumvir and all-powerful building-site speculator—the Roman people with its proud inscriptions, the people before whom Gauls, Greeks, Parthians, Syrians afar trembled, lived in appalling misery in the many-storied lodging-houses of dark suburbs,[28] accepting with indifference or even with a sort of sporting interest the consequences of the military expansion: that many famous old-noble families, descendants of the men who defeated the Celts and the Samnites, lost their ancestral homes through standing apart from the wild rush of speculation and were reduced to renting wretched apartments; that, while along the Appian Way there arose the splendid and still wonderful tombs of the financial magnates, the corpses of the people were thrown along with animal carcases and town refuse into a monstrous common grave—till in Augustus’s time it was banked over for the avoidance of pestilence and so became the site of Mæcenas’s renowned park; that in depopulated Athens, which lived on visitors and on the bounty of rich foreigners, the mob of parvenu tourists from Rome gaped at the works of the Periclean age with as little understanding as the American globe-trotter in the Sistine Chapel at those of Michelangelo, every removable art- piece having ere this been taken away or bought at fancy prices to be replaced by the Roman

buildings which grew up, colossal and arrogant, by the side of the low and modest structures of the old time. In such things—which it is the historian's business not to praise or to blame but to consider morphologically—there lies, plain and immediate enough for one who has learnt to see, an _idea_.

For it will become manifest that, from this moment on, all great conflicts of world-outlook, of politics, of art, of science, of feeling will be under the influence of this one opposition. What is the hall- mark of a politic of Civilization to-day, in contrast to a politic of Culture yesterday? It is, for the Classical rhetoric, and for the Western journalism, both serving that abstract which represents the power of Civilization—_money_.[29] It is the money-spirit which penetrates unremarked the historical forms of the people's existence, often without destroying or even in the least disturbing these forms—the form of the Roman state, for instance, underwent very much less alteration between the elder Scipio and Augustus than is usually imagined. Though forms subsist, the great political parties nevertheless cease to be more than reputed centres of decision. The decisions in fact lie elsewhere. A small number of superior heads, whose names are very likely not the best-known, settle everything, while below them are the great mass of second-rate politicians—rhetors, tribunes, deputies, journalists—selected through a provincially-conceived franchise to keep alive the illusion of popular self-determination. And art? Philosophy? The ideals of a Platonic or those of a Kantian age had for the higher mankind concerned a general validity. But those of a Hellenistic age, or those of our own, are valid exclusively for the brain of the Megalopolitan. For the villager's or, generally, the nature-man's world- feeling our Socialism—like its near relation Darwinism (how utterly un- Goethian are the formulæ of "struggle for existence" and "natural selection"!), like its other relative the woman-and-marriage problem of Ibsen, Strindberg, and Shaw, like the impressionistic tendencies of anarchic sensuousness and the whole bundle of modern longings, temptations and pains expressed in Baudelaire's verse and Wagner's music—are simply non-existent. The smaller the town, the more unmeaning it becomes to busy oneself with painting or with music of these kinds. To the Culture belong gymnastics, the tournament, the agon, and to the Civilization belongs Sport. This is the true distinction between the Hellenic palæstra and the Roman circus.[30] Art itself becomes a sport (hence the phrase "art for art's sake") to be played before a highly- intelligent audience of connoisseurs and buyers, whether the feat consist in mastering absurd instrumental tone-masses and taking harmonic fences, or in some _tour de force_ of colouring. Then a new fact- philosophy appears, which can only spare a smile for metaphysical speculation, and a new literature that is a necessity of life for the megalopolitan palate and nerves and both unintelligible and ugly to the provincials. Neither Alexandrine poetry nor _plein-air_ painting is anything to the "people." And, then as now, the phase of transition is marked by a series of scandals only to be found at such moments. The anger evoked in the Athenian populace by Euripides and by the "Revolutionary" painting of Apollodorus, for example, is repeated in the opposition to Wagner, Manet, Ibsen, and Nietzsche.

It is possible to understand the Greeks without mentioning their economic relations; the Romans, on the other hand, can _only_ be understood through these. Chæronea and Leipzig were the last battles fought about an idea. In the First Punic War and in 1870 economic motives are no longer to be overlooked. Not till the Romans came with their practical energy was slave-holding given that big collective character which many students regard as the die-stamp of Classical economics, legislation and way of life, and which in any event vastly lowered both the value and the inner worthiness of such free labour as continued to exist side by side with gang-labour. And it was not the Latin, but the Germanic peoples of the West and America who developed out of the steam-engine a big industry that transformed the face of the land. The relation of these phenomena to Stoicism and to Socialism is unmistakable. Not till the Roman Cæsarism—foreshadowed by C. Flaminius, shaped first by Marius, handled by strong-minded, large-scale men of fact—did the Classical World learn the _pre-eminence of money_. Without this fact neither Cæsar, nor "Rome" generally, is understandable. In every Greek is a Don Quixote, in every Roman a Sancho Panza factor, and these factors are dominants.

Footnote 23:

See Vol. II, pp. 117 et seq.

Footnote 24:

One cannot fail to notice this in the development of Strindberg and especially in that of Ibsen, who was never quite at home in the civilized atmosphere of his problems. The motives of "Brand" and "Rosmersholm" are a wonderful mixture of innate provincialism and a theoretically-acquired megalopolitan outlook. Nora is the very type of the provincial derailed by reading.

Footnote 25:

Who forbade the cult of the town's hero Adrastos and the reading of the Homeric poems, with the object of cutting the Doric nobility from its spiritual roots (c. 560 B.C.).

Footnote 26:

A profound word which obtains its significance as soon as the barbarian becomes a culture-man and loses it again as soon as the civilization-man takes up the motto "_Ubi bene, ibi patria_."

Footnote 27:

Hence it was that the first to succumb to Christianity were the Romans who could _not afford_ to be Stoics. See Vol. II, pp. 607 et seq.

Footnote 28:

In Rome and Byzantium, lodging-houses of six to ten stories (with street-widths of ten feet at most!) were built without any sort of official supervision, and frequently collapsed with all their inmates. A great part of the _cives Romani_, for whom _panem et circenses_ constituted all existence, possessed no more than a high-priced sleeping-berth in one of the swarming ant-hills called _insulæ_. (Pohlmann, _Aus Altertum und Gegenwart_, 1911, pp. 199 ff.)

Footnote 29:

See Vol. II, 577.

Footnote 30:

German gymnastics, from the intensely provincial and natural forms imparted to it by Jahn, has since 1813 been carried by a very rapid development into the sport category. The difference between a Berlin athletic ground on a big day and a Roman circus was even by 1914 very slight.

XIII

Considered in itself, the Roman world-dominion was a negative phenomenon, being the result not of a surplus of energy on the one side— that the Romans had never had since Zama—but of a deficiency of resistance on the other. That the Romans did _not_ conquer the world is certain;[31] they merely took possession of a booty that lay open to everyone. The _Imperium Romanum_ came into existence not as the result of such an extremity of military and financial effort as had characterized the Punic Wars, but because the old East forwent all external self-determinations. We must not be deluded by the appearance of brilliant military successes. With a few ill-trained, ill-led, and sullen legions, Lucullus and Pompey conquered whole realms—a phenomenon that in the period of the battle of Ipsus would have been unthinkable. The Mithradatic danger, serious enough for a system of material force which had never been put to any real test, would have been nothing to the conquerors of Hannibal. After Zama, the Romans never again either waged or were capable of waging a war against a great military Power.[32] Their classic wars were those against the Samnites, Pyrrhus and Carthage. Their grand hour was Cannæ. To maintain the heroic posture for centuries on end is beyond the power of any people. The Prussian- German people have had three great moments (1813, 1870 and 1914), and that is more than others have had.

Here, then, I lay it down that _Imperialism_, of which petrifacts such as the Egyptian empire, the Roman, the Chinese, the Indian may continue to exist for hundreds or thousands of years—dead bodies, amorphous and dispirited masses of men, scrap-material from a great history—is to be taken as the typical symbol of the passing away. Imperialism is Civilization unadulterated. In this phenomenal form the destiny of the West is now irrevocably set. The energy of culture-man is directed inwards, that of civilization-man outwards. And thus I see in Cecil Rhodes the first man of a new age. He stands for the political style of a far-ranging, Western, Teutonic and especially German future, and his phrase "expansion is everything" is the Napoleonic reassertion of the indwelling tendency of _every_ Civilization that has fully ripened— Roman, Arab or Chinese. It is not a matter of choice—it is not the conscious will of individuals, or even that of whole classes or peoples that decides. The expansive tendency is a doom, something daemonic and immense, which grips, forces into service, and uses up the late mankind of the world-city stage, willy-nilly, aware or unaware.[33] Life is the process of effecting possibilities, and for the brain-man there are _only extensive_ possibilities.[34] Hard as the half-developed Socialism of to-day is fighting against expansion, one day it will become arch-

expansionist with all the vehemence of destiny. Here the form-language of politics, as the direct intellectual expression of a certain type of humanity, touches on a deep metaphysical problem—on the fact, affirmed in the grant of unconditional validity to the causality-principle, that _the soul is the complement of its extension_.

When, between 480 and 230,[35] the Chinese group of states was tending towards imperialism, it was entirely futile to combat the principle of Imperialism (Lien-heng), practised in particular by the “Roman” state of Tsin[36] and theoretically represented by the philosopher Dschang Yi, by ideas of a League of Nations (Hoh-tsung) largely derived from Wang Hü, a profound sceptic who had no illusions as to the men or the political possibilities of this “late” period. Both sides opposed the anti- political idealism of Lao-tse, but as between themselves it was Lien- heng and not Hoh-tsung which swam with the natural current of expansive Civilization.[37]

Rhodes is to be regarded as the first precursor of a Western type of Cæsars, whose day is to come though yet distant. He stands midway between Napoleon and the force-men of the next centuries, just as Flaminius, who from 232 B.C. onward pressed the Romans to undertake the subjugation of Cisalpine Gaul and so initiated the policy of colonial expansion, stands between Alexander and Cæsar. Strictly speaking, Flaminius was a private person—for his real power was of a kind not embodied in any constitutional office—who exercised a dominant influence in the state at a time when the state-idea was giving way to the pressure of economic factors. So far as Rome is concerned, he was the archetype of opposition Cæsarism; with him there came to an end the _idea of state-service_ and there began the “will to power” which ignored traditions and reckoned only with forces. Alexander and Napoleon were romantics; though they stood on the threshold of Civilization and in its cold clear air, the one fancied himself an Achilles and the other read Werther. Cæsar, on the contrary, was a pure man of fact gifted with immense understanding.

But even for Rhodes political success means territorial and financial success, and only that. Of this Roman-ness within himself he was fully aware. But Western Civilization has not yet taken shape in such strength and purity as this. It was only before his maps that he could fall into a sort of poetic trance, this son of the parsonage who, sent out to South Africa without means, made a gigantic fortune and employed it as the engine of political aims. His idea of a trans-African railway from the Cape to Cairo, his project of a South African empire, his intellectual hold on the hard metal souls of the mining magnates whose wealth he forced into the service of his schemes, his capital Bulawayo, royally planned as a future Residence by a statesman who was all- powerful yet stood in no definite relation to the State, his wars, his diplomatic deals, his road-systems, his syndicates, his armies, his conception of the “great duty to civilization” of the man of brain—all this, broad and imposing, is the prelude of a future which is still in store for us and with which the history of West-European mankind will be definitely _closed_.

He who does not understand that this outcome is obligatory and insusceptible of modification, that our choice is between willing _this_ and willing nothing at all, between cleaving to _this_ destiny or despairing of the future and of life itself; he who cannot feel that there is grandeur also in the realizations of powerful intelligences, in the energy and discipline of metal-hard natures, in battles fought with the coldest and most abstract means; he who is obsessed with the idealism of a provincial and would pursue the ways of life of past ages— must forgo all desire to comprehend history, to live through history or to make history.

Thus regarded, the Imperium Romanum appears no longer as an isolated phenomenon, but as the normal product of a strict and energetic, megalopolitan, predominantly practical spirituality, as typical of a final and irreversible condition which has occurred often enough though it has only been identified as such in this instance.

Let it be realized, then:

That the secret of historical form does not lie on the surface, that it cannot be grasped by means of similarities of costume and setting, and that in the history of men as in that of animals and plants there occur phenomena showing deceptive similarity but inwardly without any connexion—e.g., Charlemagne and Haroun-al-Raschid, Alexander and Cæsar, the German wars upon Rome and the Mongol onslaughts upon West Europe—and other phenomena of extreme outward dissimilarity but of identical import—e.g., Trajan and Rameses II, the Bourbons and the Attic Demos, Mohammed and Pythagoras.

That the 19th and 20th centuries, hitherto looked on as the highest point of an ascending straight line of world-history, are in reality a stage of life which may be observed in every Culture that has ripened to its limit—a stage of life characterized not by Socialists, Impressionists, electric railways, torpedoes and differential equations (for these are only body-constituents of the time), but by a civilized spirituality which possesses not only these but also quite other creative possibilities.

That, as our own time represents a transitional phase which occurs with certainty under particular conditions, there are perfectly well-defined states (such as have occurred more than once in the history of the past) _later_ than the present-day state of West

Europe, and therefore that

The future of the West is not a limitless tending upwards and onwards for all time towards our present ideals, but a single phenomenon of history, strictly limited and defined as to form and duration, which covers a few centuries and can be viewed and, in essentials, calculated from available precedents.

Footnote 31:

See Vol. II, 529.

Footnote 32:

The conquest of Gaul by Cæsar was frankly a colonial, i.e., a one- sided, war; and the fact that it is the highest achievement in the later military history of Rome only shows that the well of real achievement was rapidly drying up.

Footnote 33:

The modern Germans are a conspicuous example of a people that has become expansive without knowing it or willing it. They were already in that state while they still believed themselves to be the people of Goethe. Even Bismarck, the founder of the new age, never had the slightest idea of it, and believed himself to have reached the _conclusion_ of a political process (cf. Vol. II, 529).

Footnote 34:

This is probably the meaning of Napoleon's significant words to Goethe: "What have we to-day to do with destiny? Policy is destiny."

Footnote 35:

Corresponding to the 300-50 B.C. phase of the Classical world.

Footnote 36:

Which in the end gave its name to the Empire (Tsin = China).

Footnote 37:

See Vol. II, 521-539.

XIV

This high plane of contemplation once attained, the rest is easy. To this _single_ idea one can refer, and by it one can solve, without straining or forcing, all those separate problems of religion, art- history, epistemology, ethics, politics, economics with which the modern intellect has so passionately—and so vainly—busied itself for decades.

This idea is one of those truths that have only to be expressed with full clarity to become indisputable. It is one of the inward necessities of the Western Culture and of its world-feeling. It is capable of entirely transforming the world-outlook of one who fully understands it, i.e., makes it intimately his own. It immensely deepens the world- picture natural and necessary to us in that, already trained to regard world-historical evolution as an organic unit seen backwards from our standpoint in the present, we are enabled by its aid to follow the broad lines into the future—a privilege of dream-calculation till now permitted only to the physicist. It is, I repeat, in effect the substitution of a Copernican for a Ptolemaic aspect of history, that is, an immeasurable widening of horizon.

Up to now everyone has been at liberty to hope what he pleased about the future. Where there are no facts, sentiment rules. But henceforward it will be every man's business to inform himself of what _can_ happen and therefore of what with the unalterable necessity of destiny and irrespective of personal ideals, hopes or desires, _will_ happen. When we use the risky word "freedom" we shall mean freedom to do, not this or that, but the necessary or nothing. The feeling that this is "just as it should be" is the hall-mark of the man of fact. To lament it and blame it is not to alter it. To birth belongs death, to youth age, to life generally its form and its

allotted span. The present is a civilized, emphatically not a cultured time, and _ipso facto_ a great number of life-capacities fall out as impossible. This may be deplorable, and may be and will be deplored in pessimist philosophy and poetry, but it is not in our power to make otherwise. It will not be—already it is not— permissible to defy clear historical experience and to expect, merely because we hope, that this will spring or that will flourish.

It will no doubt be objected that such a world-outlook, which in giving this certainty as to the outlines and tendency of the future cuts off all far-reaching hopes, would be unhealthy for all and fatal for many, once it ceased to be a mere theory and was adopted as a practical scheme of life by the group of personalities effectively moulding the future.

Such is not my opinion. We are civilized, not Gothic or Rococo, people; we have to reckon with the hard cold facts of a _late_ life, to which the parallel is to be found not in Pericles's Athens but in Cæsar's Rome. Of great painting or great music there can no longer be, for Western people, any question. Their architectural possibilities have been exhausted these hundred years. Only _extensive_ possibilities are left to them. Yet, for a sound and vigorous generation that is filled with unlimited hopes, I fail to see that it is any disadvantage to discover betimes that some of these hopes must come to nothing. And if the hopes thus doomed should be those most dear, well, a man who is worth anything will not be dismayed. It is true that the issue may be a tragic one for some individuals who in their decisive years are overpowered by the conviction that in the spheres of architecture, drama, painting, there is nothing left for _them_ to conquer. What matter if they do go under! It has been the convention hitherto to admit no limits of any sort in these matters, and to believe that each period had its own task to do in each sphere. Tasks therefore were found by hook or by crook, leaving it to be settled posthumously whether or not the artist's faith was justified and his life-work necessary. Now, nobody but a pure romantic would take this way out. Such a pride is not the pride of a Roman. What are we to think of the individual who, standing before an exhausted quarry, would rather be told that a new vein will be struck to-morrow—the bait offered by the radically false and mannerized art of the moment—than be shown a rich and virgin clay- bed near by? The lesson, I think, would be of benefit to the coming generations, as showing them what is possible—and therefore necessary— and what is excluded from the inward potentialities of their time. Hitherto an incredible total of intellect and power has been squandered in false directions. The West-European, however historically he may think and feel, is at a certain stage of life invariably uncertain of his own direction; he gropes and feels his way and, if unlucky in environment, he loses it. But now at last the work of centuries enables him to view the disposition of his own life in relation to the general culture-scheme and to test his own powers and purposes. And I can only hope that men of the new generation may be moved by this book to devote themselves to technics instead of lyrics, the sea instead of the paint- brush, and politics instead of epistemology. Better they could not do.

XV

It still remains to consider the relation of a morphology of world- history to Philosophy. All genuine historical work is philosophy, unless it is mere ant-industry. But the operations of the systematic philosopher are subject to constant and serious error through his assuming the permanence of his results. He overlooks the fact that every thought lives in a historical world and is therefore involved in the common destiny of mortality. He supposes that higher thought possesses an everlasting and unalterable objectiveness (Gegenstand), that the great questions of all epochs are identical, and that therefore they are capable in the last analysis of unique answers.

But question and answer are here one, and the great questions are made great by the very fact that unequivocal answers to them are so passionately demanded, so that it is as life-symbols only that they possess significance. There are no eternal truths. Every philosophy is the expression of its own and only its own time, and—if by philosophy we mean effective philosophy and not academic triflings about judgment- forms, sense-categories and the like—no two ages possess the same philosophic intentions. The difference is not between perishable and imperishable doctrines but between doctrines which live their day and doctrines which never live at all. The immortality of thoughts-become is an illusion—the essential is, what kind of man comes to expression in them. The greater the man, the truer the philosophy, with the inward truth that in a great work of art transcends all proof of its several elements or even of their compatibility with one another. At highest, the philosophy may absorb the entire content of an epoch, realize it within itself and then, embodying it in some grand form or personality, pass it on to be developed further and further. The scientific dress or the mark of learning adopted by a philosophy is here unimportant. Nothing is simpler than to make good poverty of ideas by founding a system, and even a good idea has little value when enunciated by a solemn ass. Only its necessity to life decides the eminence of a doctrine.

For me, therefore, the test of value to be applied to a thinker is his eye for the great facts of his own time. Only this can settle whether he is merely a clever architect of systems and principles, versed in definitions and analyses, or whether it is the very soul

of his time that speaks in his works and his intuitions. A philosopher who cannot grasp and command actuality as well will never be of the first rank. The Pre-Socratics were merchants and politicians _en grand_. The desire to put his political ideas into practice in Syracuse nearly cost Plato his life, and it was the same Plato who discovered the set of geometrical theorems that enabled Euclid to build up the Classical system of mathematics. Pascal—whom Nietzsche knows only as the “broken Christian”— Descartes, Leibniz were the first mathematicians and technicians of their time.

The great “Pre-Socratics” of China from Kwan-tsi (about 670) to Confucius (550-478) were statesmen, regents, lawgivers like Pythagoras and Parmenides, like Hobbes and Leibniz. With Lao-tsze—the opponent of all state authority and high politics and the enthusiast of small peaceful communities—unworldliness and deed-shyness first appear, heralds of lecture-room and study philosophy. But Lao-tsze was in his time, the _ancien régime_ of China, an exception in the midst of sturdy philosophers for whom epistemology meant the knowledge of the important relations of actual life.

And herein, I think, all the philosophers of the newest age are open to a serious criticism. What they do not possess is real standing in actual life. Not one of them has intervened effectively, either in higher politics, in the development of modern technics, in matters of communication, in economics, or in any other _big_ actuality, with a single act or a single compelling idea. Not one of them counts in mathematics, in physics, in the science of government, even to the extent that Kant counted. Let us glance at other times. Confucius was several times a minister. Pythagoras was the organizer of an important political movement[38] akin to the Cromwellian, the significance of which is even now far underestimated by Classical researchers. Goethe, besides being a model executive minister—though lacking, alas! the operative sphere of a great state—was interested in the Suez and Panama canals (the dates of which he foresaw with accuracy) and their effects on the economy of the world, and he busied himself again and again with the question of American economic life and its reactions on the Old World, and with that of the dawning era of machine-industry. Hobbes was one of the originators of the great plan of winning South America for England, and although in execution the plan went no further than the occupation of Jamaica, he has the glory of being one of the founders of the British Colonial Empire. Leibniz, without doubt the greatest intellect in Western philosophy, the founder of the differential calculus and the _analysis situs_, conceived or co-operated in a number of major political schemes, one of which was to relieve Germany by drawing the attention of Louis XIV to the importance of Egypt as a factor in French world-policy. The ideas of the memorandum on this subject that he drew up for the Grand Monarch were so far in advance of their time (1672) that it has been thought that Napoleon made use of them for his Eastern venture. Even thus early, Leibniz laid down the principle that Napoleon grasped more and more clearly after Wagram, viz., that acquisitions on the Rhine and in Belgium would not permanently better the position of France and that the neck of Suez would one day be the key of world-dominance. Doubtless the King was not equal to these deep political and strategic conceptions of the Philosopher.

Turning from men of this mould to the “philosophers” of to-day, one is dismayed and shamed. How poor their personalities, how commonplace their political and practical outlook! Why is it that the mere idea of calling upon one of them to prove his intellectual eminence in government, diplomacy, large-scale organization, or direction of any big colonial, commercial or transport concern is enough to evoke our pity? And this insufficiency indicates, not that they possess inwardness, but simply that they lack weight. I look round in vain for an instance in which a modern “philosopher” has made a name by even one deep or far-seeing pronouncement on an important question of the day. I see nothing but provincial opinions of the same kind as anyone else’s. Whenever I take up a work by a modern thinker, I find myself asking: has he any idea whatever of the actualities of world-politics, world-city problems, capitalism, the future of the state, the relation of technics to the course of civilization, Russia, Science? Goethe would have understood all this and revelled in it, but there is not one living philosopher capable of taking it in. This sense of actualities is of course not the same thing as the content of a philosophy but, I repeat, it is an infallible symptom of its inward necessity, its fruitfulness and its symbolic importance.

We must allow ourselves no illusions as to the gravity of this negative result. It is palpable that we have lost sight of the final significance of effective philosophy. We confuse philosophy with preaching, with agitation, with novel-writing, with lecture-room jargon. We have descended from the perspective of the bird to that of the frog. It has come to this, that the very _possibility_ of a real philosophy of to-day and to-morrow is in question. If not, it were far better to become a colonist or an engineer, to do something, no matter what, that is true and real, than to chew over once more the old dried-up themes under cover of an alleged “new wave of philosophic thought”—far better to construct an aero-engine than a new theory of apperception that is not wanted. Truly it is a poor life’s work to restate once more, in slightly different terms, views of a hundred predecessors on the Will or on psycho-physical parallelism. This may be a profession, but a philosophy it emphatically is not. A doctrine that does not attack and affect the life of the period in its inmost depths is no doctrine and had better not be taught. And what was possible even yesterday

is, to-day, at least not indispensable.

To me, the depths and refinement of mathematical and physical theories are a joy; by comparison, the æsthete and the physiologist are fumblers. I would sooner have the fine mind-begotten forms of a fast steamer, a steel structure, a precision-lathe, the subtlety and elegance of many chemical and optical processes, than all the pickings and stealings of present-day “arts and crafts,” architecture and painting included. I prefer one Roman aqueduct to all Roman temples and statues. I love the Colosseum and the giant vault of the Palatine, for they display for me to-day in the brown massiveness of their brick construction the _real_ Rome and the grand practical sense of her engineers, but it is a matter of indifference to me whether the empty and pretentious marblery of the Cæsars—their rows of statuary, their friezes, their overloaded architraves—is preserved or not. Glance at some reconstruction of the Imperial Fora—do we not find them the true counterpart of a modern International Exhibition, obtrusive, bulky, empty, a boasting in materials and dimensions wholly alien to Periclean Greece and the Rococo alike, but exactly paralleled in the Egyptian modernism that is displayed in the ruins of Rameses II (1300 B.C.) at Luxor and Karnak? It was not for nothing that the genuine Roman despised the _Græculus histrio_, the kind of “artist” and the kind of “philosopher” to be found on the soil of Roman Civilization. The time for art and philosophy had passed; they were exhausted, used up, superfluous, and his instinct for the realities of life told him so. _One_ Roman law weighed more than all the lyrics and school-metaphysics of the time together. And I maintain that to-day many an inventor, many a diplomat, many a financier is a sounder philosopher than all those who practise the dull craft of experimental psychology. This is a situation which regularly repeats itself at a certain historical level. It would have been absurd in a Roman of intellectual eminence, who might as Consul or Prætor lead armies, organize provinces, build cities and roads, or even be the Princeps in Rome, to want to hatch out some new variant of post-Platonic school philosophy at Athens or Rhodes. Consequently no one did so. It was not in harmony with the tendency of the age, and therefore it only attracted third-class men of the kind that always advances as far as the _Zeitgeist_ of the day before yesterday. It is a very grave question whether this stage has or has not set in for us already.

A century of purely extensive effectiveness, excluding big artistic and metaphysical production—let us say frankly an irreligious time which coincides exactly with the idea of the world-city—is a time of decline. True. But we have not _chosen_ this time. We cannot help it if we are born as men of the early winter of full Civilization, instead of on the golden summit of a ripe Culture, in a Phidias or a Mozart time. Everything depends on our seeing our own position, our _destiny_, clearly, on our realizing that though we may lie to ourselves about it we cannot evade it. He who does not acknowledge this in his heart, ceases to be counted among the men of his generation, and remains either a simpleton, a charlatan, or a pedant.

Therefore, in approaching a problem of the present, one must begin by asking one’s self—a question answered in advance by instinct in the case of the genuine adept—what to-day is possible and what he must forbid himself. Only a very few of the problems of metaphysics are, so to say, allocated for solution to any epoch of thought. Even thus soon, a whole world separates Nietzsche’s time, in which a last trace of romanticism was still operative, from our own, which has shed every vestige of it.

Systematic philosophy closes with the end of the 18th Century. Kant put its utmost possibilities in forms both grand in themselves and—as a rule—final for the Western soul. He is followed, as Plato and Aristotle were followed, by a specifically megalopolitan philosophy that was not speculative but practical, irreligious, social-ethical. This philosophy— paralleled in the Chinese civilization by the schools of the “Epicurean” Yang-chu, the “Socialist” Mo-ti, the “Pessimist” Chuang-tsü, the “Positivist” Mencius, and in the Classical by the Cynics, the Cyrenaics, the Stoics and the Epicureans—begins in the West with Schopenhauer, who is the first to make the _Will to life_ (“creative life-force”) the centre of gravity of his thought, although the deeper tendency of his doctrine is obscured by his having, under the influence of a great tradition, maintained the obsolete distinctions of phenomena and things-in-themselves and suchlike. It is the same creative will-to-life that was Schopenhauer-wise denied in “Tristan” and Darwin-wise asserted in “Siegfried”; that was brilliantly and theatrically formulated by Nietzsche in “Zarathustra”; that led the Hegelian Marx to an economic and the Malthusian Darwin to a biological hypothesis which together have subtly transformed the world-outlook of the Western megalopolis; and that produced a homogeneous series of tragedy-conceptions extending from Hebbel’s “Judith” to Ibsen’s “Epilogue.” It has embraced, therefore, all the possibilities of a true philosophy—and at the same time it has exhausted them.

Systematic philosophy, then, lies immensely far behind us, and ethical has been wound up. _But a third possibility, corresponding to the Classical Scepticism, still remains to the soul-world_ of the present- day West, and it can be brought to light by the hitherto unknown methods of historical morphology. That which is a possibility is a necessity. The Classical scepticism is ahistoric, it doubts by denying outright. But that of the West, if it is an inward necessity, a symbol of the autumn of our spirituality, is obliged to be historical through and through. Its solutions are got by treating everything as relative, as a historical phenomenon, and its procedure is psychological. Whereas the Sceptic philosophy arose within Hellenism as the negation of philosophy— declaring

philosophy to be purposeless—we, on the contrary, regard the _history of philosophy_ as, in the last resort, philosophy's gravest theme. This _is_ "skepsis," in the true sense, for whereas the Greek is led to renounce absolute standpoints by contempt for the intellectual past, we are led to do so by comprehension of that past as an organism.

In this work it will be our task to sketch out this unphilosophical philosophy—the last that West Europe will know. Scepticism is the expression of a pure Civilization; and it dissipates the world-picture of the Culture that has gone before. For us, its success will lie in resolving all the older problems into one, the genetic. The conviction that what _is_ also _has become_, that the natural and cognizable is rooted in the historic, that the World as the actual is founded on an Ego as the potential actualized, that the "when" and the "how long" hold as deep a secret as the "what," leads directly to the fact that everything, whatever else it may be, must at any rate be _the expression of something living_. Cognitions and judgments too are acts of living men. The thinkers of the past conceived external actuality as produced by cognition and motiving ethical judgments, but to the thought of the future they are above all _expressions and symbols. The Morphology of world-history becomes inevitably a universal symbolism._

With that, the claim of higher thought to possess general and eternal truths falls to the ground. Truths are truths only in relation to a particular mankind. Thus, my own philosophy is able to express and reflect _only_ the Western (as distinct from the Classical, Indian, or other) soul, and that soul _only_ in its present civilized phase by which its conception of the world, its practical range and its sphere of effect are specified.

XVI

In concluding this Introduction, I may be permitted to add a personal note. In 1911, I proposed to myself to put together some broad considerations on the political phenomena of the day and their possible developments. At that time the World-War appeared to me both as imminent and also as the inevitable outward manifestation of the historical crisis, and my endeavour was to comprehend it from an examination of the spirit of the preceding centuries—not years. In the course of this originally small task,[39] the conviction forced itself on me that for an effective understanding of the epoch the area to be taken into the foundation-plan must be very greatly enlarged, and that in an investigation of this sort, if the results were to be fundamentally conclusive and necessary results, it was impossible to restrict one's self to a single epoch and its political actualities, or to confine one's self to a pragmatical framework, or even to do without purely metaphysical and highly transcendental methods of treatment. It became evident that a political problem could not be comprehended by means of politics themselves and that, frequently, important factors at work in the depths could only be grasped through their artistic manifestations or even distantly seen in the form of scientific or purely philosophical ideas. Even the politico-social analysis of the last decades of the 19th century—a period of tense quiet between two immense and outstanding events: the one which, expressed in the Revolution and Napoleon, had fixed the picture of West-European actuality for a century and another of at least equal significance that was visibly and ever more rapidly approaching—was found in the last resort to be impossible without bringing in _all_ the great problems of Being in all their aspects. For, in the historical as in the natural world-picture, there is found nothing, however small, that does not embody in itself the entire sum of fundamental tendencies. And thus the original theme came to be immensely widened. A vast number of unexpected (and in the main entirely novel) questions and interrelations presented themselves. And finally it became perfectly clear that no single fragment of history could be thoroughly illuminated unless and until the secret of world-history itself, to wit the story of higher mankind as an organism of regular structure, had been cleared up. And hitherto this has not been done, even in the least degree.

From this moment on, relations and connexions—previously often suspected, sometimes touched on but never comprehended—presented themselves in ever-increasing volume. The forms of the arts linked themselves to the forms of war and state-policy. Deep relations were revealed between political and mathematical aspects of the same Culture, between religious and technical conceptions, between mathematics, music and sculpture, between economics and cognition-forms. Clearly and unmistakably there appeared the fundamental dependence of the most modern physical and chemical theories on the mythological concepts of our Germanic ancestors, the style-congruence of tragedy and power- technics and up-to-date finance, and the fact (bizarre at first but soon self-evident) that oil-painting perspective, printing, the credit system, longrange weapons, and contrapuntal

music in one case, and the nude statue, the city-state and coin-currency (discovered by the Greeks) in another were identical expressions of one and the same spiritual principle. And, beyond and above all, there stood out the fact that these great _groups of morphological relations_, each one of which symbolically represents a particular sort of mankind in the whole picture of world-history, are strictly symmetrical in structure. It is this perspective that first opens out for us the true style of history. Belonging itself as symbol and expression to one time and therefore inwardly possible and necessary only for present-day Western man, it can but be compared—distantly—to certain ideas of ultra-modern mathematics in the domain of the Theory of Groups. These were thoughts that had occupied me for many years, though dark and undefined until enabled by this method to emerge in tangible form.

Thereafter I saw the present—the approaching World-War—in a quite other light. It was no longer a momentary constellation of casual facts due to national sentiments, personal influences, or economic tendencies endowed with an appearance of unity and necessity by some historian's scheme of political or social cause-and-effect, but the type of _a historical change of phase_ occurring within a great historical organism of definable compass at the point preordained for it hundreds of years ago. The mark of the great crisis is its innumerable passionate questionings and probings. In our own case there were books and ideas by the thousand; but, scattered, disconnected, limited by the horizons of specialisms as they were, they incited, depressed and confounded but could not free. Hence, though these questions are seen, their identity is missed. Consider those art-problems that (though never comprehended in their depths) were evinced in the disputes between form and content, line and space, drawing and colour, in the notion of style, in the idea of Impressionism and the music of Wagner. Consider the decline of art and the failing authority of science; the grave problems arising out of the victory of the megalopolis over the country-side, such as childlessness and land-depopulation; the place in society of a fluctuating Fourth Estate; the crisis in materialism, in Socialism, in parliamentary government; the position of the individual _vis-à-vis_ the State; the problem of private property with its pendant the problem of marriage. Consider at the same time one fact taken from what is apparently an entirely different field, the voluminous work that was being done in the domain of folk-psychology on the origins of myths, arts, religions and thought—and done, moreover, no longer from an ideal but from a strictly morphological standpoint. It is my belief that every one of these questions was really aimed in the same direction as every other, viz., towards that _one_ Riddle of History that had never yet emerged with sufficient distinctness in the human consciousness. The tasks before men were not, as supposed, infinitely numerous—they were one and the same task. Everyone had an inkling that this was so, but no one from his own narrow standpoint had seen the single and comprehensive solution. And yet it had been in the air since Nietzsche, and Nietzsche himself had gripped all the decisive problems although, being a romantic, he had not dared to look strict reality in the face.

But herein precisely lies the inward necessity of the _stock-taking_ doctrine, so to call it. It had to come, and it could only come at this time. Our scepticism is not an attack upon, but rather the verification of, our stock of thoughts and works. It _confirms_ all that has been sought and achieved for generations past, in that it integrates all the truly living tendencies which it finds in the special spheres, no matter what their aim may be.

Above all, there discovered itself the _opposition of History and Nature_ through which alone it is possible to grasp the essence of the former. As I have already said, man as an element and representative of the World is a member, not only of nature, but also of history—which is a second Cosmos different in structure and complexion, entirely neglected by Metaphysics in favour of the first. I was originally brought to reflect on this _fundamental_ question of our world- consciousness through noticing how present-day historians as they fumble round tangible events, things-become, believe themselves to have already grasped History, the happening, the becoming itself. This is a prejudice common to all who proceed by reason and cognition, as against intuitive perception.[40] And it had long ago been a source of perplexity to the great Eleatics with their doctrine that through cognition there could be no becoming, but only a being (or having-become). In other words, History was seen as Nature (in the objective sense of the physicist) and treated accordingly, and it is to this that we must ascribe the baneful mistake of applying the principles of causality, of law, of system—that is, the structure of rigid being—to the picture of happenings. It was assumed that a human culture existed just as electricity or gravitation existed, and that it was capable of analysis in much the same way as these. The habits of the scientific researcher were eagerly taken as a model, and if, from time to time, some student asked what Gothic, or Islam, or the Polis _was_, no one inquired why such symbols of something living _inevitably_ appeared just _then, and there, in that form, and for that space of time_. Historians were content, whenever they met one of the innumerable similarities between widely discrete historical phenomena, simply to register it, adding some clever remarks as to the marvels of coincidence, dubbing Rhodes the "Venice of Antiquity" and Napoleon the "modern Alexander," or the like; yet it was just these cases, in which the _destiny-problem_ came to the fore as the true problem of history (viz., the problem of time), that needed to be treated with all possible seriousness and scientifically regulated _physiognomic_ in order to find out what strangely-constituted necessity, so completely alien to the causal, was at work. That every phenomenon _ipso facto_ propounds a metaphysical riddle, that the time of its occurrence is

never irrelevant; that it still remained to be discovered what kind of a _living_ interdependence (apart from the inorganic, natural-law interdependence) subsists within the world- picture, which radiates from nothing less than the whole man and not merely (as Kant thought) from the cognizing part of him; that a phenomenon is not only a fact for the understanding but also an expression of the spiritual, not only an object but a symbol as well, be it one of the highest creations of religion or art or a mere trifle of everyday life—all this was, philosophically, something new.

And thus in the end I came to see the solution clearly before me in immense outlines, possessed of full inward necessity, a solution derived from one single principle that though discoverable had never been discovered, that from my youth had haunted and attracted me, tormenting me with the sense that it was there and must be attacked and yet defying me to seize it. Thus, from an almost accidental occasion of beginning, there has arisen the present work, which is put forward as the provisional expression of a new world-picture. The book is laden, as I know, with all the defects of a first attempt, incomplete, and certainly not free from inconsistencies. Nevertheless I am convinced that it contains the incontrovertible formulation of an idea which, once enunciated clearly, will (I repeat) be accepted without dispute.

If, then, the narrower theme is an analysis of the Decline of that West- European Culture which is now spread over the entire globe, yet the object in view is the development of a philosophy and of the operative method peculiar to it, which is now to be tried, viz., the method of comparative morphology in world-history. The work falls naturally into two parts. The first, “Form and Actuality,” starts from the form- language of the great Cultures, attempts to penetrate to the deepest roots of their origin and so provides itself with the basis for a science of Symbolic. The second part, “World-historical Perspectives,” starts from the _facts of actual life_, and from the historical practice of higher mankind seeks to obtain a quintessence of historical experience that we can set to work upon the formation of our own future.

The accompanying tables[41] present a general view of what has resulted from the investigation. They may at the same time give some notion both of the fruitfulness and of the scope of the new methods.

CHAPTER II THE MEANING OF NUMBERS

CHAPTER II

THE MEANING OF NUMBERS

It is necessary to begin by drawing attention to certain basic terms which, as used in this work, carry strict and in some cases novel connotations. Though the metaphysical content of these terms would gradually become evident in following the course of the reasoning, nevertheless, the exact significance to be attached to them ought to be made clear beyond misunderstanding from the very outset.

The popular distinction—current also in philosophy—between “being” and “becoming” seems to miss the essential point in the contrast it is meant to express. An endless becoming—“action,” “actuality”—will always be thought of also as a condition (as it is, for example, in physical notions such as uniform velocity and the condition of motion, and in the basic hypothesis of the kinetic theory of gases) and therefore ranked in the category of “being.” On the other hand, out of the results that we do in fact obtain by and in consciousness, we may, with Goethe, distinguish as final elements “becoming” and “the become” (_Das Werden_, _das Gewordne_). In all cases, though the atom of human-ness may lie beyond the grasp of our powers of abstract conception, the very clear and definite _feeling_ of this contrast—fundamental and diffused throughout consciousness—is the most elemental something that we reach. It necessarily follows therefore that “the become” is always founded on a “becoming” and not the other way round.

I distinguish further, by the words “proper” and “alien” (_das Eigne_, _das Fremde_), those two basic facts of consciousness which for all men in the waking (not in the dreaming) state are established with an immediate inward certainty, without the necessity or possibility of more precise definition. The element called “alien” is always related in some way to the basic fact expressed by the word “perception,” i.e., the outer world, the life of sensation. Great thinkers have bent all their powers of image-forming to the task of expressing this relation, more and more rigorously, by the aid of half-intuitive dichotomies such as “phenomena and things-in-themselves,” “world-as-will and world-as-idea,” “ego and non-ego,” although human powers of exact knowing are surely inadequate for the task.

Similarly, the element “proper” is involved with the basic fact known as feeling, i.e., the inner life, in some intimate and invariable way that equally defies analysis by the methods of abstract thought.

I distinguish, again, “soul” and “world.” _The existence of this opposition is identical with the fact of purely human waking consciousness (Wachsein)._ There are degrees of clearness and sharpness in the opposition and therefore grades of the consciousness, of the spirituality, of life. These grades range from the feeling-knowledge that, unalert yet sometimes suffused through and through by an inward light, is characteristic of the primitive and of the child (and also of those moments of religious and artistic inspiration that occur ever less and less often as a Culture grows older) right to the extremity of waking and reasoning sharpness that we find, for instance, in the thought of Kant and Napoleon, for whom soul and world have become subject and object. This elementary structure of consciousness, as a fact of immediate inner knowledge, is not susceptible of conceptual subdivision. Nor, indeed, are the two factors distinguishable at all except verbally and more or less artificially, since they are always associated, always intertwined, and present themselves as a unit, a totality. The epistemological starting-point of the born idealist and the born realist alike, the assumption that soul is to world (or world to soul, as the case may be) as foundation is to building, as primary to derivative, as “cause” to “effect,” has no basis whatever in the pure fact of consciousness, and when a philosophic system lays stress on the one or the other, it only thereby informs us as to the personality of the philosopher, a fact of purely biographical significance.

Thus, by regarding waking-consciousness structurally as a tension of contraries, and applying to it the notions of “becoming” and “the thing- become,” we find for the word _Life_ a perfectly definite meaning that is closely allied to that of “becoming.” We may describe becomings and the things-become as the form in which respectively the facts and the results of life exist in the waking consciousness. To man in the waking state his proper life, progressive and constantly self-fulfilling, is presented through the element of Becoming in his consciousness—_this fact we call “the present”_—and it possesses that mysterious property of _Direction_ which in all the higher languages men have sought to impound and—vainly—to rationalize by means of the enigmatic word _time_. It follows necessarily from the above that there is a fundamental connexion between _the become_ (the _hard-set_) and _Death_.

If, now, we designate the Soul—that is, the Soul as it is felt, not as it is reasonably pictured—as the _possible_ and the World on the other hand as the _actual_ (the meaning of these expressions is unmistakable to man’s inner sense), we see life as _the form in which the actualizing of the possible is accomplished_. With respect to the property of Direction, the possible is called the _Future_ and the actualized the _Past_. The actualizing itself, the centre-of-gravity and the centre-of- meaning of life, we call the _Present_. “Soul” is the still-to-be- accomplished, “World” the accomplished, “life” the accomplishing. In this way we are enabled to assign to expressions like moment, duration, development, life-content, vocation, scope, aim, fullness and emptiness of life, the definite meanings which we shall need for all that follows and especially for the understanding of historical phenomena.

Lastly, the words _History_ and _Nature_ are here employed, as the reader will have observed already, in a quite definite and hitherto unusual sense. These words comprise _possible_ modes of understanding, of comprehending the totality of knowledge—becoming as well as things- become, life as well as things-lived—as a homogeneous, spiritualized, well-ordered _world-picture_ fashioned out of an indivisible mass- impression in this way or in that according as the becoming or the become, direction (“time”) or extension (“space”) is the dominant factor. And it is not a question of one factor being alternative to the other. The possibilities that we have of possessing an “outer world” that reflects and attests our proper existence are infinitely numerous and exceedingly heterogeneous, and the purely organic and the purely mechanical world-view (in the precise literal sense of that familiar term[42]) are only the extreme members of the series. Primitive man (so far as we can imagine his waking-consciousness) and the child (as we can remember) cannot fully see or grasp these possibilities. One condition of this higher world-consciousness is the possession of _language_, meaning thereby not mere human utterance but a culture-language, and such is non-existent for primitive man and existent but not accessible in the case of the child. In other words, neither possesses any clear and distinct notion of the world. They have an inkling but no real knowledge of history and nature, being too intimately incorporated with the ensemble of these. _They have no Culture._

And therewith that important word is given a positive meaning of the highest significance which henceforward will be assumed in using it. In the same way as we have elected to distinguish the Soul as the possible and the World as the actual, we can now differentiate between _possible_ and _actual_ culture, i.e., culture as _an idea in the_ (general or individual) _existence_ and culture as the _body_ of that idea, as the total of its visible, tangible and comprehensible expressions—acts and opinions, religion and state, arts and sciences, peoples and cities, economic and social forms, speech, laws, customs, characters, facial lines and

costumes. _Higher history_, intimately related to life and to becoming, _is the actualizing of possible Culture_.[43]

We must not omit to add that these basic determinations of meaning are largely incommunicable by specification, definition or proof, and in their deeper import must be reached by feeling, experience and intuition. There is a distinction, rarely appreciated as it should be, between experience as lived and experience as learned (zwischen Erleben und Erkennen), between the immediate certainty given by the various kinds of intuition—such as illumination, inspiration, artistic flair, experience of life, the power of "sizing men up" (Goethe's "exact percipient fancy")—and the product of rational procedure and technical experiment.

The first are imparted by means of analogy, picture, symbol, the second by formula, law, scheme. The become is experienced by learning—indeed, as we shall see, the having-become is for the human mind identical with the completed act of cognition. A becoming, on the other hand, can only be experienced by living, felt with a deep wordless understanding. It is on this that what we call "knowledge of men" is based; in fact the understanding of history implies a superlative knowledge of men. The eye which can see into the depths of an alien soul—owes nothing to the cognition-methods investigated in the "Critique of Pure Reason," yet the purer the historical picture is, the less accessible it becomes to any other eye. The mechanism of a pure nature-picture, such as the world of Newton and Kant, is cognized, grasped, dissected in laws and equations and finally reduced to system: the organism of a pure history-picture, like the world of Plotinus, Dante and Giordano Bruno, is intuitively seen, inwardly experienced, grasped as a form or symbol and finally rendered in poetical and artistic conceptions. Goethe's "living nature" is a _historical_ world-picture.[44]

Footnote 39:

The work referred to is embodied in Vol. II (pp. 521 et seq., 562 et seq., 631 et seq.).

Footnote 40:

The philosophy of this book I owe to the philosophy of Goethe, which is practically unknown to-day, and also (but in a far less degree) to that of Nietzsche. The position of Goethe in West-European metaphysics is still not understood in the least; when philosophy is being discussed he is not even named. For unfortunately he did not set down his doctrines in a rigid system, and so the systematic philosophy has overlooked him. Nevertheless he was a philosopher. His place _vis-à- vis_ Kant is the same as that of Plato—who similarly eludes the would- be-systematizer—_vis-à-vis_ Aristotle. Plato and Goethe stand for the philosophy of Becoming, Aristotle and Kant the philosophy of Being. Here we have intuition opposed to analysis. Something that it is practically impossible to convey by the methods of reason is found in individual sayings and poems of Goethe, e.g., in the Orphische Urworte, and stanzas like "Wenn im Unendlichen" and "Sagt es Niemand," which must be regarded as the expression of a _perfectly definite_ metaphysical doctrine. I would not have one single word changed in this: "The Godhead is effective in the living and not in the dead, in the becoming and the changing, not in the become and the set-fast; and therefore, similarly, the reason (_Vernunft_) is concerned only to strive towards the divine through the becoming and the living, and the understanding (_Verstand_) only to make use of the become and the set- fast" (to Eckermann). This sentence comprises my entire philosophy.

With, moreover, a "biological horizon." See Vol. II, p. 34.

II

In order to exemplify the way in which a soul seeks to actualize itself in the picture of its outer world—to show, that is, in how far Culture in the “become” state can express or portray an idea of human existence— I have chosen _number_, the primary element on which all mathematics rests. I have done so because mathematics, accessible in its full depth only to the very few, holds a quite peculiar position amongst the creations of the mind. It is a science of the most rigorous kind, like logic but more comprehensive and very much fuller; it is a true art, along with sculpture and music, as needing the guidance of inspiration and as developing under great conventions of form; it is, lastly, a metaphysic of the highest rank, as Plato and above all Leibniz show us. Every philosophy has hitherto grown up in conjunction with a mathematic _belonging_ to it. Number is the symbol of causal necessity. Like the conception of God, it contains the ultimate meaning of the world-as- nature. The existence of numbers may therefore be called a mystery, and the religious thought of every Culture has felt their impress.[45]

Just as all becoming possesses the original property of _direction_ (irreversibility), all things-become possess the property of _extension_. But these two words seem unsatisfactory in that only an artificial distinction can be made between them. The real secret of all things-become, which are _ipso facto_ things extended (spatially and materially), is embodied in mathematical number as contrasted with chronological number. Mathematical number contains in its very essence the notion of a _mechanical demarcation_, number being in that respect akin to _word_, which, in the very fact of its comprising and denoting, fences off world-impressions. The deepest depths, it is true, are here both incomprehensible and inexpressible. But the actual number with which the mathematician works, the figure, formula, sign, diagram, in short the _number-sign which he thinks, speaks or writes exactly_, is (like the exactly-used word) from the first a symbol of these depths, something imaginable, communicable, comprehensible to the inner and the outer eye, which can be accepted as representing the demarcation. The origin of numbers resembles that of the myth. Primitive man elevates indefinable nature-impressions (the “alien,” in our terminology) into deities, _numina_, at the same time capturing and impounding them by a _name_ which limits them. So also numbers are something that marks off and captures nature-impressions, and it is by means of names and numbers that the human understanding obtains power over the world. In the last analysis, the number-language of a mathematic and the grammar of a tongue are structurally alike. Logic is always a kind of mathematic and vice versa. Consequently, in all acts of the intellect germane to mathematical number—measuring, counting, drawing, weighing, arranging and dividing[46]—men strive to delimit the extended in words as well, i.e., to set it forth in the form of proofs, conclusions, theorems and systems; and it is only through acts of this kind (which may be more or less unintentioned) that waking man begins to be able to use numbers, normatively, to specify objects and properties, relations and differentiæ, unities and pluralities—briefly, that structure of the world-picture which he feels as necessary and unshakable, calls “Nature” and “cognizes.” _Nature is the numerable_, while History, on the other hand, is the aggregate of that which has no relation to mathematics— hence the mathematical certainty of the laws of Nature, the astounding rightness of Galileo’s saying that Nature is “written in mathematical language,” and the fact, emphasized by Kant, that exact natural science reaches just as far as the possibilities of applied mathematics allow it to reach. In number, then, as the _sign of completed demarcation_, lies the _essence_ of everything actual, which is cognized, is delimited, and has become all at once—as Pythagoras and certain others have been able to see with complete inward certitude by a mighty and truly religious intuition. Nevertheless, mathematics—meaning thereby the capacity to think practically in figures—must not be confused with the far narrower scientific mathematics, that is, the _theory_ of numbers as developed in lecture and treatise. The mathematical vision and thought that a Culture possesses within itself is as inadequately represented by its written mathematic as its philosophical vision and thought by its philosophical treatises. Number springs from a source that has also quite other outlets. Thus at the beginning of every Culture we find an archaic style, which might fairly have been called geometrical in other cases as well as the Early Hellenic. There is a common factor which is expressly mathematical in this early Classical style of the 10th Century B.C., in the temple style of the Egyptian Fourth Dynasty with its absolutism of straight line and right angle, in the Early Christian sarcophagus- relief, and in Romanesque construction and ornament. Here every line, every deliberately non-imitative figure of man and beast, reveals a mystic number-thought in direct connexion with the mystery of death (the hard-set).

Gothic cathedrals and Doric temples are _mathematics in stone_. Doubtless Pythagoras was the first in the Classical Culture to conceive number scientifically as the principle of a world-order of comprehensible things—as _standard_ and as _magnitude_—but even before him it had found expression, as a noble arraying of sensuous-material units, in the strict canon of the statue and the Doric order of columns. The great arts are, one and all, modes of interpretation by means of limits based on number (consider, for example, the problem of space- representation in oil painting). A high mathematical endowment may, without any mathematical science whatsoever, come to fruition and full self-knowledge in _technical_ spheres.

In the presence of so powerful a number-sense as that evidenced, even in the Old Kingdom,[47] in the dimensioning of pyramid temples and in the technique of building, water-control and public administration (not to mention the calendar), no one surely would

maintain that the valueless arithmetic of Ahmes belonging to the New Empire represents the level of Egyptian mathematics. The Australian natives, who rank intellectually as thorough primitives, possess a mathematical instinct (or, what comes to the same thing, a power of thinking in numbers which is not yet communicable by signs or words) that as regards the interpretation of pure space is far superior to that of the Greeks. Their discovery of the boomerang can only be attributed to their having a sure feeling for numbers of a class that we should refer to the higher geometry. _Accordingly_—we shall justify the adverb later—they possess an extraordinarily complicated ceremonial and, for expressing degrees of affinity, such fine shades of language as not even the higher Cultures themselves can show.

There is analogy, again, between the Euclidean mathematic and the absence, in the Greek of the mature Periclean age, of any feeling either for ceremonial public life or for loneliness, while the Baroque, differing sharply from the Classical, presents us with a mathematic of spatial analysis, a court of Versailles and a state system resting on dynastic relations.

It is the style of a Soul that comes out in the world of numbers, and the world of numbers includes something more than the science thereof.

Footnote 47:

Dynasties I-VIII, or, effectively, I-VI. The Pyramid period coincides with Dynasties IV-VI. Cheops, Chephren and Mycerinus belong to the IV dynasty, under which also great water-control works were carried out between Abydos and the Fayum.—_Tr._

III

From this there follows a fact of decisive importance which has hitherto been hidden from the mathematicians themselves.

There is not, and cannot be, number as such. There are several number- worlds as there are several Cultures. We find an Indian, an Arabian, a Classical, a Western type of mathematical thought and, corresponding with each, a type of number—each type fundamentally peculiar and unique, an expression of a specific world-feeling, a symbol having a specific validity which is even capable of scientific definition, a principle of ordering the Become which reflects the central essence of one and only one soul, viz., the soul of that particular Culture. Consequently, there are more mathematics than one. For indubitably the inner structure of the Euclidean geometry is something quite different from that of the Cartesian, the analysis of Archimedes is something other than the analysis of Gauss, and not merely in matters of form, intuition and method but above all in essence, in the intrinsic and obligatory meaning of number which they respectively develop and set forth. This number, the horizon within which it has been able to make phenomena self- explanatory, and therefore the whole of the “nature” or world-extended that is confined in the given limits and amenable to its particular sort of mathematic, are not common to all mankind, but specific in each case to one definite sort of mankind.

The style of any mathematic which comes into being, then, depends wholly on the Culture in which it is rooted, the sort of mankind it is that ponders it. The soul can bring its inherent possibilities to scientific development, can manage them practically, can attain the highest levels in its treatment of them—but is quite impotent to alter them. The idea of the Euclidean geometry is actualized in the earliest forms of Classical ornament, and that of the Infinitesimal Calculus in the earliest forms of Gothic architecture, centuries before the first learned mathematicians of the respective Cultures were born.

A deep inward experience, the genuine _awakening of the ego_, which turns the child into the higher man and initiates him into community of his Culture, marks the beginning of number-sense as it does that of language-sense. It is only after this that objects come to exist for the waking consciousness as things limitable and distinguishable as to number and kind; only after this that properties, concepts, causal necessity, system in the world-around, _a form of the world_, and _world laws_ (for that which is set

and settled is _ipso facto_ bounded, hardened, number-governed) are susceptible of exact definition. And therewith comes too a sudden, almost metaphysical, feeling of anxiety and awe regarding the deeper meaning of measuring and counting, drawing and form.

Now, Kant has classified the sum of human knowledge according to syntheses _a priori_ (necessary and universally valid) and _a posteriori_ (experiential and variable from case to case) and in the former class has included mathematical knowledge. Thereby, doubtless, he was enabled to reduce a strong inward feeling to abstract form. But, quite apart from the fact (amply evidenced in modern mathematics and mechanics) that there is no such sharp distinction between the two as is originally and unconditionally implied in the principle, the _a priori_ itself, though certainly one of the most inspired conceptions of philosophy, is a notion that seems to involve enormous difficulties. With it Kant postulates—without attempting to prove what is quite incapable of proof—both _unalterableness of form_ in all intellectual activity and _identity of form for all men_ in the same. And, in consequence, a factor of incalculable importance is—thanks to the intellectual prepossessions of his period, not to mention his own—simply ignored. This factor is the _varying degree_ of this alleged “universal validity.” There are doubtless certain characters of very wide-ranging validity which are (seemingly at any rate) independent of the Culture and century to which the cognizing individual may belong, but along with these there is a quite particular necessity of form which underlies all his thought as axiomatic and to which he is subject by virtue of belonging to his own Culture and no other. Here, then, we have two very different kinds of _a priori_ thought-content, and the definition of a frontier between them, or even the demonstration that such exists, is a problem that lies beyond all possibilities of knowing and will never be solved. So far, no one has dared to assume that the supposed constant structure of the intellect is an illusion and that the history spread out before us contains more than one _style of knowing_. But we must not forget that unanimity about things that have not yet become problems may just as well imply universal error as universal truth. True, there has always been a certain sense of doubt and obscurity—so much so, that the correct guess might have been made from that non-agreement of the philosophers which every glance at the history of philosophy shows us. But that this non-agreement is not due to imperfections of the human intellect or present gaps in a perfectible knowledge, in a word, is not due to defect, but to destiny and historical necessity—this is a _discovery_. Conclusions on the deep and final things are to be reached not by predicating constants but by studying differentiæ and developing the _organic logic_ of differences. The _comparative morphology of knowledge forms_ is a domain which Western thought has still to attack.

IV

If mathematics were a mere science like astronomy or mineralogy, it would be possible to define their object. This man is not and never has been able to do. We West-Europeans may put our own scientific notion of number to perform the same tasks as those with which the mathematicians of Athens and Baghdad busied themselves, but the fact remains that the theme, the intention and the methods of the like-named science in Athens and in Baghdad were quite different from those of our own. _There is no mathematic but only mathematics._ What we call “the history of mathematics”—implying merely the progressive actualizing of a single invariable ideal—is in fact, below the deceptive surface of history, a complex of self-contained and independent developments, an ever-repeated process of bringing to birth new form-worlds and appropriating, transforming and sloughing alien form-worlds, a purely organic story of blossoming, ripening, wilting and dying within the set period. The student must not let himself be deceived. The mathematic of the Classical soul sprouted almost out of nothingness, the historically- constituted Western soul, already possessing the Classical science (not inwardly, but outwardly as a thing learnt), had to win its own by apparently altering and perfecting, but in reality destroying the essentially alien Euclidean system. In the first case, the agent was Pythagoras, in the second Descartes. In both cases the act is, at bottom, the same.

The relationship between the form-language of a mathematic and that of the cognate major arts,[48] is in this way put beyond doubt. The temperament of the thinker and that of the artist differ widely indeed, but the expression-methods of the waking consciousness are inwardly the same for each. The sense of form of the sculptor, the painter, the composer is essentially mathematical in its nature. The same inspired ordering of an infinite world which manifested itself in the geometrical analysis and projective geometry of the 17th Century, could vivify, energize, and suffuse contemporary music with the harmony that it developed out of the art of thoroughbass, (which is the geometry of the sound-world) and contemporary painting with the principle of perspective (the felt geometry of the space-world that only the West knows). This inspired ordering is that which Goethe called “_The Idea, of which the form is immediately apprehended in the domain of intuition_, whereas pure science does not apprehend but observes and dissects.” The Mathematic goes beyond observation and dissection, and in its highest moments finds the way by vision, not abstraction. To Goethe again we owe the profound saying: “the mathematician is only complete in so far as he feels within himself the _beauty_ of the true.” Here we feel how nearly the secret of number is related to the secret of artistic creation.

And so the born mathematician takes his place by the side of the great masters of the fugue, the chisel and the brush; he and they alike strive, and must strive, to actualize the grand order of all things by clothing it in symbol and so to communicate it to the plain fellow-man who hears that order within himself but cannot effectively possess it; the domain of number, like the domains of tone, line and colour, becomes an image of the world-form. For this reason the word “creative” means more in the mathematical sphere than it does in the pure sciences— Newton, Gauss, and Riemann were artist-natures, and we know with what suddenness their great conceptions came upon them.[49] “A mathematician,” said old Weierstrass “who is not at the same time a bit of a poet will never be a full mathematician.”

The mathematic, then, is an art. As such it has its styles and style- periods. It is not, as the layman and the philosopher (who is in this matter a layman too) imagine, substantially unalterable, but subject like every art to unnoticed changes from epoch to epoch. The development of the great arts ought never to be treated without an (assuredly not unprofitable) side-glance at contemporary mathematics. In the very deep relation between changes of musical theory and the analysis of the infinite, the details have never yet been investigated, although æsthetics might have learned a great deal more from these than from all so-called “psychology.” Still more revealing would be a history of musical instruments written, not (as it always is) from the technical standpoint of tone-production, but as a study of the deep spiritual bases of the tone-colours and tone-effects aimed at. For it was the wish, intensified to the point of a longing, to fill a spatial infinity with sound which produced—in contrast to the Classical lyre and reed (lyra, kithara; aulos, syrinx) and the Arabian lute—the two great families of keyboard instruments (organ, pianoforte, etc.) and bow instruments, and that as early as the Gothic time. The development of both these families belongs spiritually (and possibly also in point of technical origin) to the Celtic-Germanic North lying between Ireland, the Weser and the Seine. The organ and clavichord belong certainly to England, the bow instruments reached their definite forms in Upper Italy between 1480 and 1530, while it was principally in Germany that the organ was developed into the _space-commanding_ giant that we know, an instrument the like of which does not exist in all musical history. The free organ-playing of Bach and his time was nothing if it was not analysis—analysis of a strange and vast tone-world. And, similarly, it is in conformity with the Western number-thinking, and in opposition to the Classical, that our string and wind instruments have been developed not singly but in great groups (strings, woodwind, brass), ordered within themselves according to the compass of the four human voices; the history of the modern orchestra, with all its discoveries of new and modification of old instruments, is in reality the self-contained history of one tone-world—a world, moreover, that is quite capable of being expressed in the forms of the higher analysis.

V

When, about 540 B.C., the circle of the Pythagoreans arrived at the idea that _number is the essence of all things_, it was not “a step in the development of mathematics” that was made, but a wholly new mathematic that was born. Long heralded by metaphysical problem-posings and artistic form-tendencies, now it came forth from the depths of the Classical soul as a formulated theory, a mathematic born in one act at one great historical moment—just as the mathematic of the Egyptians had been, and the algebra-astronomy of the Babylonian Culture with its ecliptic co-ordinate system—and new—for these older mathematics had long been extinguished and the Egyptian was never written down. Fulfilled by the 2nd century A.D., the Classical mathematic vanished in its turn (for though it seemingly exists even to-day, it is only as a convenience of notation that it does so), and gave place to the Arabian. From what we know of the Alexandrian mathematic, it is a necessary presumption that there was a great movement within the Middle East, of which the centre of gravity must have lain in the Persian-Babylonian schools (such as Edessa, Gundisapora and Ctesiphon) and of which only details found their way into the regions of Classical speech. In spite of their Greek names, the Alexandrian mathematicians—Zenodorus who dealt with figures of equal perimeter, Serenus who worked on the properties of a harmonic pencil in space, Hypsicles who introduced the Chaldean circle-division, Diophantus above all—were all without doubt Aramæans, and their works only a small part of a literature which was written principally in Syriac. This mathematic found its completion in the investigations of the Arabian- Islamic thinkers, and after these there was again a long interval. And then a perfectly new mathematic was born, the Western, _our own_, which in our infatuation we regard as “Mathematics,” as the culmination and the implicit purpose of two thousand years’ evolution, though in reality its centuries are (strictly) numbered and to-day almost spent.

The most valuable thing in the Classical mathematic is its proposition that number is the essence of all things _perceptible to the senses_. Defining number as a measure, it contains the whole world-feeling of a soul passionately devoted to the “here” and the “now.” Measurement in this sense means the measurement of something near and corporeal. Consider the content of the Classical art-work, say the free-standing statue of a naked man; here every essential and important element of Being, its whole rhythm, is exhaustively rendered by surfaces, dimensions and the sensuous relations of the parts. The Pythagorean notion of the harmony of

numbers, although it was probably deduced from music—a music, be it noted, that knew not polyphony or harmony, and formed its instruments to render single plump, almost fleshy, tones— seems to be the very mould for a sculpture that has this ideal. The worked stone is only a something in so far as it has considered limits and measured form; what it _is_ is what it _has become_ under the sculptor's chisel. Apart from this it is a _chaos_, something not yet actualized, in fact for the time being a null. The same feeling transferred to the grander stage produces, as an opposite to the state of chaos, that of _cosmos_, which for the Classical soul implies a cleared-up situation of the external world, a harmonic order which includes each separate thing as a well-defined, comprehensible and present entity. The sum of such things constitutes neither more nor less than the whole world, and the interspaces between them, which for us are filled with the impressive symbol of the Universe of Space, are for them the nonent (τ■ μ■ ■ν).

Extension means, for Classical mankind body, and for us space, and it is as a function of space that, to us, things "appear." And, looking backward from this standpoint, we may perhaps see into the deepest concept of the Classical metaphysics, Anaximander's ■πειρον—a word that is quite untranslatable into any Western tongue. It is that which possesses no "number" in the Pythagorean sense of the word, no measurable dimensions or definable limits, and therefore no being; the measureless, the negation of form, the statue not yet carved out of the block; the ■ρχ■ optically boundless and formless, which only becomes a something (namely, the world) after being split up by the senses. It is the underlying form _a priori_ of Classical cognition, bodiliness as such, which is replaced exactly in the Kantian world-picture by that Space out of which Kant maintained that all things could be "thought forth."

We can now understand what it is that divides one mathematic from another, and in particular the Classical from the Western. The whole world-feeling of the matured Classical world led it to see mathematics only as the theory of relations of magnitude, dimension and form between bodies. When, from out of this feeling, Pythagoras evolved and expressed the decisive formula, number had come, for him, to be an _optical_ symbol—not a measure of form generally, an abstract relation, but a frontier-post of the domain of the Become, or rather of that part of it which the senses were able to split up and pass under review. By the whole Classical world without exception numbers are conceived as units of measure, as magnitude, lengths, or surfaces, and for it no other sort of extension is imaginable. The whole Classical mathematic is at bottom _Stereometry_ (solid geometry). To Euclid, who rounded off its system in the third century, the triangle is of deep necessity the bounding surface of a body, never a system of three intersecting straight lines or a group of three points in three-dimensional space. He defines a line as "length without breadth" (μ■κος ■πλατ■ς). In our mouths such a definition would be pitiful—in the Classical mathematic it was brilliant.

The Western number, too, is not, as Kant and even Helmholtz thought, something proceeding out of Time as an _a priori_ form of conception, but is something specifically spatial, in that it is an order (or ordering) of like units. Actual time (as we shall see more and more clearly in the sequel) has not the slightest relation with mathematical things. Numbers belong exclusively to the domain of extension. But there are precisely as many possibilities—and therefore necessities—of ordered presentation of the extended as there are Cultures. Classical number is a thought-process dealing not with spatial relations but with visibly limitable and tangible units, and it follows naturally and necessarily that the Classical knows only the "natural" (positive and whole) numbers, which on the contrary play in our Western mathematics a quite undistinguished part in the midst of complex, hypercomplex, non- Archimedean and other number-systems.

On this account, the idea of irrational numbers—the unending decimal fractions of our notation—was unrealizable within the Greek spirit. Euclid says—and he ought to have been better understood—that incommensurable lines are "_not related to one another like numbers_." In fact, it is the idea of irrational number that, once achieved, separates the notion of number from that of magnitude, for the magnitude of such a number (π, for example) can never be defined or exactly represented by any straight line. Moreover, it follows from this that in considering the relation, say, between diagonal and side in a square the Greek would be brought up suddenly against a quite other sort of number, which was fundamentally alien to the Classical soul, and was consequently feared as a secret of its proper existence too dangerous to be unveiled. There is a singular and significant late-Greek legend, according to which the man who first published the hidden mystery of the irrational perished by shipwreck, "for the unspeakable and the formless must be left hidden for ever."[50]

The fear that underlies this legend is the selfsame notion that prevented even the ripest Greeks from extending their tiny city-states so as to organize the country-side politically, from laying out their streets to end in prospects and their alleys to give vistas, that made them recoil time and again from the Babylonian astronomy with its penetration of endless starry space,[51] and refuse to venture out of the Mediterranean along sea-paths long before dared by the Phœnicians and the Egyptians. It is the deep metaphysical fear that the sense- comprehensible and present in which the Classical existence had entrenched itself would collapse and precipitate its cosmos (largely created and sustained by art) into unknown primitive abysses. And to understand this

fear is to understand the final significance of Classical number—that is, _measure in contrast to the immeasurable_—and to grasp the high ethical significance of its limitation. Goethe too, as a nature-student, felt it—hence his almost terrified aversion to mathematics, which as we can now see was really an involuntary reaction against the _non-Classical_ mathematic, the Infinitesimal Calculus which underlay the natural philosophy of his time.

Religious feeling in Classical man focused itself ever more and more intensely upon physically present, _localized_ cults which alone expressed a college of Euclidean deities. Abstractions, _dogmas_ floating homeless in the space of thought, were ever alien to it. A cult of this kind has as much in common with a Roman Catholic dogma as the statue has with the cathedral organ. There is no doubt that something of cult was comprised in the Euclidean mathematic—consider, for instance, the secret doctrines of the Pythagoreans and the Theorems of regular polyhedrons with their esoteric significance in the circle of Plato. Just so, there is a deep relation between Descartes' analysis of the infinite and contemporary dogmatic theology as it progressed from the final decisions of the Reformation and the Counter-Reformation to entirely desensualized deism. Descartes and Pascal were mathematicians and Jansenists, Leibniz a mathematician and pietist. Voltaire, Lagrange and D'Alembert were contemporaries. Now, the Classical soul felt the principle of the irrational, which overturned the statuesquely-ordered array of whole numbers and the complete and self-sufficing world-order for which these stood, as an impiety against the Divine itself. In Plato's "Timæus" this feeling is unmistakable. For the transformation of a series of discrete numbers into a continuum challenged not merely the Classical notion of number but the Classical world-idea itself, and so it is understandable that even _negative_ numbers, which to us offer no conceptual difficulty, were impossible in the Classical mathematic, let alone _zero as a number_, that refined creation of a wonderful abstractive power which, for the Indian soul that conceived it as base for a positional numeration, was nothing more nor less than the key to the meaning of existence. _Negative magnitudes_ have no existence. The expression -2×-3=+6 is neither something perceivable nor a representation of magnitude. The series of magnitudes ends with +1, and in graphic representation of negative numbers

(+ 3 + 2 + 1 0 - 1 - 2 - 3) — ■ — ■ — ■ ■ — ■ — ■ — ■

we have suddenly, from zero onwards, _positive_ symbols of something negative; they _mean_ something, but they no longer _are_. But the fulfilment of this act did not lie within the direction of Classical number-thinking.

Every product of the waking consciousness of the Classical world, then, is elevated to the rank of actuality by way of sculptural definition. That which cannot be drawn is not "number." Archytas and Eudoxus use the terms surface- and volume-numbers to mean what we call second and third powers, and it is easy to understand that the notion of higher integral powers did not exist for them, for a fourth power would predicate at once, for the mind based on the plastic feeling, an extension in four dimensions, and four _material_ dimensions into the bargain, "which is absurd." Expressions like ε^{ix} which we constantly use, or even the fractional index (e.g., 5^½) which is employed in the Western mathematics as early as Oresme (14th Century), would have been to them utter nonsense. Euclid calls the factors of a product its sides πλευρα■ and fractions (finite of course) were treated as whole-number relationships between two lines. Clearly, out of this no conception of zero as a number could possibly come, for from the point of view of a draughtsman it is meaningless. We, having minds differently constituted, must not argue from our habits to theirs and treat their mathematic as a "first stage" in the development of "Mathematics." Within and for the purposes of the world that Classical man evolved for himself, the Classical mathematic was a complete thing—it is merely not so _for us_. Babylonian and Indian mathematics had long contained, as essential elements of _their_ number-worlds, things which the Classical number-feeling regarded as nonsense—and not from ignorance either, since many a Greek thinker was acquainted with them. It must be repeated, "Mathematics" is an illusion. A mathematical, and, generally, a scientific way of thinking is right, convincing, a "necessity of thought," when it completely expresses the life-feeling proper to it. Otherwise it is either impossible, futile and senseless, or else, as we in the arrogance of our historical soul like to say, "primitive." The modern mathematic, though "true" only for the Western spirit, is undeniably a master-work of that spirit; and yet to Plato it would have seemed a ridiculous and painful aberration from the path leading to the "true"—to wit, the Classical—mathematic. And so with ourselves. Plainly, we have almost no notion of the multitude of great ideas belonging to other Cultures that we have suffered to lapse because _our_ thought with its limitations has not permitted us to assimilate them, or (which comes to the same thing) has led us to reject them as false, superfluous, and nonsensical.

VI

The Greek mathematic, as a science of perceivable magnitudes, deliberately confines itself to facts of the comprehensibly present, and limits its researches and their validity to the near and the small. As compared with this impeccable consistency, the position of

the Western mathematic is seen to be, practically, somewhat illogical, though it is only since the discovery of Non-Euclidean Geometry that the fact has been really recognized. Numbers are images of the perfectly desensualized understanding, of pure thought, and contain their abstract validity within themselves.[52] Their exact application to the actuality of conscious experience is therefore a problem in itself—a problem which is always being posed anew and never solved—and the congruence of mathematical system with empirical observation is at present anything but self-evident. Although the lay idea—as found in Schopenhauer—is that mathematics rest upon the direct evidences of the senses, Euclidean geometry, superficially identical though it is with the popular geometry of all ages, is only in agreement with the phenomenal world approximately and within very narrow limits—in fact, the limits of a drawing-board. Extend these limits, and what becomes, for instance, of Euclidean parallels? They meet at the line of the horizon—a simple fact upon which all our art-perspective is grounded.

Now, it is unpardonable that Kant, a Western thinker, should have evaded the mathematic of distance, and appealed to a set of figure-examples that their mere pettiness excludes from treatment by the specifically Western infinitesimal methods. But Euclid, as a thinker of the Classical age, was entirely consistent with its spirit when he refrained from proving the phenomenal truth of his axioms by referring to, say, the triangle formed by an observer and two infinitely distant fixed stars. For these can neither be drawn nor “intuitively apprehended” and his feeling was precisely the feeling which shrank from the irrationals, which did not dare to give nothingness a value as zero (i.e., a number) and even in the contemplation of cosmic relations shut its eyes to the Infinite and held to its symbol of Proportion.

Aristarchus of Samos, who in 288-277 belonged to a circle of astronomers at Alexandria that doubtless had relations with Chaldaeo-Persian schools, projected the elements of a heliocentric world-system.[53] Rediscovered by Copernicus, it was to shake the metaphysical passions of the West to their foundations—witness Giordano Bruno[54]—to become the fulfilment of mighty premonitions, and to justify that Faustian, Gothic world-feeling which had already professed its faith in infinity through the forms of its cathedrals. But the world of Aristarchus received his work with entire indifference and in a brief space of time it was forgotten—designedly, we may surmise. His few followers were nearly all natives of Asia Minor, his most prominent supporter Seleucus (about 150) being from the Persian Seleucia on Tigris. In fact, the Aristarchian system had no spiritual appeal to the Classical Culture and might indeed have become dangerous to it. And yet it was differentiated from the Copernican (a point always missed) by something which made it perfectly conformable to the Classical world-feeling, viz., the assumption that the cosmos is _contained_ in a materially finite and optically appreciable _hollow sphere_, in the middle of which the planetary system, arranged as such on Copernican lines, moved. In the Classical astronomy, the earth and the heavenly bodies are consistently regarded as entities of two different kinds, however variously their movements in detail might be interpreted. Equally, the opposite idea that the earth is _only a star among stars_[55] is not inconsistent in itself with either the Ptolemaic or the Copernican systems and in fact was pioneered by Nicolaus Cusanus and Leonardo da Vinci. But by this device of a celestial sphere the principle of infinity which would have endangered the sensuous-Classical notion of bounds was smothered. One would have supposed that the infinity-conception was inevitably implied by the system of Aristarchus—long before his time, the Babylonian thinkers had reached it. But no such thought emerges. On the contrary, in the famous treatise on the grains of sand[56] Archimedes proves that the filling of this stereometric body (for that is what Aristarchus’s Cosmos is, after all) with atoms of sand leads to very high, but _not_ to infinite, figure-results. This proposition, quoted though it may be, time and again, as being a first step towards the Integral Calculus, amounts to a denial (implicit indeed in the very title) of everything that we mean by the word analysis. Whereas in our physics, the constantly-surging hypotheses of a material (i.e., directly cognizable) æther, break themselves one after the other against our refusal to acknowledge material limitations of any kind, Eudoxus, Apollonius and Archimedes, certainly the keenest and boldest of the Classical mathematicians, completely worked out, in the main with rule and compass, a _purely optical_ analysis of things-become on the basis of sculptural-Classical bounds. They used deeply-thought-out (and for us hardly understandable) methods of integration, but these possess only a superficial resemblance even to Leibniz’s definite-integral method. They employed geometrical loci and co-ordinates, but these are always specified lengths and units of measurement and never, as in Fermat and above all in Descartes, unspecified spatial relations, values of points in terms of their positions in space. With these methods also should be classed the exhaustion-method of Archimedes,[57] given by him in his recently discovered letter to Eratosthenes on such subjects as the quadrature of the parabola section by means of inscribed rectangles (instead of through similar polygons). But the very subtlety and extreme complication of his methods, which are grounded in certain of Plato’s geometrical ideas, make us realize, in spite of superficial analogies, what an enormous difference separates him from Pascal. Apart altogether from the idea of Riemann’s integral, what sharper contrast could there be to these ideas than the so-called quadratures of to-day? The name itself is now no more than an unfortunate survival, the “surface” is indicated by a bounding function, and the _drawing_ as such, has vanished. Nowhere else did the two mathematical minds approach each other more closely than in this instance, and nowhere is it

more evident that the gulf between the two souls thus expressing themselves is impassable.

In the cubic style of their early architecture the Egyptians, so to say, concealed pure numbers, fearful of stumbling upon their secret, and for the Hellenes too they were the key to the meaning of the become, the stiffened, the mortal. The stone statue and the scientific system deny life. Mathematical number, the formal principle of an extension-world of which the phenomenal existence is only the derivative and servant of waking human consciousness, bears the hall-mark of causal necessity and so is linked with _death_ as chronological number is with becoming, with _life_, with the necessity of destiny. This connexion of strict mathematical form with the _end_ of organic being, with the phenomenon of its organic remainder the corpse, we shall see more and more clearly to be the origin of all great art. We have already noticed the development of early ornament on funerary equipments and receptacles. _Numbers are symbols of the mortal._ Stiff forms are the negation of life, formulas and laws spread rigidity over the face of nature, numbers make dead—and the “Mothers” of Faust II sit enthroned, majestic and withdrawn, in

“The realms of Image unconfined. ... Formation, transformation, Eternal play of the eternal mind With semblances of all things in creation For ever and for ever sweeping round.”[58]

Goethe draws very near to Plato in this divination of one of the final secrets. For his unapproachable Mothers are Plato’s Ideas—the possibilities of a spirituality, the unborn forms to be realized as active and purposed Culture, as art, thought, polity and religion, in a world ordered and determined by that spirituality. And so the number- thought and the world-idea of a Culture are related, and by this relation, the former is elevated above mere knowledge and experience and becomes a view of the universe, there being consequently as many mathematics—as many number-worlds—as there are higher Cultures. Only so can we understand, as something _necessary_, the fact that the greatest mathematical thinkers, the creative artists of the realm of numbers, have been brought to the decisive mathematical discoveries of their several Cultures by a deep religious intuition.

Classical, Apollinian number we must regard as the creation of Pythagoras—_who founded a religion_. It was an instinct that guided Nicolaus Cusanus, the great Bishop of Brixen (about 1450), from the idea of the unendingness of God in nature to the elements of the Infinitesimal Calculus. Leibniz himself, who two centuries later definitely settled the methods and notation of the Calculus, was led by purely metaphysical speculations about the divine principle and its relation to infinite extent to conceive and develop the notion of an _analysis situs_—probably the most inspired of all interpretations of pure and emancipated space—the possibilities of which were to be developed later by Grassmann in his _Ausdehnungslehre_ and above all by Riemann, their real creator, in his symbolism of two-sided planes representative of the nature of equations. And Kepler and Newton, strictly religious natures both, were and remained convinced, like Plato, that it was precisely through the medium of number that they had been able to apprehend intuitively the essence of the divine world- order.

VII

The Classical arithmetic, we are always told, was first liberated from its sense-bondage, widened and extended by Diophantus, who did not indeed create algebra (the science of undefined magnitudes) but brought it to expression within the framework of the Classical mathematic that we know—and so suddenly that we have to assume that there was a pre- existent stock of ideas which he worked out. But this amounts, not to an enrichment of, but a complete victory over, the Classical world-feeling, and the mere fact should have sufficed in itself to show that, inwardly, Diophantus does not belong to the Classical Culture at all. What is active in him is a new number-feeling, or let us say a new limit-feeling with respect to the actual and become, and no longer that Hellenic feeling of sensuously-present limits which had produced the Euclidean geometry, the nude statue and the coin. Details of the formation of this new mathematic we do not know—Diophantus stands so completely by himself in the history of so-called late-Classical mathematics that an Indian influence has been presumed. But here also the influence it must really have been that of those early-Arabian schools whose studies (apart from the dogmatic) have hitherto been so imperfectly investigated. In Diophantus, unconscious though he may be of his own essential antagonism to the Classical foundations on which he attempted to build, there emerges from under the surface of Euclidean _intention_ the new limit- _feeling_ which I designate the “Magian.” He did not widen the idea of number as magnitude, but (unwittingly) eliminated it. No Greek could have stated anything about an _undefined_ number _a_ or an _undenominated_ number 3—which are neither magnitudes nor lines—whereas the new limit-feeling sensibly expressed by numbers of this sort at least underlay, if it did not constitute, Diophantine treatment; and the letter-notation which we employ to clothe our own (again transvalued) algebra was first introduced by Vieta in 1591, an unmistakable, if unintended, protest against the classicizing tendency of Renaissance mathematics.

Diophantus lived about 250 A.D., _that is, in the third century of that Arabian Culture_ whose organic history, till now smothered under the surface-forms of the Roman Empire and the “Middle Ages,”[59] comprises everything that happened after the beginning of our era in the region that was later to be Islam’s. It was precisely in the time of Diophantus that the last shadow of the Attic statuary art paled before the new space-sense of cupola, mosaic and sarcophagus-relief that we have in the Early-Christian-Syrian style. In that time there was once more _archaic_ art and strictly geometrical ornament; and at that time too Diocletian completed the transformation of the now merely sham Empire into a Caliphate. The four centuries that separate Euclid and Diophantus, separate also Plato and Plotinus—the last and conclusive thinker, the Kant, of a fulfilled Culture and the first schoolman, the Duns Scotus, of a Culture just awakened.

It is here that we are made aware for the first time of the existence of those higher individualities whose coming, growth and decay constitute the _real substance of history_ underlying the myriad colours and changes of the surface. The Classical spirituality, which reached its final phase in the cold intelligence of the Romans and of which the whole Classical Culture with all its works, thoughts, deeds and ruins forms the “body,” had been born about 1100 B.C. in the country about the Ægean Sea. The Arabian Culture, which, under cover of the Classical Civilization, had been germinating in the East since Augustus, came wholly out of the region between Armenia and Southern Arabia, Alexandria and Ctesiphon, and we have to consider as expressions of this new soul almost the whole “late-Classical” art of the Empire, all the young ardent religions of the East—Mandæanism, Manichæism, Christianity, Neo- Platonism, and in Rome itself, as well as the Imperial Fora, that Pantheon which is the _first of all mosques_.

That Alexandria and Antioch still wrote in Greek and imagined that they were thinking in Greek is a fact of no more importance than the facts that Latin was the scientific language of the West right up to the time of Kant and that Charlemagne “renewed” the Roman Empire.

In Diophantus, number has ceased to be the measure and essence of _plastic things_. In the Ravennate mosaics man has ceased to be a _body_. Unnoticed, Greek designations have lost their original connotations. We have left the realm of Attic καλοκ■γαθ■α the Stoic ■ταραξ■α and γαλ■νη. Diophantus does not yet know zero and negative numbers, it is true, but he has _ceased_ to know Pythagorean numbers. And this Arabian indeterminateness of number is, in its turn, something quite different from the controlled variability of the later Western mathematics, the variability of the _function_.

The Magian mathematic—we can see the outline, though we are ignorant of the details—advanced through Diophantus (who is obviously not a starting-point) boldly and logically to a culmination in the Abbassid period (9th century) that we can appreciate in Al-Khwarizmi and Alsidzshi. And as Euclidean geometry is to Attic statuary (the same expression-form in a different medium) and the analysis of space to polyphonic music, so this algebra is to the Magian art with its mosaic, its arabesque (which the Sassanid Empire and later Byzantium produced with an ever-increasing profusion and luxury of tangible-intangible organic motives) and its Constantinian high-relief in which uncertain deep-darks divide the freely-handled figures of the foreground. As algebra is to Classical arithmetic and Western analysis, so is the cupola-church to the Doric temple and the Gothic cathedral. It is not as though Diophantus were one of the great mathematicians. On the contrary, much of what we have been accustomed to associate with his name is not his work alone. His accidental importance lies in the fact that, so far as our knowledge goes, he was the first mathematician in whom the new number-feeling is unmistakably present. In comparison with the masters who _conclude_ the development of a mathematic—with Apollonius and Archimedes, with Gauss, Cauchy, Riemann—Diophantus has, in his form-language especially, something _primitive_. This something, which till now we have been pleased to refer to “late-Classical” decadence, we shall presently learn to understand and value, just as we are revising our ideas as to the despised “late-Classical” art and beginning to see in it the tentative expression of the nascent Early Arabian Culture. Similarly archaic, primitive, and groping was the mathematic of Nicolas Oresme, Bishop of Lisieux (1323-1382),[60] who was the first Western who used co-ordinates so to say elastically[61] and, more important still, to employ fractional powers—both of which presuppose a number-feeling, obscure it may be but quite unmistakable, which is completely non- Classical and _also_ non-Arabic. But if, further, we think of Diophantus together with the early-Christian sarcophagi of the Roman collections, and of Oresme together with the Gothic wall-statuary of the German cathedrals, we see that the mathematicians as well as the artists have something in common, which is, that they stand in their respective Cultures at _the same_ (viz., the primitive) level of abstract understanding. In the world and age of Diophantus the stereometric sense of bounds, which had long ago reached in Archimedes the last stages of refinement and elegance proper to the megalopolitan intelligence, had passed away. Throughout that world men were unclear, longing, mystic, and no longer bright and free in the Attic way; they were men rooted in the earth of a young country-side, not megalopolitans like Euclid and D’Alembert.[62] They no longer understood the deep and complicated forms of the Classical thought, and their own were confused and new, far as yet from urban clarity and tidiness. Their Culture was in the _Gothic_ condition, as all Cultures have been in their youth—as even

the Classical was in the early Doric period which is known to us now only by its Dipylon pottery. Only in Baghdad and in the 9th and 10th Centuries were the young ideas of the age of Diophantus carried through to completion by ripe masters of the calibre of Plato and Gauss.

As also those of law and of money. See Vol. II, pp. 68 et seq., pp. 616 et seq.

Footnote 49:

Poincaré in his _Science et Méthode_ (Ch. III), searchingly analyses the “becoming” of one of his own mathematical discoveries. Each decisive stage in it bears “_les mêmes caractères de brièveté, de soudaineté et de certitude absolue_” and in most cases this “_certitude_” was such that he merely registered the discovery and put off its working-out to any convenient season.—_Tr._

Footnote 50:

One may be permitted to add that according to legend, both Hippasus who took to himself public credit for the discovery of a sphere of twelve pentagons, viz., the regular dodecahedron (regarded by the Pythagoreans as the quintessence—or æther—of a world of real tetrahedrons, octahedrons, icosahedrons and cubes), and Archytas the eighth successor of the Founder are reputed to have been drowned at sea. The pentagon from which this dodecahedron is derived, itself involves incommensurable numbers. The “pentagram” was the recognition badge of Pythagoreans and the ■λογον (incommensurable) their special secret. It would be noted, too, that Pythagoreanism was popular till its initiates were found to be dealing in these alarming and subversive doctrines, and then they were suppressed and lynched—a persecution which suggests more than one deep analogy with certain heresy-suppressions of Western history. The English student may be referred to G. J. Allman, _Greek Geometry from Thales to Euclid_ (Cambridge, 1889), and to his articles “Pythagoras,” “Philolaus” and “Archytas” in the _Ency. Brit._, XI Edition.—_Tr._

Alexandria ceased to be a world-city in the second century A.D. and became a collection of houses left over from the Classical civilization which harboured a primitive population of quite different spiritual constitution. See Vol. II, pp. 122 et seq.

VIII

The decisive act of Descartes, whose geometry appeared in 1637, consisted not in the introduction of a new method or idea in the domain of traditional geometry (as we are so frequently told), but in the definitive conception of _a new number-idea_, which conception was expressed in the emancipation of geometry from servitude to optically- realizable constructions and to measured and measurable lines generally. With that, the analysis of the infinite became a fact. The rigid, so- called Cartesian, system of co-ordinates—a semi-Euclidean method of ideally representing measurable magnitudes—had long been known (witness Oresme) and regarded as of high importance, and when we get to the bottom of Descartes' thought we find that what he did was not to round off the system but to overcome it. Its last historic representative was Descartes' contemporary Fermat.[63]

In place of the sensuous element of concrete lines and planes—the specific character of the Classical feeling of bounds—there emerged the abstract, spatial, un-Classical element of the _point_ which from then on was regarded as a group of co-ordered pure numbers. The idea of magnitude and of perceivable dimension derived from Classical texts and Arabian traditions was destroyed and replaced by that of variable relation-values between positions in space. It is not in general realized that this amounted to the _supersession of geometry_, which thenceforward enjoyed only a fictitious existence behind a façade of Classical tradition. The word "geometry" has an inextensible Apollinian meaning, and from the time of Descartes what is called the "new geometry" is made up in part of synthetic work upon the _position_ of _points_ in a space which is no longer necessarily three-dimensional (a "manifold of points"), and in part of analysis, in which numbers are defined through point-positions in space. And this replacement of lengths by positions carries with it a purely spatial, and no longer a material, conception of extension.

The clearest example of this destruction of the inherited optical-finite geometry seems to me to be the conversion of angular functions—which in the Indian mathematic had been numbers (in a sense of the word that is hardly accessible to our minds)—into _periodic_ functions, and their passage thence into an infinite number-realm, in which they become series and not the smallest trace remains of the Euclidean figure. In all parts of that realm the circle-number π, like the Napierian base ε, generates relations of all sorts which obliterate all the old distinctions of geometry, trigonometry and algebra, which are neither arithmetical nor geometrical in their nature, and in which no one any longer dreams of actually drawing circles or working out powers.

IX

At the moment exactly corresponding to that at which (c. 540) the Classical Soul in the person of Pythagoras discovered its own proper Apollinian number, the measurable magnitude, the Western soul in the persons of Descartes and his generation (Pascal, Fermat, Desargues) discovered a notion of number that was the child of a passionate _Faustian_ tendency towards the infinite. Number as _pure magnitude_ inherent in the material presentness of things is paralleled by numbers as _pure relation_,[64] and if we may characterize the Classical "world," the cosmos, as being based on a deep need of visible limits and composed accordingly as a sum of material things, so we may say that our world-picture is an actualizing of an infinite space in which things visible appear very nearly as realities of a lower order, limited in the presence of the illimitable. The symbol of the West is an idea of which no other Culture gives even a hint, the idea of _Function_. The function is anything rather than an expansion of, it is complete emancipation from, any pre-existent idea of number. With the function, not only the Euclidean geometry (and with it the common human geometry of children and laymen, based on everyday experience) but also the Archimedean arithmetic, ceased to have any value for the really _significant_ mathematic of Western Europe. Henceforward, this consisted solely in abstract analysis. For Classical man geometry and arithmetic were self- contained and complete sciences of the highest rank, both phenomenal and both concerned with magnitudes that could be drawn or numbered. For us, on the contrary, those things are only practical auxiliaries of daily life. Addition and multiplication, the two Classical methods of reckoning magnitudes, have, like their sister geometrical-drawing, utterly vanished in the infinity of functional processes. Even the power, which in the beginning denotes numerically a set of multiplications (products of equal magnitudes), is, through the exponential idea (logarithm) and its employment in complex, negative and fractional forms, dissociated from all connexion with magnitude and transferred to a transcendent relational world which the Greeks, knowing only the two positive whole-number powers that represent areas and volumes, were unable to approach. Think, for instance, of expressions like ε^{-x}, $\sqrt[\pi]{x}$, $\alpha^{1/i}$.

Every one of the significant creations which succeeded one another so rapidly from the Renaissance onward—imaginary and complex numbers, introduced by Cardanus as early as 1550; infinite series, established theoretically by Newton's great discovery of the binomial theorem in 1666; the differential geometry, the definite integral of Leibniz; the aggregate as a new number-unit, hinted at even by Descartes; new processes like those of general integrals; the expansion of functions into series and even into infinite series of other functions—is a victory over the popular and sensuous number-feeling in us, a victory which the new mathematic had to win in order to make the new world- feeling actual.

In all history, so far, there is no second example of one Culture paying to another Culture long extinguished such reverence and submission in matters of science as ours has paid to the Classical. It was very long before we found courage to think our proper thought. But though the wish to emulate the Classical was constantly present, every step of the attempt took us in reality further away from the imagined ideal. The history of Western knowledge is thus one of _progressive emancipation_ from Classical thought, an emancipation never willed but enforced in the depths of the unconscious. _And so the development of the new mathematic consists of a long, secret and finally victorious battle against the notion of magnitude._[65]

Footnote 64:

Similarly, coinage and double-entry book-keeping play analogous parts in the money-thinking of the Classical and the Western Cultures respectively. See Vol. II, pp. 610 et seq.

Footnote 65:

The same may be said in the matter of Roman Law (see Vol. II, pp. 96 et seq.) and of coinage (see Vol. II, pp. 616 et seq.).

X

One result of this Classicizing tendency has been to prevent us from finding the new notation proper to our Western number as such. The present-day sign-language of mathematics perverts its real content. It is principally owing to that tendency that the belief in numbers as magnitudes still rules to-day even amongst mathematicians, for is it not the base of all our written notation?

But it is not the separate signs (e.g., χ, π, ς) serving to express the functions _but the function itself as unit_, as element, the variable relation no longer capable of being optically defined, that constitutes the new number; and this new number should have

demanded a new notation built up with entire disregard of Classical influences. Consider the difference between two equations (if the same word can be used of two such dissimilar things) such as 3^x + 4^x = 5^x and x^n + y^n = z^n (the equation of Fermat's theorem). The first consists of several Classical numbers—i.e., magnitudes—but the second is _one number_ of a different sort, veiled by being written down according to Euclidean-Archimedean tradition in the identical form of the first. In the first case, the sign = establishes a rigid connexion between definite and tangible magnitudes, but in the second it states that within a domain of variable images there exists a relation such that from certain alterations certain other alterations necessarily follow. The first equation has as its aim the specification by measurement of a concrete magnitude, viz., a "result," while the second has, in general, no result but is simply the picture and sign of a relation which for n>2 (this is the famous Fermat problem[66]) _can probably be shown to_ exclude integers. A Greek mathematician would have found it quite impossible to understand the purport of an operation like this, which was not meant to be "worked out."

As applied to the letters in Fermat's equation, the notion of the unknown is completely misleading. In the first equation _x_ is a magnitude, defined and measurable, which it is our business to compute. In the second, the word "defined" has no meaning at all for _x_, _y_, _z_, _n_, and consequently we do not attempt to compute their "values." Hence they are not numbers at all in the plastic sense but signs representing a connexion that is destitute of the hallmarks of magnitude, shape and unique meaning, an infinity of possible positions of like character, an ensemble unified and so attaining existence as a _number_. The whole equation, though written in our unfortunate notation as a plurality of terms, is actually _one single_ number, _x_, _y_, _z_ being no more numbers than + and = are.

In fact, directly the essentially anti-Hellenic idea of the irrationals is introduced, the foundations of the idea of number as concrete and definite collapse. Thenceforward, the series of such numbers is no longer a visible row of increasing, discrete, numbers capable of plastic embodiment but a unidimensional _continuum_ in which each "cut" (in Dedekind's sense) represents a number. Such a number is already difficult to reconcile with Classical number, for the Classical mathematic knows only _one_ number between 1 and 3, whereas for the Western the totality of such numbers is an infinite aggregate. But when we introduce further the imaginary (√-1 or _i_) and finally the complex numbers (general form _a_ + _bi_), the linear continuum is broadened into the highly transcendent form of a number-body, i.e., the content of an aggregate of homogeneous elements in which a "cut" now stands for a number-surface containing an infinite aggregate of numbers of a lower "potency" (for instance, all the real numbers), and there remains not a trace of number in the Classical and popular sense. These number- surfaces, which since Cauchy and Riemann have played an important part in the theory of functions, are _pure thought-pictures_. Even positive irrational number (e.g., √2) could be conceived in a sort of negative fashion by Classical minds; they had, in fact, enough idea of it to ban it as ■■■ητος and ■λογος. But expressions of the form _x_ + _yi_ lie beyond every possibility of comprehension by Classical thought, whereas it is on the extension of the mathematical laws over the whole region of the complex numbers, within which these laws remain operative, that we have built up the function theory which has at last exhibited the Western mathematic in all purity and unity. Not until that point was reached could this mathematic be unreservedly brought to bear in the parallel sphere of our _dynamic_ Western physics; for the Classical mathematic was fitted precisely to its own stereometric world of individual objects and to _static_ mechanics as developed from Leucippus to Archimedes.

The brilliant period of the Baroque mathematic—the counterpart of the Ionian—lies substantially in the 18th Century and extends from the decisive discoveries of Newton and Leibniz through Euler, Lagrange, Laplace and D'Alembert to Gauss. Once this immense creation found wings, its rise was miraculous. Men hardly dared believe their senses. The age of refined scepticism witnessed the emergence of one seemingly impossible truth after another.[67] Regarding the theory of the differential coefficient, D'Alembert had to say: "Go forward, and faith will come to you." Logic itself seemed to raise objections and to prove foundations fallacious. But the goal was reached.

This century was a very carnival of abstract and immaterial thinking, in which the great masters of analysis and, with them, Bach, Gluck, Haydn and Mozart—a small group of rare and deep intellects—revelled in the most refined discoveries and speculations, from which Goethe and Kant remained aloof; and in point of content it is exactly paralleled by the ripest century of the Ionic, the century of Eudoxus and Archytas (440- 350) and, we may add, of Phidias, Polycletus, Alcamenes and the Acropolis buildings—in which the form-world of Classical mathematic and sculpture displayed the whole fullness of its possibilities, and so ended.

And now for the first time it is possible to comprehend in full the elemental opposition of the Classical and the Western souls. In the whole panorama of history, innumerable and intense as historical relations are, we find no two things so fundamentally alien to one another as these. And it is because extremes meet—because it may be there is some deep common origin behind their divergence—that we find in the Western Faustian soul this yearning effort towards the Apollinian ideal, the only alien ideal which we

have loved and, for its power of intensely living in the pure sensuous present, have envied.

XI

We have already observed that, like a child, a primitive mankind acquires (as part of the inward experience that is the birth of the ego) an understanding of number and _ipso facto_ possession of an external world referred to the ego. As soon as the primitive's astonished eye perceives the dawning world of _ordered_ extension, and the _significant_ emerges in great outlines from the welter of mere impressions, and the irrevocable parting of the outer world from his proper, his inner, world gives form and direction to his waking life, there arises in the soul—instantly conscious of its loneliness—the root- feeling of _longing_ (Sehnsucht). It is this that urges "becoming" towards its goal, that motives the fulfilment and actualizing of every inward possibility, that unfolds the idea of individual being. It is the child's longing, which will presently come into the consciousness more and more clearly as a feeling of constant _direction_ and finally stand before the mature spirit as the _enigma of Time_—queer, tempting, insoluble. Suddenly, the words "past" and "future" have acquired a fateful meaning.

But this longing which wells out of the bliss of the inner life is also, in the intimate essence of every soul, a _dread_ as well. As all becoming moves towards a having-become wherein it _ends_, so the prime feeling of becoming—the longing—touches the prime feeling of having- become, the dread. In the present we feel a trickling-away, the past implies a passing. Here is the root of our eternal dread of the irrevocable, the attained, the final—our dread of mortality, of the world itself as a thing-become, where death is set as a frontier like birth—our dread in the moment when the possible is actualized, the life is inwardly fulfilled and consciousness stands at its _goal_. It is the deep world-fear of the child—which never leaves the higher man, the believer, the poet, the artist—that makes him so infinitely lonely in the presence of the alien powers that loom, threatening in the dawn, behind the screen of sense-phenomena. The element of direction, too, which is inherent in all "becoming," is felt owing to its inexorable _irreversibility_ to be something alien and hostile, and the human will- to-understanding ever seeks to bind the inscrutable by the spell of a name. It is something beyond comprehension, this transformation of future into past, and thus time, in its contrast with space, has always a queer, baffling, oppressive ambiguity from which no serious man can wholly protect himself.

This world-fear is assuredly the most _creative_ of all prime feelings. Man owes to it the ripest and deepest forms and images, not only of his conscious inward life, but also of the infinitely-varied external culture which reflects this life. Like a secret melody that not every ear can perceive, it runs through the form-language of every true art- work, every inward philosophy, every important deed, and, although those who can perceive it in that domain are the very few, it lies at the root of the great problems of mathematics. Only the spiritually dead man of the autumnal cities—Hammurabi's Babylon, Ptolemaic Alexandria, Islamic Baghdad, Paris and Berlin to-day—only the pure intellectual, the sophist, the sensualist, the Darwinian, loses it or is able to evade it by setting up a secretless "scientific world-view" between himself and the alien. As the longing attaches itself to that impalpable something whose thousand-formed elusive manifestations are comprised in, rather than denoted by, the word "time," so the other prime feeling, dread, finds its expression in the intellectual, understandable, outlinable symbols of _extension_; and thus we find that every Culture is aware (each in its own special way) of an opposition of time and space, of direction and extension, the former underlying the latter as becoming precedes having-become. It is the longing that underlies the dread, _becomes_ the dread, and not vice versa. The one is not subject to the intellect, the other is its servant. The rôle of the one is purely to experience, that of the other purely to know (erleben, erkennen). In the Christian language, the opposition of the two world-feelings is expressed by: "Fear God and love Him."

In the soul of all primitive mankind, just as in that of earliest childhood, there is something which impels it to find means of dealing with the alien powers of the extension-world that assert themselves, inexorable, in and through space. To bind, to bridle, to placate, to "know" are all, in the last analysis, the same thing. In the mysticism of all primitive periods, to _know God_ means to conjure him, to make him favourable, to _appropriate_ him inwardly. This is achieved, principally, by means of a word, the Name—the "nomen" which designates and _calls up_ the "numen"—and also by ritual practices of secret potency; and the subtlest, as well as the most powerful, form of this defence is causal and systematic knowledge, delimitation by label and number. In this respect man only becomes wholly man when he has acquired _language_. When cognition has ripened to the point of words, the original chaos of _impressions_ necessarily transforms itself into a "Nature" that has laws and must obey them, and the world-in-itself becomes a world-for-us.[68]

The world-fear is stilled when an intellectual form-language hammers out brazen vessels in which the mysterious is captured and made comprehensible. This is the _idea_ of "_taboo_,"[69] which plays a decisive part in the spiritual life of all primitive men, though the original content of the word lies so far from us that it is incapable of translation into any ripe culture-language. Blind

terror, religious awe, deep loneliness, melancholy, hate, obscure impulses to draw near, to be merged, to escape—all those _formed_ feelings of mature souls are in the childish condition blurred in a monotonous indecision. The two senses of the word “conjure” (verschwören), meaning to bind and to implore at once, may serve to make clear the sense of the mystical process by which for primitive man the formidable alien becomes “taboo.” Reverent awe before that which is independent of one’s self, things ordained and fixed by law, the alien powers of the world, is the source from which the elementary formative acts, one and all, spring. In early times this feeling is actualized in ornament, in laborious ceremonies and rites, and the rigid laws of primitive intercourse. At the zeniths of the great Cultures those formations, though retaining inwardly the mark of their origin, the characteristic of binding and conjuring, have become the complete form-worlds of the various arts and of religious, scientific and, above all, _mathematical_ thought. The method common to all—the only way of actualizing itself that the soul knows—is the _symbolizing of extension_, of space or of things; and we find it alike in the conceptions of absolute space that pervade Newtonian physics, Gothic cathedral-interiors and Moorish mosques, and the atmospheric infinity of Rembrandt’s paintings and again the dark tone-worlds of Beethoven’s quartets; in the regular polyhedrons of Euclid, the Parthenon sculptures and the pyramids of Old Egypt, the Nirvana of Buddha, the aloofness of court-customs under Sesostris, Justinian I and Louis XIV, in the God- idea of an Æschylus, a Plotinus, a Dante; and in the world-embracing spatial energy of modern technics.

Footnote 66:

That is, “it is impossible to part a cube into two cubes, a biquadrate into two biquadrates, and generally any power above the square into two powers having the same exponent.” Fermat claimed to possess a proof of the proposition, but this has not been preserved, and no general proof has hitherto been obtained.—_Tr._

Footnote 67:

Thus Bishop Berkeley’s _Discourse addressed to an infidel mathematician_ (1735) shrewdly asked whether the mathematician were in a position to criticize the divine for proceeding on the basis of faith.—_Tr._

Footnote 68:

From the savage conjuror with his naming-magic to the modern scientist who subjects things by attaching technical labels to them, the form has in no wise changed. See Vol. II, pp. 116 et seq., 322 et seq.

Footnote 69:

See Vol. II, pp. 137 et seq.

XII

To return to mathematics. In the Classical world the starting-point of every formative act was, as we have seen, the ordering of the “become,” in so far as this was present, visible, measurable and numerable. The Western, Gothic, form-feeling on the contrary is that of an unrestrained, strong-willed far-ranging soul, and its chosen badge is pure, imperceptible, unlimited space. But we must not be led into regarding such symbols as unconditional. On the contrary, they are strictly conditional, though apt to be taken as having identical essence and validity. Our universe of infinite space, whose existence, for us, goes without saying, simply does not exist for Classical man. It is not even capable of being presented to him. On the other hand, the Hellenic cosmos, which is (as we might have discovered long ago) entirely foreign to our way of thinking, was for the Hellene something self-evident. The fact is that the infinite space of our physics is a form of very numerous and extremely complicated elements tacitly assumed, which have come into being only as the copy and expression of _our_ soul, and are actual, necessary and natural only for _our_ type of waking life. The simple notions are always the most difficult. They are simple, in that they comprise a vast deal that not only is incapable of being exhibited in words but does not even need to be stated, because _for men of the particular group_ it is anchored in the intuition; and they are difficult because for all alien men their real content is _ipso facto_ quite inaccessible. Such a notion, at once simple and difficult, is our specifically Western meaning of the word “space.” The whole of our mathematic from Descartes onward is devoted to the theoretical interpretation of this great and wholly religious symbol. The aim of all our physics since Galileo is identical; but in the Classical mathematics and physics the content of this word is simply _not known_.

Here, too, Classical names, inherited from the literature of Greece and retained in use, have veiled the realities. Geometry means the art of measuring, arithmetic the art of numbering. The mathematic of the West has long ceased to have anything to do with both these forms of defining, but it has not managed to find new names for its own elements— for the word “analysis” is hopelessly inadequate.

The beginning and end of the Classical mathematic is consideration of the properties of individual bodies and their boundary-surfaces; thus indirectly taking in conic sections and higher curves. _We_, on the other hand, at bottom know only the abstract space-element of the point, which can neither be seen, nor measured, nor yet named, but represents simply a centre of reference. The straight line, for the Greeks a measurable edge, is for us an infinite continuum of points. Leibniz illustrates his infinitesimal principle by presenting the straight line as one limiting case and the point as the other limiting case of a circle having infinitely great or infinitely little radius. But for the Greek the circle is a _plane_ and the problem that interested him was that of bringing it into a commensurable condition. Thus the _squaring of the circle became for the Classical intellect the supreme problem of the finite_. The deepest problem of world-form seemed to it to be to alter surfaces bounded by curved lines, without change of magnitude, into rectangles and so to render them measureable. For us, on the other hand, it has become the usual, and not specially significant, practice to represent the number π by algebraic means, regardless of any geometrical image.

The Classical mathematician knows only what he sees and grasps. Where definite and defining visibility—the domain of his thought—ceases, his science comes to an end. The Western mathematician, as soon as he has quite shaken off the trammels of Classical prejudice, goes off into a wholly abstract region of infinitely numerous “manifolds” of _n_ (no longer 3) dimensions, in which his so-called geometry always can and generally must do without every commonplace aid. When Classical man turns to artistic expressions of his form-feeling, he tries with marble and bronze to give the dancing or the wrestling human form that pose and attitude in which surfaces and contours have all attainable proportion and meaning. But the true artist of the West shuts his eyes and loses himself in the realm of bodiless music, in which harmony and polyphony bring him to images of utter “beyondness” that transcend all possibilities of visual definition. One need only think of the meanings of the word “figure” as used respectively by the Greek sculptor and the Northern contrapuntist, and the opposition of the two worlds, the two mathematics, is immediately presented. The Greek mathematicians ever use the word σ■μα for their entities, just as the Greek lawyers used it for persons as distinct from things (σ■ματα κα■ πρ■γματα: _personæ et res_).

Classical number, integral and corporeal, therefore inevitably seeks to relate itself with the birth of bodily man, the σ■μα. The number 1 is hardly yet conceived of as actual number but rather as ■ρχ■, the prime stuff of the number-series, the origin of all true numbers and therefore all magnitudes, measures and materiality (Dinglichkeit). In the group of the Pythagoreans (the date does not matter) its figured-sign was also the symbol of the mother-womb, the origin of all life. The digit 2, the first _true_ number, which doubles the 1, was therefore correlated with the male principle and given the sign of the phallus. And, finally, 3, the “holy number” of the Pythagoreans, denoted the act of union between man and woman, the act of propagation—the erotic suggestion in adding and multiplying (the only two processes of increasing, of _propagating_, magnitude useful to Classical man) is easily seen—and its sign was the combination of the two first. Now, all this throws quite a new light upon the legends previously alluded to, concerning the sacrilege of disclosing the irrational. The irrational—in our language the employment of unending decimal fractions—implied the destruction of an organic and corporeal and reproductive order that the gods had laid down. There is no doubt that the Pythagorean reforms of the Classical religion were themselves based upon the immemorial Demeter-cult. Demeter, Gæa, is akin to Mother Earth. There is a deep relation between the honour paid to her and this exalted conception of the numbers.

Thus, inevitably, the Classical became by degrees the Culture of the _small_. The Apollinian soul had tried to tie down the meaning of things-become by means of the principle of _visible limits_; its taboo was focused upon the immediately-present and proximate alien. What was far away, invisible, was _ipso facto_ “not there.” The Greek and the Roman alike sacrificed to the gods of the place in which he happened to stay or reside; all other deities were outside the range of vision. Just as the Greek tongue—again and again we shall note the mighty symbolism of such language-phenomena—possessed _no word for space_, so the Greek himself was destitute of our feeling of landscape, horizons, outlooks, distances, clouds, and of the idea of the far-spread fatherland embracing the great nation. _Home_, for Classical man, is what he can see from the citadel of his native town and no more. All that lay beyond the visual range of this political atom was alien, and hostile to boot; beyond that narrow range, fear set in at once, and hence the appalling bitterness with which these petty towns strove to destroy one another. The Polis is the smallest of all conceivable state-forms, and its policy is frankly short-range, therein differing in the extreme from our own cabinet-diplomacy which is the policy of the unlimited. Similarly, the Classical temple, which can be taken in in one glance, is the smallest of all first-rate architectural forms. Classical geometry from Archytas to Euclid—like the school geometry of to-day which is still dominated by

it—concerned itself with small, manageable figures and bodies, and therefore remained unaware of the difficulties that arise in establishing figures of astronomical dimensions, which in many cases are not amenable to Euclidean geometry.[70] Otherwise the subtle Attic spirit would almost surely have arrived at some notion of the problems of non-Euclidean geometry, for its criticism of the well-known “parallel” axiom,[71] the doubtfulness of which soon aroused opposition yet could not in any way be elucidated, brought it very close indeed to the decisive discovery. The Classical mind as unquestioningly devoted and limited itself to the study of the small and the near as ours has to that of the infinite and ultra-visual. All the mathematical ideas that the West found for itself or borrowed from others were automatically subjected to the form-language of the Infinitesimal—and that long before the actual Differential Calculus was discovered. Arabian algebra, Indian trigonometry, Classical mechanics were incorporated as a matter of course in analysis. Even the most “self-evident” propositions of elementary arithmetic such as $2 \times 2 = 4$ become, when considered analytically, problems, and the solution of these problems was only made possible by deductions from the Theory of Aggregates, and is in many points still unaccomplished. Plato and his age would have looked upon this sort of thing not only as a hallucination but also as evidence of an utterly nonmathematical mind. In a certain measure, geometry may be treated algebraically and algebra geometrically, that is, the eye may be switched off or it may be allowed to govern. We take the first alternative, the Greeks the second. Archimedes, in his beautiful management of spirals, touches upon certain general facts that are also fundamentals in Leibniz’s method of the definite integral; but his processes, for all their superficial appearance of modernity, are subordinated to stereometric principles; in like case, an Indian mathematician would naturally have found some trigonometrical formulation.[72]

Footnote 70:

A beginning is now being made with the application of non-Euclidean geometries to astronomy. The hypothesis of curved space, closed but without limits, filled by the system of fixed stars on a radius of about 470,000,000 earth-distances, would lead to the hypothesis of a counter-image of the sun which to us appears as a star of medium brilliancy. (See translator’s footnote, p. 332.)

Footnote 71:

That only one parallel to a given straight line is possible through a given point—a proposition that is incapable of proof.

Footnote 72:

It is impossible to say, with certainty, how much of the Indian mathematics that we possess is old, i.e., before Buddha.

XIII

From this fundamental opposition of Classical and Western numbers there arises an equally radical difference in the relationship of element to element in each of these number-worlds. The nexus of _magnitudes_ is called _proportion_, that of _relations_ is comprised in the notion of _function_. The significance of these two words is not confined to mathematics proper; they are of high importance also in the allied arts of sculpture and music. Quite apart from the rôle of proportion in ordering the parts of the _individual_ statue, the typically Classical artforms of the statue, the relief, and the fresco, admit _enlargements and reductions of scale—words that in music have no meaning at all_—as we see in the art of the gems, in which the subjects are essentially reductions from life-sized originals. In the domain of Function, on the contrary, it is the idea of _transformation of groups_ that is of decisive importance, and the musician will readily agree that similar ideas play an essential part in modern composition-theory. I need only allude to one of the most elegant orchestral forms of the 18th Century, the _Tema con Variazioni_.

All proportion assumes the constancy, all transformation the variability of the constituents. Compare, for instance, the congruence theorems of Euclid, the proof of which depends in fact on the assumed ratio 1 : 1, with the modern deduction of the same by means of angular functions.

XIV

The Alpha and Omega of the Classical mathematic is _construction_ (which in the broad sense includes elementary arithmetic), that is, the production of a single visually-present figure. The chisel, in this second sculptural art, is the compass. On the other hand, in function- research, where the object is not a result of the magnitude sort but a discussion of general formal possibilities, the way of working is best described as a sort of composition-procedure closely analogous to the musical; and in fact, a great

number of the ideas met with in the theory of music (key, phrasing, chromatics, for instance) can be directly employed in physics, and it is at least arguable that many relations would be clarified by so doing.

Every _construction_ affirms, and every _operation_ denies appearances, in that the one works out that which is optically given and the other dissolves it. And so we meet with yet another contrast between the two kinds of mathematic; the Classical mathematic of small things deals with the concrete _individual instance_ and produces a once-for-all construction, while the mathematic of the infinite handles whole _classes_ of formal possibilities, _groups_ of functions, operations, equations, curves, and does so with an eye, not to any result they may have, but to their course. And so for the last two centuries—though present-day mathematicians hardly realize the fact—there has been growing up _the idea of a general morphology of mathematical operations_, which we are justified in regarding as the real meaning of modern mathematics as a whole. All this, as we shall perceive more and more clearly, is one of the manifestations of a general tendency inherent in the Western intellect, proper to the Faustian spirit and Culture and found in no other. The great majority of the problems which occupy our mathematic, and are regarded as “our” problems in the same sense as the squaring of the circle was the Greeks’,—e.g., the investigation of convergence in infinite series (Cauchy) and the transformation of elliptic and algebraic integrals into multiply- periodic functions (Abel, Gauss)—would probably have seemed to the Ancients, who strove for simple and definite quantitative results, to be an exhibition of rather abstruse virtuosity. And so indeed the popular mind regards them even to-day. There is nothing less “popular” than the modern mathematic, and it too contains its symbolism of the infinitely far, of _distance_. _All_ the great works of the West, from the “Divina Commedia” to “Parsifal,” are unpopular, whereas everything Classical from Homer to the Altar of Pergamum was popular in the highest degree.

XV

Thus, finally, the whole content of Western number-thought centres itself upon the historic _limit-problem_ of the Faustian mathematic, the key which opens the way to the Infinite, that _Faustian infinite_ which is so different from the infinity of Arabian and Indian world-ideas. Whatever the guise—infinite series, curves or functions—in which number appears in the particular case, the _essence_ of it is the _theory of the limit_.[73] This limit is the absolute opposite of the limit which (without being so called) figures in the Classical problem of the quadrature of the circle. Right into the 18th Century, Euclidean popular prepossessions obscured the real meaning of the differential principle. The idea of infinitely small quantities lay, so to say, ready to hand, and however skilfully they were handled, there was bound to remain a trace of the Classical constancy, the _semblance of magnitude_, about them, though Euclid would never have known them or admitted them as such. Thus, zero is a constant, a whole number in the linear continuum between +1 and -1; and it was a great hindrance to Euler in his analytical researches that, like many after him, he treated the differentials as zero. Only in the 19th Century was this relic of Classical number-feeling finally removed and the Infinitesimal Calculus made logically secure by Cauchy’s definitive elucidation of the _limit- idea_; only the intellectual step from the “infinitely small quantity” to the “lower limit of _every possible_ finite magnitude” brought out the conception of a variable number which oscillates beneath any assignable number that is not zero. A number of this sort has ceased to possess any character of magnitude whatever: the limit, as thus finally presented by theory, is no longer that which is approximated to, but _the approximation, the process, the operation itself. It is not a state, but a relation._ And so in this decisive problem of our mathematic, we are suddenly made to see how _historical_ is the constitution of the Western soul.[74]

Footnote 73:

The technical difference (in German usage) between _Grenz_ and _Grenzwert_ is in most cases ignored in this translation as it is only the underlying conception of “number” common to both that concerns us. _Grenz_ is the “limit” strictly speaking, i.e., the number _a_ to which the terms _a__{1}■, _a__{2}■, _a_■ ... of a particular _series_ approximate more and more closely, till nearer to _a_ than any assignable number whatever. The _Grenzwert_ of a _function_, on the other hand, is the “limit” of the value which the function takes for a given value _a_ of the variable _x_. These methods of reasoning and their derivatives enable solutions to be obtained for series such as (1⁄_m_¹,) (1⁄_m_²,) (1⁄_m_³,) ... (1⁄_m_^{_x_}) or functions such as

$$_x_(2_x_ - 1) _y_ = \frac{}{} (_x_+ 2)(_x_- 3)$$

where _x_ is _infinite_ or _indefinite_.—_Tr._

Footnote 74:

“Function, rightly understood, is existence considered as an activity” (Goethe). Cf. Vol. II, p. 618, for functional money.

XVI

The liberation of geometry from the visual, and of algebra from the notion of magnitude, and the union of both, beyond all elementary limitations of drawing and counting, in the great structure of function- theory—this was the grand course of Western number-thought. The constant number of the Classical mathematic was dissolved into the variable. Geometry _became_ analytical and dissolved all concrete forms, replacing the mathematical bodies from which the rigid geometrical values had been obtained, by abstract spatial relations which in the end ceased to have any application at all to sense-present phenomena. It began by substituting for Euclid's optical figures geometrical loci referred to a co-ordinate system of arbitrarily chosen "origin," and reducing the postulated objectiveness of existence of the geometrical object to the one condition that during the operation (which itself was one of equating and not of measurement) the selected co-ordinate system should not be changed. But these co-ordinates immediately came to be regarded as values pure and simple, serving not so much to determine as to represent and replace the position of points as space-elements. Number, the boundary of things-become, was represented, not as before pictorially by a figure, but symbolically by an equation. "Geometry" altered its meaning; the co-ordinate system as a picturing disappeared and the point became an entirely abstract number-group. In architecture, we find this inward transformation of Renaissance into Baroque through the innovations of Michael Angelo and Vignola. Visually pure lines became, in palace and church façades as in mathematics, ineffectual. In place of the clear co-ordinates that we have in Romano-Florentine colonnading and storeying, the "infinitesimal" appears in the graceful flow of elements, the scrollwork, the cartouches. The constructive dissolves in the wealth of the decorative—in mathematical language, the functional. Columns and pilasters, assembled in groups and clusters, break up the façades, gather and disperse again restlessly. The flat surfaces of wall, roof, storey melt into a wealth of stucco work and ornaments, vanish and break into a play of light and shade. The light itself, as it is made to play upon the form-world of mature Baroque— viz., the period from Bernini (1650) to the Rococo of Dresden, Vienna and Paris—has become an essentially musical element. The Dresden Zwinger[75] is a _sinfonia_. Along with 18th Century mathematics, 18th Century architecture develops into a form-world of _musical_ characters.

Footnote 75:

Built for August II, in 1711, as barbican or fore-building for a projected palace.—_Tr._

XVII

This mathematics of ours was bound in due course to reach the point at which not merely the limits of artificial geometrical form but the limits of the visual itself were felt by theory and by the soul alike as limits indeed, as obstacles to the unreserved expression of inward possibilities—in other words, the point at which the ideal of transcendent extension came into fundamental conflict with the limitations of immediate perception. The Classical soul, with the entire abdication of Platonic and Stoic ■ταραξ■α, submitted to the sensuous and (as the erotic under-meaning of the Pythagorean numbers shows) it rather _felt_ than _emitted_ its great symbols. Of transcending the corporeal here-and-now it was quite incapable. But whereas number, as conceived by a Pythagorean, exhibited the essence of individual and discrete _data_ in "Nature" Descartes and his successors looked upon number as _something to be conquered_, to be _wrung out_, an abstract relation royally indifferent to all phenomenal support and capable of holding its own against "Nature" on all occasions. The will-to-power (to use Nietzsche's great formula) that from the earliest Gothic of the Eddas, the Cathedrals and Crusades, and even from the old conquering Goths and Vikings, has distinguished the attitude of the Northern soul to its world, appears also in the sense-transcending energy, the _dynamic_ of Western number. In the Apollinian mathematic the intellect is the servant of the eye, in the Faustian its master. Mathematical, "absolute" space, we see then, is utterly un-Classical, and from the first, although mathematicians with their reverence for the Hellenic tradition did not dare to observe the fact, it was something different from the indefinite spaciousness of daily experience and customary painting, the _a priori_ space of Kant which seemed so unambiguous and sure a concept. It is a pure abstract, an ideal and unfulfillable postulate of a soul which is ever less and less satisfied with sensuous means of expression and in the end passionately brushes them aside. _The inner eye has awakened._

And then, for the first time, those who thought deeply were obliged to see that the Euclidean geometry, which is the _true and only_ geometry of the simple of all ages, is when regarded from the higher standpoint nothing but a _hypothesis_, the general validity of which, since Gauss, we know it to be quite impossible to prove in the face of other and perfectly non-perceptual geometries. The critical proposition of this geometry, Euclid's axiom of parallels, is an _assertion_, for which we are quite at liberty to substitute another assertion. We may assert, in fact, that through a given point, no parallels, or two, or many parallels may be drawn to a given straight line, and all these assumptions lead to completely irreproachable geometries of three dimensions, which can be employed in physics and even in astronomy, and are in some cases preferable to the Euclidean.

Even the simple axiom that extension is boundless (boundlessness, since Riemann and the theory of curved space, is to be distinguished from endlessness) at once contradicts the essential character of all immediate perception, in that the latter depends upon the existence of light-resistances and _ipso facto_ has material bounds. But abstract principles of boundary can be imagined which transcend, in an entirely new sense, the possibilities of optical definition. For the deep thinker, there exists even in the Cartesian geometry the tendency to get beyond the three dimensions of _experiential_ space, regarded as an unnecessary restriction on the symbolism of number. And although it was not till about 1800 that the notion of _multi-dimensional space_ (it is a pity that no better word was found) provided analysis with broader foundations, the real first step was taken at the moment when powers— that is, really, logarithms—were released from their original relation with sensually realizable surfaces and solids and, through the employment of irrational and complex exponents, brought within the realm of function as perfectly general relation-values. It will be admitted by everyone who understands anything of mathematical reasoning that directly we passed from the notion of a^3 as a natural maximum to that of $a^{_n_}$, the unconditional necessity of three-dimensional space was done away with.

Once the space-element or point had lost its last persistent relic of visualness and, instead of being represented to the eye as a cut in co- ordinate lines, was defined as a group of three independent numbers, there was no longer any inherent objection to replacing the number 3 by the general number _n_. The notion of dimension was radically changed. It was no longer a matter of treating the properties of a point metrically with reference to its position in a visible system, but of representing the entirely abstract properties of a number-group by means of any dimensions that we please. The number-group—consisting of _n_ independent ordered elements—is an _image_ of the point and it is _called_ a point. Similarly, an equation logically arrived therefrom is _called_ a plane and is the image of a plane. And the aggregate of all points of _n_ dimensions is _called_ an _n_-dimensional space.[76] In these transcendent space-worlds, which are remote from every sort of sensualism, lie the relations which it is the business of analysis to investigate and which are found to be consistently in agreement with the data of experimental physics. This space of higher degree is a symbol which is through-and-through the peculiar property of the Western mind. That mind alone has attempted, and successfully too, to capture the "become" and the extended in _these_ forms, to conjure and bind—to "know"—the alien by _this_ kind of appropriation or taboo. Not until such spheres of number-thought are reached, and not for any men but the few who have reached them, do such imaginings as systems of hypercomplex numbers (e.g., the quaternions of the calculus of vectors) and apparently quite meaningless symbols like $\infty^{_n_}$ acquire the character of something actual. And here if anywhere it must be understood that actuality is not only sensual actuality. The spiritual is in no wise limited to perception-forms for the actualizing of its idea.

Footnote 76:

From the standpoint of the theory of "aggregates" (or "sets of points"), a well-ordered set of points, irrespective of the dimension figure, is called a corpus; and thus an aggregate of _n_ - 1 dimensions is considered, _relatively_ to one of _n_ dimensions, as a surface. Thus the limit (wall, edge) of an "aggregate" represents an aggregate of lower "potentiality."

XVIII

From this grand intuition of symbolic space-worlds came the last and conclusive creation of Western mathematic—the expansion and subtilizing of the function theory in that of _groups_. Groups are aggregates or sets of homogeneous mathematical images—e.g., the totality of all differential equations of a certain type—which in structure and ordering are analogous to the Dedekind number-bodies. Here are worlds, we feel, of perfectly new numbers, which are nevertheless not utterly sense-transcendent for the _inner_ eye of the adept; and the problem now is to discover in those vast abstract form-systems certain

elements which, relatively to a particular group of operations (viz., of transformations of the system), remain unaffected thereby, that is, possess invariance. In mathematical language, the problem, as stated generally by Klein, is— given an _n_-dimensional manifold (“space”) and a group of transformations, it is required to examine the forms belonging to the manifold in respect of such properties as are not altered by transformation of the group.

And with this culmination our Western mathematic, having exhausted every inward possibility and fulfilled its destiny as the _copy and purest expression of the idea of the Faustian soul_, closes its development in the same way as the mathematic of the Classical Culture concluded in the third century. Both those sciences (the only ones of which the organic structure can even to-day be examined historically) arose out of a wholly new idea of number, in the one case Pythagoras’s, in the other Descartes’. Both, expanding in all beauty, reached their maturity one hundred years later; and both, after flourishing for three centuries, completed the structure of their ideas at the same moment as the Cultures to which they respectively belonged passed over into the phase of megalopolitan Civilization. The deep significance of this interdependence will be made clear in due course. It is enough for the moment that for us the time of the _great_ mathematicians is past. Our tasks to-day are those of preserving, rounding off, refining, selection— in place of big dynamic creation, the same clever detail-work which characterized the Alexandrian mathematic of late Hellenism.

A historical paradigm will make this clearer.

CHAPTER III THE PROBLEM OF WORLD-HISTORY

I PHYSIOGNOMIC AND SYSTEMATIC

CHAPTER III THE PROBLEM OF WORLD-HISTORY

I PHYSIOGNOMIC AND SYSTEMATIC

I

Now, at last, it is possible to take the decisive step of sketching an image of history that is independent of the accident of standpoint, of the period in which this or that observer lives—independent too of the personality of the observer himself, who as an interested member of his own Culture is tempted, by its religious, intellectual, political and social tendencies, to order the material of history according to a perspective that is limited as to both space and time, and to fashion arbitrary forms into which the superficies of history can be forced but which are entirely alien to its inner content.

What has been missing, till now, is _detachment_ from the objects considered (die Distanz vom Gegenstande). In respect of Nature, this detachment has long ago been attained, though of course it was relatively easy of attainment, since the physicist can obviously systematize the mechanical-causal picture of his world as impersonally as though he himself did not exist in it.

It is quite possible, however, to do the same as regards the form-world of History. We have merely been unaware of the possibility. The modern historian, in the very act of priding himself on his “objectivity,” naïvely and unconsciously reveals his prepossessions. For this reason it is quite legitimate to say—and it will infallibly be said some day—that so far a genuinely Faustian treatment of history has been entirely lacking. By such a treatment is meant one that has enough detachment to admit that any “present” is only such with reference to a particular generation of men; that the number of generations is infinite, and that the proper present must therefore be regarded just as something infinitely distant and alien is regarded, and treated as an interval of time neither more nor less significant in the whole picture of History than others. Such a treatment will employ no distorting modulus of personal ideals, set no personal origin of co-ordinates, be influenced by none of the personal hopes and fears and other inward impulses which count for so much in practical life; and such a detachment will—to use the words of Nietzsche (who, be it said, was far from possessing enough of it himself)—enable one to view the whole fact of Man from an immense distance, to regard the individual

Cultures, one's own included, as one regards the range of mountain peaks along a horizon.

Once again, therefore, there was an act like the act of Copernicus to be accomplished, an act of emancipation from the evident present in the name of infinity. This the Western soul achieved in the domain of Nature long ago, when it passed from the Ptolemaic world-system to that which is alone valid for it to-day, and treats the position of the observer on one particular planet as accidental instead of normative.

A similar emancipation of world-history from the accidental standpoint, the perpetually re-defined "modern period," is both possible and necessary. It is true that the 19th Century A.D. seems to us infinitely fuller and more important than, say, the 19th Century B.C.; but the moon, too, seems to us bigger than Jupiter or Saturn. The physicist has long ago freed himself from prepossessions as to relative distance, the historian not so. We permit ourselves to consider the Culture of the Greeks as an "ancient" related to our own "modern." Were they in their turn "modern" in relation to the finished and historically mature Egyptians of the court of the great Thuthmosis who lived a millennium before Homer? For us, the events which took place between 1500 and 1800 on the soil of Western Europe constitute the most important third of "world"-history; for the Chinese historian, on the contrary, who looks back on and judges by 4000 years of Chinese history, those centuries generally are a brief and unimportant episode, infinitely less significant than the centuries of the Han dynasty (206 B.C. to 220 A.D.), which in _his_ "world"-history are epoch-making.

To liberate History, then, from that thraldom to the observers' prejudices which in our own case has made of it nothing more than a record of a partial past leading up to an accidental present, with the ideals and interests of that present as criteria of the achievement and possibility, is the object of all that follows.

II

Nature and _History_[77] are the opposite extreme terms of man's range of possibilities, whereby he is enabled to order the actualities about him as a picture of the world. An actuality is Nature in so far as it assigns things-becoming their place as things-become, and History in so far as it orders things-become with reference to their becoming. An actuality as an evocation of mind is contemplated, and as an assurance of the senses is critically comprehended, the first being exemplified in the worlds of Plato, Rembrandt, Goethe and Beethoven, the second in the worlds of Parmenides, Descartes, Kant and Newton. Cognition in the strict sense of the word is that act of experience of which the completed issue is called "Nature." The cognized and "Nature" are one and the same. The symbol of mathematical number has shown us that the aggregate of things cognized is the same as the world of things mechanically defined, things correct once and for all, things brought under law. _Nature is the sum of the law-imposed necessities._ There are only laws of _Nature_. No physicist who understands his duty would wish to transcend these limits. His task is to establish an ordered code which not only includes all the laws that he can find in the picture of Nature that is proper to himself but, further, represents that picture exhaustively and without remainder.

Contemplation or vision (Anschauen), on the other hand—I may recall Goethe's words: "vision is to be carefully distinguished from seeing"—, is that act of experience which _is itself history because it is itself a fulfilling_. That which has been lived is that which has happened, and it is history. (Erlebtes ist Geschehenes, ist Geschichte.)

Every happening is unique and incapable of being repeated. It carries the hall-mark of Direction ("Time"), of _irreversibility_. That which has happened is thenceforth counted with the become and not with the becoming, with the stiffened and not the living, and belongs beyond recall to the past. Our feeling of world-fear has its sources here. Everything cognized, on the contrary, is _timeless_, neither past nor future but simply "there," and consequently permanently valid, as indeed the very constitution of natural law requires that it should be. Law and the domain of law are _anti-historical_. They exclude incident and casuality. The laws of nature are forms of rigorous and therefore inorganic necessity. It becomes easy to see why mathematics, as the ordering of things-become by number, is _always and exclusively_ associated with laws and causality.

Becoming has no number. We can count, measure, dissect only the lifeless and so much of the living as can be dissociated from livingness. Pure becoming, pure life, is in this sense incapable of being bounded. It lies beyond the domain of cause and effect, law and measure. No deep and pure historical research seeks for conformities with causal laws—or, if it does so, it does not understand its own essence.

At the same time, history as positively treated is not pure becoming: it is an image, a world-form radiated from the waking consciousness of the historian, in which the becoming _dominates_ the become. The possibility of extracting results of any sort by scientific methods depends upon the proportion of things-become present in the subject treated, and by hypothesis there is in this

case a defect of them; the higher the proportion is, the more mechanical, reasonable, causal, history is made to appear. Even Goethe's "living nature," utterly unmathematical world- picture as it was, contained enough of the dead and stiffened to allow him to treat at least his foreground scientifically. But when this content of things-become dwindles to very little, then history becomes approximately pure becoming, and contemplation and vision become an experience which can only be rendered in forms of _art_. That which Dante saw before his spiritual eyes as the destiny of the world, he _could not possibly_ have arrived at by ways of science, any more than Goethe could have attained by these ways to what he saw in the great moments of his "Faust" studies, any more than Plotinus and Giordano Bruno could have distilled their visions from researches. This contrast lies at the root of all dispute regarding the inner form of history. In the presence of the same object or corpus of facts, every observer according to his own disposition has a different _impression_ of the whole, and this impression, _intangible and incommunicable_, underlies his judgment and gives it its personal colour. The degree in which things-become are taken in differs from man to man, which is quite enough in itself to show that they can never agree as to task or method. Each accuses the other of a deficiency of "clear thinking," and yet the something that is expressed by this phrase is something not built with hands, not implying superiority or a priority of degree but necessary difference of kind. The same applies to all natural sciences.

Nevertheless, we must not lose sight of the fact that at bottom the wish to write history _scientifically_ involves a contradiction. True science reaches just as far as the notions of truth and falsity have validity: this applies to mathematics and it applies also to the science of historical spade-work, viz., the collection, ordering and sifting of material. But real historical vision (which only _begins_ at this point) belongs to the domain of significances, in which the crucial words are not "correct" and "erroneous," but "deep" and "shallow." The true physicist is not deep, but _keen_: it is only when he leaves the domain of working hypotheses and brushes against the final things that he can be deep, but at this stage he is already a metaphysician. Nature is to be handled scientifically, History poetically. Old Leopold von Ranke is credited with the remark that, after all, Scott's "Quentin Durward" was the true history-writing. And so it is: the advantage of a good history book is that it enables the reader to be his own Scott.

On the other hand, within the very realm of numbers and exact knowledge there is that which Goethe called "living Nature," an immediate vision of pure becoming and self-shaping, in fact, history as above defined. Goethe's world was, in the first instance, an organism, an existence, and it is easy therefore to see why his researches, even when superficially of a physical kind, do not make numbers, or laws, or causality captured in formulæ, or dissection of any sort their object, but are morphology in the highest sense of the word; and why his work neither uses nor needs to use the specifically Western and un-Classical means of causal treatment, metrical experiment. His treatment of the Earth's crust is invariably geology, and never mineralogy, which he called the science of something dead.

Let it be said, once more, that there are no exact boundaries set between the two kinds of world-notion. However great the contrast between becoming and the become, the fact remains that they are jointly present in every kind of understanding. He who looks at the becoming and fulfilling in them, experiences History; he who dissects them as become and fulfilled cognizes Nature.

In every man, in every Culture, in every culture-phase, there is found an inherent disposition, an inherent inclination and vocation to prefer one of the two forms as an ideal of understanding the world. Western man is in a high degree historically disposed,[78] Classical man far from being so. We follow up what is given us with an eye to past and future, whereas Classical man knew only the point-present and an ambiance of myth. We have before us a symbol of becoming in every bar of our music from Palestrina to Wagner, and the Greeks a symbol of the pure present in every one of their statues. The rhythm of a body is based upon a simultaneous relation of the parts, that of a fugue in the succession of elements in time.

Footnote 77:

See p. 55, also Vol. II, pp. 25 et seq.

Footnote 78:

"Anti-historical," the expression which we apply to a decidedly systematic valuation, is to be carefully distinguished from "ahistorical." The beginning of the IV Book (53) of Schopenhauer's _Welt als Wille und Vorstellung_ affords a good illustration of the man who thinks anti-historically, that is, deliberately for theoretical reasons suppresses and rejects the historical in himself—something that is actually there. The ahistoric Greek nature, on the contrary, neither possesses nor understands it.

III

There emerge, then, as the two basic elements of all world-picturing, the principle of Form (Gestalt) and the principle of Law (Gesetz). The more decidedly a particular world-picture shows the traits of “Nature,” the more unconditionally law and number prevail in it; and the more purely intuitive the picture of the world as eternally becoming, the more alien to numbers its manifold and intangible elements. “Form is something mobile, something becoming, something passing. The doctrine of formation is the doctrine of transformation. Metamorphosis is the key to the whole alphabet of Nature,” so runs a note of Goethe’s, marking already the methodic difference between his famous “exact percipient fancy” which quietly lets itself be worked upon by the living,[79] and the exact killing procedure of modern physics. But whatever the process, a remainder consisting of so much of the alien element as is present is always found. In strict natural sciences this remainder takes the form of the inevitable _theories and hypotheses_ which are imposed on, and leaven, the stiff mass of number and formula. In historical research, it appears as _chronology_, the number-structure of dates and statistics which, alien though number is to the essence of becoming, is so thoroughly woven around and into the world of historical forms that it is never felt to be intrusive. For it is devoid of mathematical import. Chronological number distinguishes uniquely-occurring actualities, mathematical number constant possibilities. The one sharpens the images and works up the outlines of epoch and fact for the understanding eye. But the other _is itself_ the law which it seeks to establish, the end and aim of research. Chronological number is a scientific means of pioneering borrowed from the science of sciences, mathematics, and used as such without regard to its specific properties. Compare, for instance, the meaning of the two symbols 12 × 8 = 96, and 18 October, 1813.[80] It is the same difference, in the use of figures, that prose and poetry present in the use of words.

One other point remains to be noted.[81] As a becoming always lies at the base of the become, and as the world-picture representative of becoming is that which history gives us, therefore history is the _original_ world-form, and Nature—the fully elaborated world-mechanism— is the _late_ world-form that only the men of a mature Culture can completely actualize. In fact, the darkness encompassing the simple soul of primitive mankinds, which we can realize even to-day from their religious customs and myths—that entirely organic world of pure wilfulness, of hostile demons and kindly powers—was through-and-through a living and swaying whole, ununderstandable, indefinable, incalculable. We may call this Nature if we like, but it is not what _we_ mean by “nature,” i.e., the strict image projected by a knowing intellect. Only the souls of children and of great artists can now hear the echoes of this long-forgotten world of nascent humanity, but it echoes still, and not rarely, even in the inelastic "nature"-medium that the city-spirit of the mature Culture is remorselessly building up round the individual. Hence that acute antagonism between the scientific (“modern”) and the artistic (“unpractical”) world-idea which every Late period knows; the man of fact and the poet do not and cannot understand one another. Hence comes, too, that tendency of historical study, which must inevitably contain an element of the childish, the dreamy, the Goethian, to dress up as a science, to be (using its own naïve word) “materialistic,” at the imminent risk of becoming a mere physics of public life.

“Nature,” in the exact sense, is a way of possessing actuality which is special to the few, restricted to the megalopolitans of the late periods of great Cultures, masculine, perhaps even senatorial; while History is the naïve, youthful, more or less instinctive way that is proper to _all_ men alike. At least, that is the position of the number-based, unmystical, dissectable and dissected “Nature” of Aristotle and Kant, the Sophists and the Darwinians, modern physics and chemistry, _vis-à- vis_ the lived, felt and unconfined “Nature” of Homer and the Eddas, of Doric and Gothic man. To overlook this is to miss the whole essence of historical treatment. It is history that is the truly natural, and the exact mechanically-correct “Nature” of the scientist that is the artificial conception of world by soul. Hence the paradox that modern man finds "nature"-study easy and historical study hard.

Tendencies towards a mechanistic idea of the world proceeding wholly from mathematical delimitation and logical differentiation, from law and causality, appear quite early. They are found in the first centuries of all Cultures, still weak, scattered and lost in the full tide of the religious world-conception. The name to be recalled here is that of Roger Bacon. But soon these tendencies acquire a sterner character: like everything that is wrung out of the soul and has to defend itself against human nature, they are not wanting in arrogance and exclusiveness. Quietly the spatial and comprehensible (comprehension is in its essence number, in its structure quantitative) becomes prepotent throughout the outer world of the individual and, aiding and aided by the simple impressions of sensuous-life, effects a mechanical synthesis of the causal and legal sort, so that at long last the sharp consciousness of the megalopolitan—be he of Thebes, Babylon, Benares, Alexandria or a West European cosmopolis—is subjected to so consistent a pressure of natural-law notions that, when scientific and philosophical prejudice (it is no more than that) dictates the proposition that this condition of the soul is _the_ soul and the mechanical world-picture is _the_ world, the assertion is scarcely challenged. It has been made predominant by logicians like Aristotle and Kant. But Plato and Goethe have rejected it and refuted it.

IV

The task of world-knowing—for the man of the higher Cultures a need, seen as a duty, of expressing his own essence—is certainly in every case the same, though its process may be called science or philosophy, and though its affinity to artistic creation and to faith-intuition may for one be something felt and for another something questionable. It is to present, without accretions, that form of the world-picture which to the individual in each case is proper and significant, and for him (so long as he does not _compare_) is in fact “the” world.

The task is necessarily a double one, in view of the distinction between “Nature” and “History.” Each speaks its own form-language which differs utterly from that of the other, and however the two may overlap and confuse one another in an unsifted and ambiguous world-picture such as that of everyday life, they are incapable of any inner unity.

Direction and Extension are the outstanding characters which differentiate the historical and the scientific (naturhaft) kind of impressibility, and it is totally impossible for a man to have both working creatively within him at the same time. The double meaning of the German word “Ferne” (distance, farness) is illuminating. In the one order of ideas it implies futurity, in the other a spatial interval of standing apart, and the reader will not fail to remark that the historical materialist almost necessarily conceives time as a mathematical dimension, while for the born artist, on the contrary,—as the lyrics of every land show us—the distance-impressions made by deep landscapes, clouds, horizon and setting sun attach themselves without an effort to the sense of a future. The Greek poet denies the future, and consequently he neither sees nor sings of the things of the future; he cleaves to the near, as he belongs to the present, entirely.

The natural-science investigator, the productive reasoner in the full sense of the word, whether he be an experimenter like Faraday, a theorist like Galileo, a calculator like Newton, finds in his world only directionless _quantities_ which he measures, tests and arranges. It is only the quantitative that is capable of being grasped through figures, of being causally defined, of being captured in a law or formula, and when it has achieved this, pure nature-knowledge has shot its bolt. All its laws are quantitative connexions, or as the physicist puts it, all physical processes _run a course in space_, an expression which a Greek physicist would have corrected—without altering the fact—into “all physical processes _occur between bodies_” conformably to the space- denying feeling of the Classical soul.

The historical kind of impression-process is alien to everything quantitative, and affects a different organ. To World-as-Nature certain modes of apprehension, as to World-as-History certain other modes, are _proper_. We know them and use them every day, without (as yet) having become aware of their opposition. There is _nature-knowledge_ and there is _man-knowledge_; there is _scientific_ experience and there is _vital_ experience. Let the reader track down this contrast into his own inmost being, and he will understand what I mean.

All modes of comprehending the world may, in the last analysis, be described as Morphology. _The Morphology of the mechanical and the extended, a science which discovers and orders nature-laws and causal relations, is called Systematic. The Morphology of the organic, of history and life and all that bears the sign of direction and destiny, is called Physiognomic._

V

In the West, the Systematic mode of treating the world reached and passed its culminating-point during the last century, while the great days of Physiognomic have still to come. In a hundred years all sciences that are still possible on this soil will be parts of a single vast Physiognomic of all things human. This is what the “Morphology of World- History” means. In every science, and in the aim no less than in the content of it, man tells the story of himself. Scientific experience is spiritual self-knowledge. It is from this standpoint, as a chapter of Physiognomic, that we have just treated of mathematics. We were not concerned with what this or that mathematician _intended_, nor with the savant as such or his results as a contribution to an aggregate of knowledge, but with the mathematician as a human being, with his work as a part of the phenomenon of himself, with his knowledge and purposes as a part of his expression. This alone is of importance to us here. He is the mouthpiece of a Culture which tells us about itself through him, and he belongs, as personality, as soul, as discoverer, thinker and creator, to the physiognomy of that Culture.

Every mathematic, in that it brings out and makes visible to all the idea of number that is proper to itself and inborn in its conscious being, is, whether the expression-form be a scientific system or (as in the case of Egypt) an architecture, the confession of a Soul. If it is true that the intentional accomplishments of a mathematic belong only to the surface of history, it is equally true that its unconscious element, its number-as-such, and the style in which it builds up its self- contained cosmos of forms are an expression

of its existence, its blood. Its life-history of ripening and withering, its deep relation to the creative acts, the myths and the cults of the same Culture—such things are the subject-matter of a second or historical morphology, though the possibility of such a morphology is hardly yet admitted.

The visible foregrounds of history, therefore, have the same significance as the outward phenomena of the individual man (his statue, his bearing, his air, his stride, his way of speaking and writing), as distinct from what he says or writes. In the “knowledge of men” these things exist and matter. The body and all its elaborations—defined, “become” and _mortal_ as they are—are an expression of the soul. But henceforth “knowledge of men” implies also knowledge of those superlative human organisms that I call Cultures, and of their mien, their speech, their acts—these terms being meant as we mean them already in the case of the individual.

Descriptive, creative, Physiognomic is the art of portraiture transferred to the spiritual domain. Don Quixote, Werther, Julian Sorel, are portraits of an epoch, Faust the portrait of a whole Culture. For the nature-researcher, the morphologist as systematist, the portrayal of the world is only a business of imitation, and corresponds to the “fidelity to nature” and the “likeness” of the craftsman-painter, who, at bottom, works on purely mathematical lines. But a real portrait in the Rembrandt sense of the word is physiognomic, that is, _history_ captured in a moment. The set of his self-portraits is nothing else but a (truly Goethian) autobiography. So should the biographies of the great Cultures be handled. The “fidelity” part, the work of the professional historian on facts and figures, is only a means, not an end. The countenance of history is made up of all those things which hitherto we have only managed to evaluate according to personal standards, i.e., as beneficial or harmful, good or bad, satisfactory or unsatisfactory— political forms and economic forms, battles and arts, science and gods, mathematics and morals. Everything whatsoever that has _become_ is a symbol, and the expression of a soul. Only to one having the knowledge of men will it unveil itself. The restraint of a law it abhors. What it demands is that its significance should be sensed. And thus research reaches up to a final or superlative truth—Alles Vergängliche ist nur ein Gleichnis.[82]

The nature-researcher can be educated, but the man who knows history is born. He seizes and pierces men and facts with one blow, guided by a feeling which cannot be acquired by learning or affected by persuasion, but which only too rarely manifests itself in full intensity. Direction, fixing, ordering, defining by cause and effect, are things that one can do if one likes. These things are work, but the other is creation. Form and law, portrayal and comprehension, symbol and formula, have different organs, and their opposition is that in which life stands to death, production to destruction. Reason, system and comprehension kill as they “cognize.” That which is cognized becomes a rigid object, capable of measurement and subdivision. Intuitive vision, on the other hand, vivifies and incorporates the details in a living inwardly-felt unity. Poetry and historical study are kin. Calculation and cognition also are kin. But, as Hebbel says somewhere, systems are not dreamed, and art- works are not calculated or (what is the same thing) thought out. The artist or the real historian sees the becoming of a thing (schaut, wie etwas wird), and he can re-enact its becoming from its lineaments, whereas the systematist, whether he be physicist, logician, evolutionist or pragmatical historian, learns the thing that has become. The artist’s soul, like the soul of a Culture, is something potential that may actualize itself, something complete and perfect—in the language of an older philosophy, a microcosm. The systematic spirit, narrow and withdrawn “abs-tract”) from the sensual, is an autumnal and passing phenomenon belonging to the ripest conditions of a Culture. Linked with the _city_, into which its life is more and more herded, it comes and goes with the city. In the Classical world, there is science only from the 6th-century Ionians to the Roman period, but there was art in the Classical world for just as long as there was existence.

Once more, a paradigm may help in elucidation.

Soul _World_ Existence { potentiality → fulfilment → actuality { (_Life_)

{ becoming → the become Consciousness { direction extension { organic mechanical { symbol, portrait, number, notion. [Crossed ↓ downward ↓ arrows] { _History_ _Nature_ World-image { Rhythm, form. Tension, law. { Physiognomic. Systematic. { Facts Truths

Seeking thus to obtain a clear idea of the unifying principle out of which each of these two worlds is conceived, we find that mathematically-controlled cognition relates always (and the purer it is, the more directly) to a continuous present. The picture of nature dealt with by the physicist is that which is deployed before his senses at the given moment. It is one of the tacit, but none the less firm, presuppositions of nature-research that “Nature” (_die_ Natur) is the same for every consciousness and for all times. An experiment is decisive for good and all; time being, not precisely denied, but eliminated from the field of investigation. Real history rests on an equally certain sense of the contrary; what it presupposes as its origin is a nearly indescribable sensitive faculty within, which is continuously labile under continuous impressions, and is incapable therefore of possessing what may be called a centre of

time.[83] (We shall consider later what the physicist means by “time.”) The picture of history—be it the history of mankind, of the world of organisms, of the earth or of the stellar systems—is a _memory_-picture. “Memory,” in this connexion, is conceived as a higher state (certainly not proper to every consciousness and vouchsafed to many in only a low degree), a perfectly definite kind of imagining power, which enables experience to traverse each particular moment _sub specie æternitatis_ as one point in an integral made up of all the past and all the future, and it forms the necessary basis of all looking-backward, all self-knowledge and all self-confession. In this sense, Classical man has no memory and therefore no history, either in or around himself. “No man can judge history but one who has himself experienced history,” says Goethe. In the Classical world-consciousness all Past was absorbed in the instant Present. Compare the entirely historical heads of the Nürnberg Cathedral sculptures, of Dürer, of Rembrandt, with those of Hellenistic sculpture, for instance the famous Sophocles statue. The former tell the whole history of a soul, whereas the latter rigidly confines itself to expressing the traits of a momentary being, and tells nothing of how this being is the issue of a course of life—if indeed we can speak of “course of life” at all in connexion with a purely Classical man, who is always complete and never becoming.

Footnote 79:

“There are prime phenomena which in their godlike simplicity we must not disturb or infringe.”

VI

And now it is possible to discover the ultimate elements of the historical form-world.

Countless shapes that emerge and vanish, pile up and melt again, a thousand-hued glittering tumult, it seems, of perfectly wilful chance— such is the picture of world-history when first it deploys before our inner eye. But through this seeming anarchy, the keener glance can detect those pure forms which underlie all human becoming, penetrate their cloud-mantle, and bring them unwillingly to unveil.

But of the whole picture of world-becoming, of that cumulus of grand planes that the Faust-eye[84] sees piled one beyond another—the becoming of the heavens, of the earth’s crust, of life, of man—we shall deal here only with that very small morphological unit that we are accustomed to call “world-history,” that history which Goethe ended by despising, the history of higher mankind during 6000 years or so, without going into the deep problem of the inward homogeneity of all these aspects. What gives this fleeting form-world meaning and substance, and what has hitherto lain buried deep under a mass of tangible “facts” and “dates” that has hardly yet been bored through, is the _phenomenon of the Great Cultures_. Only after these prime forms shall have been seen and felt and worked out in respect of their physiognomic meaning will it be possible to say that the essence and inner form of human History as opposed to the essence of Nature are understood—or rather, that we understand them. Only after this inlook and this outlook will a serious philosophy of history become feasible. Only then will it be possible to see each fact in the historical picture—each idea, art, war, personality, epoch—according to its symbolic content, and to regard history not as a mere

sum of past things without intrinsic order or inner necessity, but as an organism of rigorous structure and significant articulation, an organism that does not suddenly dissolve into a formless and ambiguous future when it reaches the accidental present of the observer.

Cultures are organisms, and world-history is their collective biography. Morphologically, the immense history of the Chinese or of the Classical Culture is the exact equivalent of the petty history of the individual man, or of the animal, or the tree, or the flower. For the Faustian vision, this is not a postulate but an experience; if we want to learn to recognize inward forms that constantly and everywhere repeat themselves, the comparative morphology[85] of plants and animals has long ago given us the methods. In the destinies of the several Cultures that follow upon one another, grow up with one another, touch, overshadow, and suppress one another, is compressed the whole content of human history. And if we set free their shapes, till now hidden all too deep under the surface of a trite "history of human progress," and let them march past us in the spirit, it cannot but be that we shall succeed in distinguishing, amidst all that is special or unessential, the primitive culture-form, _the_ Culture that underlies as ideal all the individual Cultures.

I distinguish the _idea_ of a Culture, which is the sum total of its inner possibilities, from its sensible _phenomenon_ or appearance upon the canvas of history as a fulfilled actuality. It is the relation of the soul to the living body, to its expression in the light-world perceptible to our eyes. This history of a Culture is the progressive actualizing of its possible, and the fulfilment is equivalent to the end. In this way the Apollinian soul, which some of us can perhaps understand and share in, is related to its unfolding in the realm of actuality, to the "Classical" or "antique" as we call it, of which the tangible and understandable relics are investigated by the archæologist, the philologist, the æsthetic and the historian.

Culture is the _prime phenomenon_ of all past and future world-history. The deep, and scarcely appreciated, idea of Goethe, which he discovered in his "living nature" and always made the basis of his morphological researches, we shall here apply—in its most precise sense—to all the formations of man's history, whether fully matured, cut off in the prime, half opened or stifled in the seed. It is the method of living into (erfühlen) the object, as opposed to dissecting it. "The highest to which man can attain, is wonder; and if the prime phenomenon makes him wonder, let him be content; nothing higher can it give him, and nothing further should he seek for behind it; here is the limit." The prime phenomenon is that in which the idea of becoming is presented net. To the spiritual eye of Goethe the idea of the prime plant was clearly visible in the form of every individual plant that happened to come up, or even that could possibly come up. In his investigation of the "os intermaxillare" his starting-point was the _prime phenomenon of the vertebrate type_; and in other fields it was geological stratification, or the leaf as the prime form of the plant-organism, or the metamorphosis of the plants as the prime form of all organic becoming. "The same law will apply to everything else that lives," he wrote, in announcing his discovery to Herder. It was a look into the heart of things that Leibniz would have understood, but the century of Darwin is as remote from such a vision as it is possible to be.

At present, however, we look in vain for any treatment of history that is entirely free from the methods of Darwinism—that is, of systematic natural science based on causality. A physiognomic that is precise, clear and sure of itself and its limits has never yet arisen, and it can only arise through the discoveries of method that we have yet to make. Herein lies the great problem set for the 20th Century to solve—to explore carefully the inner structure of the organic units through and in which world-history fulfils itself, to separate the morphologically necessary from the accidental, and, by seizing the _purport_ of events, to ascertain the languages in which they speak.

VII

A boundless mass of human Being, flowing in a stream without banks; up- stream, a dark past wherein our time-sense loses all powers of definition and restless or uneasy fancy conjures up geological periods to hide away an eternally-unsolvable riddle; down-stream, a future even so dark and timeless—such is the groundwork of the Faustian picture of human history.

Over the expanse of the water passes the endless uniform wave-train of the generations. Here and there bright shafts of light broaden out, everywhere dancing flashes confuse and disturb the clear mirror, changing, sparkling, vanishing. These are what we call the clans, tribes, peoples, races which unify a series of generations within this or that limited area of the historical surface. As widely as these differ in creative power, so widely do the images that they create vary in duration and plasticity, and when the creative power dies out, the physiognomic, linguistic and spiritual identification-marks vanish also and the phenomenon subsides again into the ruck of the generations. Aryans, Mongols, Germans, Kelts, Parthians, Franks, Carthaginians, Berbers, Bantus are names by which we specify some very heterogeneous images of this order.

But over this surface, too, the great Cultures[86] accomplish their majestic wave-cycles. They appear suddenly, swell in splendid lines, flatten again and vanish, and the face of the waters is once more a sleeping waste.

A Culture is born in the moment when a great soul awakens out of the proto-spirituality (_dem urseelenhaften Zustande_) of ever-childish humanity, and detaches itself, a form from the formless, a bounded and mortal thing from the boundless and enduring. It blooms on the soil of an exactly-definable landscape, to which plant-wise it remains bound. It dies when this soul has actualized the full sum of its possibilities in the shape of peoples, languages, dogmas, arts, states, sciences, and reverts into the proto-soul. But its living existence, that sequence of great epochs which define and display the stages of fulfilment, is an inner passionate struggle to maintain the Idea against the powers of Chaos without and the unconscious muttering deep-down within. It is not only the artist who struggles against the resistance of the material and the stifling of the idea within him. Every Culture stands in a deeply- symbolical, almost in a mystical, relation to the Extended, the space, in which and through which it strives to actualize itself. The aim once attained—the idea, the entire content of inner possibilities, fulfilled and made externally actual—the Culture suddenly hardens, it mortifies, its blood congeals, its force breaks down, and it becomes _Civilization_, the thing which we feel and understand in the words Egypticism, Byzantinism, Mandarinism. As such they may, like a worn-out giant of the primeval forest, thrust their decaying branches towards the sky for hundreds or thousands of years, as we see in China, in India, in the Islamic world. It was thus that the Classical Civilization rose gigantic, in the Imperial age, with a false semblance of youth and strength and fullness, and robbed the young Arabian Culture of the East of light and air.[87]

This—the inward and outward fulfilment, the finality, that awaits every living Culture—is the purport of all the historic “declines,” amongst them that decline of the Classical which we know so well and fully, and another decline, entirely comparable to it in course and duration, which will occupy the first centuries of the coming millennium but is heralded already and sensible in and around us to-day—the decline of the West.[88] Every Culture passes through the age-phases of the individual man. Each has its childhood, youth, manhood and old age. It is a young and trembling soul, heavy with misgivings, that reveals itself in the morning of Romanesque and Gothic. It fills the Faustian landscape from the Provence of the troubadours to the Hildesheim cathedral of Bishop Bernward.[89] The spring wind blows over it. “In the works of the old- German architecture,” says Goethe, “one sees the blossoming of an extraordinary state. Anyone immediately confronted with such a blossoming can do no more than wonder; but one who can see into the secret inner life of the plant and its rain of forces, who can observe how the bud expands, little by little, sees the thing with quite other eyes and knows what he is seeing.” Childhood speaks to us also—and in the same tones—out of early-Homeric Doric, out of early-Christian (which is really early-Arabian) art and out of the works of the Old Kingdom in Egypt that began with the Fourth Dynasty. There a mythic world- consciousness is fighting like a harassed debtor against all the dark and daemonic in itself and in Nature, while slowly ripening itself for the pure, day-bright expression of the existence that it will at last achieve and know. The more nearly a Culture approaches the noon culmination of its being, the more virile, austere, controlled, intense the form-language it has secured for itself, the more assured its sense of its own power, the clearer its lineaments. In the spring all this had still been dim and confused, tentative, filled with childish yearning and fears—witness the ornament of Romanesque-Gothic church porches of Saxony[90] and southern France, the early-Christian catacombs, the Dipylon[91] vases. But there is now the full consciousness of ripened creative power that we see in the time of the early Middle Kingdom of Egypt, in the Athens of the Pisistratidæ, in the age of Justinian, in that of the Counter-Reformation, and we find every individual trait of expression deliberate, strict, measured, marvellous in its ease and self-confidence. And we find, too, that everywhere, at moments, the coming fulfilment suggested itself; in such moments were created the head of Amenemhet III (the so-called “Hyksos Sphinx” of Tanis), the domes of Hagia Sophia, the paintings of Titian. Still later, tender to the point of fragility, fragrant with the sweetness of late October days, come the Cnidian Aphrodite and the Hall of the Maidens in the Erechtheum, the arabesques on Saracen horseshoe-arches, the Zwinger of Dresden, Watteau, Mozart. At last, in the grey dawn of Civilization, the fire in the Soul dies down. The dwindling powers rise to one more, half- successful, effort of creation, and produce the Classicism that is common to all dying Cultures. The soul thinks once again, and in Romanticism looks back piteously to its childhood; then finally, weary, reluctant, cold, it loses its desire to be, and, as in Imperial Rome, wishes itself out of the overlong daylight and back in the darkness of protomysticism, in the womb of the mother, in the grave. The spell of a “second religiousness”[92] comes upon it, and Late-Classical man turns to the practice of the cults of Mithras, of Isis, of the Sun—those very cults into which a soul just born in the East has been pouring a new wine of dreams and fears and loneliness.

VIII

The term "habit" (Habitus) is used of a plant to signify the special way, proper to itself, in which it manifests itself, i.e., the character, course and duration of its appearance in the light-world where we can see it. By its habit each kind is distinguished, in respect of each part and each phase of its existence, from all examples of other species. We may apply this useful notion of "habit" in our physiognomic of the grand organisms and speak of the habit of the Indian, Egyptian or Classical Culture, history or spirituality. Some vague inkling of it has always, for that matter, underlain the notion of _style_, and we shall not be forcing but merely clearing and deepening that word if we speak of the religious, intellectual, political, social or economic style[93] of a Culture. This "habit" of existence in space, which covers in the case of the individual man action and thought and conduct and disposition, embraces in the case or the existence of whole Cultures the totality of life-expressions of the higher order. The choice of particular branches of art (e.g., the round and fresco by the Hellenes, counterpoint and oil-painting by the West) and the out-and-out rejection of others (e.g., of plastic by the Arabs); inclination to the esoteric (India) or the popular (Greece and Rome); preference for oratory (Classical) or for writing (China, the West) as the form of spiritual communication, are all style-manifestations, and so also are the various types of costume, of administration, of transport, of social courtesies. All great personalities of the Classical world form a self-contained group, whose spiritual habit is definitely different from that of all great men of the Arabian or the Western groups. Compare even Goethe and Raphael with Classical men, and Heraclitus, Sophocles, Plato, Alcibiades, Themistocles, Horace and Tiberius rank themselves together instantly as members of one family. Every Classical Cosmopolis—from Hiero's Syracuse to Imperial Rome the embodiment and sense-picture of one and the same life-feeling—differs radically in lay-out and street- plan, in the language of its

public and private architecture, in the type of its squares, alleys, courts, façades, in its colour, noises, street-life and night-life, from the group of Indian or that of Arabian or that of Western world-cities. Baghdad and Cairo could be felt in Granada long after the conquest; even Philip II's Madrid had all the physiognomic hall-marks of modern London and Paris. There is a high symbolism in every dissimilarity of this sort. Contrast the Western tendency to straight-lined perspectives and street-alignments (such as the grand tract of the Champs-Elysées from the Louvre, or the Piazza before St. Peter's) with the almost deliberate complexity and narrowness of the Via Sacra, the Forum Romanum and the Acropolis, whose parts are arranged without symmetry and with no perspective. Even the town- planning—whether darkly as in the Gothic or consciously as in the ages of Alexander and Napoleon—reflects the same principle as the mathematic— in the one case the Leibnizian mathematic of infinite space, in the other the Euclidean mathematic of separate bodies.[94] But to the "habit" of a group belong, further, its definite _life-duration_ and its definite tempo of development. Both of these are properties which we must not fail to take into account in a historical theory of structure. The rhythm (Takt) of Classical existence was different from that of Egyptian or Arabian; and we can fairly speak of the _andante_ of Greece and Rome and the _allegro con brio_ of the Faustian spirit.

The notion of life-duration as applied to a man, a butterfly, an oak, a blade of grass, comprises a specific time-value, which is quite independent of all the accidents of the individual case. Ten years are a slice of life which is approximately equivalent for all men, and the metamorphosis of insects is associated with a number of days exactly known and predictable in individual cases. For the Romans the notions of _pueritia_, _adolescentia_, _iuventus_, _virilitas_, _senectus_ possessed an almost mathematically precise meaning. Without doubt the biology of the future will—in opposition to Darwinism and to the exclusion in principle of causal fitness-motives for the origins of species—take these _pre-ordained_ life durations as the starting-point for a new enunciation of its problem.[95] The duration of a generation— whatever may be its nature—is a fact of almost mystical significance.

Now, such relations are valid also, and to an extent never hitherto imagined, for all the higher Cultures. _Every Culture, every adolescence and maturing and decay of a Culture, every one of its intrinsically necessary stages and periods, has a definite duration, always the same, always recurring with the emphasis of a symbol._ In the present work we cannot attempt to open up this world of most mysterious connexions, but the facts that will emerge again and again as we go on will tell us of themselves how much lies hidden here. What is the meaning of that striking fifty-year period, the rhythm of the political, intellectual and artistic "becoming" of all Cultures?[96] Of the 300-year period of the Baroque, of the Ionic, of the great mathematics, of Attic sculpture, of mosaic painting, of counterpoint, of Galileian mechanics? What does the _ideal_ life of one millennium for each Culture mean in comparison with the individual man's "three-score years and ten"? As the plant's being is brought to expression in form, dress and carriage by leaves, blossoms, twigs and fruit, so also is the being of a Culture manifested by its religious, intellectual, political and economic formations. Just as, say, Goethe's individuality discourses of itself in such widely- different forms as the _Faust_, the _Farbenlehre_, the _Reineke Fuchs_, _Tasso_, _Werther_, the journey to Italy and the Friederike love, the _Westöstliche Diwan_ and the _Römische Elegien_; so the individuality of the Classical world displays itself in the Persian wars, the Attic drama, the City-State, the Dionysia and not less in the Tyrannis, the Ionic column, the geometry of Euclid, the Roman legion, and the gladiatorial contests and "panem et circenses" of the Imperial age.

In this sense, too, every individual being that has any sort of importance recapitulates,[97] of intrinsic necessity, all the epochs of the Culture to which it belongs. In each one of us, at that decisive moment when he begins to know that he is an ego, the inner life wakens just where and just how that of the Culture wakened long ago. Each of us men of the West, in his child's day-dreams and child's play, lives again its Gothic—the cathedrals, the castles, the hero-sagas, the crusader's "Dieu le veult," the soul's oath of young Parzival. Every young Greek had his Homeric age and his Marathon. In Goethe's Werther, the image of a tropic youth that every Faustian (but no Classical) man knows, the springtime of Petrarch and the Minnesänger reappears. When Goethe blocked out the _Urfaust_,[98] he was Parzival; when he finished _Faust I_, he was Hamlet, and only with _Faust II_ did he become the world-man of the 19th Century whom Byron could understand. Even the senility of the Classical—the faddy and unfruitful centuries of very late Hellenism, the second-childhood of a weary and blasé intelligence—can be studied in more than one of its grand old men. Thus, much of Euripides' _Bacchæ_ anticipates the life-outlook, and much of Plato's _Timæus_ the religious syncretism of the Imperial age; and Goethe's _Faust II_ and Wagner's _Parsifal_ disclose to us in advance the shape that _our_ spirituality will assume in our next (_in point of creative power our last_) centuries.

Biology employs the term _homology_ of organs to signify morphological equivalence in contradistinction to the term _analogy_ which relates to functional equivalence. This important, and in the sequel most fruitful, notion was conceived by Goethe (who was led thereby to the discovery of the "os intermaxillare" in man) and put into strict scientific shape by Owen;[99] this notion also we shall incorporate in our historical method.

It is known that for every part of the bone-structure of the human head an exactly corresponding part is found in all vertebrated animals right down to the fish, and that the pectoral fins of fish and the feet, wings and hands of terrestrial vertebrates are homologous organs, even though they have lost every trace of similarity. The lungs of terrestrial, and the swim-bladders of aquatic animals are homologous, while lungs and gills on the other hand are analogous—that is, similar in point of use.[100] And the trained and deepened morphological insight that is required to establish such distinctions is an utterly different thing from the present method of historical research, with its shallow comparisons of Christ and Buddha, Archimedes and Galileo, Cæsar and Wallenstein, parcelled Germany and parcelled Greece. More and more clearly as we go on, we shall realize what immense views will offer themselves to the historical eye as soon as the rigorous morphological method has been understood and cultivated. To name but a few examples, _homologous_ forms are: Classical sculpture and West European orchestration, the Fourth Dynasty pyramids and the Gothic cathedrals, Indian Buddhism and Roman Stoicism (Buddhism and Christianity are _not even analogous_); the periods of “the Contending States” in China, the Hyksos in Egypt and the Punic Wars; the age of Pericles and the age of the Ommayads; the epochs of the Rigveda, of Plotinus and of Dante. The Dionysiac movement is homologous with the Renaissance, analogous to the Reformation. For us, "Wagner is the _résumé_ of modernity," as Nietzsche rightly saw; and the equivalent that logically _must_ exist in the Classical modernity we find in Pergamene art. (Some preliminary notion of the fruitfulness of this way of regarding history, may be gathered from studying the tables included in this volume.)

The application of the “homology” principle to historical phenomena brings with it an entirely new connotation for the word “contemporary.” I designate as contemporary two historical facts that occur in exactly the same—relative—positions in their respective Cultures, and therefore possess exactly equivalent importance. It has already been shown how the development of the Classical and that of the Western mathematic proceeded in complete congruence, and we might have ventured to describe Pythagoras as the contemporary of Descartes, Archytas of Laplace, Archimedes of Gauss. The Ionic and the Baroque, again, ran their course _contemporaneously_. Polygnotus pairs in time with Rembrandt, Polycletus with Bach. The Reformation, Puritanism and, above all, the turn to Civilization appear simultaneously in all Cultures; in the Classical this last epoch bears the names of Philip and Alexander, in our West those of the Revolution and Napoleon. Contemporary, too, are the building of Alexandria, of Baghdad, and of Washington; Classical coinage and our double-entry book-keeping; the first Tyrannis and the Fronde; Augustus and Shih-huang-ti;[101] Hannibal and the World War.

I hope to show that without exception all great creations and forms in religion, art, politics, social life, economy and science appear, fulfil themselves and die down _contemporaneously_ in all the Cultures; that the inner structure of one corresponds strictly with that of all the others; that there is not a single phenomenon of deep physiognomic importance in the record of one for which we could not find a counterpart in the record of every other; and that this counterpart is to be found under a characteristic form and in a perfectly definite chronological position. At the same time, if we are to grasp such homologies of facts, we shall need to have a far deeper insight and a far more critical attitude towards the visible foreground of things than historians have hitherto been wont to display; who amongst them, for instance, would have allowed himself to dream that the counterpart of Protestantism was to be found in the Dionysiac movement, and that English Puritanism was for the West what Islam was for the Arabian world?

Seen from this angle, history offers possibilities far beyond the ambitions of all previous research, which has contented itself in the main with arranging the facts of the past so far as these were known (and that according to a one-line scheme)—the possibilities, namely, of

Overpassing the present as a research-limit, and predetermining the spiritual form, duration, rhythm, meaning and product of the _still unaccomplished_ stages of our western history; and

Reconstructing long-vanished and unknown epochs, even whole Cultures of the past, by means of morphological connexions, in much the same way as modern palæontology deduces far-reaching and trustworthy conclusions as to skeletal structure and species from a single unearthed skull-fragment.

It is possible, given the physiognomic rhythm, to recover from scattered details of ornament, building, script, or from odd political, economic and religious data, the organic characters of whole centuries of history, and from known elements on the scale of art-expression, to find corresponding elements on the scale of political forms, or from that of mathematical forms to read that of economic. This is a truly Goethian method—rooted in fact in Goethe’s conception of the _prime phenomenon_— which is already to a limited extent current in comparative zoology, but can be extended, to a degree hitherto undreamed of, over the whole field of history.

Footnote 93:

In English the word “cast” will evidently satisfy the sense better on occasion. The word “stil” will therefore not necessarily be always rendered “style.”—_Tr._

Footnote 94:

See Vol. II, pp. 109 et seq.

Footnote 95:

See Vol. II, pp. 36 et seq.

Footnote 96:

I will only mention here the distances apart of the three Punic Wars, and the series—likewise comprehensible only as rhythmic—Spanish Succession War, Silesian wars, Napoleonic Wars, Bismarck’s wars, and the World War (cf. Vol. II, p. 488). Connected with this is the spiritual relation of grandfather and grandson, a relation which produces in the mind of primitive peoples the conviction that the soul of the grandfather returns in the grandson, and has originated the widespread custom of giving the grandson the grandfather’s _name_, which by its mystic spell binds his soul afresh to the corporeal world.

Footnote 97:

The word is used in the sense in which biology employs it, viz., to describe the process by which the embryo traverses all the phases which its species has undergone.—_Tr._

Footnote 98:

The first draft of _Faust I_, discovered only comparatively recently.— _Tr._

Footnote 99:

See Ency. Brit., XIth Ed., articles _Owen, Sir Richard; Morphology and Zoology_ (p. 1029).—_Tr._

Footnote 100:

It is not superfluous to add that there is nothing of the causal kind in these _pure phenomena_ of “Living Nature.” Materialism, in order to get a system for the pedestrian reasoner, has had to adulterate the picture of them with fitness-causes. But Goethe—who anticipated just about as much of Darwinism as there will be left of it in fifty years from Darwin—_absolutely_ excluded the causality-principle. And the very fact that the Darwinians quite failed to notice its absence is a clear indication that Goethe’s “Living Nature” belongs to actual life, "cause"-less and "aim"-less; for the idea of the prime-phenomenon does not involve causal assumptions of any sort unless it has been misunderstood in advance in a mechanistic sense.

Footnote 101:

Reigned 246-210 B.C. He styled himself “first universal emperor” and intended a position for himself and his successors akin to that of “Divus” in Rome. For a brief account of his energetic and comprehensive work see Ency. Brit., XI Ed., article _China_, p. 194.—_Tr._

CHAPTER IV

THE PROBLEM OF WORLD-HISTORY

II

THE IDEA OF DESTINY AND THE PRINCIPLE OF CAUSALITY

CHAPTER IV

THE PROBLEM OF WORLD-HISTORY

II THE IDEA OF DESTINY AND THE PRINCIPLE OF CAUSALITY

I

Following out this train of thought to the end, we come into the presence of an opposition in which we perceive the key—the only key— wherewith to approach, and (so far as the word has any meaning at all) to solve, one of the oldest and gravest of man's riddles. This is the opposition of the _Destiny Idea_ and the _Causality Principle_—an opposition which, it is safe to say, has never hitherto been recognized for what it is, the necessary foundation of world-building.

Anyone who understands at all what is meant by saying that the soul is the _idea of an existence_, will also divine a near relationship between it and the _sure sense of a destiny_ and must regard Life itself (our name for the form in which the actualizing of the possible is accomplished) as directed, irrevocable in every line, fate-laden. Primitive man feels this dimly and anxiously, while for the man of a higher Culture it is definite enough to become his vision of the world— though this vision is communicable only through religion and art, never through notions and proofs.

Every higher language possesses a number of words such as luck, doom, conjuncture, vocation, about which there is, as it were, a veil. No hypothesis, no science, can ever get into touch with that which we feel when we let ourselves sink into the meaning and sound of these words. They are symbols, not notions. In them is the centre of gravity of that world-picture that I have called the World-as-history as opposed to the World-as-nature. The Destiny-idea demands life-experience and not scientific experience, the power of seeing and not that of calculating, depth and not intellect. There is an _organic logic_, an instinctive, dream-sure logic of all existence as opposed to the _logic of the inorganic_, the logic of understanding and of things understood—a logic of direction as against a logic of extension—and no systematist, no Aristotle or Kant, has known how to deal with it. They are on their own ground when they tell us about "judgment," "perception," "awareness," and "recollection," but as to what is in the words "hope," "happiness," "despair," "repentance," "devotion," and "consolation" they are silent. He who expects here, in the domain of the living, to find reasons and consequences, or imagines that an inward certainty as to the meaning of life is the same thing as "Fatalism" or "Predestination," simply knows nothing of the matters in question, confusing experience lived with experience acquired or acquirable. Causality is the reasonable, the law- bound, the describable, the badge of our whole waking and reasoning existence. But destiny is the word for an inner certainty that is _not_ describable. We bring out that which is in the causal by means of a physical or an epistemological system, through numbers, by reasoned classification; but the idea of destiny can be imparted only by the artist working through media like portraiture, tragedy and music. The one requires us to _distinguish_ and in distinguishing to dissect and destroy, whereas the other is _creative_ through and through, and thus destiny is related to life and causality to death.

In the Destiny-idea the soul reveals its world-longing, its desire to rise into the light, to accomplish and actualize its vocation. To no man is it entirely alien, and not before one has become the unanchored "late" man of the megalopolis is original vision quite overpowered by matter-of-fact feeling and mechanizing thought. Even then, in some intense hour, the lost vision comes back to one with terrible clearness, shattering in a moment all the causality of the world's surface. For the world as a system of causal connexions is not only a "late" but also a highly rarefied conception and only the energetic intellects of high Cultures are capable of possessing it—or perhaps we should say, devising it—with conviction. The notion of causality is coterminous with the notion of law: the only laws that are, are causal laws. But just as there lies in the causal, according to Kant, a _necessity of the thinking consciousness_ and the _basic form of its relation to the essence of things_, so also, designated by the words destiny, dispensation, vocation, there is a something that is an inevitable _necessity of life_. Real history is heavy with fate but free of laws. One can divine the future (there is, indeed, a certain insight that can penetrate its secrets deeply) but one cannot reckon it. The physiognomic flair which enables one to read a whole life in a face or to sum up whole peoples from the picture of an epoch—and to do so without deliberate effort or "system"—is utterly remote from all "cause and effect."

He who comprehends the light-world that is before his eyes not physiognomically but systematically, and makes it intellectually his own by the methods of _causal_ experience, must necessarily in the end come to believe that every living thing can be understood by reference to cause and effect—that there is no secret and no inner directedness. He, on the other hand, who as Goethe did—and for that matter as everyone does in nine out of ten of his waking moments—lets the impressions of the world about him work merely upon his senses, absorbs these impressions as a whole, feels the become in its becoming. The stiff mask of causality

is lifted by mere _ceasing to think_. Suddenly, Time is no more a riddle, a notion, a “form” or “dimension” but becomes an inner certainty, destiny itself; and in its directedness, its _irreversibility_, its livingness, is disclosed the very meaning of the historical world-picture. _Destiny and Causality are related as Time and Space._

In the two possible world-forms then—History and Nature, the physiognomy of all becoming and the system of all things become—destiny _or_ causality prevails. Between them there is all the difference between a feeling of life and a method of knowledge. Each of them is the starting- point of a complete and self-contained, but not _of a unique_ world. Yet, after all, just as the become is founded upon a becoming, so the _knowledge_ of cause and effect is founded upon the sure _feeling_ of a destiny. Causality is—so to say—destiny become, destiny made inorganic and modelled in reason-forms. Destiny itself (passed over in silence by Kant and every other builder of rational world-systems because with their armoury of _abstractions_ they could not touch _life_) stands beyond and outside all comprehended Nature. Nevertheless, being itself the original, it alone gives the stiff dead principle of cause-and- effect the opportunity to figure in the later scenes of a culture-drama, alive and historical, as the incarnation of a tyrannical thinking. The existence of the Classical soul is the _condition_ for the appearance of Democritus’s method, the existence of the Faustian soul for that of Newton’s. We may well imagine that either of these Cultures might have failed to produce a natural science of its own, but we cannot imagine the systems without their cultural foundations.

Here again we see how becoming and the become, direction and extension, include one another and are subordinated each to the other, according as we are in the historical or in the “natural” focus. If history is that kind of world-order in which all the become is fitted to the becoming, then the products of scientific work must _inter alia_ be so handled; and, in fact, for the historical eye there is only a _history_ of physics. It was Destiny that the discoveries of oxygen, Neptune, gravitation and spectrum analysis happened as and when they did. It was Destiny that the phlogiston theory, the undulatory theory of light, the kinetic theory of gases could arise at all, seeing that they were elucidations of results and, as such, highly personal to their respective authors, and that other theories (“correct” or “erroneous”) might equally well have been developed instead. And it is again Destiny and the result of strong personality when one theory vanishes and another becomes the lodestar of the physicist’s world. Even the born physicist speaks of the “fate” of a problem or the “history” of a discovery.

Conversely, if “Nature” is that constitution of things in which the becoming should logically be incorporated in the thing-become, and living direction in rigid extension, history may best be treated as a chapter of epistemology; and so indeed Kant would have treated it if he had remembered to include it at all in his system of knowledge. Significantly enough, he did not; for him as for every born systematist Nature is _The_ World, and when he discusses time without noticing that it has direction and is irreversible, we see that he is dealing with the Nature-world and has no inkling of the possibility of another, the history-world. Perhaps, for Kant, this other world _was_ actually impossible.

Now, _Causality has nothing whatever to do with Time_. To the world of to-day, made up of Kantians who know not how Kantian they are, this must seem an outrageous paradox. And yet every formula of Western physics exhibits the “how” and the “how long” as distinct in essence. As soon as the question is pressed home, causality restricts its answer rigidly to the statement _that_ something happens—and not _when_ it happens. The “effect” must of necessity be put with the “cause.” The _distance_ between them belongs to a different order, it lies within the act of understanding itself (which is an element of life) and not within the thing or things understood. It is of the essence of the extended that it overcomes directedness, and of Space that it contradicts Time, _and yet the latter, as the more fundamental, precedes and underlies the former_. Destiny claims the same precedence; we begin with the idea of Destiny, and only later, when our waking-consciousness looks fearfully for a spell that will bind in the sense-world and overcome the death that cannot be evaded, do we conceive causality as an anti-Fate, and make it _create another world to protect us from and console us for this_. And as the web of cause and effect gradually spreads over the visible surfaces there is formed a convincing picture of timeless duration— essentially, Being, but Being endowed with attributes by the sheer force of pure thought. This tendency underlies the feeling, well known in all mature Cultures, that “Knowledge is Power,” the power that is meant being power over Destiny. The abstract savant, the natural-science researcher, the thinker in systems, whose whole intellectual existence bases itself on the causality principle, are “late” manifestations of an unconscious _hatred_ of the powers of incomprehensible Destiny. “Pure Reason” denies all possibilities that are outside itself. Here strict thought and great art are eternally in conflict. The one keeps its feet, and the other lets itself go. A man like Kant must always feel himself as superior to a Beethoven as the adult is to the child, but this will not prevent a Beethoven from regarding the “Critique of Pure Reason” as a pitiable sort of philosophy. _Teleology_, that nonsense of all nonsenses within science, is a misdirected attempt to deal mechanically with the _living_ content of scientific knowledge (for knowledge implies someone to know, and though the substance of thought may be “Nature” the _act_ of thought is history), and so with life itself as an inverted causality. Teleology is a caricature of the Destiny-idea which transforms the

vocation of Dante into the _aim_ of the savant. It is the deepest and most characteristic tendency both of Darwinism—the megalopolitan-intellectual product of the most abstract of all Civilizations—and of the materialist conception of history which springs from the same root as Darwinism and, like it, kills all that is organic and fateful. Thus the morphological element of the Causal is a _Principle_, and the morphological element of Destiny is an _Idea_, an idea that is incapable of being "cognized," described or defined, and can only be felt and inwardly lived. This idea is something of which one is either entirely ignorant or else—like the man of the spring and every truly significant man of the late seasons, believer, lover, artist, poet—entirely certain.

Thus Destiny is seen to be the true _existence-mode of the prime phenomenon_, that in which the living idea of becoming unfolds itself immediately to the intuitive vision. And therefore the Destiny-idea dominates the whole world-picture of history, while causality, which is the existence-mode of _objects_ and stamps out of the world of sensations a set of well-distinguished and well-defined _things_, _properties_ and _relations_, dominates and penetrates, as the form of the understanding, the Nature-world that is the understanding's "alter ego."

But inquiry into the degree of validity of causal connexions within a presentation of nature, or (what is henceforth the same thing for us) into the destinies involved in that presentation, becomes far more difficult still when we come to realize that for primitive man or for the child no comprehensive causally-ordered world exists at all as yet and that we ourselves, though "late" men with a consciousness disciplined by powerful speech-sharpened thought, can do no more, even in moments of the most strained attention (the only ones, really, in which we are exactly in the physical focus), than _assert_ that the causal order which we see in such a moment is continuously present in the actuality around us. Even waking, we take in the actual, "the living garment of the Deity," _physiognomically_, and we do so involuntarily and by virtue of a power of experience that is rooted in the deep sources of life.

A _systematic_ delineation, on the contrary, is the expression of an understanding emancipated from perception, and by means of it we bring the mental picture of all times and all men into conformity with the moment's picture of Nature as ordered by ourselves. But the mode of this ordering, which has a history that we cannot interfere with in the smallest degree, is not the working of a cause, but a destiny.

II

The way to the problem of Time, then, begins in the primitive wistfulness and passes through its clearer issue the Destiny-idea. We have now to try to outline, briefly, the content of that problem, so far as it affects the subject of this book.

The _word_ Time is a sort of charm to summon up that intensely personal something designated earlier as the "proper," which with an inner certainty we oppose to the "alien" something that is borne in upon each of us amongst and within the crowding impressions of the sense-life. "The Proper," "Destiny" and "Time" are interchangeable words.

The problem of Time, like that of Destiny, has been completely misunderstood by all thinkers who have confined themselves to the systematic of the Become. In Kant's celebrated theory there is not one word about its character of directedness. Not only so, but the omission has never even been noticed. But what _is_ time as a length, time without direction? Everything living, we can only repeat, has "life," direction, impulse, will, a movement-quality (Bewegtheit) that is most intimately allied to yearning and has not the smallest element in common with the "motion" (Bewegung) of the physicists. The living is indivisible and irreversible, once and uniquely occurring, and its course is entirely indeterminable by mechanics. For all such qualities belong to the essence of Destiny, and "Time"—that which we actually feel at the sound of the word, which is clearer in music than in language, and in poetry than in prose—has this _organic_ essence, while Space has not. Hence, Kant and the rest notwithstanding, it is impossible to bring Time _with Space_ under one general Critique. Space is a _conception_, but time is a _word_ to indicate something inconceivable, a sound- symbol, and to use it as a notion, scientifically, is utterly to misconceive its nature. Even the word direction—which unfortunately cannot be replaced by another—is liable to mislead owing to its visual content. The vector-notion in physics is a case in point.

For primitive man the word "time" can have no meaning. He simply lives, without any necessity of specifying an opposition to something else. He _has_ time, but he _knows_ nothing of it. All of us are conscious, as being aware, of space only, and not of time. Space "is," (i.e. exists, in and with our sense-world)—as a self-extension while we are living the ordinary life of dream, impulse, intuition and conduct, and as space in the strict sense in the moments of strained attention. "Time," on the contrary, is a _discovery_, which is only made by thinking. We create it as an idea or notion and do not begin till much later to suspect that _we ourselves are Time_, inasmuch as we live.[102] And only the higher Cultures, whose world-conceptions have reached the mechanical-Nature stage, are capable of deriving from their consciousness of a well- ordered measurable and comprehensible

Spatial, the projected image of time, the _phantom_ time,[103] which satisfies their need of comprehending, measuring and causally ordering all. And this impulse—a sign of the sophistication of existence that makes its appearance quite early in every Culture—fashions, outside and beyond the real life- feeling, that which is called time in all higher languages and has become for the town-intellect a completely _inorganic magnitude_, as deceptive as it is current. But, if the characteristics, or rather the characteristic, of extension—limit and causality—is really wizard's gear wherewith our proper soul attempts to conjure and bind alien powers— Goethe speaks somewhere of the "principle of reasonable order that we bear within ourselves and could impress as the seal of our power upon everything that we touch"—if all law is a fetter which our world-dread hurries to fix upon the incrowding sensuous, a deep necessity of self- preservation, so also the invention of a time that is knowable and spatially representable within causality is a later act of this same self-preservation, an attempt to bind by the force of _notion_ the tormenting inward riddle that is doubly tormenting to the intellect that has attained power only to find itself defied. Always a subtle hatred underlies the intellectual process by which anything is forced into the domain and form-world of measure and law. The living is _killed_ by being introduced into space, for space is dead and makes dead. With birth is given death, with the fulfilment the end. Something _dies_ within the woman when she conceives—hence comes that eternal hatred of the sexes, child of world-fear. The man destroys, in a very deep sense, when he begets—by bodily act in the sensuous world, by "knowing" in the intellectual. Even in Luther[104] the word "know" has the secondary genital sense. And with the "knowledge" of life—which remains alien to the lower animals—the knowledge of death has gained that power which dominates man's whole waking consciousness. By a _picture_ of time the actual is changed into the transitory.[105]

The mere creation of the _name_ Time was an unparalleled deliverance. To name anything by a name is to win power over it. This is the essence of primitive man's art of magic—the evil powers are constrained by naming them, and the enemy is weakened or killed by coupling certain magic procedures with his name.[106]

And there is something of this primitive expression of world-fear in the way in which all systematic philosophies use mere names as a last resort for getting rid of the Incomprehensible, the Almighty that is all too mighty for the intellect. We name something or other the "Absolute," and we feel ourselves at once its superior. Philosophy, the _love_ of Wisdom, is at the very bottom defence against the incomprehensible. What is named, comprehended, measured is _ipso facto_ overpowered, made inert and taboo.[107] Once more, "knowledge is power." Herein lies one root of the difference between the idealist's and the realist's attitude towards the Unapproachable; it is expressed by the two meanings of the German word _Scheu_—respect and abhorrence.[108] The idealist contemplates, the realist would subject, mechanize, render innocuous. Plato and Goethe accept the secret in humility, Aristotle and Kant would open it up and destroy it. The most deeply significant example of this realism is in its treatment of the Time problem. The dread mystery of Time, life itself, must be spellbound and, by the magic of comprehensibility, neutralized.

All that has been said about time in "scientific" philosophy, psychology and physics—the supposed answer to a question that had better never have been asked, namely what _is_ time?—touches, not at any point the secret itself, but only a spatially-formed _representative_ phantom. The livingness and directedness and fated course of real Time is replaced by a figure which, be it never so intimately absorbed, is only a _line_, measurable, divisible, reversible, and not a portrait of that which is incapable of being portrayed; by a "time" that can be mathematically expressed in such forms as $\sqrt{_t_}$, $_t_^2$, $-_t_$, from which the assumption of a time of zero magnitude or of negative times is, to say the least, _not_ excluded.[109] Obviously this is something quite outside the domain of Life, Destiny, and living _historical_ Time; it is a purely conceptual time-system that is remote even from the sensuous life. One has only to substitute, in any philosophical or physical treatise that one pleases, this word "Destiny" for the word "time" and one will instantly see how understanding loses its way when language has emancipated it from sensation, and how impossible the group "time and space" is. What is not experienced and felt, what is merely _thought_, necessarily takes a _spatial_ form, and this explains why no systematic philosopher has been able to make anything out of the mystery-clouded, far-echoing sound symbols "Past" and "Future." In Kant's utterances concerning time they do not even occur, and in fact one cannot see any relation which could connect them with what is said there. But only this spatial form enables time and space to be brought into functional interdependence as magnitudes _of the same_ order, as four-dimensional vector analysis[110] conspicuously shows. As early as 1813 Lagrange frankly described mechanics as a four-dimensional geometry, and even Newton's cautious conception of "tempus absolutum sive duratio" is not exempt from this _intellectually inevitable_ transformation of the living into mere extension. In the older philosophy I have found one, and only one, profound and reverent presentation of Time; it is in Augustine—"If no one questions me, I know: if I would explain to a questioner, I know not."[111]

When philosophers of the present-day West "hedge"—as they all do—by saying that things _are_ in time as in space and that "outside" them nothing is "conceivable," they are merely putting another kind of space (Räumlichkeit) beside the ordinary one, just

as one might, if one chose, call hope and electricity the two forces of the universe. It ought not, surely, to have escaped Kant when he spoke of the “two forms” of perception, that whereas it is easy enough to come to a scientific understanding about space (though not to “explain” it, in the ordinary sense of the word, for that is beyond human powers), treatment of time on the same lines breaks down utterly. The reader of the “Critique of Pure Reason” and the “Prolegomena” will observe that Kant gives a well- considered proof for the connexion of space and geometry but carefully avoids doing the same for time and arithmetic. There he did not go beyond enunciation, and constant reassertion of analogy between the two conceptions lured him over a gap that would have been fatal to his system. _Vis-à-vis_ the Where and the How, the When forms a world of its own as distinct as is metaphysics from physics. Space, object, number, notion, causality are so intimately akin that it is impossible—as countless mistaken systems prove—to treat the one independently of the other. Mechanics is a copy of the logic of its day and vice versa. The picture of thought as psychology builds it up and the picture of the space-world as contemporary physics describes it are reflections of one another. Conceptions and things, reasons and causes, conclusions and processes coincide so nicely, as received by the consciousness, that the abstract thinker himself has again and again succumbed to the temptation of setting forth the thought-“process” graphically and schematically— witness Aristotle’s and Kant’s tabulated categories. “Where there is no scheme, there is no philosophy” is the objection of principle— unacknowledged though it may be—that all professional philosophers have against the “intuitives,” to whom inwardly they feel themselves far superior. That is why Kant crossly describes the Platonic style of thinking “as the art of spending good words in babble” (die Kunst, wortreich zu schwatzen), and why even to-day the lecture-room philosopher has not a word to say about Goethe’s philosophy. Every logical operation is capable of being _drawn_, every system a _geometrical_ method of handling thoughts. And therefore Time either finds no place in the system at all, or is made its victim.

This is the refutation of that widely-spread misunderstanding which connects time with arithmetic and space with geometry by superficial analogies, an error to which Kant ought never to have succumbed—though it is hardly surprising that Schopenhauer, with his incapacity for understanding mathematics, did so. Because the living act of numbering is somehow or other related to time, number and time are constantly confused. But numbering is not number, any more than drawing is a drawing. Numbering and drawing are a becoming, numbers and figures are things become. Kant and the rest have in mind now the living act (numbering) and now the result thereof (the relations of the finished figure); but the one belongs to the domain of Life and Time, the other to that of Extension and Causality. _That_ I calculate is the business of organic, _what_ I calculate the business of inorganic, logic. Mathematics as a whole—in common language, arithmetic and geometry— answers the _How?_ and the _What?_—that is, the problem of the Natural order of things. In opposition to this problem stands that of the _When?_ of things, the specifically historical problem of destiny, future and past; and all these things are comprised in the word _Chronology_, which simple mankind understands fully and unequivocally.

Between arithmetic and geometry there is no opposition.[112] Every kind of number, as has been sufficiently shown in an earlier chapter, belongs entirely to the realm of the extended and the become, whether as a Euclidean magnitude or as an analytical function; and to which heading should we have to assign the cyclometric[113] functions, the Binomial Theorem, the Riemann surfaces, the Theory of Groups? Kant’s scheme was refuted by Euler and d’Alembert before he even set it up, and only the unfamiliarity of his successors with the mathematics of their time—what a contrast to Descartes, Pascal and Leibniz, who evolved the mathematics of _their_ time from the depths of their own philosophy!—made it possible for mathematical notions of a relation between time and arithmetic to be passed on like an heirloom, almost uncriticized.

But between Becoming and any part whatsoever of mathematics there is not the slightest contact. Newton indeed was profoundly convinced (and he was no mean philosopher) that in the principles of his Calculus of Fluxions[114] he had grasped the problem of Becoming, and therefore of Time—in a far subtler form, by the way, than Kant’s. But even Newton’s view could not be upheld, even though it may find advocates to this day. Since Weierstrass proved that continuous functions exist which either cannot be differentiated at all or are capable only of partial differentiation, this most deep-searching of all efforts to close with the Time-problem mathematically has been abandoned.

Footnote 102:

The sensuous life and the intellectual life too are Time; it is only sensuous _experience_ and intellectual _experience_, the “world,” that is spatial nature. (As to the nearer affinity of the Feminine to Time, see Vol. II, pp. 403 et seq.)

Footnote 103:

The expression “space of time” (Zeitraum) which is common to many languages, is evidence of our inability to represent direction otherwise than by extension.

Footnote 104:

I.e., the translated Bible.—_Tr._

Footnote 105:

See Vol. II, pp. 19 et seq.

Footnote 106:

See p. 80 of this volume, and Vol. II, pp. 166, 328.

Footnote 107:

See Vol. II, p. 137.

Footnote 108:

The nearest English equivalent is perhaps the word “fear.” “Fearful” would correspond exactly but for the fact that in the second sense the word is objective instead of subjective. The word “shy” itself bears the second meaning in such trivial words as gun-shy, work-shy.—_Tr._

Footnote 109:

The Relativity theory, a working hypothesis which is on the way to overthrowing Newton’s mechanics—which means at bottom his view of the problem of motion—admits cases in which the words “earlier” and “later” may be inverted. The mathematical foundation of this theory by Minkowski uses _imaginary_ time units for measurement.

Footnote 110:

The dimensions are _x_, _y_, _z_ (in respect of space) and _t_ (in respect of time), and all four appear to be regarded as perfectly equivalent in transformations. [The English reader may be referred to A. Einstein, “Theory of Relativity,” Ch. XI and appendices I, II.— _Tr._]

Footnote 111:

Si nemo ex me quaerat, scio; si quaerenti explicari velim, nescio. (_Conf._ XI, 14.)

Footnote 112:

Save in elementary mathematics. (It may be remarked that most philosophers since Schopenhauer have approached these questions with the prepossessions of elementary mathematics.)

Footnote 113:

The “inverse circular functions” of English text-books.—_Tr._

Footnote 114:

The Newtonian form of the differential calculus was distinct from the Leibnizian, which is now in general use. Without going into unnecessary detail, the characteristic of Newton’s method was that it was meant not for the calculation of quadratures and tangents (which had occupied his predecessors), nor as an organ of functional theory as such (as the differential calculus became much later), but quite definitely as a method of dealing with _rate of change_ in pure mechanics, with the “flowing” or “fluxion” of a dependent variable under the influence of a variable which for Newton was the “fluent,” and which we call the argument of a function.—_Tr._

III

Time is a counter-conception (Gegenbegriff) to Space, arising out of Space, just as the notion (as distinct from the fact) of Life arises only in opposition to thought, and the notion (as distinct from the fact) of birth and generation only in opposition to death.[115] This is implicit in the very essence of all awareness. Just as any sense- impression is only remarked when it detaches itself from another, so any kind of understanding that is genuine critical activity[116] is only made possible through the setting-up of a new concept as anti-pole to one already present, or through the divorce (if we may call it so) of a pair of inwardly-polar concepts which as long as they are mere constituents, possess no actuality.[117] It has long been presumed—and rightly, beyond a doubt—that all root-words, whether they express things or properties, have come into being by pairs; but even later, even to- day, the connotation that every new word receives is a reflection of some other. And so, guided by language, the understanding, incapable of fitting a sure inward subjective certainty of Destiny into its form- world, created "time" out of space as its opposite. But for this we should possess neither the word nor its connotation. And so far is this process of word-formation carried that the particular style of extension possessed by the Classical world led to a specifically Classical notion of time, differing from the time-notions of India, China and the West exactly as Classical space differs from the space of these Cultures.[118]

For this reason, the notion of an art-form—which again is a "counter- concept"—has only arisen when men became aware that their art-creations had a connotation (Gehalt) at all, that is, when the expression-language of the art, along with its effects, had ceased to be something perfectly natural and taken-for-granted, as it still was in the time of the Pyramid-Builders, in that of the Mycenæan strongholds and in that of the early Gothic cathedrals. Men become suddenly aware of the existence of "works," and then for the first time the understanding eye is able to distinguish a causal side and a destiny side in every living art.

In every work that displays the _whole_ man and the _whole_ meaning of the existence, fear and longing lie close together, but they are and they remain different. To the fear, to the Causal, belongs the whole "taboo" side of art—its stock of motives, developed in strict schools and long craft-training, carefully protected and piously transmitted; all of it that is comprehensible, learnable, _numerical_; all the _logic_ of colour, line, structure, order, which constitutes the mother- tongue of every worthy artist and every great epoch. But the other side, opposed to the "taboo" as the directed is to the extended and as the development-destiny within a form-language to its syllogisms, comes out in genius (namely, in that which is wholly personal _to the individual artists_, their imaginative powers, creative passion, depth and richness, as against all mere mastery of form) and, beyond even genius, in that superabundance of creativeness in the race which conditions the rise and fall of whole arts. This is the "totem" side, and owing to it— notwithstanding all the æsthetics ever penned—there is no timeless and solely-true way of art, but only a _history_ of art, marked like everything that lives with the sign of irreversibility.[119]

And this is why architecture of the grand style—which is the only one of the arts that handles the alien and fear-instilling itself, the immediate Extended, the stone—is naturally _the_ early art in all Cultures, and only step by step yields its primacy to the special arts of the city with their more mundane forms—the statue, the picture, the musical composition. Of all the great artists of the West, it was probably Michelangelo who suffered most acutely under the constant nightmare of world-fear, and it was he also who, alone among the Renaissance masters, never freed himself from the architectural. He even painted as though his surfaces were stone, become, stiff, _hateful_. His work was a bitter wrestle with the powers of the cosmos which faced him and challenged him in the form of material, whereas in the yearning Leonardo's colour we see, as it were, a glad materialization of the spiritual. But in every large architectural problem an implacable causal logic, not to say mathematic, comes to expression—in the Classical orders of columns a Euclidean relation of _beam_ and _load_, in the "analytically" disposed thrust-system of Gothic vaulting the dynamic relation of _force_ and _mass_. Cottage-building traditions—which are to be traced in the one and in the other, which are the necessary background even of Egyptian architecture, which in fact develop in every early period and are regularly lost in every later—contain the whole sum of this logic of the extended. But the symbolism of direction and destiny is beyond all the "technique" of the great arts and hardly approachable by way of æsthetics. It lies—to take some instances—in the contrast that is always felt (but never, either by Lessing or by Hebbel, elucidated) between Classical and Western tragedy; in the succession of scenes of old Egyptian relief and generally in the _serial_ arrangement of Egyptian statues, sphinxes, temple-halls; in the choice, as distinct from the treatment, of materials (hardest diorite to affirm, and softest wood to deny, the future); in the occurrence, and not in the grammar, of the individual arts, e.g., the victory of arabesque over the Early Christian picture, the retreat of oil-painting before chamber music in the Baroque; in the utter diversity of intention in Egyptian, Chinese and Classical statuary. All these are not matters of "can" but of "must," and therefore it is not mathematics and abstract thought, but the great arts in their kinship with the contemporary religions, that give the key to the problem of Time, a problem that can hardly be solved within the domain of history[120] alone.

See Vol. II, pp. 13, 19.

Footnote 116:

See Vol. II, p. 16.

Footnote 117:

The original reads: “(So ist jede Art von Verstehen ... nur dadurch möglich ...) dass ein Begriffspaar von innerem Gegensatz gewissermassen durch Auseinandertreten erst Wirklichkeit erhält.”— _Tr._

Footnote 118:

At this point the German text repeats the paragraph which in this edition begins at “But inquiry” (p. 121) and ends at the close of section I (p. 121).—_Tr._

Footnote 119:

See Vol. II, pp. 137, 159.

Footnote 120:

Here the author presumably means history in the ordinary acceptation of the word.—_Tr._

IV

It follows from the meaning that we have attached to the Culture as a prime phenomenon and to destiny as the organic logic of existence, that each Culture must necessarily possess its own destiny-idea. Indeed, this conclusion is implicit from the first in the feeling that every great Culture is nothing but the actualizing and form of a single, singularly- constituted (einzigartig) soul. And what cannot be felt by one sort of men exactly as it is felt by another (since the life of each is the expression of the idea _proper_ to himself) and still less transcribed, what is named by us “conjuncture,” “accident,” “Providence” or “Fate,” by Classical man “Nemesis,” “Ananke,” “Tyche” or “Fatum,” by the Arab “Kismet,” by everyone in some way of his own, is just that of which each unique and unreproduceable soul-constitution, quite clear to those who share in it, is a rendering.

The Classical form of the Destiny-idea I shall venture to call Euclidean. Thus it is the sense-actual person of Œdipus, his “empirical ego,” nay, his σ■μα that is hunted and thrown by Destiny. Œdipus complains that Creon has misused his “body”[121] and that the oracle applied to his “body.”[122] Æschylus, again, speaks of Agamemnon as the “royal body, leader of fleets.”[123] It is this same word σ■μα that the mathematicians employ more than once for the “bodies” with which they deal. But the destiny of King Lear is of the “analytical” type—to use here also the term suggested by the corresponding number-world—and consists in dark inner relationships. The idea of fatherhood emerges; spiritual threads weave themselves into the action, incorporeal and transcendental, and are weirdly illuminated by the counterpoint of the secondary tragedy of Gloster’s house. Lear is at the last a mere name, the axis of something unbounded. _This_ conception of destiny is the “infinitesimal” conception. It stretches out into infinite time and infinite space. It touches the bodily, Euclidean existence not at all, but affects only the Soul. Consider the mad King between the fool and the outcast in the storm on the heath, and then look at the Laocoön group; the first is the Faustian, the other the Apollinian way of suffering. Sophocles, too, wrote a Laocoön drama; and we may be certain that there was nothing of _pure soul-agony_ in it. Antigone goes below ground in the body, because she has buried her brother’s body. Think of Ajax and Philoctetes, and then of the Prince of Homburg and Goethe’s Tasso—is not the difference between magnitude and relation traceable right into the depths of artistic creation?

This brings us to another connexion of high symbolic significance. The drama of the West is ordinarily designated _Character-Drama_. That of the Greeks, on the other hand, is best described as _Situation-Drama_, and in the antithesis we can perceive what it is that Western, and what it is that Classical, man respectively feel as the basic life-form that is imperilled by the onsets of tragedy and fate. If in lieu of “direction” we say “irreversibility,” if we let ourselves sink into the terrible meaning of those words “too late” wherewith we resign a fleeting bit of the present to the _eternal_ past, we find the deep foundation of every tragic

crisis. It is Time that is the tragic, and it is by the meaning that it intuitively attaches to Time that one Culture is differentiated from another; and consequently “tragedy” of the grand order has only developed in the Culture which has most passionately affirmed, and in that which has most passionately denied, Time. The sentiment of the ahistoric soul gives us a Classical tragedy of the moment, and that of the ultrahistorical soul puts before us Western tragedy that deals with the _development of a whole life_. Our tragedy arises from the feeling of an _inexorable_ Logic of becoming, while the Greek feels the _illogical, blind Casual of the moment_—the life of Lear matures inwardly towards a catastrophe, and that of Œdipus stumbles without warning upon a situation. And now one may perceive how it is that synchronously with Western drama there rose and fell a mighty portrait-art (culminating in Rembrandt), a kind of historical and biographical art which (_because_ it was so) was sternly discountenanced in Classical Greece at the apogee of Attic drama. Consider the veto on likeness-statuary in votive offerings[124] and note how—from Demetrius of Alopeke (about 400)[125]—a timid art of “ideal” portraiture began to venture forth when, and only when, grand tragedy had been thrown into the background by the light society-pieces of the “Middle Comedy.”[126] Fundamentally all Greek statues were standard masks, like the actors in the theatre of Dionysus; all bring to expression, in significantly strict form, _somatic_ attitudes and positions. Physiognomically they are _dumb_, corporeal and _of necessity_ nude—character-heads of definite individuals came only with the Hellenistic age. Once more we are reminded of the contrast between the Greek number-world, with its computations of tangible results, and the other, our own, in which the relations between groups of functions or equations or, generally, formula-elements of the same order are investigated morphologically, and the character of these relations fixed _as such_ in express laws.

Footnote 124:

Phidias, and through him his patron Pericles, were attacked for alleged introduction of portraits upon the shield of Athene Parthenos. In Western religious art, on the contrary, portraiture was, as everyone knows, a habitual practice. Every Madonna, for instance, is more or less of a portrait.

With this may be compared again the growing resistance of Byzantine art, as it matured, to portraiture in sacred surroundings, evidenced for instance in the history of the _nimbus_ or halo—which was removed from the insignia of the Prince to become the badge of the Saint—in the legend of the miraculous effacement of Justinian’s pompous inscription on Hagia Sophia, and in the banishment of the human patron from the celestial part of the church to the earthly.—_Tr._

Footnote 125:

Who was criticized as “no god-maker but a man-maker” and as one who spoilt the _beauty_ of his work by aiming at _likeness_.

Cresilas, the sculptor from whom the only existing portrait of Pericles is derived, was a little earlier; in him, however, the “ideal” was still the supreme aim.—_Tr._

The writers immediately succeeding Aristophanes.—_Tr._

V

In the capacity of experientially living history and the way in which history, particularly the history of personal becoming, is lived, one man differs very greatly from another.

Every Culture possesses a wholly individual way of looking at and comprehending the world-as-Nature; or (what comes to the same thing) it _has_ its own peculiar “Nature” which no other sort of man can possess in exactly the same form. But in a far greater degree still, every Culture—including the individuals comprising it (who are separated only by minor distinctions)—possesses a specific and peculiar sort of history—and it is in the picture of this and the style of this that the general and the personal, the inner and the outer, the world-historical and the biographical becoming, are immediately perceived, felt and lived. Thus the autobiographical tendency of Western man—revealed even in Gothic times in the symbol of auricular confession[127]—is utterly alien to Classical man; while his intense historical awareness is in complete contrast to the almost dreamy unconsciousness of the Indian. And when Magian man—primitive Christian or ripe scholar of Islam—uses the words “world-history,” what is it that he sees before him?

But it is difficult enough to form an exact idea even of the “Nature” proper to another kind of man, although in this domain things specifically cognizable are causally ordered and unified in a communicable system. And it is quite impossible for us to penetrate completely a historical world-aspect of “becoming” formed by a soul that is quite differently constituted from our own. Here there must always be an intractable residue, greater or smaller in proportion to our historical instinct, physiognomic tact and knowledge of men. All the same, the solution of this very problem is the condition-precedent of all really deep understanding of the world. The historical environment of another is a part of his _essence_, and no such other can be understood without the knowledge of his time-sense, his destiny-idea and the style and degree of acuity of his inner life. In so far therefore as these things are not directly confessed, we have to extract them from the symbolism of the alien Culture. And as it is thus and only thus that we can approach the incomprehensible, the style of an alien Culture, and the great time-symbols belonging thereto acquire an immeasurable importance.

As an example of these hitherto almost uncomprehended signs we may take the _clock_, a creation of highly developed Cultures that becomes more and more mysterious as one examines it. Classical man managed to do without the clock, and his abstention was more or less deliberate. To the Augustan period, and far beyond it, the time of day was estimated by the length of one’s shadow,[128] although sun-dials and water-clocks, designed in conformity with a strict time-reckoning and imposed by a deep sense of past and future, had been in regular use in both the older Cultures of Egypt and Babylonia.[129] Classical man’s existence— Euclidean, relationless, point-formed—was wholly contained in the instant. Nothing must remind him of past or future. For the true Classical, archæology did not exist, nor did its _spiritual inversion_, _astrology_. The Oracle and the Sibyl, like the Etruscan-Roman “haruspices” and “augurs,” did not foretell any distant future but merely gave indications on particular questions of immediate bearing. No time-reckoning entered intimately into everyday life (for the Olympiad sequence was a mere literary expedient) and what really matters is not the goodness or badness of a calendar but the questions: “who uses it?” and “does the life of the nation run by it?” In Classical cities nothing suggested duration, or old times or times to come—there was no pious preservation of ruins, no work conceived for the benefit of future generations; in them we do not find that durable[130] material was deliberately chosen. The Dorian Greek ignored the Mycenæan stone- technique and built in wood or clay, though Mycenæan and Egyptian work was before him and the country produced first-class building-stone. The Doric style is a timber style—even in Pausanias’s day some wooden columns still lingered in the Heræum of Olympia. The real organ of history is “memory” in the sense which is always postulated in this book, viz., that which preserves as a constant present the image of one’s personal past and of a national and a world-historical past[131] as well, and is conscious of the course both of personal and of super- personal becoming. That organ was not present in the make-up of a Classical soul. There was no “Time” in it. Immediately behind his proper present, the Classical historian sees a background that is already destitute of temporal and therefore of inward order. For Thucydides the Persian Wars, for Tacitus the agitation of the Gracchi, were already in this vague background;[132] and the great families of Rome had traditions that were pure romance—witness Cæsar’s slayer, Brutus, with his firm belief in his reputed tyrannicide ancestor. Cæsar’s reform of the calendar may almost be regarded as a deed of emancipation from the Classical life-feeling. But it must not be forgotten that Cæsar also imagined a renunciation of Rome and a transformation of the City-State into an empire which was to be dynastic—marked with the badge of duration—and to have its centre of gravity in Alexandria, which in fact is the birthplace of his calendar. His assassination seems to us a last outburst of the antiduration feeling that was incarnate in the _Polis_ and the _Urbs Roma_.

Even then Classical mankind was still living every hour and every day for itself; and this is equally true whether we take the individual Greek or Roman, or the city, or the nation, or the whole Culture. The hot-blooded pageantry, palace-orgies, circus-battles

of Nero or Caligula—Tacitus is a true Roman in describing only these and ignoring the smooth progress of life in the distant provinces—are final and flamboyant expressions of the Euclidean world-feeling that deified the body and the present.

The Indians also have no sort of time-reckoning (the absence of it in their case expressing their Nirvana) and no clocks, and _therefore_ no history, no life memories, no care. What the conspicuously historical West calls “Indian history” achieved itself without the smallest consciousness of what it was doing.[133] The millennium of the Indian Culture between the Vedas and Buddha seems like the stirrings of a sleeper; here life was _actually_ a dream. From all this our Western Culture is unimaginably remote. And, indeed, man has never—not even in the “contemporary” China of the Chóu period with its highly-developed sense of eras and epochs[134]—been so awake and aware, so deeply sensible of time and conscious of direction and fate and movement as he has been in the West. _Western history was willed and Indian history happened._ In Classical existence years, in Indian centuries scarcely counted, but here the hour, the minute, yea the second, is of importance. Of the tragic tension of a historical crisis like that of August, 1914, when even moments seem overpowering, neither a Greek nor an Indian could have had any idea.[135] Such crises, too, a deep-feeling man of the West can experience _within himself_, as a true Greek could never do. Over our country-side, day and night from thousands of belfries, ring the bells[136] that join future to past and fuse the point-moments of the Classical present into a grand relation. The epoch which marks the birth of our Culture—the time of the Saxon Emperors— marks also the discovery of the wheel-clock.[137] Without exact time- measurement, without a _chronology of becoming_ to correspond with his imperative need of archæology (the preservation, excavation and collection of _things-become_), Western man is unthinkable. The Baroque age intensified the Gothic symbol of the belfry to the point of grotesqueness, and produced the pocket watch that constantly accompanies the individual.[138]

Another symbol, as deeply significant and as little understood as the symbol of the clock, is that of the funeral customs which all great Cultures have consecrated by ritual and by art. The grand style in India begins with tomb-temples, in the Classical world with funerary urns, in Egypt with pyramids, in early Christianity with catacombs and sarcophagi. In the dawn, innumerable equally-possible forms still cross one another chaotically and obscurely, dependent on clan-custom and external necessities and conveniences. But every Culture promptly elevates one or another of them to the highest degree of symbolism. Classical man, obedient to his deep unconscious life-feeling, picked upon burning, an act of annihilation in which the Euclidean, the here- and-now, type of existence was powerfully expressed. He _willed_ to have no history, no duration, neither past nor future, neither preservation nor dissolution, and therefore he _destroyed_ that which no longer possessed a present, the _body_ of a Pericles, a Cæsar, a Sophocles, a Phidias. And the soul passed to join the vague crowd to which the living members of the clan paid (but soon ceased to pay) the homage of ancestor-worship and soul-feast, and which in its _formlessness_ presents an utter contrast to the ancestor-_series_, the _genealogical tree_, that is eternalized with all the marks of historical order in the family-vault of the West. In this (with one striking exception, the Vedic dawn in India) no other Culture parallels the Classical.[139] And be it noted that the Doric-Homeric spring, and above all the “Iliad,” invested this act of burning with all the vivid feeling of a _new-born_ symbol; for those very warriors whose deeds probably formed the nucleus of the epic were in fact buried almost in the Egyptian manner in the graves of Mycenæ, Tiryns, Orchomenos and other places. And when in Imperial times the sarcophagus or “flesh-consumer”[140] began to supersede the vase of ashes, it was again, as in the time when the Homeric urn superseded the shaft-grave of Mycenæ, a _changed sense of Time_ that underlay the change of rite.

The Egyptians, who preserved their past in memorials of stone and hieroglyph so purposefully that we, four thousand years after them, can determine the order of their kings’ reigns, so thoroughly eternalized their bodies that today the great Pharaohs lie in our museums, recognizable in every lineament, a symbol of grim triumph—while of Dorian kings not even the names have survived. For our own part, we know the exact birthdays and deathdays of almost every great man since Dante, and, moreover, we see nothing strange in the fact. Yet in the time of Aristotle, the very zenith of Classical education, it was no longer known with certainty if Leucippus, the founder of Atomism and a contemporary of Pericles—i.e., hardly a century before—had ever existed at all; much as though for us the existence of Giordano Bruno was a matter of doubt[141] and the Renaissance had become pure saga.

And these museums themselves, in which we assemble everything that is left of the corporeally-sensible past! Are not they a symbol of the highest rank? Are they not intended to conserve in mummy the entire “body” of cultural development?

As we collect countless data in milliards of printed books, do we not also collect _all_ the works of _all_ the dead Cultures in these myriad halls of West-European cities, in the mass of the collection depriving each individual piece of that instant of actualized purpose that is its own—the one property that the Classical soul would have respected—and _ipso facto_ dissolving it into our unending and unresting Time? Consider what it was that the Hellenes named Μουσεῖον;[142] how deep a significance lies in the change of sense!

Footnote 127:

See Vol. II, pp. 360 et seq.

Footnote 128:

Diels, _Antike Technik_ (1920), p. 159.

Footnote 129:

About 400 B.C. savants began to construct crude sun-dials in Africa and Ionia, and from Plato's time still more primitive clepsydræ came into use; but in both forms, the Greek clock was a mere imitation of the far superior models of the older East, and it had not the slightest connexion with the Greek life-feeling. See Diels, _op. cit._, pp. 160 et seq.

Footnote 130:

Horace's _monumentum ære perennius_ (Odes III, 30) may seem to conflict with this: but let the reader reconsider the whole of that ode in the light of the present argument, and turn also to Leuconoe and her "Babylonian" impieties (Odes I, 11) _inter alia_, and he will probably agree that so far as Horace is concerned, the argument is supported rather than impugned.—_Tr._

Footnote 131:

Ordered, for us, by the Christian chronology and the ancient-mediæval- modern scheme. It was on those foundations that, from early Gothic times, the images of religion and of art have been built up in which a large part of Western humanity continues to live. To predicate the same of Plato or Phidias is quite impossible, whereas the Renaissance artists could and did project a classical past, which indeed they permitted to dominate their judgments completely.

Footnote 132:

See pp. 9. et seq.

Footnote 133:

The Indian history of our books is a Western reconstruction from texts and monuments. See the chapter on epigraphy in the "Indian Gazetteer," Vol. II.—_Tr._

Footnote 134:

See Vol. II, pp. 482, 521 et seq.

Footnote 135:

There is one famous episode in Greek history that may be thought to contradict this—the race against time of the galley sent to Mitylene to countermand the order of massacre (Thucydides, III, 49). But we observe that Thucydides gives twenty times the space to the debates at Athens that he gives to the drama of the galley-rowers pulling night and day to save life. And we are told that it was the Mitylenean ambassadors who spared no expense to make it worth the rowers' while to win, whereupon "there arose such a zeal of rowing that...." The final comment is, strictly construing Thucydides's own words: "Such was the magnitude of the danger that Mitylene passed by" (παρ■ τοσο■τον μ■ν ■ Μυτιλ■νη ■λθε κινδ■νου), a phrase which recalls forcibly what has just been said regarding the "situation-drama."— _Tr._

Footnote 136:

Besides the clock, the bell itself is a Western "symbol." The passing- bell tolled for St. Hilda of Whitby in 680, and a century before that time bells had come into general use in Gaul both for monasteries and for parish churches. On the contrary, it was not till 865 that Constantinople possessed bells, and these were presented in that year by Venice. The presence of a belfry in a Byzantine church is accounted a proof of "Western influence": the East used and still largely uses mere gongs and rattles for religious purposes. (British Museum "Handbook of Early Christian Antiquities)".—_Tr._

Footnote 137:

May we be permitted to guess that the Babylonian sun-dial and the Egyptian water-clock came into being “simultaneously,” that is, on the threshold of the third millennium before Christ? The history of clocks is inwardly inseparable from that of the calendar; it is therefore to be assumed that the Chinese and the Mexican Cultures also, with their deep sense of history, very early devised and used methods of time- measurement.

(The Mexican Culture developed the most intricate of all known systems of indicating year and day. See British Museum “Handbook of May on Antiquities.”—_Tr._)

Footnote 138:

Let the reader try to imagine what a Greek would feel when suddenly made acquainted with this custom of ours.

Footnote 139:

The Chinese ancestor-worship honoured genealogical order with strict ceremonies. And whereas here ancestor-worship by degrees came to be the centre of all piety, in the Classical world it was driven entirely into the background by the cults of _present_ gods; in Roman times it hardly existed at all.

(Note the elaborate precautions taken in the Athenian “Anthesteria” to keep the anonymous mass of ghosts at bay. This feast was anything but an All Souls’ Day of re-communion with the departed spirits.—_Tr._)

Footnote 140:

With obvious reference to the resurrection of the flesh (■κ νεκρ■ν). But the meaning of the term “resurrection” has undergone, from about 1000 A.D., a profound—though hardly noticed—change. More and more it has tended to become identified with “immortality.” But in the resurrection from the dead, the implication is that time begins again to repeat in space, whereas in “immortality” it is time that overcomes space.

Footnote 141:

For English readers, the most conspicuous case of historic doubt is the Shakespeare-Bacon matter. But even here, it is only the work of Shakespeare that is in question, not his existence and personality, for which we have perfectly definite evidence.—_Tr._

Footnote 142:

Originally a philosophical and scientific lecture-temple founded in honour of Aristotle, and later the great University of Alexandria, bore the title Μουσε■ον. Both Aristotle and the University amassed collections but they were collections of (_a_) books, (_b_) natural history specimens, living or taken from life. In the West, the collection of _memorials of the past as such_ dates from the earliest days of the Renaissance.—_Tr._

VI

It is the _primitive feeling of Care_[143] which dominates the physiognomy of Western, as also that of Egyptian and that of Chinese history, and it creates, further, the symbolism of the erotic which represents the flowing on of endless life in the form of the familial series of individual existences. The point-formed Euclidean existence of Classical man, in this matter as in others, conceived only the here-and- now definitive act of begetting or of bearing, and thus it comes about that we find the birth-pangs of the mother made the centre of Demeter- worship and the Dionysiac symbol of the phallus (the sign of a sexuality wholly concentrated on the moment and losing past and future in it) more or less everywhere in the Classical. In the Indian world we find, correspondingly, the sign of the Lingam and the sect of worshippers of Paewati.[144] In the one case as in the other, man feels himself as nature, as a plant, as a willless and care-less element of becoming (dem Sinn des Werdens willenlos und sorglos hingegeben). The domestic religion of Rome centred on the _genius_, i.e., the creative power of the head of the family. To all this, the deep and thoughtful care of the Western soul has opposed the sign of _mother-love_, a symbol which in the Classical Culture only appeared above the horizon to the extent that we see it in, say, the mourning for Persephone or (though this is only Hellenistic) the seated statue of Demeter of Knidos.[145] The Mother with the Child—the future—at her breast, the Mary-cult in the new Faustian form, began to flourish only in the centuries of the Gothic and found its highest expression in Raphael’s Sistine Madonna.[146] This conception is not one belonging to Christianity generally. On the contrary, Magian Christianity had elevated Mary as Theotokos, “she who gave birth to

God”[147] into a symbol felt quite otherwise than by us. The lulling Mother is as alien to Early-Christian-Byzantine art as she is to the Hellenic (though for other reasons) and most certainly Faust’s Gretchen, with the deep spell of unconscious motherhood on her, is nearer to the Gothic Madonna than all the Marys of Byzantine and Ravennate mosaics. Indeed, the presumption of a spiritual relation between them breaks down completely before the fact that the Madonna with the Child answers exactly to the Egyptian Isis with Horus—both are caring, nursing mothers—and that nevertheless this symbol had vanished for a thousand years and more (for the whole duration of the Classical and the Arabian Cultures) before it was reawakened by the Faustian soul.[148]

From the maternal care the way leads to the paternal, and there we meet with the highest of all the time-symbols that have come into existence within a Culture, the State. The meaning of the child to the mother is the future, the continuation, namely, of her own life, and mother-love is, as it were, a welding of two discontinuous individual existences; likewise, the meaning of the state to the man is comradeship in arms for the protection of hearth and home, wife and child, and for the insurance for the whole people of its future and its efficacy. The state is the inward form of a nation, its “form” in the athletic sense, and history, in the high meaning, is the State conceived as kinesis and not as kinema (nicht als Bewegtes sondern als Bewegung gedacht). _The Woman as Mother is, and the Man as Warrior and Politician makes, History._[149]

And here again the history of higher Cultures shows us three examples of state-formations in which the element of care is conspicuous: the Egyptian administration even of the Old Kingdom (from 3000 B.C.); the Chinese state of the Chóu dynasty (1169-256 B.C.), of the organization of which the Chóu Li gives such a picture that, later on, no one dared to believe in the authenticity of the book; and the states of the West, behind whose characteristic eye-to-the-future there is an unsurpassably intense Will to the future.[150] And on the other hand we have in two examples—the Classical and the Indian world—a picture of utterly care- less submission to the moment and its incidents. Different in themselves as are Stoicism and Buddhism (the old-age dispositions of these two worlds), they are at one in their negation of the historical feeling of care, their contempt of zeal, of organizing power, and of the duty- sense; and therefore neither in Indian courts nor in Classical market- places was there a thought for the morrow, personal or collective. The _carpe diem_ of Apollinian man applies also to the Apollinian state.

As with the political, so with the other side of historical existence, the economic. The hand-to-mouth life corresponds to the love that begins and ends in the satisfaction of the moment. There was an economic organization on the grand scale in Egypt, where it fills the whole culture-picture, telling us in a thousand paintings the story of its industry and orderliness; in China, whose mythology of gods and legend- emperors turns entirely upon the holy tasks of cultivation; and in Western Europe, where, beginning with the model agriculture of the Orders, it rose to the height of a special science, “national economy,” which was in very principle a _working hypothesis_, purporting to show not what happens but what _shall_ happen. In the Classical world, on the other hand—to say nothing of India—men managed from day to day, in spite of the example of Egypt; the earth was robbed not only of its wealth but of its capacities, and the casual surpluses were instantly squandered on the city mob. Consider critically any great statesman of the Classical— Pericles and Cæsar, Alexander and Scipio, and even revolutionaries like Cleon and Tiberius Gracchus. Not one of them, economically, looked far ahead. No city ever made it its business to drain or to afforest a district, or to introduce advanced cultivation methods or new kinds of live stock or new plants. To attach a Western meaning to the “agrarian reform” of the Gracchi is to misunderstand its purport entirely. Their aim was to make their supporters _possessors_ of land. Of educating these into managers of land, or of raising the standard of Italian husbandry in general, there was not the remotest idea—one let the future come, one did not attempt to work upon it. Of this economic Stoicism of the Classical world the exact antithesis is Socialism, meaning thereby not Marx’s theory but Frederick William I’s Prussian practice which long preceded Marx and will yet displace him—the socialism, inwardly akin to the system of Old Egypt, that comprehends and cares for permanent economic relations, trains the individual in his duty to the whole, and glorifies hard work as an affirmation of Time and Future.

VII

The ordinary everyday man in all Cultures only observes so much of the physiognomy of becoming—his own and that of the living world around him— as is in the foreground and immediately tangible. The sum of his experiences, inner and outer, fills the course of his day merely as a series of facts. Only the outstanding (bedeutende) man feels behind the commonplace unities of the history-stirred surface a deep logic of becoming. This logic, manifesting itself in the idea of Destiny, leads him to regard the less significant collocations of the day and the surface as mere incidents.

At first sight, however, there seems to be only a difference of degree in the connotations of “destiny” and “incident.” One feels that it is more or less of an incident when Goethe goes to Sesenheim, but destiny when he goes to Weimar;[151] one regards the former as an episode and the latter as an epoch. But we can see at once that the distinction depends on the inward quality of the man who

is impressed. To the mass, the whole life of Goethe may appear as a sequence of anecdotal incidents, while a very few will become conscious, with astonishment, of a symbolic necessity inherent even in its most trivial occurrences. Perhaps, then, the discovery of the heliocentric system by Aristarchus was an unmeaning incident for the Classical Culture, but its supposed[152] rediscovery by Copernicus a destiny for the Faustian? Was it a destiny that Luther was not a great organizer and Calvin was? And if so, for whom was it a destiny—for Protestantism as a living unit, for the Germans, or for Western mankind generally? Were Tiberius Gracchus and Sulla incidents and Cæsar a destiny?

Questions like these far transcend the domain of the understanding that operates through concepts (der begriffliche Verständigung). What is destiny, what incident, the spiritual experiences of the individual soul—and of the Culture-soul—decide. Acquired knowledge, scientific insight, definition, are all powerless. Nay more, the very attempt to grasp them epistemologically defeats its own object. For without the inward certainty that destiny is something entirely intractable to critical thought, we cannot perceive the world of becoming at all. Cognition, judgment, and the establishment of _causal_ connexions within the known (i.e., between things, properties, and positions that have been distinguished) are one and the same, and he who approaches history in the spirit of _judgment_ will only find "data." But that—be it Providence or Fate—which moves in the depths of present happening or of represented past happening is lived, and only lived, and lived with that same overwhelming and unspeakable certainty that genuine Tragedy awakens in the uncritical spectator. Destiny and incident form an opposition in which the soul is ceaselessly trying to clothe something which consists _only_ of feeling and living and intuition, and can only be made plain in the most subjective religious and artistic creations of those men who are _called_ to divination. To evoke this root-feeling of living existence which endows the picture of history with its meaning and content, I know of no better way—for "name is mere noise and smoke"—than to quote again those stanzas of Goethe which I have placed at the head of this book to mark its fundamental intention.

"In the Endless, self-repeating flows for evermore The Same. Myriad arches, springing, meeting, hold at rest the mighty frame. Streams from all things love of living, grandest star and humblest clod. All the straining, all the striving is eternal peace in God."[153]

On the surface of history it is the _unforeseen_ that reigns. Every individual event, decision and personality is stamped with its hall-mark. No one foreknew the storm of Islam at the coming of Mohammed, nor foresaw Napoleon in the fall of Robespierre. The coming of great men, their doings, their fortune, are all incalculables. No one knows whether a development that is setting in powerfully will accomplish its course in a straight line like that of the Roman patrician order or will go down in doom like that of the Hohenstaufen or the Maya Culture. And— science notwithstanding—it is just the same with the destinies of every single species of beast and plant within earth-history and beyond even this, with the destiny of the earth itself and all the solar systems and Milky Ways. The insignificant Augustus made an epoch, and the great Tiberius passed away ineffective. Thus, too, with the fortunes of artists, artworks and art-forms, dogmas and cults, theories and discoveries. That, in the whirl of becoming, one element merely succumbed to destiny when another became (and often enough has continued and will continue to be) a destiny itself—that one vanishes with the wave-train of the surface while the other _makes_ this, is something that is not to be explained by any why-and-wherefore and yet is of inward necessity. And thus the phrase that Augustine in a deep moment used of Time is valid also of destiny—"if no one questions me, I know: if I would explain to a questioner, I know not."

So, also, the supreme ethical expression of Incident and Destiny is found in the Western Christian's idea of Grace—the grace, obtained through the sacrificial death of Jesus, of being made free to will.[154] The polarity of Disposition (original sin) and Grace—a polarity which must ever be a projection of feeling, of the emotional life, and not a precision of learned reasoning—embraces the existence of every truly significant man of this Culture. It is, even for Protestants, even for atheists, hidden though it may be behind a scientific notion of "evolution" (which in reality is its direct descendant[155]), the foundation of every confession and every autobiography; and it is just its absence from the constitution of Classical man that makes confession, by word or thought, impossible to him. It is the final meaning of Rembrandt's self-portraits and of music from Bach to Beethoven. We may choose to call that something which correlates the life-courses of all Western men disposition, Providence or "inner evolution"[156] but it remains inaccessible to thought. "Free will" is an inward certitude. But whatever one may will or do, that which actually ensues upon and issues from the resolution—abrupt, surprising, unforeseeable—_subserves_ a deeper necessity and, for the eye that sweeps over the picture of the distant past, visibly conforms to a major order. And when the Destiny of that which was willed has been Fulfilment we are fain to call the inscrutable "Grace." What did Innocent III, Luther, Loyola, Calvin, Jansen, Rousseau and Marx will, and what came of the things that they willed in the stream of Western history? Was it Grace or Fate? Here all rationalistic dissection ends in nonsense. The Predestination doctrine of Calvin and Pascal—who, both of them more upright than Luther and Thomas Aquinas, dared to draw the causal conclusion from Augustinian dialectic—is the _necessary_ absurdity to

which the pursuit of these secrets by the reason leads. They lost the destiny-logic of the world-becoming and found themselves in the causal logic of notion and law; they left the realm of direct intuitive vision for that of a mechanical system of objects. The fearful soul-conflicts of Pascal were the strivings of a man, at once intensely spiritual and a born mathematician, who was determined to subject the last and gravest problems of the soul both to the intuitions of a grand instinctive faith and to the abstract precision of a no less grand mathematical plan. In this wise the Destiny-idea—in the language of religion, God's Providence—is brought _within the schematic form of the Causality Principle_, i.e., the Kantian form of mind activity (productive imagination); _for that is what Predestination signifies_, notwithstanding that thereby Grace—the causation-free, living Grace which can only be experienced as an inward certainty—is made to appear as a nature-force that is bound by irrevocable law and to turn the religious world-picture into a rigid and gloomy system of machinery. And yet was it not a Destiny again—for the world as well as for themselves— that the English Puritans, who were filled with this conviction, were ruined not through any passive self-surrender but through their hearty and vigorous certainty that their will was the will of God?

Footnote 143:

The connotation of "care" is almost the same as that of "Sorge," but the German word includes also a certain specific, _ad hoc_ apprehension, that in English is expressed by "concern" or "fear."— _Tr._

Footnote 144:

The _Lingayats_ are one of the chief sects of the Saivas (that is, of the branch of Hinduism which devotes itself to Shiva) and Paewati worshippers belong to another branch, having the generic name of Saktas, who worship the "active female principle" in the persons of Shiva's consorts, of whom Paewati is one. Vaishnavism—the Vishnu branch of Indian religion—also contains an erotic element in that form which conceives Vishnu as Krishna. But in Krishna worship the erotic is rather less precise and more amorous in character.

Footnote 148:

In connexion with this very important link in the Author's argument, attention may be drawn to a famous wall-painting of very early date in the Catacomb of St. Priscilla. In this, Mary is definitely and unmistakably the _Stillende Mutter_. But she is, equally unmistakably, different in soul and style from her "Early-Christian-Byzantine" successor the Theotokos. Now, it is well known that the art of the catacombs, at any rate in its beginnings, is simply the art of contemporary Rome, and that this "Roman" art had its home in Alexandria. See Woermann's _Geschichte der Kunst_, III, 14-15, and British Museum "Guide to Early Christian Art," 72-74, 86. Woermann speaks of this Madonna as the prototype of our grave, tenderly- solicitous Mother-Madonnas. Dr. Spengler would probably prefer to regard her as the last Isis. In any case it is significant that the symbol disappears: in the very same catacomb is a Theotokos of perhaps a century later date.—_Tr._

The path from Calvin to Darwin is easily seen in English philosophy.

Footnote 156:

This is one of the eternal points of dispute in Western art-theory. The Classical, ahistorical, Euclidean soul has no "evolution"; the Western, on the contrary, extends itself in evolving like the convergent function that it is. The one _is_, the other _becomes_. And thus all Classical tragedy assumes the _constancy_ of the personality, and all Western its _variability_, which essentially constitutes a "character" in our sense, viz., a picture of being that consists in continuous qualitative movement and an endless wealth of relationships. _In Sophocles the grand gesture ennobles the suffering, in Shakespeare the grand idea_ (Gesinnung) _ennobles the doing_. As our æsthetic took its examples from _both_ Cultures, it was bound to go wrong in the very enunciation of its problem.

VIII

We can proceed to the further elucidation of the incidental (or casual) without running the risk of considering it as an exception or a breach in the causal continuity of "Nature," for Nature is _not_ the world- picture in which Destiny is operative. Wherever the sight emancipates itself from the sensible-become, spiritualizes itself into Vision, penetrates through the enveloping world and lets prime phenomena instead of mere objects work upon it, we have the grand _historical_, trans- natural, super-natural outlook, the outlook of Dante and Wolfram and also the outlook of Goethe in old age that is most clearly manifested in the finale of Faust II. If we linger in contemplation in this world of Destiny and Incident, it will very likely seem to us incidental that the episode of "world-history" should have played itself out in this or that phase of one particular star amongst the millions of solar systems; incidental that it should be men, peculiar animal-like creatures inhabiting the crust of this star, that present the spectacle of "knowledge" and, moreover, present it in just this form or in just that form, according to the very different versions of Aristotle, Kant and others; incidental that as the counter-pole of this "knowing" there should have arisen just these codes of "natural law," each supposedly eternal and universally-valid and each evoking a supposedly general and common picture of "Nature." Physics—quite rightly—banishes incidentals from its field of view, but it is incidental, again, that physics itself should occur in the alluvial period of the earth's crust, uniquely, as a particular kind of intellectual composition.

The world of incident is the world of once-actual facts that longingly or anxiously we live forward to (entgegenleben) as Future, that raise or depress us as the living Present, and that we contemplate with joy or with grief as Past. The world of causes and effects is the world of the constantly-possible, of the timeless truths which we know by dissection and distinction.

The latter only are scientifically attainable—they are indeed _identical_ with science. He who is blind to this other, to the world as _Divina Commedia_ or drama for a god, can only find a senseless turmoil of incidents,[157] and here we use the word in its most trivial sense. So it has been with Kant and most other systematists of thought. But the professional and inartistic sort of historical

research too, with its collecting and arranging of mere data, amounts for all its ingenuity to little more than the giving of a _cachet_ to the banal-incidental. Only the insight that can penetrate into the metaphysical is capable of experiencing in data _symbols_ of that which happened, and so of elevating an Incident into a Destiny. And he who is to himself a Destiny (like Napoleon) does not need this insight, since between himself as a fact and the other facts there is a harmony of metaphysical rhythm which gives his decisions their dreamlike certainty.[158]

It is this insight that constitutes the singularity and the power of Shakespeare. Hitherto, neither our research nor our speculation has hit upon this in him—that he is _the Dramatist of the Incidental_. And yet this Incidental is the very heart of Western tragedy, which is a true copy of the Western history idea and with it gives the clue to that which we understand in the world—so misconstrued by Kant—"Time." It is incidental that the political situation of "Hamlet," the murder of the King and the succession question impinge upon just that character that Hamlet is. Or, take Othello—it is incidental that the man at whom Iago, the commonplace rogue that one could pick up in any street, aims his blow is one whose person possesses just this wholly special physiognomy. And Lear! Could anything be more incidental (and therefore more "natural") than the conjunction of this commanding dignity with these fateful passions and the inheritance of them by the daughters? No one has even to-day realized all the significance of the fact that Shakespeare took his stories as he found them and _in the very finding of them_ filled them with the force of inward necessity, and never more sublimely so than in the case of the Roman dramas. For the _will_ to understand him has squandered itself in desperate efforts to bring in a moral causality, a "therefore," a connexion of "guilt" and "expiation." But all this is neither correct nor incorrect—these are words that belong to the World-as-Nature and imply that something causal is being judged—but _superficial_, shallow, that is, in contrast to the poet's deep subjectivizing of the mere fact-anecdote. Only one who feels this is able to admire the grand naïveté of the entrances of Lear and Macbeth. Now, Hebbel is the exact opposite, he destroys the depth of the anecdote by a system of cause and effect. The arbitrary and abstract character of his plots, which everyone feels instinctively, comes from the fact that the causal scheme of his spiritual conflicts is in contradiction with the historically-motived world-feeling and the quite other logic proper to that feeling. These people do not live, they _prove_ something by coming on. One feels the presence of a great understanding, not that of a deep life. Instead of the Incident we get a Problem.

Further, this _Western_ species of the Incidental is entirely alien to the Classical world-feeling and therefore to its drama. Antigone has no incidental character to affect her fortunes in any way. What happened to Œdipus—unlike the fate of Lear—might just as well have happened to anyone else. This is the Classical "Destiny," the _Fatum_ which is common to all mankind, which affects the "body" and in no wise depends upon incidents of personality.

The kind of history that is commonly written must, even if it does not lose itself in compilation of data, come to a halt before the _superficially_ incidental—that is the ... destiny of its authors, who, spiritually, remain more or less in the ruck. In their eyes nature and history mingle in a cheap unity, and incident or accident, "sa sacrée majesté le Hazard," is for the man of the ruck the easiest thing in the world to understand. For him the secret logic of history 'which he does not feel' is replaced by a causal that is only waiting behind the scene to come on and prove itself. It is entirely appropriate that the anecdotal foreground of history should be the arena of all the scientific causality-hunters and all the novelists and sketch-writers of the common stamp. How many wars have been begun when they were because some jealous courtier wished to remove some general from the proximity of his wife! How many battles have been won and lost through ridiculous incidents! Only think how Roman history was written in the 18th Century and how Chinese history is written even to-day! Think of the Dey smacking the Consul with his fly-flap[159] and other such incidents that enliven the historical scene with comic-opera motives! Do not the deaths of Gustavus Adolphus and of Alexander seem like expedients of a nonplussed playwright; Hannibal a simple intermezzo, a surprise intrusion in Classical history; or Napoleon's "transit" more or less of a melodrama? Anyone who looks for the inner form of history in any causal succession of its visible detail-events must always, if he is honest, find a comedy of burlesque inconsequence, and I can well imagine that the dance-scene of the drunken Triumvirs in "Antony and Cleopatra" (almost overlooked, but one of the most powerful in that immensely deep work)[160] grew up out of the contempt of the prince of _historical_ tragedy for the pragmatic aspect of history. For this is the aspect of it that has always dominated "the world," and has encouraged ambitious little men to interfere in it. It was because their eyes were set on _this_, and its rationalistic structure, that Rousseau and Marx could persuade themselves that they could alter the "course of the world" by a theory. And even the social or economic interpretation of political developments, to which present-day historical work is trying to rise as to a peak-ideal (though its biological cast constantly leads us to suspect foundations of the causal kind), is still exceedingly shallow and trivial.

Napoleon had in his graver moments a strong feeling for the deep logic of world-becoming, and in such moments could divine to what extent he _was_, and to what extent he _had_, a destiny. "I feel myself driven towards an end that I do not know. As soon as I

shall have reached it, as soon as I shall become unnecessary, an atom will suffice to shatter me. Till then, not all the forces of mankind can do anything against me," he said at the beginning of the Russian campaign. Here, certainly, is not the thought of a pragmatist. In this moment he divined how little the logic of Destiny needs particular instances, better men or situations. Supposing that he himself, as "empirical person," had fallen at Marengo—then that which he _signified_ would have been actualized in some other form. A melody, in the hands of a great musician, is capable of a wealth of variations; it can be entirely transformed so far as the simple listener is concerned without altering itself—which is quite another matter—fundamentally. The epoch of German national union accomplished itself through the person of Bismarck, that of the Wars of Freedom through broad and almost nameless events; but either theme, to use the language of music, could have been "worked out" in other ways. Bismarck might have been dismissed early, the battle of Leipzig might have been lost, and for the group of wars 1864—1866—1870 there might have been substituted (as "modulations") diplomatic, dynastic, revolutionary or economic facts—though it must not be forgotten that _Western history, under the pressure of its own physiognomic abundance_ (as distinct from physiognomic style, for even Indian history has that) _demands, so to say, contrapuntally strong accents—wars or big personalities—at the decisive points_. Bismarck himself points out in his reminiscences that in the spring of 1848 national unity could have been achieved on a broader base than in 1870 but for the policy (more accurately, the personal taste) of the King of Prussia;[161] and yet, again, according to Bismarck, this would have been so tame a working-out that a coda of one sort or another (_da capo e poi la coda_) would have been imperatively necessary. Withal, the Theme—the meaning of the epoch— would have been entirely unaltered by the facts assuming this or that shape. Goethe might—possibly—have died young, but _not_ his "idea." Faust and Tasso would not have been written, but they would have "been" in a deeply mysterious sense, even though they lacked the poet's elucidation.

For if it is incidental that the history of higher mankind fulfils itself in the form of great Cultures, and that one of these Cultures awoke in West Europe about the year 1000; yet from the moment of awakening it is bound by its charter. Within every epoch there is unlimited abundance of surprising and unforeseeable possibilities of self-actualizing in detail-facts, but the epoch itself is necessary, for the life-unity is in it. That its inner form is precisely what it is, constitutes its specific determination (Bestimmung). Fresh incidentals can affect the shape of its development, can make this grandiose or puny, prosperous or sorrowful, but alter it they cannot. An irrevocable fact is not merely a special case but a special type; thus in the history of the Universe we have the type of the "solar system" of sun and circling planets; in the history of our planet we have the type "life" with its youth, age, duration and reproduction; in the history of "life" the type "humanity," and in the world-historical stage of that humanity the type of the great individual Culture.[162] And these Cultures are essentially related to the plants, in that they are bound for the whole duration of their life to the soil from which they sprang. Typical, lastly, is the manner in which the men of a Culture understand and experience Destiny, however differently the picture may be coloured for this individual and that; what I say here about it is not "true," but inwardly necessary for this Culture and this time-phase of it, and if it convinces you, it is not because there is only one "truth" but because you and I belong to the same epoch.

For this reason, the Euclidean soul of the Classical Culture could only experience its existence, bound as this was to present foregrounds, in the form of _incidents of the Classical style_. If in respect of the Western soul we can regard incident as a minor order of Destiny, in respect of the Classical soul it is just the reverse. Destiny is incident become immense—that is the very signification of Ananke, Heimarmene, Fatum. As the Classical soul did not genuinely live through history, it possessed no genuine feeling for a _logic_ of Destiny. We must not be misled by words. The most popular goddess of Hellenism was Tyche, whom the Greeks were practically unable to distinguish from Ananke. But Incident and Destiny are felt by _us_ with all the intensity of an opposition, and on the issue of this opposition we feel that everything fundamental in our existence depends. _Our_ history is that of great connexions, Classical history—its full actuality, that is, and not merely the image of it that we get in the historian (e.g., Herodotus)—is that of anecdotes, of a series of plastic details. The style of the Classical life generally, the style of every individual life within it, is anecdotal, using the word with all seriousness. The sense-perceivable side of events condenses on _anti-historical, daemonic, absurd_ incidents; it is the denial and disavowal of all logic of happening. The stories of the Classical master-tragedies one and all _exhaust_ themselves in incidents that mock at any meaning of the world; they are the exact denotation of what is connoted by the word ε■μαρμ■νη[163] in contrast to the Shakesperian _logic_ of incident. Consider Œdipus once more: that which happened to him was wholly extrinsic, was neither brought about nor conditioned by anything subjective to himself, and could just as well have happened to anyone else. This is the very _form of the Classical myth_. Compare with it the necessity—inherent in and governed by the man's whole existence and the relation of that existence to Time—that resides in the destiny of Othello, of Don Quixote, of Werther. It is, as we have said before, the difference of situation-tragedy and character-tragedy. And this opposition repeats itself in history proper—every epoch of the West has character, while each epoch of the Classical only presents a situation. While the life of Goethe was one of fate-filled logic, that of Cæsar was one of mythical indidentalness, and it was left to

Shakespeare to _introduce_ logic into it. Napoleon is a tragic character, Alcibiades fell into tragic situations. Astrology, in the form in which from Gothic to Baroque the Western soul knew it—was dominated by it even in denying it—was the attempt to master one's _whole_ future life-course; the Faustian horoscope, of which the best-known example is perhaps that drawn out for Wallenstein by Kepler, _presupposes_ a steady and purposeful direction in the existence that has yet to be accomplished. But the Classical oracle, always consulted for the _individual_ case, is the genuine symbol of the meaningless incident and the moment; it accepts the point-formed and the discontinuous as the elements of the world's course, and oracle-utterances were therefore entirely in place in that which was written and experienced as history at Athens. Was there one single Greek who possessed the notion of a historical _evolution_ towards this or that or any aim? And _we_—should we have been able to reflect upon history or to make it if we had _not_ possessed it? If we compare the destinies of Athens and of France at corresponding times after Themistocles and Louis XIV, we cannot but feel that the style of the historical feeling and the style of its actualization are always one. In France logic _à outrance_, in Athens un-logic.

The ultimate meaning of this significant fact can now be understood. History is the actualizing of a soul, and the same style governs the history one makes as governs the history one contemplates. The Classical mathematic excludes the symbol of infinite space, and therefore the Classical history does so too. It is not for nothing that the scene of Classical existence is the smallest of any, the individual _Polis_, that it lacks horizon and perspective—notwithstanding the episode of Alexander's expedition[164]—just as the Attic stage cuts them off with its flat back-wall, in obvious contrast to the long-range efficacy of Western Cabinet diplomacy and the Western capital city. And just as the Greeks and the Romans neither knew nor (with their fundamental abhorrence of the Chaldean astronomy) would admit as actual any cosmos but that of the foreground; just as at bottom their deities are house- gods, city-gods, field-gods but never star-gods,[165] so also what they _depicted_ was only foregrounds. Never in Corinth or Athens or Sicyon do we find a landscape with mountain horizon and driving clouds and distant towns; every vase-painting has the same constituents, figures of Euclidean separateness and artistic self-sufficiency. Every pediment or frieze group is serially and not contrapuntally built up. But then, life-experience itself was one strictly of foregrounds. Destiny was not the "course of life" but something upon which one suddenly stumbles. And this is how Athens produced, with Polygnotus's fresco and Plato's geometry, _a fate-tragedy_ in which fate is precisely the fate that we discredit in Schiller's "Bride of Messina." The complete unmeaning of blind doom that is embodied, for instance, in the curse of the House of Atreus, served to reveal to the ahistorical Classical soul the full meaning of its own world.

IX

We may now point our moral with a few examples, which, though hazardous, ought not at this stage to be open to misunderstanding. Imagine Columbus supported by France instead of by Spain, as was in fact highly probable at one time. Had Francis I been the master of America, without doubt he and not the Spaniard Charles V would have obtained the imperial crown. The early Baroque period from the Sack of Rome to the Peace of Westphalia, which was actually the _Spanish_ century in religion, intellect, art, politics and manners, would have been shaped from Paris and not from Madrid. Instead of the names of Philip, Alva, Cervantes, Calderon, Velasquez we should be talking to-day of great Frenchmen who in fact—if we may thus roundly express a very difficult idea—remained unborn. The style of the Church which was definitively fixed in this epoch by the Spaniard Loyola and the Council of Trent which he spiritually dominated; the style of politics to which the war-technique of Spanish captains, the diplomacy of Spanish cardinals and the courtly spirit of the Escorial gave a stamp that lasted till the Congress of Vienna and in essential points till beyond Bismarck; the architecture of the Baroque; the great age of Painting; ceremonial and the polite society of the great cities—all these would have been represented by other profound heads, noble and clerical, by wars other than Philip II's wars, by another architect than Vignola, by another Court. The Incidental chose the Spanish gesture for the late period of the West. But the _inward logic_ of that age, which was _bound_ to find its fulfilment in the great Revolution (or some event of the same connotation), remained intact.

This French revolution might have been represented by some other event of different form and occurring elsewhere, say in England or Germany. But its "idea,"—which (as we shall see later) was the transition from Culture to Civilization, the victory of the inorganic megalopolis over the organic countryside which was henceforward to become spiritually "the provinces,"—was necessary, and the moment of its occurrence was also necessary. To describe such a moment we shall use the term (long blurred, or misused as a synonym for period) _epoch_. When we say an event is epoch-making we mean that it marks in the course of a Culture a necessary and fateful turning-point. The merely incidental event, a crystallization-form of the historical surface, may be represented by other appropriate incidents, but the _epoch_ is necessary and predeterminate. And it is evident that the question of whether, in respect of a particular Culture and its course, an event ranks as an epoch or as an episode is connected with its ideas of Destiny and Incidents, and therefore also with its idea of the Tragic as "epochal" (as in the West) or as "episodic" (as in the Classical world).

We can, further, distinguish between _impersonal_ or anonymous and _personal_ epochs, according to their physiognomic type in the picture of history. Amongst "incidents" of the first rank we include those great persons who are endowed with such formative force that the destiny of thousands, of whole peoples, and of ages, are incorporated in their private destinies; but at the same time we can distinguish the adventurer or successful man who is destitute of inward greatness (like Danton or Robespierre) from the Hero of history by the fact that his personal destiny displays only the traits of the common destiny. Certain names may ring, but "the Jacobins" collectively and not individuals amongst them were the type that dominated the time. The first part of this epoch of the Revolution is therefore thoroughly anonymous, just as the second or Napoleonic is in the highest degree personal. In a few years the immense force of these phenomena accomplished what the corresponding epoch of the Classical (c. 386-322), fluid and unsure of itself, required decades of undermining-work to achieve. It is of the essence of all Culture that at the outset of each stage the same potentiality is present, and that necessity fulfils itself thereafter either in the form of a great individual person (Alexander, Diocletian, Mohammed, Luther, Napoleon) or in that of an almost anonymous happening of powerful inward constitution (Peloponnesian War, Thirty Years' War, Spanish Succession War) or else in a feeble and indistinct evolution (periods of the Diadochi and of the Hyksos, the Interregnum in Germany). And the question which of these forms is the more likely to occur in any given instance, is one that is influenced in advance by the historical and therefore also the tragic style of the Culture

concerned.[166]

The tragic in Napoleon's life—which still awaits discovery by a poet great enough to comprehend it and shape it—was that he, who rose into effective being by fighting British policy and the British spirit which that policy so eminently represented, completed by that very fighting the continental victory of this spirit, which thereupon became strong enough, in the guise of "liberated nations" to overpower him and to send him to St. Helena to die. It was not Napoleon who originated the expansion principle. That had arisen out of the Puritanism of Cromwell's _milieu_ which called into life the British Colonial Empire.[167] Transmitted through the English-schooled intellects of Rousseau and Mirabeau to the Revolutionary armies, of which English philosophical ideas were essentially the driving force, it became their tendency even from that day of Valmy which Goethe alone read aright. It was not Napoleon who formed the idea, but the idea that formed Napoleon, and when he came to the throne he was obliged to pursue it further against the only power, England namely, whose purpose was _the same_ as his own. His Empire was a creation of French blood but of English style. It was in London, again, that Locke, Shaftesbury, Samuel Clarke and, above all, Bentham built up the theory of "European Civilization"—the Western Hellenism—which Bayle, Voltaire and Rousseau carried to Paris. Thus it was in the name of _this_ England of Parliamentarianism, business morality and journalism that Valmy, Marengo, Jena, Smolensk and Leipzig were fought, and in _all_ these battles it was the English spirit that defeated the French Culture of the West.[168] The First Consul had no intention of incorporating West Europe in France; his primary object was—note the Alexander-idea on the threshold of every Civilization!—to replace the British Colonial Empire by a French one. Thereby, French preponderance in the Western culture-region would have been placed on a practically unassailable foundation; it would have been the Empire of Charles V on which the sun never set, but managed from Paris after all, in spite of Columbus and Philip, and organized as an economic-military instead of as an ecclesiastical-chivalric unit. So far-reaching, probably, was the destiny that was in Napoleon. But the Peace of Paris in 1763 had already decided the question _against_ France, and Napoleon's great plans time and again came to grief in petty incidents. At Acre a few guns were landed in the nick of time from the British warships: there was a moment, again, just before the signature of the Peace of Amiens, when the whole Mississippi basin was still amongst his assets and he was in close touch with the Maratha powers that were resisting British progress in India; but again a minor naval incident[169] obliged him to abandon the whole of a carefully-prepared enterprise: and, lastly, when by the occupation of Dalmatia, Corfu and all Italy he had made the Adriatic a French lake, with a view to another expedition to the East, and was negotiating with the Shah of Persia for action against India, he was defeated by the whims of the Tsar Alexander, who at times was undoubtedly willing to support a march on India and whose aid would infallibly have secured its success. It was only after the failure of all extra-European combinations that he chose, as his _ultima ratio_ in the battle against England, the incorporation of Germany and Spain, and so, raising against himself _his own_ English- Revolutionary ideas, the very ideas of which he had been the vehicle,[170] he took the step that made him "no longer necessary."

At one time it falls to the Spanish spirit to outline, at another to the British or the French to remould, the world-embracing colonial system. A "United States of Europe," actualized through Napoleon as founder of a romantic and popular military monarchy, is the analogue of the Realm of the Diadochi; actualized as a 21st-Century economic organism by a matter-of-fact Cæsar, it is the counterpart of the _imperium Romanum_. These are incidentals, but they are in the picture of history. But Napoleon's victories and defeats (which always hide a victory of England and Civilization over Culture), his Imperial dignity, his fall, the _Grande Nation_, the episodic liberation of Italy (in 1796, as in 1859, essentially no more than a change of political costume for a people long since become insignificant), the destruction of the Gothic ruin of the Roman-German Empire, are mere surface phenomena, behind which is marching the great logic of genuine and invisible History, and it was in the sense of this logic that the West, having fulfilled its French- formed Culture in the _ancien régime_, closed it off with the English Civilization. As symbols of "contemporary" epochal moments, then, the storming of the Bastille, Valmy, Austerlitz, Waterloo and the rise of Prussia correspond to the Classical-history facts of Chæronea, Gaugamela (Arbela), Alexander's Indian expedition and the Roman victory of Sentinum.[171] And we begin to understand that in wars and political catastrophies—the chief material of our historical writings—victory is not the essence of the fight nor peace the aim of a revolution.

Footnote 166:

The original is somewhat obscure. It reads: "Welche Form die Wahrscheinlichkeit für sich hat, ist bereits eine Frage des historischen—und also des tragischen—Stils."—_Tr._

Footnote 167:

The words of Canning at the beginning of the XIXth century may be recalled. “South America free! and if possible English!” The expansion idea has never been expressed in greater purity than this.

Footnote 168:

The Western Culture of maturity was through-and-through a French outgrowth of the Spanish, beginning with Louis XIV. But even by Louis XVI’s time the English park had defeated the French, sensibility had ousted wit, London costume and manners had overcome Versailles, and Hogarth, Chippendale and Wedgwood had prevailed over Watteau, Boulle and Sèvres.

Footnote 169:

The allusion is to the voyage of Linois’s small squadron to Pondichéry in 1803, its confrontation by another small British squadron there, and the counter-order which led Linois to retire to Mauritius.—_Tr._

Footnote 170:

Hardenberg’s reorganization of Prussia was thoroughly English in spirit, and as such incurred the severe censure of the old Prussian Von der Marwitz. Scharnhorst’s army reforms too, as a breakaway from the professional army system of the eighteenth-century cabinet-wars, are a sort of “return to nature” in the Rousseau-Revolutionary sense.

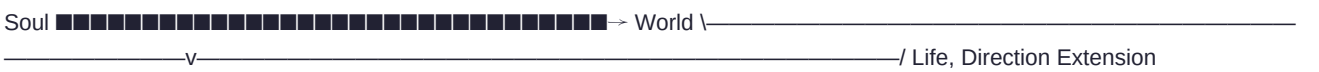
Footnote 171:

Where in 295 B.C. the Romans decisively defeated the last great Samnite effort to resist their hegemony over Italy.—_Tr._

X

Anyone who has absorbed these ideas will have no difficulty in understanding how the causality principle is bound to have a fatal effect upon the capacity for genuinely experiencing History when, at last, it attains its rigid form in that “late” condition of a Culture to which it is proper and in which it is able to tyrannize over the world- picture. Kant, very wisely, established causality as a necessary form of knowledge, and it cannot be too often emphasized that this was meant to refer exclusively to the understanding of man’s environment by the way of reason. But while the word “necessary” was accepted readily enough, it has been overlooked that this limitation of the principle to a single domain of knowledge is just what forbids its application to the contemplation and experiencing of living history. Man-knowing and Nature-knowing are in essence entirely incapable of being compared, but nevertheless the whole Nineteenth Century was at great pains to abolish the frontier between Nature and History in favour of the former. The more historically men tried to think, the more they forgot that in this domain they ought _not_ to think. In forcing the rigid scheme of a spatial and anti-temporal relation of cause and effect upon something alive, they disfigured the visible face of becoming with the construction-lines of a physical nature-picture, and, habituated to their own late, megalopolitan and causally-thinking _milieu_, they were unconscious of the fundamental absurdity of a science that sought to understand an organic becoming by methodically misunderstanding it as the _machinery_ of the thing-become. Day is not the cause of night, nor youth of age, nor blossom of fruit. Everything that we grasp intellectually has a _cause_, everything that we live organically with inward certitude has a _past_. The one recognizes the _case_, that which is generally possible and has a fixed inner form which is the same whenever and wherever and however often it occurs, the other recognizes the _event_ which once was and will never recur. And, according as we grasp something in our envelope-world critically and consciously or physiognomically and involuntarily, we draw our conclusion from technical or from living experience, and we relate it to a timeless cause in space or to a direction which leads from yesterday to to-day and to-morrow.

But the spirit of our great cities _refuses_ to be involuntary. Surrounded by a machine-technique that it has itself created in surprising Nature’s most dangerous secret, the “law,” it seeks to conquer history also technically, “theoretically and practically.” “Usefulness,” suitableness to purpose (Zweckmässigkeit), is the great word which assimilates the one to the other. A materialist conception of history, ruled by laws of causal Nature, leads to the setting up of usefulness-ideals such as “enlightenment,” “humanity,” “world-peace,” as aims of world-history, to be reached by the “march of progress.” But in these schemes of old age the feeling of Destiny has died, and with it the young reckless courage that, self-forgetful and big with a future, presses on to meet a dark decision.



For only youth has a future, and _is_ Future, that enigmatic synonym of directional Time and of Destiny. _Destiny is always young._ He who replaces it by a mere chain of causes and effects, sees even in the not- yet-actualized something, as it were, old and past—_direction_ is wanting. But he who lives towards a something in the superabundant flow of things need not concern himself with aims and abilities, for he feels that he himself is the meaning of what is to happen. This was the faith in the Star that never left Cæsar nor Napoleon nor the great doers of another kind; and this it is that lies deepest of all—youthful melancholy notwithstanding—in every childhood and in every young clan, people, Culture, that extends forward over all their history for men of act and of vision, who are young however white their hair, younger even than the most juvenile of those who look to a timeless utilitarianism. The feeling of a significance in the momentarily present world-around discloses itself in the earliest days of childhood, when it is still only the persons and things of the nearest environment that essentially exist, and develops through silent and unconscious experience into a comprehensive picture. This picture constitutes the general expression of the whole Culture as it is at the particular stage, and it is only the fine judge of life and the deep searcher of history who can interpret it.

At this point a distinction presents itself between the _immediate impression_ of the present and the _image_ of the past that is only presented in the spirit, in other words between the world as happening and the world as history. The eye of the man of action (statesman and general) appreciates the first, that of the man of contemplation (historian and poet) the second. Into the first one plunges practically to do or to suffer; chronology,[172] that great symbol of irrevocable past, claims the second. We look backwards, and we live forward towards the unforeseen, but even in childhood our _technical_ experience soon introduces into the image of the singular occurrence elements of the foreseeable, that is, an image of regulated Nature which is subject not to physiognomic fact but to calculation. We apprehend a “head of game” as a living entity and immediately afterwards as food; we see a flash of lightning as a peril and then as an electrical discharge. And this second, later, petrifying projection of the world more and more tends to overpower the first in the Megalopolis; the image of the past is mechanized and materialized and from it is deduced a set of causal rules for present and future. We come to believe in historical laws and in a rational understanding of them.

Nevertheless science is always natural science. Causal knowledge and technical experience refer only to the become, the extended, the comprehended. As life is to history, so is knowledge (Wissen) to Nature, viz., to the sensible world apprehended as an element, treated as in space and subjected to the law of cause and effect. Is there, then, a science of History at all? To answer this question, let us remember that in every personal world-picture, which only approximates more or less to the ideal picture, there is both something of Nature and something of History. No Nature is without living, and no History without causal, _harmonies_. For within the sphere of Nature, although two like experiments, conformably to law, have the like result, yet each of these experiments is a historical event possessing a date and not recurring. And within that of History, the dates or data of the past (chronologies, statistics, names, forms[173]) form a rigid web. “Facts are facts” even if we are unaware of them, and all else is image, _Theoria_, both in the one domain and in the other. But history is itself the condition of being “in the focus” and the material is only an aid to this condition, whereas in Nature the real aim is the winning of the material, and theory is only the servant of this purpose.

There is, therefore, not a science _of_ history but an ancillary science _for_ history, which ascertains that which has been. For the historical outlook itself the data are always symbols. Scientific research, on the contrary, is science and only science. In virtue of its technical origin and purpose it sets out to find data and laws of the causal sort and nothing else, and from the moment that it turns its glance upon something else it becomes _Metaphysics_, something trans-scientific. And just because this is so, historical and natural-science data are different. The latter consistently repeat themselves, the former never. The latter are _truths_, the former _facts_. However closely related incidentals and causals may appear to be in the everyday picture, fundamentally they belong to different worlds. As it is beyond question that the shallowness of a man’s history-picture (the man himself, therefore) is in proportion to the dominance in it of frank incidentals, so it is beyond question that the emptiness of written history is in proportion to the degree in which it makes the establishment of purely factual relations its object. The more deeply a man lives History, the more rarely will he receive “causal” impressions and the more surely will he be sensible of their utter insignificance. If the reader examines Goethe’s writings in natural science, he will be astounded to find how “living nature” can be set forth without formulas, without laws, almost without a trace of the causal. For him, Time is not a distance but a feeling. But the experience of last and deepest things is practically denied to the ordinary savant who dissects and arranges purely critically and allows himself neither to contemplate nor to feel. In the case of History, on the contrary, this power of experience is _the_ requisite. And thus is justified the paradox that the less a historical researcher has to do with real science, the better it is for his history.

To elucidate once more by a diagram:

Destiny-Experience Causal Knowledge The uniquely The occurring and irrevocable constantly-possible “Fact” “Truth” Physiognomic tact (instinct) Systematic criticism (reason) ↓ [Crossed downward ↓ arrows] Consciousness Consciousness as _servant_ of Being as _master_ of Being The world-image of “History” The world-image of "Nature" _Life-experience_ _Scientific methods_ Image of the Past Religion. Natural Science Constructive Contemplation Theoretical: Myth and Dogma. Hypothesis (Historian, Tragic Dramatist) Practical: Cult. Technique to _investigate_ Destiny Direction into the Future Constructive Action (Statesman) to _be_ Destiny

XI

Is it permissible to fix upon one, any one, group of social, religious, physiological or ethical facts as the “cause” of another? “Certainly,” the rationalistic school of history, and still more the up-to-date sociology, would reply. That, they would say, is what is meant by our comprehending history and deepening our knowledge of it. But in reality, with “civilized” man there is always the implicit postulate of an underlying _rational_ purpose—without which indeed his world would be meaningless. And there is something rather comic in the most unscientific freedom that he allows himself in his _choice_ of his fundamental causes. One man selects this, another that, group as _prima causa_—an inexhaustible source of polemics—and all fill their works with pretended elucidations of the “course of history” on natural-science lines. Schiller has given us the classical expression of this method in one of his immortal banalities, the verse in which the “Weltgetriebe” is stat “durch Hunger und durch Liebe”; and the Nineteenth Century, progressing from Rationalism to Materialism, has made this opinion canonical. The cult of the useful was set up on high. To it Darwin, in the name of his century, sacrificed Goethe’s Nature-theory. The organic logic of the facts of life was supplanted by a mechanics in physiological garb. Heredity, adaptation, natural selection, are utility-causes of purely mechanical connotation. The historical _dispensations_ were superseded by a naturalistic _movement_ “in space.” (But _are there_ historical or spiritual “processes,” or life- “processes” of any sort whatever? Have historical “movements” such as, for example, the Renaissance or the Age of Enlightenment anything whatever to do with the scientific notion of movement?) The word “process” eliminated Destiny and unveiled the secret of becoming, and lo! there was no longer a tragic but only an exact mathematical structure of world-happening. And thereupon the “exact” historian enunciated the proposition that in the history-picture we had before us a sequence of “states” of mechanical type which were amenable to rational analysis like a physical experiment or a chemical reaction, and that therefore causes, means, methods and objects were capable of being grouped together as a comprehensible system on the visible surface. It all becomes astonishingly simple. And one is bound to admit that given a sufficiently shallow observer, the hypothesis (so far as concerns _his_ personality and its world-picture) comes off.

Hunger and Love[174] thus become mechanical causes of mechanical processes in the “life of peoples.” Social problems and sexual problems (both belonging to a “physics” or “chemistry” of public—all-too-public— existence) become the obvious themes of utilitarian history and _therefore of the corresponding tragedy_. For the social drama necessarily accompanies the materialist treatment of history, and that which in Goethe’s “Wahlverwandtschaften” was destiny in the highest sense has become in Ibsen’s “Lady from the Sea” nothing but a sexual problem. Ibsen and all the reason-poets of our great cities build—build from their very first causes to their very last effect—but they do not sing. As artist, Hebbel fought hard to overcome this merely prosaic element in his more critical than intuitive temperament, to be a poet _quand même_, hence his desperate and wholly un-Goethean effort to _motive_ his events. In Hebbel, as in Ibsen, motiving means trying to shape tragedy _causally_, and he dissected and re-dissected and transformed and retransformed his Anecdote until he had made it into a system that proved a case. Consider his treatment of the Judith story— Shakespeare would have taken it as it was, and scented a world-secret in the physiognomic charm of the pure adventure. But Goethe’s warning: “Do not, I beg you, look for anything behind phenomena. _They are themselves their own lesson_ (sie selbst sind die Lehre)” had become incomprehensible to the century of Marx and Darwin. The idea of trying to read a destiny in the physiognomy of the past and that of trying to represent unadulterated Destiny as a tragedy were equally remote from them. In both domains, the cult of the useful had set before itself an entirely different aim. Shapes were called into being, not to be, but to prove something. “Questions” of the day were “treated,” social problems suitably “solved,” and the stage, like the history-book, became a means to that end. Darwinism, however unconscious of what it was doing, has made biology politically effective. Somehow or other, democratic stirrings happened in the protoplasm, and the struggle for existence of the rain-worms is a useful lesson for the bipeds who have scraped through.

With all this, the historians have failed to learn the lesson that our ripest and strictest science, Physics, would have taught them, the lesson of prudence. Even if we concede them their causal method, the superficiality with which they apply it is an outrage. There is neither the intellectual discipline nor the keen sight, let alone the scepticism that is inherent in our handling of physical hypotheses.[175] For the attitude of the physicist to his atoms, electrons, currents, and fields of force, to æther and mass, is very

far removed from the naïve faith of the layman and the Monist in these things. They are _images_ which he subjects to the abstract relationships of his differential equations, in which he clothes trans-phenomenal numbers, and if he allows himself a certain freedom to choose amongst several theories, it is because he does not try to find in them any actuality but that of the “conventional sign.”[176] He knows, too, that over and above an experimental acquaintance with the technical structure of the world-around, all that it is possible to achieve by this process (which is the only one open to natural science) is a symbolic interpretation of it, no more—certainly not “Knowledge” in the sanguine popular sense. For, the image of Nature being a creation and copy of the Intellect, its “alter ego” in the domain of the extended, to _know_ Nature means to know oneself.

If Physics is the maturest of our sciences, Biology, whose business is to explore the picture of organic life, is in point both of content and of methods the weakest. What historical investigation _really_ is, namely pure Physiognomic, cannot be better illustrated than by the course of Goethe’s nature-studies. He works upon mineralogy, and at once his views fit themselves together into a conspectus of an earth-history in which his beloved granite signifies nearly the same as that which I call the proto-human signifies in man’s history. He investigates well- known plants, and the prime phenomenon of metamorphosis, the original form of the history of all plant existence, reveals itself; proceeding further, he reaches those extraordinarily deep ideas of vertical and spiral tendencies in vegetation which have not been fully grasped even yet. His studies of ossature, based entirely on the contemplation of life, lead him to the discovery of the “os intermaxillare” in man and to the view that the skull-structure of the vertebrates developed out of six vertebræ. Never is there a word of causality. He feels the necessity of Destiny just as he himself expressed it in his _Orphische Urworte_:

“So must thou be. Thou canst not Self escape. So erst the Sibyls, so the Prophets told. Nor Time nor any Power can mar the shape Impressed, that living must itself unfold.”

The mere chemistry of the stars, the mathematical side of physical observations, and physiology proper interested him, the great historian of Nature very little, because they belonged to Systematic and were concerned with experiential learning of the become, the dead, and the rigid. This is what underlies his anti-Newton polemic—a case in which, it must be added, both sides were in the right, for the one had “knowledge” of the regulated nature-process in the dead colour[177] while the experiencing of the other, the artist, was intuitive-sensuous “feeling.” Here we have the two worlds in plain opposition; and now therefore the essentials of their opposition must be stated with all strictness.

History carries the mark of the _singular-factual_, Nature that of the _continuously possible_. So long as I scrutinize the image of the world- around in order to see by what laws it _must_ actualize itself, irrespective of whether it does happen or merely might happen— irrespective, that is, of time—then I am working in a genuine science. For the necessity of a nature-law (and there are no other laws) it is utterly immaterial whether it becomes phenomenal infinitely often or never. _That is, it is independent of Destiny._ There are thousands of chemical combinations that never are and never will be produced, but they are demonstrably possible and therefore they _exist_—for the fixed System of Nature though not for the Physiognomy of the whirling universe. A system consists of truths, a history rests on facts. Facts follow one another, truths follow _from_ one another, and this is the difference between “when” and “how.” That there has been a flash of lightning is a fact and can be indicated, without a word, by the pointing of a finger. “When there is lightning there is thunder,” on the contrary, is something that must be communicated by a proposition or sentence. Experience-lived may be quite wordless, while systematic knowing can only be through words. “Only that which has no history is capable of being defined,” says Nietzsche somewhere. But History is present becoming that tends into the future and looks back on the past. Nature stands beyond all time, its mark is extension, and it is without directional quality. Hence, for the one, the necessity of the mathematical, and for the other the necessity of the tragic.

In the actuality of waking existence both worlds, that of scrutiny and that of acceptance (Hingebung), are interwoven, just as in a Brabant tapestry warp and woof together effect the picture. Every law must, to be _available_ to the understanding at all, once have been discovered through some destiny-disposition in the history of an intellect—that is, it must have once been in experiential life; and every destiny appears in some sensible garb—as persons, acts, scenes and gestures—in which Nature-laws are operative. Primitive life is submissive before the daemonic unity of the fateful; in the consciousness of the mature Culture this “early” world-image is incessantly in conflict with the other, “late,” world-image; and in the civilized man the tragic world- feeling succumbs to the mechanizing intellect. History and nature _within ourselves_ stand opposed to one another as _life_ is to _death_, as _ever-becoming time_ to _ever-become space_. In the waking consciousness, becoming and become struggle for control of the world- picture, and the highest and maturest forms of both sorts (possible only for the great Cultures) are seen, in the case of the Classical soul, in the opposition of Plato and Aristotle, and, in the case of our Western, in that of Goethe and Kant—the pure physiognomy of the world contemplated by the soul of an eternal child, and its pure system comprehended by the reason of an

eternal greybeard.

XII

Herein, then, I see the _last_ great task of Western philosophy, the only one which still remains in store for the aged wisdom of the Faustian Culture, the preordained issue, it seems, of our centuries of spiritual evolution. No Culture is at liberty to _choose_ the path and conduct of its thought, but here for the first time a Culture can foresee the way that destiny has chosen for it.

Before my eyes there seems to emerge, as a vision, a hitherto unimagined mode of superlative historical research that is truly Western, necessarily alien to the Classical and to every other soul but ours—a comprehensive Physiognomic of all existence, a morphology of becoming for _all_ humanity that drives onward to the highest and last ideas; a duty of penetrating the world-feeling not only of our proper soul but of all souls whatsoever that have contained grand possibilities and have expressed them in the field of actuality as grand Cultures. This philosophic view—to which we and we alone are entitled in virtue of our analytical mathematic, our contrapuntal music and our perspective painting—in that its scope far transcends the scheme of the systematist, presupposes the eye of an artist, and of an artist who can feel the whole sensible and apprehensible environment dissolve into a deep infinity of mysterious relationships. So Dante felt, and so Goethe felt. To bring up, out of the web of world-happening, a millennium of organic culture-history as an entity and person, and to grasp the conditions of its inmost spirituality—such is the aim. Just as one penetrates the lineaments of a Rembrandt portrait or a Cæsar-bust, so the new art will contemplate and understand the grand, fateful lines in the visage of a Culture as a superlative human individuality.

To attempt the interpretation of a poet or a prophet, a thinker or a conqueror, is of course nothing new, but to enter a culture-soul—Classical, Egyptian or Arabian—so intimately as to absorb into one's self, to make part of one's own life, the totality expressed by typical men and situations, by religion and polity, by style and tendency, by thought and customs, is quite a new manner of experiencing life. Every epoch, every great figure, every deity, the cities, the tongues, the nations, the arts, in a word everything that ever existed and will become existent, are physiognomic traits of high symbolic significance that it will be the business of quite a new kind of "judge of men" (Menschenkenner) to interpret. Poems and battles, Isis and Cybele, festivals and Roman Catholic masses, blast furnaces and gladiatorial games, dervishes and Darwinians, railways and Roman roads, "Progress" and Nirvana, newspapers, mass-slavery, money, machinery—all these are equally signs and symbols in the world-picture of the past that the soul presents to itself and would interpret. "_Alles Vergängliche ist nur ein Gleichnis._" Solutions and panoramas as yet unimagined await the unveiling. Light will be thrown on the dark questions which underlie dread and longing—those deepest of primitive human feelings—and which the will-to-know has clothed in the "problems" of time, necessity, space, love, death, and first causes. There is a wondrous music of the spheres which _wills to be heard_ and which a few of our deepest spirits will hear. The physiognomic of world-happening will become the _last Faustian philosophy_.

CHAPTER V

MAKROKOSMOS

I

THE SYMBOLISM OF THE WORLD-PICTURE AND THE SPACE-PROBLEM

CHAPTER V

MAKROKOSMOS

I THE SYMBOLISM OF THE WORLD-PICTURE AND THE SPACE-PROBLEM

I

The notion of a world-history of physiognomic type expands itself therefore into the wider idea of an _all-embracing symbolism_. Historical research, in the sense that we postulate here, has simply to investigate the picture of the once-living past and to determine its inner form and logic, and the Destiny-idea is the furthest limit to which it can penetrate. But this research, however comprehensive the new orientation tends to make it, cannot be more than a fragment and a foundation of a still wider treatment. Parallel with it, we have a Nature-investigation that is equally fragmentary and is limited to its own causal system of relations. But

neither tragic nor technical “motion” (if we may distinguish by these words the respective bases of the lived and the known) exhausts the living itself. We both live and know when we are awake, but, in addition, we live when mind and senses are asleep. Though night may close every eye, the blood does not sleep. We are moving in the moving (so at least we try to indicate, by a word borrowed from science, the inexpressible that in sleep-hours we feel with inward certainty). But it is only in the waking existence that “here” and “there” appear as an irreducible duality. Every impulse proper to oneself has an expression and every impulse alien to oneself makes an impression. And thus everything of which we are conscious, whatever the form in which it is apprehended—“soul” and “world,” or life and actuality, or History and Nature, or law and feeling, Destiny or God, past and future or present and eternity—has for us a deeper meaning still, a final meaning. And the one and only means of rendering this incomprehensible comprehensible must be a kind of metaphysics which regards _everything whatsoever_ as having significance as a _symbol_.

Symbols are sensible signs, final, indivisible and, above all, unsought impressions of definite meaning. A symbol is a trait of actuality that for the sensuously-alert man has an immediate and inwardly-sure significance, and that is incommunicable by process of reason. The detail of a Doric or Early-Arabic or Early-Romanesque ornament; the forms of the cottage and the family, of intercourse, of costume and rite; the aspect, gait and mien of a man and of whole classes of peoples and men; the communication-and community-forms of man and beast; and beyond all this the whole voiceless language of Nature with her woods and pastures, flocks, clouds, stars, moonlight and thunderstorm, bloom and decay, nearness and distance—all this is the emblematical impression of the Cosmos upon us, who are both aware and in our reflective hours quite capable of listening to this language. Vice versa, it is the sense of a homogeneous understanding that raises up the family, the class, the tribe, or finally the Culture, out of the general humanity and assembles it as such.

Here, then, we shall not be concerned with what a world “is,” but with what it signifies to the being that it envelops. When we wake up, at once something extends itself between a “here” and a “there.” We live the “here” as something proper, we experience the “there” as something alien. There is a dualizing of soul and world as poles of actuality; and in the latter there are both resistances which we grasp causally as things and properties, and impulses in which we feel beings, _numina_ (“just like ourselves”) to be operative. But there is in it, further, something which, as it were, eliminates the duality. Actuality—the world _in relation to_ a soul—is for every individual the projection of the Directed upon the domain of the Extended—the Proper mirroring itself on the Alien; one’s _actuality then signifies oneself_. By an act that is both creative and unconscious—for it is not “I” who actualize the possible, but “it” actualizes itself through me—the bridge of symbol is thrown between the living “here” and “there.” Suddenly, necessarily, and completely “the” world comes into being out of the totality of received and remembered elements: and as it is an individual who apprehends the world, there is for each individual a singular world.

There are therefore as many worlds as there are waking beings and like- living, like-feeling groups of beings. The supposedly single, independent and external world that each believes to be common to all is really an ever-new, uniquely-occurring and non-recurring experience in the existence of each.

A whole series of grades of consciousness leads up from the root- beginnings of obscure childish intuition, in which there is still no clear world for a soul or self-conscious soul within a world, to the highly intellectualized states of which only the men of fully-ripened civilizations are capable. This gradation is at the same time an expansion of symbolism from the stage in which there is an inclusive meaning of _all_ things to one in which separate and specific signs are distinguished. It is not merely when, after the manner of the child, the dreamer and the artist, I am passive to a world full of dark significances; or when I am awake without being in a condition of extreme alertness of thought and act (such a condition is much rarer even in the consciousness of the real thinker and man of action than is generally supposed)—it is continuously and always, for as long as my life can be considered to be a waking life at all, that I am endowing that which is outside me with the _whole_ content that is in me, from the half-dreamy impressions of world-coherence to the rigid world of causal laws and number that overlies and binds them. And even in the domain of pure number the symbolical is not lacking, for we find that refined _thought_ puts inexpressible meanings into signs like the triangle, the circle and the numbers 7 and 12.

This is the _idea of the Macrocosm, actuality as the sum total of all symbols in relation to one soul_. From this property of being significant nothing is exempt. All that is, symbolizes. From the corporeal phenomena like visage, shape, mien (of individuals and classes and peoples alike), which have always been known to possess meaning, to the supposedly eternal and universally-valid forms of knowledge, mathematics and physics, everything speaks out of the essence of one and only one soul.

At the same time these individuals' worlds as lived and experienced by men of _one_ Culture or spiritual community are interrelated, and on the greater or less degree of this interrelation depends the greater or less communicability of intuitions, sensations and thoughts from one to another—that is, the possibility of making intelligible what one has created in the style of one's own being, through expression-media such as language or art or religion, by means of word-sounds or formulæ or signs that are themselves also symbols. The degree of interrelation between one's world and another's fixes the limit at which understanding becomes self-deception. Certainly it is only very imperfectly that we can understand the Indian or the Egyptian soul, as manifested in the men, customs, deities, root-words, ideas, buildings and acts of it. The Greeks, ahistoric as they were, could not even guess at the essence of alien spiritualities—witness the naïveté with which they were wont to rediscover their own gods and Culture in those of alien peoples. But in our own case too, the current translations of the ■ρχ■, or _Atman_, or _Tao_ of alien philosophers presuppose our proper world-feeling, which is that from which our "equivalents" claim their significance, as the basis of an alien soul-expression. And similarly we elucidate the characters of early Egyptian and Chinese portraits with reference to our own life-experience. In both cases we deceive ourselves. That the artistic masterpieces of all Cultures are still living for us—"immortal" as we say—is another such fancy, kept alive by the unanimity with which we understand the alien work in the proper sense. Of this tendency of ours the effect of the Laocoön group on Renaissance sculpture and that of Seneca on the Classicist drama of the French are examples.

II

Symbols, as being things actualized, belong to the domain of the extended. They are become and not becoming (although they may stand for a becoming) and they are therefore rigidly limited and subject to the laws of space. There are _only_ sensible-spatial symbols. The very word "form" designates something extended in the extended,—even the inner forms of music are no exception, as we shall see. But extension is the hall-mark of the fact "waking consciousness," and this constitutes only one side of the individual existence and is intimately bound up with that existence's destinies. Consequently, every trait of the actual waking-consciousness, whether it be feeling or understanding, is in the moment of our becoming aware of it, already _past_. We can only _reflect_ upon impressions, "think them over" as our happy phrase goes, but that which for the sensuous life of the animals is _past_, is for the grammatical (wortgebundene) understanding of man _passing_, _transient_. That which happens is, of course, transient, for a happening is irrevocable, but every kind of significance is also transient. Follow out the destiny of the Column, from the Egyptian tomb- temple in which columns are ranked to mark the path for the traveller, through the Doric peripteros in which they are held together by the body of the building, and the Early-Arabian basilica where they support the interior, to the façades of the Renaissance in which they provide the upward-striving element. As we see, an old significance never returns; that which has entered the domain of extension has begun and ended at once. A deep relation, and one which is early felt, exists _between space and death_. Man is the only being that knows death; all others become old, but with a consciousness wholly limited to the moment which must seem to them eternal. They live, but like children in those first years in which Christianity regards them as still "innocent," they know nothing of life, and they die and they see death without knowing anything about it. Only fully-awakened man, man proper, whose understanding has been emancipated by the habit of language from dependence on sight, comes to possess (besides sensibility) the _notion_ of transience, that is, a memory of the past as past and an experiential conviction of irrevocability. We _are_ Time,[178] but we _possess_ also an image of history and in this image death, and with death birth, appear as the two riddles. For all other beings life pursues its course without suspecting its limits, i.e., without conscious knowledge of task, meaning, duration and object. It is because there is this deep and significant identity that we so often find the awakening of the inner life in a child associated with the death of some relation. The child _suddenly_ grasps the lifeless corpse for what it is, something that has become wholly matter, wholly space, and at the same moment it feels itself as an individual _being_ in an alien extended world. "From the child of five to myself is but a step. But from the new-born baby to the child of five is an appalling distance," said Tolstoi once. Here, in the decisive moments of existence, when man first becomes man and realizes his immense loneliness in the universal, the world-fear reveals itself for the first time as the essentially human fear in the presence of death, the limit of the light-world, rigid space. Here, too, the higher thought originates as meditation upon death. Every religion, every scientific investigation, every philosophy proceeds from it. Every great symbolism attaches its form-language to the cult of the dead, the forms of disposal of the dead, the adornment of the graves of the dead. The Egyptian style begins with the tomb-temples of the Pharaohs, the Classical with the geometrical decoration of the funerary urns, the Arabian with catacomb and sarcophagus, the Western with the cathedral wherein the sacrificial death of Jesus is re-enacted daily under the hands of the priest. From this primitive fear springs, too, historical sensitiveness in all its modes, the Classical with its cleaving to the life-abundant present, the Arabian with its baptismal rite that wins new life and overcomes death, the Faustian with its contrition that makes worthy to receive the Body of Jesus and therewith immortality. Till we have the constantly-wakeful concern for the life that is _not yet past_, there is

no concern for that which _is past_. The beast has only the future, but man knows also the past. And thus every new Culture is awakened in and with a new view of the world, that is, a sudden glimpse of death as the secret of the perceivable world. It was when the idea of the impending end of the world spread over Western Europe (about the year 1000) that the Faustian soul of this religion was born.

Primitive man, in his deep amazement before death, sought with all the forces of his spirit to penetrate and to spellbind this world of the extended with the inexorable and always present limits of its causality, this world filled with dark almightiness that continuously threatened to make an end of him. This energetic defensive lies deep in unconscious existence, but, as being the first impulse that genuinely projects soul and world as parted and opposed, it marks the threshold of _personal_ conduct of life. Ego-feeling and world-feeling begin to work, and all culture, inner or outer, bearing or performance, is as a whole only the intensification of this being-human. Henceforward all that resists our sensations is not mere resistance or thing or impression, as it is for animals and for children also, but an expression as well. Not merely are things actually contained in the world-around but also they possess _meaning_, as phenomena in the world-_view_. Originally they possessed only a relationship to men, but now there is also a relationship of men to them. They have become emblems of his existence. And thus the essence of every genuine—_unconscious and inwardly necessary_—symbolism proceeds from the knowledge of death in which the secret of space reveals itself. All symbolism implies a defensive; it is the expression of a deep _Scheu_ in the old double sense of the word,[179] and its form-language tells at once of hostility and of reverence.

Every thing-become is mortal. Not only peoples, languages, races and Cultures are transient. In a few centuries from now there will no more be a Western Culture, no more be German, English or French than there were Romans in the time of Justinian. Not that the sequence of human generations failed; it was the inner form of a people, which had put together a number of these generations as a single gesture, that was no longer there. The _Civis Romanus_, one of the most powerful symbols of Classical being, had nevertheless, as a form, only a duration of some centuries. But the primitive phenomenon of the great Culture will itself have disappeared some day, and with it the drama of world-history; aye, and man himself, and beyond man the phenomenon of plant and animal existence on the earth's surface, the earth, the sun, the whole world of sun-systems. All art is mortal, not merely the individual artifacts but the arts themselves. One day the last portrait of Rembrandt and the last bar of Mozart will have ceased to be—though possibly a coloured canvas and a sheet of notes may remain—because the last eye and the last ear accessible to their message will have gone. Every thought, faith and science dies as soon as the spirits in whose worlds their "eternal truths" were true and necessary are extinguished. Dead, even, are the star-worlds which "appeared," a proper world to the proper eye, to the astronomers of the Nile and the Euphrates, for our eye is different from theirs; and our eye in its turn is mortal. All this we know. The beast does not know, and what he does not know does not exist in his experienced world-around. But if the image of the past vanishes, the longing to give a deeper meaning to the passing vanishes also. And so it is with reference to the purely human macrocosm that we apply the oft- quoted line, which shall serve as motto for all that follows: _Alles Vergängliche ist nur ein Gleichnis_.

From this we are led, without our noticing it, back to the space- problem, though now it takes on a fresh and surprising form. Indeed, it is as a corollary to these ideas that it appears for the first time as capable of solution—or, to speak more modestly, of enunciation—just as the time-problem was made more comprehensible by way of the Destiny- idea. From the moment of our awakening, the fateful and directed life appears in the phenomenal life as an experienced _depth_. Everything extends itself, but it is not yet "space," not something established in itself but a self-extension continued from the moving here to the moving there. World-experience is bound up with the essence of _depth_ (i.e., _far-ness_ or _distance_). In the abstract system of mathematics, "depth" is taken along with "length" and "breadth" as a "third" dimension; but this trinity of elements of like order is misleading from the outset, for in our impression of the spatial world these elements are unquestionably _not_ equivalents, let alone homogeneous. Length and breadth are no doubt, experientially, a unit and not a mere sum, but they are (the phrase is used deliberately) simply a form of reception; they represent the purely sensuous impression. But depth is a representation of _expression_, of _Nature_, and with it begins the "world."

This discrimination between the "third" and the other two dimensions, so called, which needless to say is wholly alien to mathematics, is inherent also in the opposition of the notions of sensation and contemplation. Extension into depth converts the former into the latter; in fact, depth is the first and genuine dimension in the literal sense of the word.[180] In it the waking consciousness is active, whereas in the others it is strictly passive. It is the _symbolic content of a particular order_ as understood by one particular Culture that is expressed by this original fundamental and unanalysable element. The experiencing of depth (this is a premiss upon which all that follows is dependent) is an act, as entirely involuntary and necessary as it is creative, whereby the

ego keeps its world, so to say, in subordination (zudiktiert erhält). Out of the rain of impressions the ego fashions a formal unit, a cinematic _picture_, which as soon as it is mastered by the understanding is subjected to law and the causality principle; and therefore, as the projection of an individual spirit it is transient and mortal.

There is no doubt, however reason may contest it, that this extension is capable of infinite variety, and that it operates differently not merely as between child and man, or nature-man and townsman, or Chinese and Romans, but as between individual and individual according as they experience their worlds contemplatively or alertly, actively or placidly. Every artist has rendered “Nature” by line and by tone, every physicist—Greek, Arabian or German—has dissected “Nature” into ultimate elements, and how is it that they have not all discovered the same? Because every one of them has had his own Nature, though—with a naïveté that was really the salvation of his world-idea and of his own self— every one believed that he had it in common with all the rest. Nature is a possession which is saturated through and through with the most personal connotations. _Nature is a function of the particular Culture._

III

Kant believed that he had decided the great question of whether this _a priori_ element was pre-existent or obtained by experience, by his celebrated formula that Space is the form of perception which underlies all world impressions. But the “world” of the careless child and the dreamer undeniably possess this form in an insecure and hesitant way,[181] and it is only the tense, practical, _technical_ treatment of the world-around—imposed on the free-moving being which, unlike the lilies of the fields, must care for its life—that lets sensuous self- extension stiffen into rational tridimensionality. And it is only the city-man of matured Cultures that really _lives_ in this glaring wakefulness, and only for his thought that there is a Space wholly divorced from sensuous life, “absolute,” dead and alien to Time; and it exists not as a form of the intuitively-perceived but as a form of the rationally-comprehended. There is no manner of doubt that the “space” which Kant saw all around him with such unconditional certainty when he was thinking out his theory, did not exist in anything like so rigorous a form for his Carolingian ancestors. Kant’s greatness consists in his having created the idea of a "form _a priori_," but not in the application that he gave it. We have already seen that Time is not a “form of perception” nor for that matter a form at all—forms exist only in the extended—and that there is no possibility of defining it except as a counter-concept to Space. But there is the further question—does this word “space” exactly cover the formal content of the intuitively- perceived? And beyond all this there is the plain fact that the “form of perception” _alters with distance_. Every distant mountain range is “perceived” as a scenic plane. No one will pretend that he sees the moon as a body; for the eye it is a pure plane and it is only by the aid of the telescope—i.e. when the distance is artificially reduced—that it progressively obtains a spatial form. Obviously, then, the “form of perception” is a function of distance. Moreover, when we reflect upon anything, we do not exactly remember the impressions that we received at the time, but “represent to ourselves” the picture of a space abstracted from them. But this representation may and does deceive us regarding the living actuality. Kant let himself be misled; he should certainly not have permitted himself to distinguish between forms of perception and forms of ratiocination, for _his_ notion of Space in principle embraced both.[182]

Just as Kant marred the Time-problem by bringing it into relation with an essentially misunderstood arithmetic and—on that basis—dealing with a phantom sort of time that lacks the life-quality of direction and is therefore a mere spatial scheme, so also he marred the Space-problem by relating it to a common-place geometry.

It befell that a few years after the completion of Kant’s main work Gauss discovered the first of the Non-Euclidean geometries. These, irreproachably demonstrated as regards their own internal validity, enable it to be proved that there are _several_ strictly mathematical kinds of three-dimensional extension, all of which are _a priori_ certain, and none of which can be singled out to rank as the genuine “form of perception.”

It was a grave, and in a contemporary of Euler and Lagrange an unpardonable, error to postulate that the Classical school-geometry (for it was that which Kant always had in mind) was to be found reproduced in the forms of Nature around us. In moments of attentive observation at very short range, and in cases in which the relations considered are sufficiently small, the living impressions and the rules of customary geometry are certainly in approximate agreement. But the _exact_ conformity asserted by philosophy can be demonstrated neither by the eye nor by measuring-instruments. Both these must always stop short at a certain limit of accuracy which is very far indeed below that which would be necessary, say, for determining which of the Non-Euclidean geometries is the geometry of “empirical” Space.[183] On the large scales and for great distances, where the experience of depth completely dominates the perception-picture (for example, looking on a broad landscape as against a drawing) the form of perception is in fundamental contradiction with mathematics. A glance down any avenue shows us that parallels meet at the

horizon. Western perspective and the otherwise quite different perspective of Chinese painting are both alike based on this fact, and the connexion of these perspectives with the root- problems of their respective mathematics is unmistakable.

Experiential Depth, in the infinite variety of its modes, eludes every sort of numerical definition. The whole of lyric poetry and music, the entire painting of Egypt, China and the West by hypothesis deny any strictly mathematical structure in space as felt and seen, and it is only because all modern philosophers have been destitute of the smallest understanding of painting that they have failed to note the contradiction. The “horizon” _in and by which every visual image gradually passes into a definitive plane_, is incapable of any mathematical treatment. Every stroke of a landscape painter’s brush refutes the assertions of conventional epistemology.

As mathematical magnitudes abstract from life, the “three dimensions” have no natural limits. But when this proposition becomes entangled with the surface-and-depth of experienced impression, the original epistemological error leads to another, viz., that apprehended extension is also without limits, although in fact our vision only comprises the _illuminated_ portion of space and stops at the light-limit of the particular moment, which may be the star-heavens or merely the bright atmosphere. The “visual” world is the totality of _light-resistances_, since vision depends on the presence of radiated or reflected light. The Greeks took their stand on this and stayed there. It is the Western world-feeling that has produced the idea of a limitless universe of space—a space of infinite star-systems and distances that far transcends all optical possibilities—and this was a creation of the _inner_ vision, incapable of all actualization through the eye, and, even as an idea, alien to and unachievable by the men of a differently-disposed Culture.

IV

The outcome, then, of Gauss’s discovery, which _completely_ altered the course of modern mathematics,[184] was the statement that there are severally equally valid structures of three-dimensional extension. That it should even be asked which of them corresponds to actual perception shows that the problem was not in the least comprehended. Mathematics, whether or not it employs visible images and representations as working conveniences, concerns itself with systems that are entirely emancipated from life, time and distance, with form-worlds of pure numbers whose validity—not _fact-foundation_—is timeless and like everything else that is “known” is known by causal logic and not experienced.

With this, the difference between the living intuition-way and the mathematical form-language became manifest and the secret of _spatial becoming_ opened out.

As becoming is the foundation of the become, continuous living history that of fulfilled dead nature, the organic that of the mechanical, destiny that of causal law and the causally-settled, so too _direction is the origin of extension. The secret of Life accomplishing itself which is touched upon by the word Time forms the foundation of that which, as accomplished, is understood by_ (or rather _indicated to an inner feeling in us by_) _the word Space_. Every extension that is actual has first been accomplished in and with an experience of depth, and what is primarily indicated by the word Time is just this process of extending, first sensuously (in the main, visually) and only later intellectually, into depth and distance, i.e., the _step_ from the planar semi-impression to the macrocosmically ordered world-picture with its mysterious-manifest kinesis. We feel—and the feeling is what constitutes the state of all-round awareness in us—that we are _in_ an extension that encircles us; and it is only necessary to follow out this original impression that we have of the worldly to see that in reality there is only one true “dimension” of space, which is direction from one’s self outwards into the distance, the “there” and the future, and that the abstract system of three dimensions is a mechanical representation and not a fact of life. By the depth-experience sensation is _expanded_ into the world. We have seen already that the directedness that is in life wears the badge of _irreversibility_, and there is something of this same hall-mark of Time in our instinctive tendency to feel the depth that is in the world uni-directionally also—viz., from ourselves outwards, and never from the horizon inwards. The bodily mobility of man and beast is disposed in this sense. We move _forward_— towards the Future, nearing with every step not merely our aim but our old age—and we feel every _backward_ look as a glance at something that is past, that has already become history.[185]

If we can describe the basic form of the understood, viz., causality, as _destiny become rigid_, we may similarly speak of spatial depth as a _time become rigid_. That which not only man but even the beast _feels_ operative around him as destiny, he _perceives_ by touching, looking, listening, scenting as movement, and under his intense scrutiny it stiffens and becomes causal. We _feel_ that it is drawing towards spring and we feel in advance how the spring landscape expands around us; but we _know_ that the earth as it moves in space revolves and that the duration of spring consists of ninety such revolutions of the earth, or days. Time gives birth to Space, but Space gives death to Time.

Had Kant been more precise, he would, instead of speaking of the “two forms of perception,” have called time the form of perception and space the form of the perceived, and then the connexion of the two would probably have revealed itself to him. The logician, mathematician, or scientist in his moments of intense thought, knows only the Become—which has been detached from the singular event by the very act of meditating upon it—and true systematic space—in which everything possesses the _property_ of a mathematically-expressible “duration.” But it is just this that indicates to us how space is continuously “becoming.” While we gaze into the distance with our senses, it floats around us, but when we are startled, the alert eye sees a tense and rigid space. This space _is_; the principle of its existing at all is that it is, outside time and detached from it and from life. In it duration, a piece of perished time, resides as a known property of things. And, as we know ourselves too as _being_ in this space, we know that we also have a duration and a limit, of which the moving finger of our clock ceaselessly warns us. But the rigid Space itself is transient too—at the first relaxation of our intellectual tension it vanishes from the many-coloured spread of our world-around—and so it is a sign and symbol of _the most elemental and powerful symbol_, of life itself.

For the involuntary and unqualified realization of depth, which dominates the consciousness with the force of an elemental event (_simultaneously with the awakening of the inner life_), marks the frontier between child and ... Man. The symbolic experience of depth is what is lacking in the child, who grasps at the moon and knows as yet no meaning in the outer world but, like the soul of primitive man, dawns in a dreamlike continuum of sensations (in traumhafter Verbundenheit mit allem Empfindungshaften hindämmert). Of course the child is not without experience of the extended, of a very simple kind, but there is no _world-perception_; distance is felt, but it does not yet speak to the soul. And with the soul’s awakening, direction, too, first reaches living expression—Classical expression in steady adherence to the near- present and exclusion of the distant and future; Faustian in direction- energy which has an eye only for the most distant horizons; Chinese, in free hither-and-thither wandering that nevertheless goes to the goal; Egyptian in resolute march down the path once entered. Thus the Destiny- idea manifests itself in every line of a life. With it alone do we become members of a particular Culture, whose members are connected by a common world-feeling and a common world-form derived from it. A deep identity unites the awakening of the _soul_, its birth into clear existence in the name of a Culture, with the sudden realization of distance and time, the _birth of its outer world_ through the symbol of extension; and thenceforth this symbol is and remains the _prime symbol_ of that life, imparting to it its specific style and the historical form in which it progressively actualizes its inward possibilities. From the specific directedness is derived the specific prime-symbol of extension, namely, for the Classical world-view the near, strictly limited, self- contained Body, for the Western infinitely wide and infinitely profound three-dimensional Space, for the Arabian the world as a Cavern. And therewith an old philosophical problem dissolves into nothing: this prime form of the world is _innate_ in so far as it is an original possession of the soul of that Culture which is expressed by our life as a whole, and _acquired_ in so far that every individual soul re-enacts for itself that creative act and unfolds in early childhood the symbol of depth to which its existence is predestined, as the emerging butterfly unfolds its wings. The first comprehension of depth is _an act of birth_—the spiritual complement of the bodily.[186] In it the Culture is born out of its mother-landscape, and the act is repeated by every one of its individual souls throughout its life-course. This is what Plato—connecting it with an early Hellenic belief—called anamnesis. The definiteness of the world-form, which for each dawning soul _suddenly is_, derives meaning from Becoming. Kant the systematic, however, with his conception of the form _a priori_, would approach the interpretation of this very riddle from a dead result instead of along a living way.

From now on, we shall consider the _kind of extension as the prime symbol of a Culture_. From it we are to deduce the entire form-language of its actuality, its physiognomy as contrasted with the physiognomy of every other Culture and still more with the almost entire lack of physiognomy in primitive man’s world-around. For now the interpretation of depth rises to acts, to formative expression in works, to the _trans_-forming of actuality, not now merely in order to subserve necessities of life (as in the case of the animals) but above all to create a picture out of extensional elements of all sorts (material, line, colour, tone, motion)—a picture, often, that re-emerges with power to charm after lost centuries in the world-picture of another Culture and tells new men of the way in which its authors understood the world.

But the prime symbol does not actualize itself; it is operative through the form-sense of every man, every community, age and epoch and dictates the style of every life-expression. It is inherent in the form of the state, the religious myths and cults, the ethical ideals, the forms of painting and music and poetry, the fundamental notions of each science— but it is not presented by these. Consequently, it is not presentable by words, for language and words are themselves _derived_ symbols. Every individual symbol tells of it, but only to the inner feelings, not to the understanding. And when we say, as henceforth we shall say, that the prime-symbol of the Classical soul is the material and individual body, that of the Western pure infinite space, it must always be with the reservation that concepts cannot represent the inconceivable, and thus at the most a _significative feeling_ may be evoked by the sound of words.

Infinite space is the ideal that the Western soul has always striven to find, and to see immediately actualized, in its world-around; and hence it is that the countless space-theories of the last centuries possess— over and above all ostensible “results”—a deep import as symptoms of a world-feeling. In how far does unlimited extension _underlie_ all objective things? There is hardly a single problem that has been more earnestly pondered than this; it would almost seem as if every other world-question was dependent upon the one problem of the nature of space. And is it not in fact so—_for us_? And how, then, has it escaped notice that the whole Classical world never expended one word on it, and indeed did not even possess a word[187] by which the problem could be exactly outlined? Why had the great pre-Socratics nothing to say on it? Did they overlook in their world just that which appears to us the problem of all problems? Ought we not, in fact, to have seen long ago that the answer is in the very fact of their silence? How is it that according to _our_ deepest feeling the “world” is nothing but that world-of-space which is the true offspring of our depth-experience, and whose grand emptiness is corroborated by the star-systems lost in it? Could a “world” of this sense have been made even comprehensible to a Classical thinker? In short, we suddenly discover that the “eternal problem” that Kant, in the name of humanity, tackled with a passion that itself is symbolic, is a _purely Western_ problem that simply does not arise in the intellects of other Cultures.

What then was it that Classical man, whose insight into his own world- around was certainly not less piercing than ours, regarded as the prime problem of all being? It was the problem of ■ρχ■, the _material origin and foundation_ of all sensuously-perceptible things. If we grasp this we shall get close to the significance of the fact—not the fact of space, but the fact that made it a necessity of destiny for the space- problem to become the problem of the Western, and only the Western, soul.[188] This very spatiality (Räumlichkeit) that is the truest and sublimest element in the aspect of _our_ universe, that absorbs into itself and begets out of itself the substantiality of all things, Classical humanity (which knows no word for, and therefore has no idea of, space) with one accord cuts out as the nonent, τ■ μ■ ■ν, that which _is not_. The pathos of this denial can scarcely be exaggerated. The whole passion of the Classical soul is in this act of excluding by symbolic negation that which it _would_ not feel as actual, that in which its own existence _could_ not be expressed. A world of other colour suddenly confronts us here. The Classical statue in its splendid bodiliness—all structure and expressive surfaces and no incorporeal _arrière-pensée_ whatsoever—contains without remainder all that Actuality is for the Classical eye. The material, the optically definite, the comprehensible, the immediately present—this list exhausts the characteristics of this kind of extension. The Classical universe, the _Cosmos_ or well-ordered aggregate of all near and completely viewable things, is concluded by the corporeal vault of heaven. More there is not. The need that is in us to think of “space” as being behind as well as before this shell was wholly absent from the Classical world- feeling. The Stoics went so far as to treat even properties and relations of things as “bodies.” For Chrysippus, the Divine Pneuma is a “body,” for Democritus seeing consists in our being penetrated by material particles of the things seen. The State is a body which is made up of all the bodies of its citizens, the law knows only corporeal persons and material things. And the feeling finds its last and noblest expression in the stone body of the Classical temple. The windowless interior is carefully concealed by the array of columns; but outside there is not one truly straight line to be found. Every flight of steps has a slight sweep outward, every step relatively to the next. The pediment, the roof-ridge, the sides are all curved. Every column has a slight swell and none stand truly vertical or truly equidistant from one another. But swell and inclination and distance vary from the corners to the centres of the sides in a carefully toned-off ratio, and so the whole corpus is given a something that swings mysterious about a centre. The curvatures are so fine that to a certain extent they are invisible to the eye and only to be “sensed.” But it is just by these means that direction in depth is eliminated. While the Gothic style _soars_, the Ionic _swings_. The interior of the cathedral pulls up with primeval force, but the temple is laid down in majestic rest. All this is equally true as relating to the Faustian and Apollinian Deity, and likewise of the fundamental ideas of the respective physics. To the principles of position, material and form we have opposed those of straining movement, force and mass, and we have defined the last-named as a constant ratio between force and acceleration, nay, finally volatilized both in the purely spatial elements of _capacity_ and _intensity_. It was an obligatory consequence also of this way of conceiving actuality that the instrumental music of the great 18th-Century masters should emerge as a master-art—for it is the only one of the arts whose form-world is inwardly related to the contemplative vision of pure space. In it, as opposed to the statues of Classical temple and forum, we have bodiless realms of tone, tone-intervals, tone-seas. The orchestra swells, breaks, and ebbs, it depicts distances, lights, shadows, storms, driving clouds, lightning flashes, colours etherealized and transcendent—think of the instrumentation of Gluck and Beethoven. “Contemporary,” in our sense, with the Canon of Polycletus, the treatise in which the great sculptor laid down the strict rules of human body-build which remained authoritative till beyond Lysippus, we find the strict canon (completed by Stamitz about 1740) of the sonata-movement of four elements which begins to relax in late-Beethoven quartets and symphonies and, finally, in the lonely, utterly infinitesimal tone-world of the “Tristan” music, frees itself from all earthly comprehensibleness. This prime feeling of a loosing, Erlösung, solution, of the Soul in the Infinite, of a liberation from all material heaviness which the highest

moments of our music always awaken, sets free also the energy of depth that is in the Faustian soul: whereas the effect of the Classical art-work is to bind and to bound, and the body-feeling secures, brings back the eye from distance to a Near and Still that is saturated with beauty.

Footnote 172:

Which, inasmuch as it has been detached from time, is able to employ mathematical symbols. These rigid figures _signify_ for us a destiny of yore. But their meaning is other than mathematical. Past is not a cause, nor Fate a formula, and to anyone who handles them, as the historical materialist handles them, mathematically, the past event as such, as an actuality that has lived once and only once, is invisible.

Footnote 173:

That is, not merely conclusions of peaces or deathdays of persons, but the Renaissance style, the _Polis_, the Mexican Culture and so forth— are dates or data, facts that have been, even when we possess no representation of them.

Footnote 174:

See Vol. II, pp. 403 et seq., 589 et seq.

Footnote 175:

The formation of hypotheses in Chemistry is much more thoughtless, owing to the less close relation of that science to mathematics. A house of cards such as is presented to us in the researches of the moment on atom-structure (see, for example, M. Born, _Der Aufbau der Materie_, 1920) would be impossible in the near neighbourhood of the electro-magnetic theory of light, whose authors never for a moment lost sight of the frontier between mathematical vision and its representation by a picture, or of the fact that this was only a picture.

Footnote 176:

There is no difference essentially between these representations and the switchboard wiring-diagram.

Footnote 177:

Goethe's theory of colour openly controverted Newton's theory of light. A long account of the controversy will be found in Chapter IX of G. H. Lewes's _Life of Goethe_—a work that, taken all in all, is one of the wisest biographies ever written. In reading his critique of Goethe's theory, of course, it has to be borne in mind that he wrote before the modern development of the electro-magnetic theory, which has substituted a merely mathematical existence for the Newtonian physical existence of colour-rays as such in white light. Now, this physical existence was just what, in substance, Goethe denied. What he affirmed, in the simpler language of his day, was that white light was something simple and colourless that becomes coloured through diminutions or modifications imposed upon it by "darkness." The modern physicist, using a subtler hypothesis than Newton's and a more refined "balance" than that which Lewes reproaches Goethe for "flinging away," has found in white light, not the Newtonian mixture of colour-rays, but a surge of irregular wave-trains which are only regularized into colour-vibrations through being acted upon by analysers of one sort and another, from prisms to particulate matter. This necessity of a counter-agent for the production of colour seems—to a critical outsider at any rate—very like the necessity of an efficient negative principle or "opaque" that Goethe's intuitive interpretation of his experiments led him to postulate. It is this that is the heart of the theory, and not the "simplicity" of light _per se_.

So much it seems desirable to add to the text and the reference, in order to expand the author's statement that "both were right." For Lewes, with all his sympathetic penetration of the man and real appreciation of his scientific achievement, feels obliged to regard his methods and his theory as such as "erroneous." And it is perhaps not out of place in this book to adduce an instance of the peculiar nature and power of intuitive vision (which entirely escapes direct description) in which Vision frankly challenges Reason on its own ground, meets with refutation (or contempt) from the Reason of its day, and yet may come to be upheld in its specific rightness (its rightness as vision, that is, apart from its technical enunciation by the seer) by the Reason of a later day.—_Tr._

Footnote 178:

See p. 123.

Footnote 179:

See page 123.

Footnote 180:

The word _dimension_ ought only to be used in the singular. It means extension but not extensions. The idea of the three directions is an out-and-out abstraction and is not contained in the immediate extension-feeling of the body (the “soul”). Direction as such, the direction-essence, gives rise to the mysterious _animal_ sense of right and left and also the _vegetable_ characteristic of below-to-above, earth to heaven. The latter is a fact felt dream-wise, the former a truth of waking existence to be learned and therefore capable of being transmuted. Both find expression in architecture, to wit, in the symmetry of the plan and the energy of the elevation, and it is only because of this that we specially distinguish in the “architecture” of the space around us the angle of 90° in preference, for example, to that of 60°. Had not this been so, the conventional number of our “dimensions” would have been quite different.

Footnote 181:

The want of perspective in children’s drawings is emphatically not perceptible to the children themselves.

Footnote 182:

His idea that the _a priori_-ness of space was proved by and through the unconditional validity of simple geometrical facts rests, as we have already remarked, on the all-too-popular notion that mathematics are either geometry or arithmetic. Now, even in Kant’s time the mathematic of the West had got far beyond this naïve scheme, which was a mere imitation of the Classical. Modern geometry bases itself not on space but on multiply-infinite number-manifolds—amongst which the three-dimensional is simply the undistinguished special case—and within these groups investigates functional formations with reference to their structure; that is, there is no longer any contact or even possibility of contact between any possible kind of sense-perception and mathematical facts in the domain of such extensions as these, and yet the demonstrability of the latter is in no wise impaired thereby. Mathematics, then, are independent of the perceived, and the question now is, how much of this famous demonstrability of the forms of perception is left when the artificiality of juxtaposing both in a supposedly single process of experience has been recognized.

Footnote 183:

It is true that a geometrical theorem may be proved, or rather demonstrated, by means of a drawing. But the theorem is differently constituted in every kind of geometry, and that being so, the drawing ceases to be a _proof_ of anything whatever.

Footnote 184:

So much so that Gauss said nothing about his discovery until almost the end of his life for tear of “the clamour of the Bœotians.”

Footnote 185:

The distinction of right and left (see p. 169) is only conceivable as the outcome of this directedness in the dispositions of the body. “In front” has no meaning whatever for the body of a plant.

Footnote 186:

It may not be out of place here to refer to the enormous importance attached in savage society to initiation-rites at adolescence.—_Tr._

Footnote 187:

Either in Greek or in Latin, τ■πος (= _locus_) means spot, locality, and also social position; χ■ρα (= _spatium_) means space-between, distance, rank, and also ground and soil (e.g., τ■ ■κ τ■ς χ■ρας, produce); τ■ κ■νον (_vacuum_) means quite unequivocally a hollow body, and the stress is emphatically on the envelope. The literature of the Roman Imperial Age, which attempted to render the _Magian_ world- feeling through Classical words, was reduced to such clumsy versions as ■ρατ■ς τ■πος

(sensible world) or _spatium inane_ (“endless space,” but also “wide surface”—the root of the word “spatium” means to swell or grow fat). In the true Classical literature, the idea not being there, there was no necessity for a word to describe it.

Footnote 188:

It has not hitherto been seen that this fact is implicit in Euclid’s famous parallel axiom (“through a point only one parallel to a straight line is possible”).

This was the only one of the Classical theorems which remained unproved, and as we know now, it is incapable of proof. But it was just that which made it into a dogma (as opposed to any experience) _and therefore the metaphysical centre_ and main girder of that geometrical system. Everything else, axiom or postulate, is merely introductory or corollary to this. This one proposition is necessary and universally-valid for the Classical intellect, _and yet not deducible_. What does this signify?

It signifies that the statement is a _symbol_ of the first rank. It contains the structure of Classical corporeality. It is just this proposition, theoretically the weakest link in the Classical geometry (objections began to be raised to it as early as Hellenistic times), that reveals its soul, and it was just this proposition, self-evident within the limits of routine experience, that the Faustian number- thinking, derived from incorporeal spatial distances, fastened upon as the centre of doubt. It is one of the deepest symbols of _our_ being that we have opposed to the Euclidean geometry not one but _several_ other geometries all of which for us are equally true and self- consistent. The specific tendency of the anti-Euclidean group of geometries—in which there may be no parallel or two parallels or several parallels to a line through a point—lies in the fact that by their very plurality the corporeal sense of extension, which Euclid _canonized_ by his principle, is entirely got rid of; for what they reject is that which all corporeal postulates but all spatial denies. The question of which of the three Non-Euclidean geometries is the “correct” one (i.e., that which underlies actuality)—although Gauss himself gave it earnest consideration—is in respect of world-feeling entirely Classical and therefore it should not have been asked by a thinker of our sphere. Indeed it prevents us from seeing the true and deep meaning implicit in the plurality of these geometries. The specifically Western symbol resides not in the reality of one or of another, but in the true plurality of _equally possible_ geometries. It is the _group_ of space-structures—in the abundance of which the classical system is a mere particular case—that has dissolved the last residuum of the corporeal into the pure space-feeling.

V

Each of the great Cultures, then, has arrived at a secret language of world-feeling that is only fully comprehensible by him whose soul belongs to that Culture. We must not deceive ourselves. Perhaps we can read a little way into the Classical soul, because its form-language is almost the exact inversion of the Western; how far we have succeeded or can ever succeed is a question which necessarily forms the starting- point of all criticism of the Renaissance, and it is a very difficult one. But when we are told that probably (it is at best a doubtful venture to meditate upon so alien an expression of Being) the Indians conceived numbers which according to our ideas possessed neither value nor magnitude nor relativity, and which only became positive and negative, great or small units in virtue of position, we have to admit that it is impossible for us exactly to re-experience what spiritually underlies this kind of number. For us, 3 is always _something_, be it positive or negative; for the Greeks it was unconditionally a positive magnitude, +3; but for the Indian it indicates a possibility without existence, to which the word “something” is _not yet_ applicable, outside both existence and non-existence which are _properties_ to be introduced into it. +3, -3, ■, are thus emanating actualities of subordinate rank which reside in the mysterious substance (3) in some way that is entirely hidden from us. It takes a Brahmanic soul to perceive these numbers as self-evident, as ideal emblems of a self- complete world-form; to us they are as unintelligible as is the Brahman Nirvana, for which, as lying beyond life _and_ death, sleep _and_ waking, passion, compassion _and_ dispassion and yet somehow actual, words entirely fail us. Only this spirituality could originate the grand conception of _nothingness as a true number, zero_, and even then this zero is the Indian zero for which existent and non-existent are equally external designations.[189]

Arabian thinkers of the ripest period—and they included minds of the very first order like Alfarabi and Alkabi—in controverting the ontology of Aristotle, _proved_ that the body as such did not necessarily assume space for existence, and deduced the essence of this space—the _Arabian_ kind of extension, that is—from the characteristic of “one’s being in a position.”

But this does not prove that as against Aristotle and Kant they were in error or that their thinking was muddled (as we so readily say of what our own brains cannot take in). It shows that the Arabian spirit possessed other world-categories than our own. They could

have rebutted Kant, or Kant them, with the same subtlety of proof—and both disputants would have remained convinced of the correctness of their respective standpoints.

When we talk of space to-day, we are all thinking more or less in the same style, just as we are all using the same languages and word-signs, whether we are considering mathematical space or physical space or the space of painting or that of actuality, although all philosophizing that insists (as it must) upon putting an _identity_ of understanding in the place of such kinship of significance-feeling must remain somewhat questionable. But no Hellene or Egyptian or Chinaman could re-experience any part of those feelings of ours, and no artwork or thought-system could possibly convey to him unequivocally what “space” means for us. Again, the prime conceptions originated in the quite differently constituted soul of the Greek, like ■ρχ■, ■λη, μορφ■, comprise the whole content of his world. But this world is differently constituted from ours. It is, for us, alien and remote. We may take these words of Greek and translate them by words of our own like “origin,” “matter” and “form,” but it is mere imitation, a feeble effort to penetrate into a world of feeling in which the finest and deepest elements, in spite of all we can do, remain dumb; it is as though one tried to set the Parthenon sculptures for a string quartet, or cast Voltaire’s God in bronze. The master-traits of thought, life and world-consciousness are as manifold and different as the features of individual men; in those respects as in others there are distinctions of “races” and “peoples,” and men are as unconscious of these distinctions as they are ignorant of whether “red” and “yellow” do or do not mean the same for others as for themselves. It is particularly the common symbolic of language that nourishes the illusion of a homogeneous constitution of human inner-life and an identical world-form; in this respect the great thinkers of one and another Culture resemble the colour-blind in that each is unaware of his own condition and smiles at the errors of the rest.

And now I draw the conclusions. There is a plurality of prime symbols. It is the depth-experience through which the world becomes, through which perception _extends itself_ to world. Its signification is for the soul to which it belongs and only for that soul, and it is different in waking and dreaming, acceptance and scrutiny, as between young and old, townsmen and peasant, man and woman. It actualizes for every high Culture the possibility of form upon which that Culture’s existence rests and it does so of deep necessity. All fundamentals words like our mass, substance, material, thing, body, extension (and multitudes of words of the like order in other culture-tongues) are emblems, obligatory and determined by destiny, that out of the infinite abundance of world-possibilities evoke in the name of the individual Culture those possibilities that alone are significant and therefore necessary for it. None of them is exactly transferable just as it is into the experiential living and knowing of another Culture. And none of these prime words ever recurs. The _choice of prime symbol_ in the moment of the Culture- soul’s awakening into self-consciousness on its own soil—a moment that for one who can read world-history thus contains something catastrophic— decides all.

Culture, as the soul’s total expression “become” and perceptible in gestures and works, as its mortal transient body, obnoxious to law, number and causality:

As the historical drama, a picture in the whole picture of world- history:

As the sum of grand emblems of life, feeling and understanding:

—this is the language through which alone a soul can tell of what it undergoes.

The macrocosm, too, is a property of the individual soul; we can never know how it stands with the soul of another. That which is implied by “infinite space,” the space that “passeth all understanding,” which is the creative interpretation of depth-experience proper and peculiar to us men of the West—the kind of extension that is nothingness to the Greeks, the Universe to us—dyes our world in a colour that the Classical, the Indian and the Egyptian souls had not on their palettes. One soul listens to the world-experience in A flat major, another in F minor; one apprehends it in the Euclidean spirit, another in the contrapuntal, a third in the Magian spirit. From the purest analytical Space and from Nirvana to the most somatic reality of Athens, there is a series of prime symbols each of which is capable of forming a complete world out of itself. And, as the idea of the Babylonian or that of the Indian world was remote, strange and elusive for the men of the five or six Cultures that followed, so also the Western world will be incomprehensible to the men of Cultures yet unborn.

CHAPTER VI

MAKROKOSMOS

II

APOLLINIAN, FAUSTIAN AND MAGIAN SOUL

CHAPTER VI

MAKROKOSMOS

II APOLLINIAN, FAUSTIAN AND MAGIAN SOUL

I

Henceforth we shall designate the soul of the Classical Culture, which chose the sensuously-present individual body as the ideal type of the extended, by the name (familiarized by Nietzsche) of the _Apollinian_. In opposition to it we have the _Faustian_ soul, whose prime-symbol is pure and limitless space, and whose “body” is the Western Culture that blossomed forth with the birth of the Romanesque style in the 10th century in the Northern plain between the Elbe and the Tagus. The nude statue is Apollinian, the art of the fugue Faustian. Apollinian are: mechanical statics, the sensuous cult of the Olympian gods, the politically individual city-states of Greece, the doom of Œdipus and the phallus-symbol. Faustian are: Galileian dynamics, Catholic and Protestant dogmatics, the great dynasties of the Baroque with their cabinet diplomacy, the destiny of Lear and the Madonna-ideal from Dante’s Beatrice to the last line of _Faust II_. The painting that defines the individual body by contours is Apollinian, that which forms space by means of light and shade is Faustian—this is the difference between the fresco of Polygnotus and the oil painting of Rembrandt. The Apollinian existence is that of the Greek who describes his ego as _soma_ and who lacks all idea of an inner development and therefore all real history, inward and outward; the Faustian is an existence which _is led_ with a deep consciousness and introspection of the ego, and a resolutely personal culture evidenced in memoirs, reflections, retrospects and prospects and conscience. And in the time of Augustus, in the countries between Nile and Tigris, Black Sea and South Arabia, there appears—aloof but able to speak to us through forms borrowed, adopted and inherited—the Magian soul of the Arabian Culture with its algebra, astrology and alchemy, its mosaics and arabesques, its caliphates and mosques, and the sacraments and scriptures of the Persian, Jewish, Christian, “post-Classical” and Manichæan religions.

“Space”—speaking now in the Faustian idiom—is a spiritual something, rigidly distinct from the momentary sense-present, which _could_ not be represented in an Apollinian language, whether Greek or Latin. But the created _expression-space_ of the Apollinian arts is equally alien to ours. The tiny cella of the early-Classical temple was a dumb dark nothingness, a structure (originally) of perishable material, an envelope of the moment in contrast to the eternal vaults of Magian cupolas and Gothic naves, and the closed ranks of columns were expressly meant to convey that for the eye at any rate this body possessed no _Inward_. In no other Culture is the firm footing, the socket, so emphasized. The Doric column bores into the ground, the vessels are always thought of from below upward (whereas those of the Renaissance float above their footing), and the sculpture-schools feel the stabilizing of their figures as their main problem. Hence in archaic works the legs are disproportionately emphasized, the foot is planted on the full sole, and if the drapery falls straight down, a part of the hem is removed to show that the foot is standing. The Classical relief is strictly stereometrically set on a plane, and there is an interspace between the figures but no depth. A landscape of Claude Lorrain, on the contrary, is _nothing but_ space, every detail being made to subserve its illustration. All bodies in it possess an atmospheric and perspective meaning purely as carriers of light and shade. The extreme of this disembodiment of the world in the service of space is Impressionism. Given this world-feeling, the Faustian soul in the springtime necessarily arrived at an architectural problem which had its centre of gravity in the spatial vaulting-over of vast, and from porch to choir dynamically deep, cathedrals. This last expressed _its_ depth- experience. But with it was associated, in opposition to the cavernous Magian expression-space,[190] the element of a soaring into the broad universe. Magian roofing, whether it be cupola or barrel-vault or even the horizontal baulk of a basilica, _covers in_. Strzygowski[191] has very aptly described the architectural idea of Hagia Sophia as an introverted Gothic striving under a closed outer casing. On the other hand, in the cathedral of Florence the cupola _crowns_ the long Gothic body of 1367, and the same tendency rose in Bramante’s scheme for St. Peter’s to a veritable towering-up, a magnificent “Excelsior,” that Michelangelo carried to completion with the dome that floats high and bright over the vast vaulting. To this sense of space the Classical opposes the symbol of the Doric peripteros, wholly corporeal and comprehensible in one glance.

The Classical Culture begins, then, with a great _renunciation_. A rich, pictorial, almost over-ripe art lay ready to its hand. But this _could_ not become the expression of the young soul, and so from about 1100 B.C. the harsh, narrow, and to our eyes scanty and barbaric, early-Doric geometrical style appears in opposition to the Minoan.[192] For the three centuries which correspond to the

flowering of our Gothic, there is no hint of an architecture, and it is only at about 650 B.C., “contemporarily” with Michelangelo’s transition into the Baroque, that the Doric and Etruscan temple-type arises. All “Early” art is religious, and this symbolic Negation is not less so than the Egyptian and the Gothic Affirmation. The idea of _burning_ the dead accords with the cult-site but not with the cult-building; and the Early Classical religion which conceals itself from us behind the solemn names of Calchas, Tiresias, Orpheus and (probably) Numa[193] possessed for its rites simply that which is left of an architectural idea when one has subtracted the architecture, viz., the sacred precinct. The original cult-plan is thus the Etruscan templum, a sacred area merely staked off on the ground by the augurs with an impassable boundary and a propitious entrance on the East side.[194] A “templum” was created where a rite was to be performed or where the representative of the state authority, senate or army, happened to be. It existed only for the duration of its use, and the spell was then removed. It was probably only about 700 B.C. that the Classical soul so far mastered itself as to represent this architectural Nothing in the sensible form of a built body. In the long run the Euclidean feeling proved stronger than the mere antipathy to duration.

Faustian architecture, on the contrary, begins on the grand scale simultaneously with the first stirrings of a new piety (the Cluniac reform, c. 1000) and a new thought (the Eucharistic controversy between Berengar of Tours and Lanfranc 1050),[195] and proceeds at once to plans of gigantic intention; often enough, as in the case of Speyer, the whole community did not suffice to fill the cathedral,[196] and often again it proved impossible to complete the projected scheme. The passionate language of this architecture is that of the poems too.[197] Far apart as may seem the Christian hymnology of the south and the Eddas of the still heathen north, they are alike in the implicit space-endlessness of prosody, rhythmic syntax and imagery. Read the _Dies Iræ_ together with the Völuspá,[198] which is little earlier; there is the same adamantine will to overcome and break all resistances of the visible. No rhythm ever imagined radiates immensities of space and distance as the old Northern does:

Zum Unheil werden—noch allzulange Männer und Weiber—zur Welt geboren Aber wir beide —bleiben zusammen Ich und Sigurd.

The accents of the Homeric hexameter are the soft rustle of a leaf in the midday sun, the rhythm of _matter_; but the “Stabreim” likes “potential energy” in the world-pictures of modern physics, creates a tense restraint in the void without limits, distant night-storms above the highest peaks. In its swaying indefiniteness all words and things dissolve themselves—it is the dynamics, not the statics, of language. The same applies to the grave rhythm of _Media vita in morte sumus_. Here is heralded the colour of Rembrandt and the instrumentation of Beethoven—_here infinite solitude is felt as the home of the Faustian soul_. What is Valhalla? Unknown to the Germans of the Migrations and even to the Merovingian Age, it was conceived by the nascent Faustian soul. It was conceived, no doubt, under Classic-pagan and Arabian- Christian impressions, for the antique and the sacred writings, the ruins and mosaics and miniatures, the cults and rites and dogmas of these past Cultures reached into the new life at all points. _And yet_, this Valhalla is something beyond all sensible actualities floating in remote, dim, Faustian regions. Olympus rests on the homely Greek soil, the Paradise of the Fathers is a magic garden somewhere in the Universe, but Valhalla is nowhere. Lost in the limitless, it appears with its inharmonious gods and heroes the supreme symbol of solitude. Siegfried, Parzeval, Tristan, Hamlet, Faust are the loneliest heroes in all the Cultures. Read the wondrous awakening of the inner life in Wolfram’s Parzeval. The longing for the woods, the mysterious compassion, the ineffable sense of forsakenness—it is all Faustian and only Faustian. Every one of us knows it. The motive returns with all its profundity in the Easter scene of Faust I.

“A longing pure and not to be described drove me to wander over woods and fields, and in a mist of hot abundant tears I felt a world arise and live for me.”

Of this world-experience neither Apollinian nor Magian man, neither Homer nor the Gospels, knows anything whatever. The climax of the poem of Wolfram, that wondrous Good Friday morning scene when the hero, at odds with God and with himself, meets the noble Gawan and resolves to go on pilgrimage to Tevrezent, takes us to the heart of the _Faustian_ religion. Here one can feel the mystery of the Eucharist which binds the communicant to a mystic company, to a Church that alone can give bliss. In the myth of the Holy Grail and its Knights one can feel the inward necessity of the German-Northern Catholicism. In opposition to the Classical sacrifices offered to individual gods in separate temples, there is here the _one never-ending_ sacrifice repeated everywhere and every day. This is the Faustian idea of the 9th-11th Centuries, the Edda time, foreshadowed by Anglo-Saxon missionaries like Winfried but only then ripened. The Cathedral, with its High Altar enclosing the accomplished miracle, is its expression in stone.[199]

The plurality of separate bodies which represents Cosmos for the Classical soul, requires a similar pantheon—hence the antique polytheism. The _single_ world-volume, be it conceived as cavern or as space, demands the _single_ god of Magian or Western Christianity. Athene or Apollo might be represented by a statue, but it is and has long been evident to our feeling that the Deity of

the Reformation and the Counter-Reformation can only be “manifested” in the storm of an organ fugue or the solemn progress of cantata and mass. From the rich manifold of figures in the Edda and contemporary legends of saints to Goethe our myth develops itself in steady opposition to the Classical—in the one case a continuous disintegration of the divine that culminated in the early Empire in an impossible multitude of deities, in the other a process of simplification that led to the Deism of the 18th Century.

The Magian hierarchy of heaven—angels, saints, persons of the Trinity— has grown paler and paler, more and more disembodied, in the sphere of the Western pseudomorphosis,[200] supported though it was by the whole weight of Church authority, and even the Devil—the great adversary in the Gothic world-drama[201]—has disappeared unnoticed from among the possibilities of the Faustian world-feeling. Luther could still throw the inkpot at him, but he has been passed over in silence by perplexed Protestant theologians long ago. For the _solitude_ of the Faustian soul agrees not at all with a duality of world powers. God himself is the All. About the end of the 17th Century this religiousness could no longer be limited to pictorial expression, and instrumental music came as its last and only form-language: we may say that the Catholic faith is to the Protestant as an altar-piece is to an oratorio. But even the Germanic gods and heroes are surrounded by this rebuffing immensity and enigmatic gloom. They are steeped in music and in night, for daylight gives visual bounds and therefore shapes bodily things. Night eliminates body, day soul. Apollo and Athene have no souls. On Olympus rests the eternal light of the transparent southern day, and Apollo’s hour is high noon, when great Pan sleeps. But Valhalla is light-less, and even in the Eddas we can trace that deep midnight of Faust’s study-broodings, the midnight that is caught by Rembrandt’s etchings and absorbs Beethoven’s tone colours. No Wotan or Baldur or Freya has “Euclidean” form. Of them, as of the Vedic gods of India, it can be said that they suffer not “any graven image or any likeness whatsoever”; and this impossibility carries an implicit recognition that eternal space, and not the corporeal copy— which levels them down, desecrates them, denies them—is the supreme symbol. This is the deep-felt motive that underlies the iconoclastic storms in Islam and Byzantium (_both_, be it noted, of the 7th century), and the closely similar movement in our Protestant North. Was not Descartes’s creation of the _anti-Euclidean_ analysis of space an iconoclasm? The Classical geometry handles a number-world of day, the function-theory is the genuine mathematic of night.

Footnote 189:

This zero, which probably contains a suggestion of the _Indian_ idea of extension—of that spatiality of the world that is treated in the Upanishads and is entirely alien to our space-consciousness—was of course wholly absent in the Classical. By way of the Arabian mathematics (which completely transformed its meaning) it reached the West, where it was only introduced in 1554 by Stipel, with its sense, moreover, again fundamentally changed, for it became the mean of +1 and -1 as a cut in a linear continuum, i.e., it was assimilated to the Western number-world in a wholly un-Indian sense of _relation_.

Footnote 190:

The word _Höhlengefühl_ is Leo Frobenius’s (_Paideuma_, p. 92). (The Early-Christian Church of the Nativity at Bethlehem [A.D. 327] is built over a natural cave.—_Tr._)

Müller-Decker, _Die Etrusker_ (1877), II, pp. 128 et seq. Wissowa, _Religion und Kultus der Römer_ (1912), p. 527. The oldest plan of Roma Quadrata was a “templum” whose limits had nothing to do with the building-up of the city but were connected with sacral rules, as the significance of this precinct (the “Pomœrium”) in later times shows. A “templum,” too, was the Roman camp whose rectangular outline is visible to-day in many a Roman-founded town; it was the consecrated area within which the army felt itself under the protection of its gods, and originally had nothing whatever to do with fortification, which is a product of Hellenistic

times. (It may be added that Roman camps retained their rigidity of outline even where obvious “military considerations” of ground, etc., must have suggested its modification.—_Tr._) Most Roman stone-temples ("_ædes_") were not “templa” at all. On the other hand, the early Greek τ■μενος of Homeric times must have had a similar significance.

II

That which is expressed by the soul of the West in its extraordinary wealth of media—words, tones, colours, pictorial perspectives, philosophical systems, legends, the spaciousness of Gothic cathedrals and the formulæ of functions—namely its world-feeling, is expressed by the soul of Old Egypt (which was remote from all ambitions towards theory and literariness) almost exclusively by the immediate language of _Stone_. Instead of spinning word-subtleties around its form of extension, its “space” and its “time,” instead of forming hypotheses and number-systems and dogmas, it set up its huge symbols in the landscape of the Nile in all silence. Stone is the great emblem of the Timeless- Become; space and death seem bound up in it. “Men have built for the dead,” says Bachofen in his autobiography, “before they have built for the living, and even as a perishable wooden structure suffices for the span of time that is given to the living, so the housing of the dead for ever demands the solid stone of the earth. The oldest cult is associated with the stone that marks the place of burial, the oldest temple- building with the tomb-structure, the origins of art and decoration with the grave-ornament. Symbol has created itself in the graves. That which is thought and felt and silently prayed at the grave-side can be expressed by no word, but only hinted by the boding symbol that stands in unchanging grave repose.” The dead strive no more. They are no more Time, but only Space—something that stays (if indeed it stays at all) but does _not_ ripen towards a Future; and hence it is stone, the abiding stone, that expresses how the dead is mirrored in the waking consciousness of the living. The Faustian soul looks for an immortality to follow the bodily end, a sort of marriage with endless space, and it disembodies the stone in its Gothic thrust-system (contemporary, we may note, with the “consecutives” in Church music[202]) till at last nothing remained visible but the indwelling depth- and height-energy of this self-extension. The Apollinian soul would have its dead burned, would see them annihilated, and so it remained averse from stone building throughout the early period of its Culture. The Egyptian soul saw itself as moving down a narrow and inexorably-prescribed life-path to come at the end before the judges of the dead (“Book of the Dead,” cap. 125). That was its _Destiny-idea_. The Egyptian’s existence is that of the traveller who follows one unchanging direction, and the whole form- language of his Culture is a translation into the sensible of this one theme. And as we have taken _endless space_ as the prime symbol of the North and _body_ as that of the Classical, so we may take the word

way as most intelligibly expressing that of the Egyptians. Strangely, and for Western thought almost incomprehensibly, the one element in extension that they emphasize is that of direction in depth. The tomb- temples of the Old Kingdom and especially the mighty pyramid-temples of the Fourth Dynasty represent, not a purposed organization of space such as we find in the mosque and the cathedral, but a rhythmically ordered _sequence_ of spaces. The sacred way leads from the gate-building on the Nile through passages, halls, arcaded courts and pillared rooms that grow ever narrower and narrower, to the chamber of the dead,[203] and similarly the Sun-temples of the Fifth Dynasty are not "buildings" but a path enclosed by mighty masonry.[204] The reliefs and the paintings appear always as rows which with an impressive compulsion lead the beholder in a definite direction. The ram and sphinx avenues of the New Empire have the same object. For the Egyptian, the depth-experience which governed his world-form was so emphatically directional that he comprehended space more or less as a continuous process of actualization. There is nothing rigid about distance as expressed here. The man must move, and so become himself a symbol of life, in order to enter into relation with the stone part of the symbolism. "Way" signifies both Destiny and third dimension. The grand wall-surfaces, reliefs, colonnades past which he moves are "length and breadth"; that is, mere perceptions of the senses, and it is the forward-driving life that _extends_ them into "world." Thus the Egyptian experienced space, we may say, in and by the processional march along its distinct elements, whereas the Greek who sacrificed _outside_ the temple did not feel it and the man of our Gothic centuries praying in the cathedral let himself be immersed in the quiet infinity of it. And consequently the art of these Egyptians must aim at _plane_ effects and nothing else, even when it is making use of solid means. For the Egyptian, the pyramid over the king's tomb is a _triangle_, a huge, powerfully expressive _plane_ that, whatever be the direction from which one approaches, closes off the "way" and commands the landscape. For him, the columns of the inner passages and courts, with their dark backgrounds, their dense array and their profusion of adornments, appear entirely as vertical strips which rhythmically accompany the march of the priests. Relief-work is—in utter contrast to the Classical—carefully restricted in one plane; in the course of development dated by the Third to the Fifth dynasties it diminishes from the thickness of a finger to that of a sheet of paper, and finally it is _sunk_ in the plane.[205] The dominance of the horizontal, the vertical and the right angle, and the avoidance of all foreshortening support the two-dimensional principle and serve to insulate this directional depth-experience which coincides with the way and the grave at its end. It is an art that admits of no deviation for the relief of the tense soul.

Is not this an expression in the noblest language that it is possible to conceive of what all our space-theories would like to put into words? Is it not a metaphysic in stone by the side of which the written metaphysics of Kant seems but a helpless stammering?

There is, however, another Culture that, different as it most fundamentally is from the Egyptian, yet found a closely-related prime symbol. This is the Chinese, with its intensely directional principle of the Tao.[206] But whereas the Egyptian treads to the end a way that is prescribed for him with an inexorable necessity, the Chinaman _wanders_ through his world; consequently, he is conducted to his god or his ancestral tomb not by ravines of stone, between faultless smooth walls, but by friendly Nature herself. Nowhere else has the _landscape_ become so genuinely the material of the architecture. "Here, on religious foundations, there has been developed a grand lawfulness and unity common to all building, which, combined with the strict maintenance of a north-south general axis, always holds together gate-buildings, side- buildings, courts and halls in the same homogeneous plan, and has led finally to so grandiose a planning and such a command over ground and space that one is quite justified in saying that the artist builds and reckons with the landscape itself."[207] The temple is not a self- contained building but a lay-out, in which hills, water, trees, flowers, and stones in definite forms and dispositions are just as important as gates, walls, bridges and houses. This Culture is the only one in which the art of gardening is a grand religious art. There are gardens that are reflections of particular Buddhist sects.[208] It is the architecture of the landscape, and only that, which explains the architecture of the buildings, with their flat extension and the emphasis laid on the roof as the really expressive element. And just as the devious ways through doors, over bridges, round hills and walls lead at last to the end, so the paintings take the beholder from detail to detail whereas Egyptian relief masterfully points him in the one set direction. "The whole picture is _not_ to be taken at once. Sequence in time presupposes a sequence of space-elements through which the eye is to wander from one to the next."[209] Whereas the Egyptian architecture dominates the landscape, the Chinese espouses it. But in both cases it is direction in depth that maintains the _becoming_ of space as a continuously-present experience.

Footnote 202:

This refers to the diaphonic chant of Church music in the eleventh and twelfth centuries. The form of this chant is supposed to have been an accompaniment of the "plain chant" by voices moving parallel to it at a fourth, fifth, or octave.—_Tr._

O. Fischer, _Chinesische Landmalerei_ (1921), p. 24. What makes Chinese—as also Indian—art so difficult a study for us is the fact that all works of the early periods (namely, those of the Hwangho region from 1300 to 800 B.C. and of pre-Buddhist India) have vanished without a trace. But that which we now call “Chinese art” corresponds, say, to the art of Egypt from the Twentieth Dynasty onward, and the great schools of painting find their parallel in the sculpture schools of the Saïte and Ptolemaic periods, in which an antiquarian preciosity takes the place of the living inward development that is no longer there. Thus from the examples of Egypt we are able to tell how far it is permissible to argue backwards to conclusions about the art of Chóu and Vedic times.

III

All art is _expression-language_.[210] Moreover, in its very earliest essays—which extend far back into the animal world—it is that of one active existence speaking for itself only, and it is unconscious of witnesses even though in the absence of such the impulse to expression would not come to utterance. Even in quite “late” conditions we often see, instead of the combination of artist and spectator, a crowd of art- makers who _all_ dance or mime or sing. The idea of the “Chorus” as sum total of persons present has never entirely vanished from art-history. It is only the higher art that becomes decisively an art “before witnesses” and especially (as Nietzsche somewhere remarks) before God as the supreme witness.[211]

This expression is either _ornament_ or _imitation_. Both are _higher_ possibilities and their polarity to one another is hardly perceptible in the beginnings. Of the two, imitation is definitely the earlier and the closer to the producing race. Imitation is the outcome of a physiognomic idea of a second person with whom (or which) the first is involuntarily induced into resonance of vital rhythm (mitschwingen im); whereas ornament evidences an ego conscious of its own specific character. The former is widely spread in the animal world, the latter almost peculiar to man.

Imitation is born of the secret rhythm of all things cosmic. For the waking being the One appears as discrete and extended; there is a Here and a There, a Proper and an Alien something, a Microcosm and a Macrocosm that are polar to one another in the sense-life, and what the rhythm of imitation does is to bridge this dichotomy. Every religion is an effort of the waking soul to reach the powers of the world-around. And so too is Imitation, which in its most devoted moments is wholly religious, for it consists in an identity of inner activity between the soul and body “here” and the world-around “there” which, vibrating as one, become one. As a bird poises itself in the storm or a float gives to the swaying waves, so our limbs take up an irresistible beat at the sound of march-music. Not less contagious is the imitation of another’s bearing and movements, wherein children in particular excel. It reaches the superlative when we “let ourselves go” in the common song or parade- march or dance that creates out of many units one unit of feeling and expression, a “we.” But a “successful” picture of a man or a landscape is also the outcome of a felt harmony

of the pictorial motion with the secret swing and sway of the living opposite; and it is this actualizing of physiognomic rhythm that requires the executant to be an adept who can reveal the idea, the _soul_, of the alien in the play of its surface. In certain unreserved moments we are all adepts of this sort, and in such moments, as we follow in an imperceptible rhythm the music and the play of facial expression, we suddenly look over the precipice and see great secrets. The aim of all imitation is effective simulation; this means effective assimilation of ourselves into an alien something— such a transposition and transubstantiation that the One lives henceforth in the Other that it describes or depicts—and it is able to awaken an intense feeling of unison over all the range from silent absorption and acquiescence to the most abandoned laughter and down into the last depths of the erotic, a unison which is inseparable from creative activity. In this wise arose the popular circling-dances (for instance, the Bavarian _Schuhplattler_ was originally imitated from the courtship of the woodcocks) but this too is what Vasari means when he praises Cimabue and Giotto as the first who returned to the imitation of “Nature”—the Nature, that is, of springtime men, of which Meister Eckart said: “God flows out in all creatures, and therefore all created is God.” That which in this world-around presents itself to our contemplation—and therefore contains meaning for our feelings—as movement, we render by movement. Hence all imitation is in the broadest sense dramatic; drama is presented in the movement of the brush-stroke or the chisel, the melodic curve of the song, the tone of the recitation, the line of poetry, the description, the dance. But everything that we _experience_ with and in seeings and hearings is always an alien soul to which we are uniting ourselves. It is only at the stage of the Megalopolis that art, reasoned to pieces and de- spiritualized, goes over to naturalism as that term is understood nowadays; viz., imitation of the charm of visible appearances, of the stock of sensible characters that are capable of being scientifically fixed.

Ornament detaches itself now from Imitation as something which does not follow the stream of life but rigidly _faces it_. Instead of physiognomic traits overheard in the alien being, we have established motives, _symbols_, which are impressed upon it. The intention is no longer to pretend but to conjure. The “I” overwhelms the “Thou.” Imitation is only a _speaking_ with means that are born of the moment and unreproduceable—but Ornament _employs a language_ emancipated from the speaking, a stock of forms that possesses duration and is not at the mercy of the individual.[212]

Only the _living_ can be imitated, and it can be imitated only in movements, for it is through these that it reveals itself to the senses of artists and spectators. To that extent, imitation belongs to Time and Direction. All the dancing and drawing and describing and portraying for eye and ear is irrevocably “directional,” and hence the highest possibilities of Imitation lie in the copying of a destiny, be it in tones, verses, picture or stage-scene.[213] Ornament, on the contrary, is something taken away from Time: it is pure extension, settled and stable. Whereas an imitation expresses something by _accomplishing itself_, ornament can only do so by presenting itself to the senses as a finished thing. It is Being as such, wholly independent of origin. Every imitation possesses beginning and end, while an ornament possesses only duration, and therefore we can only imitate the destiny of an _individual_ (for instance, Antigone or Desdemona), while by an ornament or symbol only the generalized destiny-idea itself can be represented (as, for example, that of the Classical world by the Doric column). And the former presupposes a talent, while the latter calls for an acquirable knowledge as well.

All strict arts have their grammar and syntax of form-language, with rules and laws, inward logic and tradition. This is true not merely for the Doric cabin-temple and Gothic cottage-cathedral, for the carving- schools of Egypt[214] and Athens and the cathedral plastic of northern France, for the painting-schools of the Classical world and those of Holland and the Rhine and Florence, but also for the fixed rules of the Skalds and Minnesänger which were learned and practised as a craft (and dealt not merely with sentence and metre but also with gesture and the choice of imagery[215]), for the narration-technique of the Vedic, Homeric and Celto-Germanic Epos, for the composition and delivery of the Gothic sermon (both vernacular and Latin), and for the orators’ prose[216] in the Classical, and for the rules of French drama. In the ornamentation of an art-work is reflected the inviolable causality of the macrocosm as the man of the particular kind sees and comprehends it. Both have system. Each is penetrated with the religious side of life— _fear_ and love.[217] A genuine symbol can instil fear or can set free from fear; the “right” emancipates and the “wrong” hurts and depresses. The imitative side of the arts, on the contrary, stands closer to the real race-feelings of _hate_ and love, out of which arises the opposition of _ugly_ and _beautiful_. This is in relation only with the living, of which the inner rhythm repels us or draws us into phase with it, whether it be that of the sunset-cloud or that of the tense breath of the machine. An imitation is beautiful, an ornament _significant_, and therein lies the difference between direction and extension, organic and inorganic logic, life and death. That which we think beautiful is “worth copying.” Easily it swings with us and draws us on to imitate, to join in the singing, to repeat. Our hearts beat higher, our limbs twitch, and we are stirred till our spirits overflow. But as it belongs to Time, it “has its time.” A symbol endures, but everything beautiful vanishes with the life-pulsation of the man, the class, the people or the race that feels it as a specific beauty in the general cosmic rhythm.[218] The “beauty” that Classical sculpture and poetry contained for Classical eyes is something different from the beauty that they contain for ours—something

extinguished irrecoverably with the Classical soul—while what we regard as beautiful in it is something that only exists for us. Not only is that which is beautiful for one kind of man neutral or ugly for another—e.g., the whole of our music for the Chinese, or Mexican sculpture for us. For _one and the same life_ the accustomed, the habitual, owing to the very fact of its possessing duration, cannot possess beauty.

And now for the first time we can see the opposition between these two sides of every art in all its depth. Imitation spiritualizes and quickens, ornament enchants and kills. The one becomes, the other is. And therefore the one is allied to love and, above all—in songs and riot and dance—to the _sexual love_, which turns existence to face the future; and the other to care of the past, to recollection[219] and to the _funerary_. The beautiful is longingly pursued, the significant instils dread, and there is no deeper contrast than that between the house of the living and the house of the dead.[220] The peasant's cottage[221] and its derivative the country noble's hall, the fenced town and the castle are mansions of life, unconscious expressions of circling blood, that no art produced and no art can alter. The idea of the family appears in the plan of the proto-house, the inner form of the stock in the plan of its villages—which after many a century and many a change of occupation still show what race it was that founded them[222]—the life of a nation and its social ordering in the plan (_not_ the elevation or silhouette) of the city.[223] On the other hand, Ornamentation of the high order develops itself on the stiff symbols of death, the urn, the sarcophagus, the stele and the temple of the dead,[224] and beyond these in gods' temples and cathedrals _which are Ornament through and through_, not the expressions of a race but the language of a world-view. They are pure art through and through—just what the castle and the cottage are not.[225]

For cottage and castle are _buildings in which_ art, and, specifically, imitative art, is _made and done_, the home of Vedic, Homeric and Germanic epos, of the songs of heroes, the dance of boors and that of lords and ladies, of the minstrel's lay. The cathedral, on the other hand, _is_ art, and, moreover, the only art by which _nothing_ is imitated; it alone is pure tension of persistent forms, pure three- dimensional logic that expresses itself in edges and surfaces and volumes. But the art of villages and castles is derived from the inclinations of the moment, from the laughter and high spirit of feasts and games, and to such a degree is it dependent on Time, so much is it a thing of occasion, that the troubadour obtains his very name from finding, while Improvisation—as we see in the Tzigane music to-day—is nothing but race manifesting itself to alien senses under the influence of the hour. To this free creative power all spiritual art opposes the strict _school_ in which the individual—in the hymn as in the work of building and carving—is the servant of a logic of timeless forms, and so in all Cultures the seat of its style-history is in its early cult architecture. In the castle it is the life and not the structure that possesses style. In the town the plan is an image of the destinies of a people, whereas the silhouette of emergent spires and cupolas tells of the _logic in the builders' world-picture_, of the "first and last things" of their universe.

In the architecture of the living, stone _serves a_ worldly _purpose_, but in the architecture of the cult _it is a symbol_.[226] Nothing has injured the history of the great architectures so much as the fact that it has been regarded as the history of architectural techniques instead of as that of architectural ideas which took their technical expression- means as and where they found them. It has been just the same with the history of musical instruments,[227] which also were developed on a foundation of tone-language. Whether the groin and the flying buttress and the squinch-cupola were imagined specially for the great architectures or were expedients that lay more or less ready to hand and were taken into use, is for art-history a matter of as little importance as the question of whether, technically, stringed instruments originated in Arabia or in Celtic Britain. It may be that the Doric column was, as a matter of workmanship, borrowed from the Egyptian temples of the New Empire, or the late-Roman domical construction from the Etruscans, or the Florentine court from the North-African Moors. Nevertheless the Doric peripteros, the Pantheon, and the Palazzo Farnese belong to wholly different worlds—they subserve the artistic expression of the prime- symbol in three different Cultures.

Footnote 211:

The monologue-art of very lonely natures is also in reality a conversation with self in the second person. But it is only in the intellectuality of the megalopolitan stages that the impulse to express is overcome by the impulse to communicate (see Vol. II, p. 135) which gives rise to that tendencious art that seeks to instruct or convert or prove views of a politico-social or moral character,

and provokes the antagonistic formula of “Art for Art’s sake”—which is itself rather a view than a discipline, though it does at least serve to recall the primitive significance of artistic expression.

See Vol. II, pp. 138 et seq., and Worringer, _Abstraktion und Einführung_, pp. 66 et seq.

Footnote 213:

Imitation, being life, is past in the very moment of accomplishment. The curtain falls, and it passes either into oblivion or, if the product is a durable artifact, into art-history. Of the songs and dances of old Cultures nothing remains, of their pictures and poems little. And even this little contains, substantially, only the ornamental side of the original imitation. Of a grand drama there remains only the text, not the image and the sound; of a poem only the words, not the recital; and of all their music the notes at most, not the tone-colours of the instruments. The essential is irrevocably gone, and every “reproduction” is in reality something new and different.

IV

In every springtime, consequently, there are _two_ definitely ornamental and non-imitative arts, that of building and that of decoration. In the longing and pregnant centuries before it, elemental expression belongs exclusively to Ornamentation in the narrow sense. The Carolingian period is represented only by its ornament, as its architecture, for want of the _Idea_, stands between the styles. And similarly, as a matter of art-history, it is immaterial that no buildings of the Mycenæan age have survived.[228] But with the dawn of the great Culture, _architecture as ornament_ comes into being suddenly and with such a force of expression that for a century mere decoration-as-such shrinks away from it in awe. The spaces, surfaces and edges of stone speak _alone_. The tomb of Chephren is the culmination of mathematical simplicity—everywhere right angles, squares and rectangular pillars, nowhere adornment, inscription or desinence—and it is only after some generations have passed that Relief ventures to infringe the solemn magic of those spaces and the strain begins to be eased. And the noble Romanesque of Westphalia-Saxony (Hildesheim, Gernrode, Paulinzella, Paderborn), of Southern France and of the Normans (Norwich and Peterborough) managed to render the whole sense of the world with indescribable power and dignity in _one_ line, _one_ capital, _one_ arch.

When the form-world of the springtime is at its highest, and not before, the ordained relation is that architecture is lord and ornament is vassal. And the word “ornament” is to be taken here in the widest possible sense. Even conventionally, it covers the Classical _unit_- motive with its quiet poised symmetry or meander supplement, the _spun surface_ of arabesque and the not dissimilar surface-patterning of Mayan art, and the “Thunder-pattern”[229] and others of the early Chóu period which prove once again the landscape basis of the old Chinese architecture without a doubt. But the warrior figures of Dipylon vases are also conceived in the spirit of ornament, and so, in a far higher degree still, are the statuary _groups_ of Gothic cathedrals. “The figures were composed pillarwise from the spectator, the figures of the pillar being, with reference to the spectator, ranked upon one another like rhythmic figures in a symphony that soars heavenward and expands its sounds in every direction.”[230] And besides draperies, gestures, and figure-types, even the structure of the hymn-strophe and the parallel motion of the parts in church music are ornament in the service of the all-ruling architectural idea.[231] The spell of the great Ornamentation remains unbroken till in the beginning of a “late” period architecture falls into a _group_ of civic and worldly special arts that unceasingly devote themselves to pleasing and clever imitation and become _ipso facto_ personal. To Imitation and Ornament the same applies that has been said already of time and space. Time gives birth to space, but space gives death to time.[232] In the beginning, rigid symbolism had petrified everything alive; the Gothic statue was not permitted to be a living body, but was simply a set of lines disposed in human form. But now Ornament loses all its sacred rigour and becomes more and more decoration for the architectural setting of a polite and mannered life. It was purely as this, namely _as a beautifying_ element, that Renaissance taste was adopted by the courtly and patrician world of the North (and by it alone!). Ornament meant something quite different in the Egyptian Old Kingdom from what it meant in the Middle; in the geometric period from what it meant in the Hellenistic; at the end of the 12th Century from what it meant at the end of Louis XIV’s reign. And architecture too becomes pictorial and makes music, and its forms seem always to be trying to imitate something in the picture of the world- around. From the Ionic capital we proceed to the Corinthian, and from Vignola through Bernini to the Rococo.

At the last, when Civilization sets in, true ornament and, with it, great art as a whole are extinguished. The transition consists—in every Culture—in Classicism and Romanticism of one sort or another, the former being a sentimental regard for an Ornamentation (rules, laws, types) that has long been archaic and soulless, and the latter a sentimental Imitation, not of life, but of an older Imitation. In the place of architectural style we find architectural taste. Methods of painting and mannerisms of writing, old forms and new, home and foreign, come and go with the fashion. The inward necessity is no longer there, there are no longer “schools,” for everyone selects what and where it pleases him to select. _Art becomes craft-art_ (_Kunstgewerbe_) in all its branches—

architecture and music, poetry and drama—and in the end we have a pictorial and literary stock-in-trade which is destitute of any deeper significance and is employed according to taste. This final or industrial form of Ornament—no longer historical, no longer in the condition of “becoming”—we have before us not only in the patterns of oriental carpets, Persian and Indian metal work,` Chinese porcelain, but also in Egyptian (and Babylonian) art as the Greeks and Romans met it. The Minoan art of Crete is pure craft-art, a northern outlier of Egyptian post-Hyksos taste; and its “contemporary,” Hellenistic-Roman art from about the time of Scipio and Hannibal, similarly subserves the habit of comfort and the play of intellect. From the richly-decorated entablature of the Forum of Nerva in Rome to the later provincial ceramics in the West, we can trace the same steady formation of an unalterable craft-art that we find in the Egyptian and the Islamic worlds, and that we have to presume in India after Buddha and in China after Confucius.

V

Now, Cathedral and Pyramid-temple are different in spite of their deep inward kinship, and it is precisely in these differences that we seize the mighty phenomenon of the Faustian soul, whose depth-impulse refuses to be bound in the prime symbol of a way, and from its earliest beginnings strives to transcend every optical limitation. Can anything be more alien to the Egyptian conception of the State—whose tendency we may describe as a noble sobriety—than the political ambitions of the great Saxon, Franconian and Hohenstaufen Emperors, who came to grief because they overleapt all political actualities and for whom the recognition of any bounds would have been a betrayal of the idea of their rulership? Here the prime symbol of infinite space, with all its indescribable power, entered the field of active political existence. Beside the figures of the Ottos, Conrad II, Henry VI and Frederick II stand the Viking-Normans, conquerors of Russia, Greenland, England, Sicily and almost of Constantinople; and the great popes, Gregory VII and Innocent III—all of whom alike aimed at making their visible spheres of influence coincident with the whole known world. This is what distinguishes the heroes of the Grail and Arthurian and Siegfried sagas, ever roaming in the infinite, from the heroes of Homer with their geographically modest horizon; and the Crusades, that took men from the Elbe and the Loire to the limits of the known world, from the historical events upon which the Classical soul built the “Iliad” and which from the style of that soul we may safely assume to have been local, bounded, and completely appreciable.

The Doric soul actualized the symbol of the corporally-present individual thing, while deliberately rejecting all big and far-reaching creations, and it is for this very good reason that the first post- Mycenæan period has bequeathed nothing to our archæologists. The expression to which this soul finally attained was the Doric temple with its purely outward effectiveness, set upon the landscape as a massive image but denying and artistically disregarding the space within as the µ■ ■v, that which was held to be incapable of existence. The ranked columns of the Egyptians carried the roof of a hall. The Greek in borrowing the motive invested it with a meaning proper to himself—he turned the architectural type inside out like a glove. The outer column- sets are, in a sense, relics of a denied interior.[233]

The Magian and the Faustian souls, on the contrary, built high. Their dream-images became concrete as vaultings above significant inner- spaces, structural anticipations respectively of the mathematic of algebra and that of analysis. In the style that radiated from Burgundy and Flanders rib-vaulting with its lunettes and flying buttresses emancipated the contained space from the sense-appreciable surface[234] bounding it. In the Magian interior "the window is merely a negative component, a utility-form in no wise yet developed into an art-form—to put it crudely, nothing but a hole in the wall."[235] When windows were in practice indispensable, they were for the sake of artistic impression concealed by galleries as in the Eastern basilica.[236] The _window as architecture_, on the other hand, is peculiar to the Faustian soul and the most significant symbol of its depth-experience. In it can be felt the will to emerge from the interior into the boundless. The same will that is immanent in contrapuntal music was native to these vaultings. The incorporeal world of this music was and remained that of the first Gothic, and even when, much later, polyphonic music rose to such heights as those of the Matthew Passion, the Eroica, and Tristan and Parsifal, it became of inward necessity _cathedral-like_ and returned to its home, the stone language of the Crusade-time. To get rid of every trace of Classical corporeality, there was brought to bear the full force of a deeply significant Ornamentation, which defies the delimiting power of stone with its weirdly impressive transformations of vegetal, animal and human bodies (St. Pierre in Moissac), which dissolves all its lines into melodies and variations on a theme, all its façades into many-voiced fugues, and all the bodiliness of its statuary into a music of drapery- folds. It is this spirituality that gave their deep meaning to the gigantic glass-expanses of our cathedral-windows with their polychrome, _translucent and therefore wholly bodiless_, painting—an art that has never and nowhere repeated itself and forms the completest contrast that can be imagined to the Classical fresco. It is perhaps in the Sainte- Chapelle at Paris that this emancipation from bodiliness is most evident. Here the stone practically vanishes in the gleam of the glass. Whereas the fresco-painting is co-material with the wall on and with which it has grown and its colour is effective as material, here we have

colours dependent on no carrying surface but as free in space as organ notes, and shapes poised in the infinite. Compare with the Faustian spirit of these churches—almost wall-less, loftily vaulted, irradiated with many-coloured light, aspiring from nave to choir—the Arabian (that is, the Early-Christian Byzantine) cupola-church. The pendentive cupola, that seems to float on high above the basilica or the octagon, was indeed also a victory over the principle of natural gravity which the Classical expressed in architrave and column; it, too, was a defiance of architectural body, of "exterior." But the very absence of an exterior emphasizes the more the unbroken coherence of the wall that shuts in the Cavern and allows no look and no hope to emerge from it. An ingeniously confusing interpenetration of spherical and polygonal forms; a load so placed upon a stone drum that it seems to hover weightless on high, yet closing the interior without outlet; all structural lines concealed; vague light admitted, through a small opening in the heart of the dome but only the more inexorably to emphasize the walling-in—such are the characters that we see in the masterpieces of this art, S. Vitale in Ravenna, Hagia Sophia in Constantinople, and the Dome of the Rock[237] in Jerusalem. Where the Egyptian puts reliefs that with their flat planes studiously avoid any foreshortening suggestive of lateral depth, where the Gothic architects put their pictures of glass to draw in the world of space without, the Magian clothes his walls with sparkling, predominantly golden, mosaics and arabesques and so drowns his cavern in that unreal, fairy-tale light which for Northerners is always so seductive in Moorish art.

Footnote 228:

The same applies to the architecture of Thinite Egypt and to the Seleucid-Persian sun and fire temples of the pre-Christian area.

Footnote 231:

And, finally, ornament in the highest sense includes _script_, and with it, the Book, which is the true associate of the cult-building, and as an art-work always appears and disappears with it. (See Vol. II, pp. 182. et seq., pp. 298 et seq.) In writing, it is understanding as distinct from intuition that attains to form: it is not essences that those signs symbolize but notions abstracted therefrom by words, and as for the speech-habituated human intellect rigid space is the presented objective, the writing of a Culture is (after its stone- building) the purest of all expressions of its prime-symbol. It is quite impossible to understand the history of Arabesque if we leave the innumerable Arabian scripts out of consideration, and it is no less impossible to separate Egyptian and Chinese style-history from the history of the corresponding writing-signs and their arrangement and application.

Footnote 232:

See p. 173.

Footnote 233:

Certainly the Greeks at the time when they advanced from the Antæ to the Peripteros were under the mighty influence of the Egyptian _series_-columns—it was at this time that their sculpture in the round, indisputably following Egyptian models, freed itself from the relief manner which still clings to the Apollo figures. But this does not alter the fact that the motive of the Classical column and the Classical application of the rank-principle were wholly and peculiarly Classical.

“Mosque of Omar.”—_Tr._

VI

The phenomenon of the _great style_, then, is an emanation from the essence of the Macrocosm, from the prime-symbol of a _great_ culture. No one who can appreciate the connotation of the word sufficiently to see that it designates not a form-aggregate but a form-history, will try to aline the fragmentary and chaotic art-utterances of primitive mankind with the comprehensive certainty of a style that consistently develops over centuries. Only the art of great Cultures, the art that has ceased to be only art and has begun to be an effective unit of expression and significance, possesses style.

The organic history of a style comprises a "pre—," a "non—" and a "post— ." The bull tablet of the First Dynasty of Egypt[238] is not yet “Egyptian.” Not till the Third Dynasty do the works acquire a style—but then they do so suddenly and very definitely. Similarly the Carolingian period stands “between-styles.” We see different forms touched on and explored, but nothing of inwardly necessary expression. The creator of the Aachen Minster “thinks surely and builds surely, but does not feel surely.”[239] The Marienkirche in the Castle of Würzburg (c. 700) has its counterpart in Salonika (St. George), and the Church of St. Germigny des Près (c. 800) with its cupolas and horseshoe niches is almost a mosque. For the whole of West Europe the period 850-950 is almost a blank. And just so to-day Russian art stands between two styles. The primitive wooden architecture with its steep eight-sided tent-roof (which extends from Norway to Manchuria) is impressed with Byzantine motives from over the Danube and Armenian-Persian from over the Caucasus. We can certainly feel an “elective affinity” between the Russian and the Magian souls, but as yet the prime symbol of Russia, the _plane without limit_,[240] finds no sure expression either in religion or in architecture. The church roof emerges, hillock-wise, but little from the landscape and on it sit the tent-roofs whose points are coifed with the “kokoshniks” that suppress and would abolish the upward tendency. They neither tower up like the Gothic belfry nor enclose like the mosque-cupola, but _sit_, thereby emphasizing the horizontality of the building, which is meant to be regarded merely from the outside. When about 1760 the Synod forbade the tent roofs and prescribed the orthodox onion-cupolas, the heavy cupolas were set upon slender cylinders, of which there may be any number[241] and which sit on the roof-plane.[242] It is not yet a style, only the promise of a style that will awaken when the real Russian religion awakens.

In the Faustian West, this awakening happened shortly before A.D. 1000. In one moment, the Romanesque style was there. Instead of the fluid organization of space on an insecure ground plan, there was, suddenly, a strict dynamic of space. From the very beginning, inner and outer construction were placed in a fixed relation, the wall was penetrated by the form-language and the form worked into the wall in a way that no other Culture has ever imagined. From the very beginning the window and the belfry were invested with their meanings. The form was irrevocably assigned. Only its development remained to be worked out.

The Egyptian style began with another such creative act, just as unconscious, just as full of symbolic force. The prime symbol of the Way came into being suddenly with the beginning of the Fourth Dynasty (2930 B.C.). The world-creating depth-experience of this soul gets its substance from the direction-factor itself. Spatial depth as stiffened Time, distance, death, Destiny itself dominate the expression, and the merely sensuous dimensions of length and breadth become an escorting plane which restricts and prescribes the Way of destiny. The Egyptian flat-relief, which is designed to be seen at close quarters and arranged serially so as to compel the beholder to pass along the wall-planes in the prescribed direction, appears with similar suddenness about the beginning of the Fifth Dynasty.[243] The still later avenues of sphinxes and statues and the rock- and terrace-temples constantly intensify that tendency towards the one distance that the world of Egyptian mankind knows, the grave. Observe how soon the colonnades of the early period come to be systems of huge, close-set pillars that _screen off_ all side-view. This is something that has never reproduced itself in any other architecture.

The grandeur of this style appears to us as rigid and unchanging. And certainly it stands beyond the passion which is ever seeking and fearing and so imparts to subordinate characters a quality of restless personal movement in the flow of the centuries. But, vice versa, we cannot doubt that to an Egyptian the Faustian style (which _is_ our style, from earliest Romanesque to Rococo and Empire) would with its unresting persistent search for a Something, appear far more uniform than we can imagine. It follows, we must not forget, from the conception of style that we are working on here, that Romanesque, Gothic, Renaissance, Baroque and

Rococo are only _stages of one and the same style_, in which it is naturally the variable that we and the constant that men of other eyes remark. In actual fact, the inner unity of the Northern Renaissance is shown in innumerable reconstructions of Romanesque work in Baroque and of late Gothic work in Rococo that are not in the least startling. In peasant art, Gothic and Baroque have been identical, and the streets of old towns with their pure harmony of all sorts of gables and façades (wherein definite attributions to Romanesque or Gothic Renaissance or Baroque or Rococo are often quite impossible) show that the family resemblance between the members is far greater than they themselves realize.

The Egyptian style was purely architectural, and remained so till the Egyptian soul was extinguished. It is the only one in which Ornamentation as a decorative supplement to architecture is entirely absent. It allowed of no divergence into arts of entertainment, no display-painting, no busts, no secular music. In the Ionic phase, the centre of gravity of the Classical style shifted from architecture to an independent plastic art; in that of the Baroque the style of the West passed into music, whose form-language in its turn ruled the entire building art of the 18th Century; in the Arabian world, after Justinian and Chosroes-Nushirvan, Arabesque dissolved all the forms of architecture, painting and sculpture into style-impressions that nowadays we should consider as craft-art. But in Egypt the sovereignty of architecture remained unchallenged; it merely softened its language a little. In the chambers of the pyramid-temple of the Fourth Dynasty (Pyramid of Chephren) there are unadorned angular pillars. In the buildings of the Fifth (Pyramid of Sahu-rê) the plant-column makes its appearance. Lotus and papyrus branches turned into stone arise gigantic out of a pavement of transparent alabaster that represents water, enclosed by purple walls. The ceiling is adorned with birds and stars. The sacred way from the gate-buildings to the tomb-chamber, the picture of life, is a stream—it is the Nile itself become one with the prime- symbol of direction. The spirit of the mother-landscape unites with the soul that has sprung from it.

In China, in lieu of the awe-inspiring pylon with its massy wall and narrow entrance, we have the “Spirit-wall” (yin-pi) that conceals the way in. The Chinaman slips into life and thereafter follows the Tao of life’s path; as the Nile valley is to the up-and-down landscape of the Hwang Ho, so is the stone-enclosed temple-way to the mazy paths of Chinese garden-architecture. And just so, in some mysterious fashion, the Euclidean existence is linked with the multitude of little islands and promontories of the Ægean, and the passionate Western, roving in the infinite, with the broad plains of Franconia and Burgundy and Saxony.

VII

The Egyptian style is the expression of a _brave_ soul. The rigour and force of it Egyptian man himself never felt and never asserted. He dared all, but said nothing. In Gothic and Baroque, on the contrary, the triumph over heaviness became a perfectly conscious motive of the form- language. The drama of Shakespeare deals openly with the desperate conflict of will and world. Classical man, again, was weak in the face of the “powers.” The κ■θαρσις of fear and pity, the _relief and recovery_ of the Apollinian soul in the moment of the περιπ■τεια was, according to Aristotle, the effect deliberately aimed at in Attic tragedy. As the Greek spectator watched _someone whom he knew_ (for everyone knew the myth and its heroes and lived in them) senselessly maltreated by fortune, without any conceivable possibility of resistance to the Powers, and saw him go under with splendid mien, defiant, heroic, his own Euclidean soul experienced a marvellous uplifting. If life was worthless, at any rate the _grand gesture_ in losing it was not so. The Greek willed nothing and dared nothing, but he found a stirring beauty in _enduring_. Even the earlier figures of Odysseus the patient, and, above all, Achilles the archetype of Greek manhood, have this characteristic quality. The morale of the Cynics, that of the Stoics, that of Epicurus, the common Greek ideals of σωφροσ■νη and ■ταραξ■α, Diogenes devoting himself to θεωρ■α in a tub—all this is masked cowardice in the face of grave matters and responsibilities, and different indeed from the pride of the Egyptian soul. Apollinian man goes below ground out of life’s way, even to the point of suicide, which _in this Culture alone_ (if we ignore certain related Indian ideals) ranked as a high ethical act and was treated with the solemnity of a ritual symbol.[244] The Dionysiac intoxication seems a sort of furious drowning of uneasinesses that to the Egyptian soul were utterly unknown. And consequently the Greek Culture is that of the small, the easy, the simple. Its technique is, compared with Egyptian or Babylonian, a clever nullity.[245] No ornamentation shows such a poverty of invention as theirs, and their stock of sculptural positions and attitudes could be counted on one’s fingers. “In its poverty of forms, which is conspicuous even allowing that at the beginning of its development it may have been better off than it was later, the Doric style pivoted everything on proportions and on measure.”[246] Yet, even so, what adroitness in avoiding! The Greek architecture with its commensuration of load and support and its peculiar smallness of scale suggests a persistent evasion of difficult architectural problems that on the Nile and, later, in the high North were literally looked for, which moreover were known and certainly not burked in the Mycenæan age. The Egyptian loved the strong stone of immense buildings; it was in keeping with his self- consciousness that he should choose only the hardest for his task. But the Greek avoided it; his architecture first set itself small tasks, then ceased altogether. If we survey it as a whole, and then compare it with the totality of Egyptian or Mexican or even, for that matter, Western architecture, we

are astounded at the feeble development of the style. A few variations of the Doric temple and it was exhausted. It was already closed off about 400 when the Corinthian capital was invented, and everything subsequent to this was merely modification of what existed.

The result of this was an almost bodily standardization of form-types and style-species. One might choose between them, but never overstep their strict limits—that would have been in some sort an admission of an infinity of possibilities. There were three orders of columns and a definite disposition of the architrave corresponding to each; to deal with the difficulty (considered, as early as Vitruvius, as a conflict) which the alternation of triglyphs and metopes produced at the corners, the nearest intercolumniations were narrowed—no one thought of imagining new forms to suit the case. If greater dimensions were desired, the requirements were met by superposition, juxtaposition, etc., of additional elements. Thus the Colosseum possesses three rings, the Didymæum of Miletus three rows of columns in front, and the Frieze of the Giants of Pergamum an endless succession of individual and unconnected motives. Similarly with the style-species of prose and the types of lyric poetry, narrative and tragedy. Universally, the expenditure of powers on the basic form is restricted to the minimum and the creative energy of the artist directed to detail-fineness. It is a statical treatment of static genera, and it stands in the sharpest possible contrast to the dynamic fertility of the Faustian with its ceaseless creation of new types and domains of form.

VIII

We are now able to see the _organism_ in a great style-course. Here, as in so many other matters, Goethe was the first to whom vision came. In his “Winckelmann” he says of Velleius Paterculus: “with his standpoint, it was not given to him to see all art as a living thing (ζ■ον) that must have an inconspicuous beginning, a slow growth, a brilliant moment of fulfilment and a gradual decline like every other organic being, though it is presented in a set of individuals.” This sentence contains the entire morphology of art-history. Styles do not follow one another like waves or pulse-beats. It is not the personality or will or brain of the artist that makes the style, but the style that makes the _type_ of the artist. The style, like the Culture, is a prime phenomenon in the strictest Goethian sense, be it the style of art or religion or thought, or the style of life itself. It is, as “Nature” is, an ever-new experience of waking man, his alter ego and mirror-image in the world- around. And therefore in the general historical picture of a Culture there can be but one style, _the style of the Culture_. The error has lain in treating mere style-phases—Romanesque, Gothic, Baroque, Rococo, Empire—as if they were styles on the same level as units of quite another order such as the Egyptian, the Chinese (or even a “prehistoric”) style. Gothic and Baroque are simply the youth and age of one and the same vessel of forms, the style of the West as ripening and ripened. What has been wanting in our art-research has been detachment, freedom from prepossessions, and the will to abstract. Saving ourselves trouble, we have classed any and every form-domain that makes a strong impression upon us as a “style,” and it need hardly be said that our insight has been led astray still further by the Ancient-Mediæval-Modern scheme. But in reality, even a masterpiece of strictest Renaissance like the court of the Palazzo Farnese is infinitely nearer to the arcade- porch of St. Patroclus in Soest, the interior of the Magdeburg cathedral, and the staircases of South-German castles of the 18th Century than it is to the Temple of Pæstum or to the Erechtheum. The same relation exists between Doric and Ionic, and hence Ionic columns can be as completely combined with Doric building forms as late Gothic is with early Baroque in St. Lorenz at Nürnberg, or late Romanesque with late Baroque in the beautiful upper part of the West choir at Mainz. And our eyes have scarcely yet learned to distinguish within the Egyptian style the Old Kingdom and Middle Empire elements corresponding to Doric and Gothic youth and to Ionic and Baroque maturity, because from the Twelfth Dynasty these elements interpenetrate in all harmony in the form-language of all the greater works.

The task before art-history is to write the _comparative biographies of the great styles_, all of which as organisms of the same genus possess structurally cognate life histories.

In the beginning there is the timid, despondent, naked expression of a newly-awakened soul which is still seeking for a relation between itself and the world that, though its proper creation, yet is presented as alien and unfriendly. There is the child’s fearfulness in Bishop Bernward’s building at Hildesheim, in the Early-Christian catacomb- painting, and in the pillar-halls of the Egyptian Fourth Dynasty. A February of art, a deep presentiment of a coming wealth of forms, an immense suppressed tension, lies over the landscape that, still wholly rustic, is adorning itself with the first strongholds and townlets. Then follows the joyous mounting into the high Gothic, into the Constantinian age with its pillared basilicas and its domical churches, into the relief-ornament of the Fifth-Dynasty temple. _Being_ is understood, a sacred form-language has been completely mastered and radiates its glory, and the Style ripens into a majestic symbolism of directional depth and of Destiny. But fervent youth comes to an end, and contradictions arise within the soul itself. The Renaissance, the Dionysiac-musical hostility to Apollinian Doric, the Byzantine of 450 that looks to Alexandria and away from the overjoyed art of Antioch, indicate a moment of resistance, of effective

or ineffective impulse to destroy what has been acquired. It is very difficult to elucidate this moment, and an attempt to do so would be out of place here.

And now it is the manhood of the style-history that comes on. The Culture is changing into the intellectuality of the great cities that will now dominate the country-side, and _pari passu_ the style is becoming intellectualized also. The grand symbolism withers; the riot of superhuman forms dies down; milder and more worldly arts drive out the great art of developed stone. Even in Egypt sculpture and fresco are emboldened to lighter movement. The _artist_ appears, and “plans” what formerly grew out of the soil. Once more existence becomes self- conscious and now, detached from the land and the dream and the mystery, stands questioning, and wrestles for an expression of its new duty—as at the beginning of Baroque when Michelangelo, in wild discontent and kicking against the limitations of his art, piles up the dome of St. Peter’s—in the age of Justinian I which built Hagia Sophia and the mosaic-decked domed basilicas of Ravenna—at the beginning of that Twelfth Dynasty in Egypt which the Greeks condensed under the name of Sesostris—and at the decisive epoch in Hellas (c. 600) whose architecture probably, nay certainly, expressed that which is echoed for us in its grandchild Æschylus.

Then comes the gleaming autumn of the style. Once more the soul depicts its happiness, this time con

PREFACE

In offering to the public a second edition of _The Law of Civilization and Decay_ I take the opportunity to say emphatically that such value as the essay may have lies in its freedom from any preconceived bias. All theories contained in the book, whether religious or economic, are the effect, and not the cause, of the way in which the facts unfolded themselves. I have been passive.

The value of history lies not in the multitude of facts collected, but in their relation to each other, and in this respect an author can have no larger responsibility than any other scientific observer. If the sequence of events seems to indicate the existence of a law governing social development, such a law may be suggested, but to approve or disapprove of it would be as futile as to discuss the

moral bearings of gravitation.

Some years ago, when writing a sketch of the history of the colony of Massachusetts Bay, I became deeply interested in certain religious aspects of the Reformation, which seemed hardly reconcilable with the theories usually advanced to explain them. After the book had been published, I continued reading theology, and, step by step, was led back, through the schoolmen and the crusades, to the revival of the pilgrimage to Palestine, which followed upon the conversion of the Huns. As ferocious pagans, the Huns had long closed the road to Constantinople; but the change which swept over Europe after the year 1000, when Saint Stephen was crowned, was unmistakable; the West received an impulsion from the East. I thus became convinced that religious enthusiasm, which, by stimulating the pilgrimage, restored communication between the Bosphorus and the Rhine, was the power which produced the accelerated movement culminating in modern centralization.

Meanwhile I thought I had discovered not only that faith, during the eleventh, twelfth, and early thirteenth centuries, spoke by preference through architecture, but also that in France and Syria, at least, a precise relation existed between the ecclesiastical and military systems of building, and that the one could not be understood without the other. In the commercial cities of the same epoch, on the contrary, the religious idea assumed no definite form of artistic expression, for the Gothic never flourished in Venice, Genoa, Pisa, or Florence, nor did any pure school of architecture thrive in the mercantile atmosphere. Furthermore, commerce from the outset seemed antagonistic to the imagination, for a universal decay of architecture set in throughout Europe after the great commercial expansion of the thirteenth century; and the inference I drew from these facts was, that the economic instinct must have chosen some other medium by which to express itself. My observations led me to suppose that the coinage might be such a medium, and I ultimately concluded that, if the development of a mercantile community is to be understood, it must be approached through its money.

Another conviction forced upon my mind, by the examination of long periods of history, was the exceedingly small part played by conscious thought in moulding the fate of men. At the moment of action the human being almost invariably obeys an instinct, like an animal; only after action has ceased does he reflect.

These controlling instincts are involuntary, and divide men into species distinct enough to cause opposite effects under identical conditions. For instance, impelled by fear, one type will rush upon an enemy, and another will run away; while the love of women or of money has stamped certain races as sharply as ferocity or cunning has stamped the lion or the fox.

Like other personal characteristics, the peculiarities of the mind are apparently strongly hereditary, and, if these instincts be transmitted from generation to generation, it is plain that, as the external world changes, those who receive this heritage must rise or fall in the social scale, according as their nervous system is well or ill adapted to the conditions to which they are born. Nothing is commoner, for example, than to find families who have been famous in one century sinking into obscurity in the next, not because the children have degenerated, but because a certain field of activity which afforded the ancestor full scope, has been closed against his offspring. Particularly has this been true in revolutionary epochs such as the Reformation; and families so situated have very generally become extinct.

When this stage had been reached, the Reformation began to wear a new aspect, but several years elapsed before I saw whither my studies led. Only very slowly did a sequence of cause and effect take shape in my mind, a sequence wholly unexpected in character, whose growth resembled the arrangement of the fragments of an inscription, which cannot be read until the stones have been set in a determined order. Finally, as the historical work neared an end, I perceived that the intellectual phenomena under examination fell into a series which seemed to correspond, somewhat closely, with the laws which are supposed to regulate the movements of the material universe.

Theories can be tested only by applying them to facts, and the facts relating to successive phases of human thought, whether conscious or unconscious, constitute history; therefore, if intellectual phenomena are evolved in a regular sequence, history, like matter, must be governed by law. In support of such a conjecture, I venture to offer an hypothesis by which to classify a few of the more interesting intellectual phases through which human society must, apparently, pass, in its oscillations between barbarism and civilization, or, what amounts to the same thing, in its movement from a condition of physical dispersion to one of concentration. The accompanying volume contains the evidence which suggested the hypothesis, although, it seems hardly necessary to add, an essay of this size on so vast a subject can only be regarded as a suggestion.

The theory proposed is based upon the accepted scientific principle that the law of force and energy is of universal application in nature, and that animal life is one of the outlets through which solar energy is dissipated.

Starting from this fundamental proposition, the first deduction is, that, as human societies are forms of animal life, these societies must differ among themselves in energy, in proportion as nature has endowed them, more or less abundantly, with energetic material.

Thought is one of the manifestations of human energy, and among the earlier and simpler phases of thought, two stand conspicuous--Fear and Greed. Fear, which, by stimulating the imagination, creates a belief in an invisible world, and ultimately develops a priesthood; and Greed, which dissipates energy in war and trade.

Probably the velocity of the social movement of any community is proportionate to its energy and mass, and its centralization is proportionate to its velocity; therefore, as human movement is accelerated, societies centralize. In the earlier stages of concentration, fear appears to be the channel through which energy finds the readiest outlet; accordingly, in primitive and scattered communities, the imagination is vivid, and the mental types produced are religious, military, artistic. As consolidation advances, fear yields to greed, and the economic organism tends to supersede the emotional and martial.

Whenever a race is so richly endowed with the energetic material that it does not expend all its energy in the daily struggle for life, the surplus may be stored in the shape of wealth; and this stock of stored energy may be transferred from community to community, either by conquest, or by superiority in economic competition.

However large may be the store of energy accumulated by conquest, a race must, sooner or later, reach the limit of its martial energy, when it must enter on the phase of economic competition. But, as the economic organism radically differs from the emotional and martial, the effect of economic competition has been, perhaps invariably, to dissipate the energy amassed by war.

When surplus energy has accumulated in such bulk as to preponderate over productive energy, it becomes the controlling social force. Thenceforward, capital is autocratic, and energy vents itself through those organisms best fitted to give expression to the power of capital. In this last stage of consolidation, the economic, and, perhaps, the scientific intellect is propagated, while the imagination fades, and the emotional, the martial, and the artistic types of manhood decay. When a social velocity has been attained at which the waste of energetic material is so great that the martial and imaginative stocks fail to reproduce themselves, intensifying competition appears to generate two extreme economic types,--the usurer in his most formidable aspect, and the peasant whose nervous system is best adapted to thrive on scanty nutriment. At length a point must be reached when pressure can go no further, and then, perhaps, one of two results may follow: A stationary period may supervene, which may last until ended by war, by exhaustion, or by both combined, as seems to have been the case with the Eastern Empire; or, as in the Western, disintegration may set in, the civilized population may perish, and a reversion may take place to a primitive form of organism.

The evidence, however, seems to point to the conclusion that, when a highly centralized society disintegrates, under the pressure of economic competition, it is because the energy of the race has been exhausted. Consequently, the survivors of such a community lack the power necessary for renewed concentration, and must probably remain inert until supplied with fresh energetic material by the infusion of barbarian blood.

CIVILIZATION AND DECAY

CHAPTER I

THE ROMANS

When the Romans first emerged from the mist of fable, they were already a race of land-owners who held their property in severalty, and, as the right of alienation was established, the formation of relatively large estates had begun. The ordinary family, however, held, perhaps, twelve acres, and, as the land was arable, and the staple grain, it supported a dense rural population. The husbandmen who tilled this land were of the martial type, and, probably for that reason, though supremely gifted as administrators and soldiers, were ill-fitted to endure the strain of the unrestricted economic competition of a centralized society. Consequently their conquests had hardly consolidated before decay set in, a decay whose causes may be traced back until they are lost in the dawn of history.

The Latins had little economic versatility; they lacked the instinct of the Greeks for commerce, or of the Syrians and Hindoos for manufactures. They were essentially land-owners, and, when endowed with the acquisitive faculty, usurers. The latter early developed into a distinct species, at once more subtle of intellect and more tenacious of life than the farmers, and on the disparity between these two types of men, the fate of all subsequent civilization has hinged. At a remote antiquity Roman society divided into creditors and debtors; as it consolidated, the power of the former increased, thus intensifying the pressure on the weak, until, when centralization culminated under the Cæsars, reproduction slackened, disintegration set in, and, after some centuries of decline, the Middle Ages began.

The history of the monarchy must probably always remain a matter of conjecture, but it seems reasonably certain that the expulsion of the Tarquins was the victory of an hereditary monied caste, which succeeded in concentrating the functions of government in a practically self-perpetuating body drawn from their own order.[1] Niebuhr has demonstrated, in one of his most striking chapters, that usury was originally a patrician privilege; and some of the fiercest struggles of the early republic seem to have been decided against the oligarchy by wealthy plebeians, who were determined to break down the monopoly in money-lending. At all events, the conditions of life evidently favoured the growth of the instinct which causes its possessor to suck the vitality of the economically weak; and Macaulay, in the preface to _Virginia_, has given so vivid a picture of the dominant class, that one passage at least should be read entire.

“The ruling class in Rome was a monied class; and it made and administered the laws with a view solely to its own interest. Thus the relation between lender and borrower was mixed up with the relation between sovereign and subject. The great men held a large portion of the community in dependence by means of advances at enormous usury. The law of debt, framed by creditors, and for the protection of creditors, was the most horrible that has ever been known among men. The liberty, and even the life, of the insolvent were at the mercy of the patrician money-lenders. Children often became slaves in consequence of the misfortunes of their parents. The debtor was imprisoned, not in a public gaol under the care of impartial public functionaries, but in a private workhouse belonging to the creditor. Frightful stories were told respecting these dungeons.”

But a prisoner is an expense, and the patricians wanted money. Their problem was to exhaust the productive power of the debtor before selling him, and, as slaves have less energy than freemen, a system was devised by which the plebeians were left on their land, and stimulated to labour by the hope of redeeming themselves and their children from servitude. Niebuhr has explained at length how this was done.

For money weighed out a person could pledge himself, his family, and all that belonged to him. In this condition he became _nexus_, and remained in possession of his property until breach of condition, when the creditor could proceed by summary process.[2] Such a contract satisfied the requirements, and the usurers had then only to invent a judgment for debt severe enough to force the debtor to become _nexus_ when the alternative was offered him. This presented no difficulty. When an action was begun the defendant had thirty days of grace, and was then arrested and brought before the prætor. If he could neither pay nor find security, he was fettered with irons weighing not less than fifteen pounds, and taken home by the plaintiff. There he was allowed a pound of corn a day, and given sixty days in which to settle. If he failed, he was taken again before the prætor and sentenced. Under this sentence he might be sold or executed, and, where there were several plaintiffs, they might cut him up among them, nor was any individual liable for carving more than his share.[3] A man so sentenced involved his descendants, and therefore, rather than submit, the whole debtor class became _nexi_, toiling for ever to fulfil contracts quite beyond their strength, and year by year sinking more hopelessly into debt, for ordinarily the accumulated interest soon raised “the principal to many times its original amount.”[4] Niebuhr has thus summed up the economic situation:--

“To understand the condition of the plebeian debtors, let the reader, if he is a man of business, imagine that the whole of the private debts in a given country were turned into bills at a year, bearing interest at twenty per cent or more; and that the non-payment of them were followed on summary process by imprisonment, and by the transfer of the debtor’s whole property to his creditor, even though it exceeded what he owed. We do not need those further circumstances, which are incompatible with our manners, the personal slavery of the debtor and of his children, to form an estimate of the fearful condition of the unfortunate plebeians.”[5]

Thus the usurer first exhausted a family and then sold it; and as his class fed on insolvency and controlled legislation, the laws were as ingeniously contrived for creating debt, as for making it profitable when contracted. One characteristic device was the power given the magistrate of fining for “offences against order.” Under this head “men might include any accusations they pleased, and by the higher grades in the scale of fines they might accomplish whatever they desired.”[6] As the capitalists owned the courts and administered justice, they had the means at hand of ruining any plebeian whose property was tempting. Nevertheless, the stronghold of usury lay in the fiscal system, which down to the fall of the Empire was an engine for working bankruptcy. Rome’s policy was to farm the taxes; that is to say, after assessment, to sell them to a publican, who collected what he could. The business was profitable in proportion as it was extortionate, and the country was subjected to a levy unregulated by law, and conducted to enrich speculators. “Ubi publicanus est,” said Livy, quoting the Senate, “ibi aut jus publicum vanum, aut libertatem sociis nullam esse.”[7]

Usury was the cream of this business. The custom was to lend to defaulters at such high rates of interest that insolvency was nearly certain to follow; then the people were taken on execution, and slave-hunting formed a regular branch of the revenue

service. In Cicero's time whole provinces of Asia Minor were stripped bare by the traffic. The effect upon the Latin society of the fifth century before Christ was singularly destructive. Italy was filled with petty states in chronic war, the troops were an unpaid militia, which comprised the whole able-bodied population, and though the farms yielded enough for the family in good times, when the males were with the legions labour was certain to be lacking. The campaigns therefore brought want, and with want came the inability to pay taxes.

As late as the Tunic War, Regulus asked to be relieved from his command, because the death of his slave and the incompetence of his hired man left his fields uncared for; and if a general and a consul were pinched by absence, the case of the men in the ranks can be imagined. Even in victory the lot of the common soldier was hard enough, for, beside the chance of wounds and disease, there was the certain loss of time, for which no compensation was made. Though the plebeians formed the whole infantry of the line, they received no part of the conquered lands, and even the plunder was taken from them, and appropriated by the patricians to their private use.[8] In defeat, the open country was overrun, the cattle were driven off or slaughtered, the fruit trees cut down, the crops laid waste, and the houses burned. In speaking of the Gallic invasion, Niebuhr has pointed out that the ravaging of the enemy, and the new taxes laid to rebuild the ruined public works, led to general insolvency.[9]

Such conditions fostered the rapid propagation of distinct types of mind, and at a very early period Romans had been bred destitute of the martial instinct, but more crafty and more tenacious of life than the soldier. These were the men who conceived and enforced the usury laws, and who held to personal pledges as the dearest privilege of their order; nor does Livy attempt to disguise the fact "that every patrician house was a gaol for debtors; and that in seasons of great distress, after every sitting of the courts, herds of sentenced slaves were led away in chains to the houses of the nobless."[10]

Of this redoubtable type the Claudian family was a famous specimen, and the picture which has been drawn by Macaulay of the great usurer, Appius Claudius, the decemvir, is so brilliant that it cannot be omitted.

"Appius Claudius Crassus ... was descended from a long line of ancestors distinguished by their haughty demeanour, and by the inflexibility with which they had withstood all the demands of the plebeian order. While the political conduct and the deportment of the Claudian nobles drew upon them the fiercest public hatred, they were accused of wanting, if any credit is due to the early history of Rome, a class of qualities which, in a military commonwealth, is sufficient to cover a multitude of offences. The chiefs of the family appear to have been eloquent, versed in civil business, and learned after the fashion of their age; but in war they were not distinguished by skill or valour. Some of them, as if conscious where their weakness lay, had, when filling the highest magistracies, taken internal administration as their department of public business, and left the military command to their colleagues. One of them had been entrusted with an army, and had failed ignominiously. None of them had been honoured with a triumph....

"His grandfather, called, like himself, Appius Claudius, had left a name as much detested as that of Sextus Tarquinius. This elder Appius had been consul more than seventy years before the introduction of the Licinian Laws. By availing himself of a singular crisis in public feeling, he had obtained the consent of the commons to the abolition of the tribuneship, and had been the chief of that Council of Ten to which the whole direction of the State had been committed. In a few months his administration had become universally odious. It had been swept away by an irresistible outbreak of popular fury; and its memory was still held in abhorrence by the whole city. The immediate cause of the downfall of this execrable government was said to have been an attempt made by Appius Claudius upon the chastity of a beautiful young girl of humble birth. The story ran that the Decemvir, unable to succeed by bribes and solicitations, resorted to an outrageous act of tyranny. A vile dependant of the Claudian house laid claim to the damsel as his slave. The cause was brought before the tribunal of Appius. The wicked magistrate, in defiance of the clearest proofs, gave judgment for the claimant. But the girl's father, a brave soldier, saved her from servitude and dishonour by stabbing her to the heart in the sight of the whole Forum. That blow was the signal for a general explosion. Camp and city rose at once; the Ten were pulled down; the tribuneship was re-established; and Appius escaped the hands of the executioner only by a voluntary death."[11]

Virginia was slain in 449 B.C., just in the midst of the long convulsion which began with the secession to the Mons Sacer, and ended with the Licinian Laws. During this century and a quarter, usury drained the Roman vitality low. Niebuhr was doubtless right in his conjecture that the mutinous legions were filled with nexi to whom the continuance of the existing status meant slavery, and Mommsen also pointed out that the convulsions of the third and fourth centuries, in which it seemed as though Roman society must disintegrate, were caused by "the insolvency of the middle class of land-holders."[12]

Had Italy been more tranquil, it is not inconceivable that the small farmers might even then have sunk into the serfdom which awaited them under the Empire, for in peace the patricians might have been able to repress insurrection with their clients; but the

accumulation of capital had hardly begun, and several centuries were to elapse before money was to take its ultimate form in a standing army. Meanwhile, troops were needed almost every year to defend the city; and, as the legions were a militia, they were the enemy and not the instrument of wealth. Until the organization of a permanent paid police they were, however, the highest expression of force, and, when opposed to them, the monied oligarchy was helpless, as was proved by the secession to the Mons Sacer. The storm gathered slowly. The rural population was ground down under the usury laws, and in 495 B.C. the farmers refused to respond to the levy. The consul Publius Servilius had to suspend prosecutions for debt and to liberate debtors in prison; but at the end of the campaign the promises he had made in the moment of danger were repudiated by Appius Claudius, who rigorously enforced the usury legislation, and who was, for the time, too strong to be opposed.

That year the men submitted, but the next the legions had again to be embodied; they again returned victorious; their demands were again rejected; and then, instead of disbanding, they marched in martial array into the district of Crustumeria, and occupied the hill which ever after was called the Sacred Mount.[13] Resistance was not even attempted; and precisely the same surrender was repeated in 449. When Virginius stabbed his daughter he fled to the camp, and his comrades seized the standards and marched for Rome. The Senate yielded at once, decreed the abolition of the Decemvirate, and the triumphant cohorts, drawn up upon the Aventine, chose their tribunes.

Finally, in the last great struggle, when Camillus was made dictator to coerce the people, he found himself impotent. The monied oligarchy collapsed when confronted with an armed force; and Camillus, reduced to act as mediator, vowed a temple to Concord, on the passage of the Licinian Laws.[14] The Licinian Laws provided for a partial liquidation, and also for an increase of the means of the debtor class by redistribution of the public land. This land had been seized in war, and had been monopolized by the patricians without any particular legal right. Licinius obtained a statute by which back payments of interest should be applied to extinguishing the principal of debts, and balances then remaining due should be liquidated in three annual instalments. He also limited the quantity of the public domain which could be held by any individual, and directed that the residue which remained after the reduction of all estates to that standard should be distributed in five-acre lots.

Pyrrhus saw with a soldier's eye that Rome's strength did not lie in her generals, who were frequently his inferiors, but in her farmers, whom he could not crush by defeat, and this was the class which was favoured by the Licinian Laws. They multiplied greatly when the usurers capitulated, and, as Macaulay remarked, the effect of the reform was "singularly happy and glorious." It was indeed no less than the conquest of Italy. Rome, "while the disabilities of the plebeians continued ... was scarcely able to maintain her ground against the Volscians and Hernicans. When those disabilities were removed, she rapidly became more than a match for Carthage and Macedon."[15]

But nature's very bounty to the Roman husbandman and soldier proved his ruin. Patient of suffering, enduring of fatigue, wise in council, fierce in war, he routed all who opposed him; and yet the vigorous mind and the robust frame which made him victorious in battle, were his weakness when at peace. He needed costly nutriment, and when brought into free economic competition with Africans and Asiatics, he starved. Such competition resulted directly from foreign conquests, and came rapidly when Italy had consolidated, and the Italians began to extend their power over other races. Nearly five centuries intervened between the foundation of the city and the defeat of Pyrrhus, but within little more than two hundred years from the victory of Beneventum, Rome was mistress of the world.

Indeed, beyond the peninsula, there was not much, save Carthage, to stop the march of the legions. After the death of Alexander, in 323 B.C., Greece fell into decline, and by 200, when Rome attacked Macedon, she was in decrepitude. The population of Asia Minor, Syria, and Egypt was not martial, and had never been able to cope in battle with the western races; while Spain and Gaul, though inhabited by fierce and hardy tribes, lacked cohesion, and could not withstand the onset of organized and disciplined troops. Distance, therefore, rather than hostile military force, fixed the limit of the ancient centralization, for the Romans were not maritime, and consequently failed to absorb India or discover America. Thus their relatively imperfect movement made the most material difference between the ancient and modern economic system.

By conquest the countries inhabited by races of a low vitality and great tenacity of life were opened both for trade and slaving, and their cheap labour exterminated the husbandmen of Italy. Particularly after the annexation of Asia Minor this labour overran Sicily, and the cultivation of the cereals by the natives became impossible when the island had been parcelled out into great estates stocked by capitalists with eastern slaves who, at Rome, undersold all competitors. During the second century the precious metals poured into Latium in a flood, great fortunes were amassed and invested in land, and the Asiatic provinces of the Empire were swept of their men in order to make these investments pay. No data remain by which to estimate, even approximately, the size of

this involuntary migration, but it must have reached enormous numbers, for sixty thousand captives were the common booty of a campaign, and after provinces were annexed they were depopulated by the publicans.

The best field hands came from the regions where poverty had always been extreme, and where, for countless generations, men had been inured to toil on scanty food. Districts like Bithynia and Syria, where slaves could be bought for little or nothing, had always been tilled by races far more tenacious of life than any Europeans. After Lucullus plundered Pontus, a slave brought only four drachmæ, or, perhaps, seventy cents.[16] On the other hand, competition grew sharper among the Italians themselves. As capital accumulated in the hands of the strongest, the poor grew poorer, and pauperism spread. As early as the Marsian War, in 90 B.C., Lucius Marcius Philippus estimated that there were only two thousand wealthy families among the burgesses. In about three hundred years nature had culled a pure plutocracy from what had been originally an essentially martial race.

The primitive Roman was a high order of husbandman, who could only when well fed flourish and multiply. He was adapted to that stage of society when the remnants of caste gave a certain fixity of tenure to the farmer, and when prices were maintained by the cost of communication with foreign countries. As the world centralized, through conquest, these barriers were swept away. Economic competition became free, land tended to concentrate in fewer and fewer hands, and this land was worked by eastern slaves, who reduced the wages of labour to the lowest point at which the human being can survive.

The effect was to split society in halves, the basis being servile, and the freemen being separated into a series of classes, according to the economic power of the mind. Wealth formed the title to nobility of the great oligarchy which thus came to constitute the core of the Empire. At the head stood the senators, whose rank was hereditary unless they lost their property, for to be a senator a man had to be rich. Augustus fixed $48,000 as the minimum of the senatorial fortune, and made up the deficiency to certain favoured families,[17] but Tiberius summarily ejected spendthrifts.[18] All Latin literature is redolent of money. Tacitus, with an opulent connection, never failed to speak with disdain of the base-born, or, in other words, of the less prosperous. “Poppæus Sabinus, a man of humble birth,” raised to position by the caprice of two emperors;[19] “Cassius Severus, a man of mean extraction”;[20] and, in the poetry of antiquity, there are few more famous lines than those in which Juvenal has described the burden of poverty:

“Haud facile emergunt, quorum virtutibus obstat Res angusta domi.”[21]

Perhaps no modern writer has been so imbued with the spirit of the later Empire as Fustel de Coulanges, and on this subject he has been emphatic. Not only were the Romans not democratic, but at no period of her history did Rome love equality. In the Republic rank was determined by wealth. The census was the basis of the social system. Every citizen had to declare his fortune before a magistrate, and his grade was then assigned him. “Poverty and wealth established the legal differences between men.”

The first line of demarcation lay between those who owned land and those who did not. The former were _assidui_: householders rooted in the soil. The latter were _proletarians_. The _proletarians_ were equal in their poverty; but the _assidui_ were unequal in their wealth, and were consequently divided into five classes. Among these categories all was unequal--taxes, military service, and political rights. They did not mix together.

“If one transports oneself to the last century of the Republic ... one finds there an aristocracy as strongly consolidated as the ancient patrician.... At the summit came the senatorial order. To belong to it the first condition was to possess a great fortune.... The Roman mind did not understand that a poor man could belong to the aristocracy, or that a rich man was not part of it.”[22]

Archaic customs lingered late in Rome, for the city was not a centre of commercial exchanges; and long after the death of Alexander, when Greece passed its meridian, the Republic kept its copper coinage. Regulus farmed his field with a single slave and a hired servant, and there was, in truth, nothing extraordinary in the famous meeting with Cincinnatus at the plough, although such simplicity astonished a contemporary of Augustus. Advancing centralization swept away these ancient customs, a centralization whose march is, perhaps, as sharply marked by the migration of vagrants to the cities, as by any single phenomenon. Vagrant paupers formed the proletariat for whose relief the “Frumentariæ Leges” were framed; and yet, though poor-laws in some form are considered a necessity in modern times, few institutions of antiquity have been more severely criticised than those regulating charity. From the time of Cato downward, the tendency has been to maintain that at Rome demagogues fed the rabble at the cost of the lives of the free-holders.

Probably the exact converse is the truth; the public gifts of food appear to have been the effect of the ruin of agriculture, and not its cause. After the Italian husbandmen had been made insolvent by the competition of races of lower vitality, they flocked starving to

the capital, but it was only reluctantly that the great speculators in grain, who controlled the Senate, admitted the necessity of granting State aid to the class whom they had destroyed.

Long before the Punic Wars the Carthaginians had farmed Sicily on capitalistic principles; that is to say, they had stocked domains with slaves, and had traded on the basis of large sales and narrow profits. The Romans when they annexed the island only carried out this system to its logical end. Having all Asia Minor to draw upon for labour, they deliberately starved and overworked their field-hands, since it was cheaper to buy others than to lose command of the market. The familiar story of the outbreak of the Servile War, about 134 B.C., shows how far the contemporaries of the Sicilian speculators believed them capable of going.

Damophilus, an opulent Sicilian landlord, being one day implored by his slaves to have pity on their nakedness and misery, indignantly demanded why they went hungry and cold, with arms in their hands, and the country before them. Then he bound them to stakes and flayed them with the lash.[23]

The reduction of Syracuse by Marcellus broke the Carthaginian power in the island, and, after the fall of Agrigentum in 210 B.C., the pacification of the country went on rapidly. Probably from the outset, even in the matter of transportation, the provinces of the mainland were at a disadvantage because of the cheapness of sea freights, but at all events the opening of the Sicilian grain trade had an immediate and disastrous effect on Italy. The migration of vagrants to Rome began forthwith, and within seven years, 203 B.C., a public distribution of wheat took place, probably by the advice of Scipio. Nevertheless the charity was private and not gratuitous. On the contrary, a charge of six sesterces, or twenty-five cents the bushel, was made, apparently near half the market rate, a price pretty regularly maintained on such occasions down to the Empire. This interval comprehended the whole period of the Sicilian supremacy in the corn trade, for in 30 B.C. Egypt was annexed by Augustus.

The distress which followed upon free trade with Egypt finally broke down the resistance of the rich to gratuitous relief for the poor. Previously the opposition to State aid had been so stubborn that until 123 B.C. no legal provision whatever was made for paupers; and yet the account left by Polybius of the condition of Lombardy toward the middle of the second century shows the complete wreck of agriculture.

“The yield of corn in this district is so abundant that wheat is often sold at four obols a Sicilian medimnus [about eight cents by the bushel, or a little less than two sesterces], barley at two, or a metretes of wine for an equal measure of barley.... The cheapness and abundance of all articles of food may also be clearly shown from the fact that travellers in these parts, when stopping at inns, do not bargain for particular articles, but simply ask what the charge is per head for board. And for the most part the innkeepers are content” with half an as (about half a cent) a day.[24]

These prices indicate a lack of demand so complete, that the debtors among the peasantry must have been ruined, and yet tax-payers remained obdurate. Gratuitous distributions were tried in 58 B.C. by the Lex Clodia, but soon abandoned as costly, and Cæsar applied himself to reducing the outlay on the needy. He hoped to reach his end by cutting down the number of grain-receivers one-half, by providing that no grain should be given away except on presentation of a ticket, and by ordering that the number of ticket-holders should not be increased. The law of nature prevailed against him, for the absorption of Egypt in the economic system of the Empire, marked, in the words of Mommsen “the end of the old and the beginning of a new epoch.”[25]

Among the races which have survived through ages upon scanty nutriment, none have, perhaps, excelled the Egyptian fellah. Even in the East no peasantry has probably been so continuously overworked, so under-paid, and so taxed.

“If it is the aim of the State to work out the utmost possible amount from its territory, in the Old World the Lagids were absolutely the masters of statecraft. In particular they were in this sphere the instructors and the models of the Cæsars.”[26]

In the first century Egypt was, as it still is, preeminently a land of cheap labour; but it was also something more. The valley of the Nile, enriched by the overflow of the river, returned an hundred-fold, without manure; and this wonderful district was administered, not like an ordinary province, but like a private farm belonging to the citizens of Rome. The emperor reserved it to himself. How large a revenue he drew from it is immaterial; it suffices that one-third of all the grain consumed in the capital came from thence. According to Athenæus, some of the grain ships in use were about 420 feet long by 57 broad, or nearly the size of a modern steamer in the Atlantic trade.[27] From the beginning of the Christian era, therefore, the wages of the Egyptian fellah regulated the price of the cereals within the limits where trade was made free by Roman consolidation, and it is safe to say that, thenceforward, such of the highly nourished races as were constrained to sustain this competition, were doomed to perish. It is even extremely doubtful whether the distributions of grain by the government materially accelerated the march of the decay. Spain should have

been far enough removed from the centre of exchanges to have had a certain local market of her own, and yet Martial, writing about 100 A.D., described the Spanish husbandman eating and drinking the produce he could not sell, and receiving but four sesterces the bushel for his wheat, which was the price paid by paupers in the time of Cicero.[28]

Thus by economic necessity great estates were formed in the hands of the economically strong. As the value of cereals fell, arable land passed into vineyards or pasture, and, the provinces being unable to sustain their old population, eviction went on with gigantic strides. Had the Romans possessed the versatility to enable them to turn to industry, factories might have afforded a temporary shelter to this surplus labour, but manufactures were monopolized by the East; therefore the beggared peasantry were either enslaved for debt, or wandered as penniless paupers to the cities, where gradually their numbers so increased as to enable them to extort a gratuitous dole. Indeed, during the third century, their condition fell so low that they were unable even to cook the food freely given them, and Aurelian had their bread baked at public ovens.[29]

As centralization advanced with the acceleration of human movement, force expressed itself more and more exclusively through money, and the channel in which money chose to flow was in investments in land. The social system fostered the growth of large estates. The Romans always had an inordinate respect for the landed magnate, and a contempt for the tradesman. Industry was reputed a servile occupation, and, under the Republic, the citizen who performed manual labour was almost deprived of political rights. Even commerce was thought so unworthy of the aristocracy that it was forbidden to senators. “The soil was always, in this Roman society, the principal source and, above all, the only measure of wealth.”

A law of Tiberius obliged capitalists to invest two-thirds of their property in land. Trajan not only exacted of aspirants to office that they should be rich, but that they should place at least one-third of their fortune in Italian real estate; and, down to the end of the Empire, the senatorial class “was at the same time the class of great landed proprietors.”[30]

The more property consolidated, the more resistless the momentum of capital became. Under the Empire small properties grew steadily rarer, and the fewer they were, the greater the disadvantage at which their owners stood. The small farmer could hardly sustain himself in competition with the great landlord. The grand domain of the capitalist was not only provided with a full complement of labourers, vine-dressers, and shepherds, but with the necessary artisans. The poor farmer depended on his rich neighbour even for his tools. “He was what a workman would be to-day who, amidst great factories, worked alone.”[31] He bought dearer and sold cheaper, his margin of profit steadily shrunk; at last he was reduced to a bare subsistence in good years, and the first bad harvest left him bankrupt.

The Roman husbandman and soldier was doomed, for nature had turned against him; the task of history is but to ascertain his fate, and trace the fortunes of his country after he had gone.

Of the evicted, many certainly drifted to the cities and lived upon charity, forming the proletariat, a class alike despised and lost to self-respect: some were sold into slavery, others starved; but when all deductions have been made, a surplus is left to be accounted for, and there is reason to suppose that these stayed on their farms as tenants to the purchasers.

In the first century such tenancies were common. The lessee remained a freeman, under no subjection to his landlord, provided he paid his rent; but in case of default the law was rigorous. Everything upon the land was liable as a pledge, and the tenant himself was held in pawn unless he could give security for what he owed. In case, therefore, of prolonged agricultural depression, all that was left of the ancient rural population could hardly fail to pass into the condition of serfs, bound to the land by debts beyond the possibility of payment.

That such a depression actually occurred, and that it extended through several centuries, is certain. Nor is it possible that its only cause was Egyptian competition, for had it been so, an equilibrium would have been reached when the African exchanges had been adjusted, whereas a continuous decline of prices went on until long after the fall of the Western Empire. The only other possible explanation of the phenomenon is that a contraction of the currency began soon after the death of Augustus, and continued without much interruption down to Charlemagne. Between the fall of Carthage and the birth of Christ, the Romans plundered the richest portions of the world west of the Indus; in the second century, North Africa, Macedon, Spain, and parts of Greece and Asia Minor; in the first, Athens, Cappadocia, Syria, Gaul, and Egypt. These countries yielded an enormous mass of treasure, which was brought to Rome as spoil of war, but which was not fixed there by commercial exchanges, and which continually tended to flow back to the natural centres of trade. Therefore, when conquests ceased, the sources of new bullion dried up, and the quantity held in Italy diminished as the balance of trade grew more and more unfavourable.

Under Augustus the precious metals were plenty and cheap, and the prices of commodities were correspondingly high; but a full generation had hardly passed before a dearth began to be felt, which manifested itself in a debasement of the coinage, the surest sign of an appreciation of the currency.

Speaking generally, the manufactures and the more costly products of antiquity came from countries to the east of the Adriatic, while the West was mainly agricultural; and nothing is better established than that luxuries were dear under the Empire, and food cheap.[32] Therefore exchanges were unfavourable to the capital from the outset; the exports did not cover the imports, and each year a deficit had to be made good in specie.

The Romans perfectly understood the situation, and this adverse balance caused them much uneasiness. Tiberius dwelt upon it in a letter to the Senate as early as 22 A.D. In that year the ædiles brought forward proposals for certain sumptuary reforms, and the Senate, probably to rid itself of a delicate question, referred the matter to the executive. Most of the emperor's reply is interesting, but there is one particularly noteworthy paragraph. "If a reform is in truth intended, where must it begin? and how am I to restore the simplicity of ancient times?... How shall we reform the taste for dress?... How are we to deal with the peculiar articles of female vanity, and, in particular, with that rage for jewels and precious trinkets, which drains the Empire of its wealth, and sends, in exchange for bawbles, the money of the Commonwealth to foreign nations, and even to the enemies of Rome?"[33] Half a century later matters were, apparently, worse, for Pliny more than once returned to the subject. In the twelfth book of his Natural History, after enumerating the many well-known spices, perfumes, drugs, and gems, which have always made the Eastern trade of such surpassing value, he estimated that at the most moderate computation 100,000,000 sesterces, or about $4,000,000 in coin, were annually exported to Arabia and India alone; and at a time when silk was worth its weight in gold, the estimate certainly does not seem excessive. He added, "So dear do pleasures and women cost us."[34]

The drain to Egypt and the Asiatic provinces could hardly have been much less serious. Adrian almost seems to have been jealous of the former, for in his letter to Servianus, after having criticised the people, he remarked that it was also a rich and productive country "in which no one was idle," and in which glass, paper and linen were manufactured.[35] The Syrians were both industrial and commercial. Tyre, for example, worked the raw silk of China, dyed and exported it. The glass of Tyre and Sidon was famous; the local aristocracy were merchants and manufacturers, "and, as later the riches acquired in the East flowed to Genoa and Venice, so then the commercial gains of the West flowed back to Tyre and Apamea."[36]

Within about sixty years from the final consolidation of the Empire under Augustus, this continuous efflux of the precious metals began to cause the currency to contract, and prices to fall; and the first effect of shrinking values appears to have been a financial crisis in 33 A.D. Probably the diminution in the worth of commodities relatively to money, had already made it difficult for debtors to meet their liabilities, for Tacitus has prefaced his story by pointing out that usury had always been a scourge of Rome, and that just previous to the panic an agitation against the money-lenders had begun with a view to enforcing the law regarding interest. As most of the senators were deep in usury they applied for protection to Tiberius, who granted what amounted to a stay of proceedings, and then, as soon as the capitalists felt themselves safe, they proceeded to take their revenge. Loans were called, accommodation refused, and mortgagors were ruthlessly sold out. "There was great scarcity of money ... and, on account of sales on execution, coin accumulated in the imperial, or the public treasury. Upon this the Senate ordered that every one should invest two-thirds of his capital on loan, in Italian real estate; but the creditors called in the whole, nor did public opinion allow debtors to compromise." Meanwhile there was great excitement but no relief, "as the usurers hoarded for the purpose of buying low. The quantity of sales broke the market, and the more liabilities were extended, the harder liquidation became. Many were ruined, and the loss of property endangered social station and reputation."[37] The panic finally subsided, but contraction went on and next showed itself, twenty-five years later, in adulterated coinage. From the time of the Punic Wars, about two centuries and a half before Christ, the silver denarius, worth nearly seventeen cents, had been the standard of the Roman currency, and it kept its weight and purity unimpaired until Nero, when it diminished from 1⁄84 to 1⁄96 of a pound of silver, the pure metal being mixed with 1⁄10 of copper.[38] Under Trajan, toward 100 A.D., the alloy reached twenty per cent; under Septimius Severus a hundred years later it had mounted to fifty or sixty per cent, and by the time of Elagabalus, 220 A.D., the coin had degenerated into a token of base metal, and was repudiated by the government.

Something similar happened to the gold. The aureus, though it kept its fineness, lost in weight down to Constantine. In the reign of Augustus it equalled one-fortieth of a Roman pound of gold, in that of Nero one forty-fifth, in that of Caracalla but one-fiftieth, in that of Diocletian one-sixtieth, and in that of Constantine one seventy-second, when the coin ceased passing by tale and was taken only by weight.[39]

The repudiation of the denarius was an act of bankruptcy; nor did the financial position improve while the administration remained at Rome. Therefore the inference is that, toward the middle of the third century, Italy had lost the treasure she had won in war, which had gradually gravitated to the centre of exchanges. This inference is confirmed by history. The movements of Diocletian seem to demonstrate that after 250 A.D. Rome ceased to be either the political or commercial capital of the world.

Unquestionably Diocletian must have lived a life of intense activity at the focus of affairs, to have raised himself from slavery to the purple at thirty-nine; and yet Gibbon thought he did not even visit Rome until he went thither to celebrate his triumph, after he had been

INTRODUCTION.

There is a passion, or a perversion of appetite, which, like all human passions, has played a considerable part in the world's history for good or evil; but which has hardly yet received the philosophical attention and the scientific investigation it deserves. The reason of this may be that in all Christian societies the passion under consideration has been condemned to pariahdom; consequently, philosophy and science have not deigned to make it the subject of special enquiry. Only one great race in past ages, the Greek race, to whom we owe the inheritance of our ideas, succeeded in raising it to the level of chivalrous enthusiasm. Nevertheless, we find it present everywhere and in all periods of history. We cannot take up the religious books, the legal codes, the annals, the descriptions of the manners of any nation, whether large or small, powerful or feeble, civilised or savage, without meeting with this passion in one form or other. Sometimes it assumes the calm and dignified attitude of conscious merit, as in Sparta, Athens, Thebes. Sometimes it skulks in holes and corners, hiding an abashed head and shrinking from the light of day, as in the capitals of modern Europe. It confronts us on the steppes of Asia, where hordes of nomads drink the milk of mares; in the bivouac of Keltish warriors, lying wrapped in wolves' skins round their camp-fires; upon the sands of Arabia, where the Bedaween raise desert dust in flying squadrons. We discern it among the palm-groves of the South Sea Islands, in the card-houses and temple-gardens of Japan, under Esquimaux snow-huts, beneath the sultry vegetation of Peru, beside the streams of Shiraz and the waters of the Ganges, in the cold clear air of Scandinavian winters. It throbs in our huge cities. The pulse of it can be felt in London, Paris, Berlin, Vienna, no less than in Constantinople, Naples, Teheran, and Moscow. It finds a home in Alpine valleys, Albanian ravines, Californian canyons, and gorges of Caucasian mountains. It once sat, clothed in Imperial purple, on the throne of the Roman Caesars, crowned with the tiara on the chair of St. Peter. It has flaunted, emblazoned with the heraldries of France and England, in coronation ceremonies at Rheims and Westminster. The royal palaces of Madrid and Aranjuez tell their tales of it. So do the ruined courtyards of Granada and the castle-keep of Avignon. It shone with clear radiance in the gymnasium of Hellas, and nerved the dying heroes of Greek freedom for their last forlorn hope upon the plains of Chæronea. Endowed with inextinguishable life, in spite of all that has been done to suppress it, this passion survives at large in modern states and towns, penetrates society, makes itself felt in every quarter of the globe where men are brought into communion with men.

Yet no one dares to speak of it; or if they do, they bate their breath, and preface their remarks with maledictions.

Those who read these lines will hardly doubt what passion it is that I am hinting at. _Quod semper ubique et ab omnibus_--surely it deserves a name. Yet I can hardly find a name which will not seem to soil this paper. The accomplished languages of Europe in the nineteenth century supply no term for this persistent feature of human psychology, without importing some implication of disgust, disgrace, vituperation. Science, however, has recently--within the last twenty years in fact--invented a convenient phrase, which does not prejudice the matter under consideration. She speaks of the "inverted sexual instinct"; and with this neutral nomenclature the investigator has good reason to be satisfied.

Inverted sexuality, the sexual instinct diverted from its normal channel, directed (in the case of males) to males, forms the topic of the following discourse. The study will be confined to modern times, and to those nations which regard the phenomenon with religious detestation. This renders the enquiry peculiarly difficult, and exposes the enquirer, unless he be a professed expert in diseases of the mind and nervous centres, to almost certain misconstruction. Still, there is no valid reason why the task of statement and analysis should not be undertaken. Indeed, one might rather wonder why candid and curious observers of humanity have not attempted to fathom a problem which faces them at every turn in their historical researches and in daily life. Doubtless their neglect is due to natural or acquired repugnance, to feelings of disgust and hatred, derived from immemorial tradition, and destructive of the sympathies which animate a really zealous pioneer. Nevertheless, what is human is alien to no human being. What the law punishes, but what, in spite of law, persists and energises, ought to arrest attention. We are all of us responsible to some extent for the maintenance and enforcement of our laws. We are all of us, as evolutionary science surely teaches, interested in the facts of anthropology, however repellant some of these may be to our own feelings. We cannot evade the conditions of _atavism_ and _heredity_. Every family runs the risk of producing a boy or a girl whose life will be embittered by inverted sexuality, but who in all other respects will be no worse or better than the normal members of the home. Surely, then, it is our duty and our interest to learn what we can about its nature, and to arrive through comprehension at some rational method of dealing with it.

I.

CHRISTIAN OPINION.

Since this enquiry is limited to actual conditions of contemporary life, we need not discuss the various ways in which the phenomenon of sexual inversion has been practically treated by races with whose habits and religions we have no affinity.

On the other hand, it is of the highest importance to obtain a correct conception of the steps whereby the Christian nations, separating themselves from ancient paganism, introduced a new and stringent morality into their opinion on this topic, and enforced their ethical views by legal prohibitions of a very formidable kind.

Without prejudging or prejudicing this new morality, now almost universally regarded as a great advance upon the ethics of the earlier pagan world, we must observe that it arose when science was non-existent, when the study of humanity had not emerged from the cradle, and when theology was in the ascendant. We have therefore to expect from it no delicate distinctions, no anthropological investigations, no psychological analysis, and no spirit of toleration. It simply decreed that what had hitherto been viewed as immorality at worst should henceforth be classed among crimes against God, nature, humanity, the state.

Opening the Bible, we find severe penalties attached to sexual inversion by the Mosaic law, in the interests of population and in harmony with the Jewish theory of abominations. The lesson is driven home by the legend of two cities, Sodom and Gomorrah, overwhelmed with fire because of their addiction to abnormal sexual indulgences. Here the _vindices flammæ_ of the Roman code appear for the first time--the stake and the flames, which mediæval legislation appointed for offenders of this sort.

St. Paul, penetrated with Hebrew ethics, denounced the corruption of the Gentiles in these words: "For this cause God gave them up into vile affections: for even their women did change the natural use into that which is against nature: and likewise also the men, leaving the natural use of the woman, burned in their lust one toward another; men with men working that which is unseemly, and receiving in themselves that recompence of their error which was meet."

Christ uttered no opinion upon what we now call sexual inversion. Neither light nor leading comes from Him, except such as may be indirectly derived from his treatment of the woman taken in adultery.

When the Empire adopted Christianity, it had therefore the traditions of the Mosaic law and the first chapter of the Epistle to the Romans to guide its legislators on this topic. The Emperors felt obscurely that the main pulses of human energy were slackening; population all tended to dwindle; the territory of the empire shrank slowly year by year before their eyes. As the depositaries of a higher religion and a nobler morality, they felt it their duty to stamp out pagan customs, and to unfurl the banner of social purity. The corruption of the Roman cities had become abominable. The laziness and cowardice of Roman citizens threatened the commonwealth with ruin. To repress sexual appetites was not the ruler's object. It was only too apparent that these natural desires no longer prompted the people to sufficient procreation or fertility. The brood begotten upon Roman soil was inadequate to cope with the inrushing tide of barbarians. Wisdom lay in attempting to rehabilitate marriage, the family domestic life. Meanwhile a certain vice ran riot through society, a vice for which Jehovah had rained fire and brimstone upon Sodom, a vice which the Mosaic code punished with death, a vice threatened by St. Paul with "that recompence of their error which was meet."

Justinian, in 538 A.D., seems to have been terrified by famines, earthquakes and pestilences. He saw, or professed to see, in these visitations the avenging hand of Jehovah, the "recompence which was meet" mysteriously prophesied by St. Paul. Thereupon he fulminated his edict against unnatural sinners, whereby they were condemned to torments and the supreme penalty of death. The preamble to his famous Novella 77 sets forth the principles on which it has been framed: "Lest as the result of these impious acts whole cities should perish together with their inhabitants; for we are taught by Holy Scripture, to wit that through these acts cities have perished with the men in them.... It is on account of such crimes that famines and earthquakes take place, and also pestilences."

Before Justinian, both Constantine and Theodosius passed laws against sexual inversion, committing the offenders to "avenging flames." But these statutes were not rigidly enforced, and modern opinion on the subject may be said to flow from Justinian's legislation. Opinion, in matters of custom and manners, always follows law. Though Imperial edicts could not eradicate a passion which is inherent in human nature, they had the effect of stereotyping extreme punishments in all the codes of Christian nations, and of creating a permanent social antipathy.

II.

VULGAR ERRORS.

Gibbon's remarks upon the legislation of Constantine, Theodosius, and Justinian supply a fair example of the way in which men of learning and open mind have hitherto regarded what, after all, is a phenomenon worthy of cold and calm consideration. "I touch," he says, "with reluctance, and despatch with impatience, a more odious vice, of which modesty rejects the name, and nature abominates the idea." After briefly alluding to the morals of Etruria, Greece, and Rome, he proceeds to the enactments of Constantine: "Adultery was first declared to be a capital offence ... the same penalties were inflicted on the passive and active guilt of pæderasty; and all criminals, of free or servile condition, were either drowned, or beheaded, or cast alive into the avenging flames."[1] Then, without further comment, he observes: "The adulterers were spared by the common sympathy of mankind; but the lovers of their own sex were pursued by general and pious indignation." "Justinian relaxed the punishment at least of female infidelity: the guilty spouse was only condemned to solitude and penance, and at the end of two years she might be recalled to the arms of a forgiving husband. But the same Emperor declared himself the implacable enemy of unmanly lust, and the cruelty of his persecution can scarcely be excused by the purity of his motives. In defiance of every principle of justice he stretched to past as well as future offences the operations of his edicts, with the previous allowance of a short respite for confession and pardon. A painful death was inflicted by the amputation of the sinful instrument, or the insertion of sharp reeds into the pores and tubes of most exquisite sensibility." One consequence of such legislation may be easily foreseen. "A sentence of death and infamy was often founded on the slight and suspicious evidence of a child or a servant: the guilt of the green faction, of the rich, and of the enemies of Theodora, was presumed by the judges, and pæderasty became the crime of those to whom no crime could be imputed."

This state of things has prevailed wherever the edicts of Justinian have been adopted into the laws of nations. The Cathari, the Paterini, the heretics of Provence, the Templars, the Fraticelli, were all accused of unnatural crimes, tortured into confession, and put to death. Where nothing else could be adduced against an unpopular sect, a political antagonist, a wealthy corporation, a rival in literature, a powerful party-leader, unnatural crime was insinuated, and a cry of "Down with the pests of society" prepared the populace for a crusade.

It is the common belief that all subjects of sexual inversion have originally loved women, but that, through monstrous debauchery and superfluity of naughtiness, tiring of normal pleasure, they have wilfully turned their appetites into other channels. This is true about a certain number. But the sequel of this Essay will prove that it does not meet by far the larger proportion of cases, in whom such instincts are inborn, and a considerable percentage in whom they are also inconvertible. Medical jurists and physicians have recently agreed to accept this as a fact.

It is the common belief that a male who loves his own sex must be despicable, degraded, depraved, vicious, and incapable of humane or generous sentiments. If Greek history did not contradict this supposition, a little patient enquiry into contemporary manners would suffice to remove it. But people will not take this trouble about a matter, which, like Gibbon, they "touch with reluctance and despatch with impatience." Those who are obliged to do so find to their surprise that "among the men who are subject to this deplorable vice there are even quite intelligent, talented, and highly-placed persons, of excellent and even noble character."[2] The vulgar expect to discover the objects of their outraged animosity in the scum of humanity. But these may be met with every day in drawing-rooms, law-courts, banks, universities, mess-rooms; on the bench, the throne, the chair of the professor; under the blouse of the workman, the cassock of the priest, the epaulettes of the officer, the smock-frock of the ploughman, the wig of the barrister, the mantle of the peer, the costume of the actor, the tights of the athlete, the gown of the academician.

It is the common belief that one, and only one, unmentionable act is what the lovers seek as the source of their unnatural gratification, and that this produces spinal disease, epilepsy, consumption, dropsy, and the like.[3] Nothing can be more mistaken, as the scientifically reported cases of avowed and adult sinners amply demonstrate. Neither do they invariably or even usually prefer the _aversa Venus_; nor, when this happens, do they exhibit peculiar signs of suffering in health.[4] Excess in any venereal pleasure will produce diseases of nervous exhaustion and imperfect nutrition. But the indulgence of inverted sexual instincts within due limits, cannot be proved to be especially pernicious. Were it so, the Dorians and Athenians, including Sophocles, Pindar, Æschines, Epaminondas, all the Spartan kings and generals, the Theban legion, Pheidias, Plato, would have been one nation of rickety, phthisical, dropsical paralytics. The grain of truth contained in this vulgar error is that, under the prevalent laws and hostilities of modern society, the inverted passion has to be indulged furtively, spasmodically, hysterically; that the repression of it through fear and shame frequently leads to habits of self-abuse; and that its unconquerable solicitations sometimes convert it from a healthy outlet of the sexual nature into a morbid monomania.[5] It is also true that professional male prostitutes, like their female counterparts, suffer from local and constitutional disorders, as is only natural.[6]

It is the common belief that boys under age are specially liable to corruption. This error need not be confuted here. Anyone who chooses to read the cases recorded by Casper-Liman, Casper in his Novellen, Krafft-Ebing, and Ulrichs, or to follow the developments of the present treatise, or to watch the manners of London after dark, will be convicted of its absurdity. Young boys are less exposed to dangers from abnormal than young girls from normal voluptuaries.

It is the common belief that all subjects from inverted instinct carry their lusts written in their faces; that they are pale, languid, scented, effeminate, painted, timid, oblique in expression. This vulgar error rests upon imperfect observation. A certain class of such people are undoubtedly feminine. From their earliest youth they have shown marked inclination for the habits and the dress of women; and when they are adult, they do everything in their power to obliterate their manhood. It is equally true that such unsexed males possess a strong attraction for some abnormal individuals. But it is a gross mistake to suppose that all the tribe betray these attributes. The majority differ in no detail of their outward appearance, their physique, or their dress from normal men. They are athletic, masculine in habits, frank in manner, passing through society year after year without arousing a suspicion of their inner temperament. Were it not so, society would long ago have had its eyes opened to the amount of perverted sexuality it harbours.

The upshot of this discourse on vulgar errors is that popular opinion is made up of a number of contradictory misconceptions and confusions. Moreover, it has been taken for granted that "to investigate the depraved instincts of humanity is unprofitable and disgusting." Consequently the subject has been imperfectly studied; and individuals belonging to radically different species are confounded in one vague sentiment of reprobation. Assuming that they are all abominable, society is content to punish them indiscriminately. The depraved debauchee who abuses boys receives the same treatment as the young man who loves a comrade. The male prostitute who earns his money by extortion is scarcely more contemned than a man of birth and breeding who has been seen walking with soldiers.

III.

LITERATURE--DESCRIPTIVE.

Sexual inversion can boast a voluminous modern literature, little known to general readers. A considerable part of this is pornographic, and need not arrest our attention.[7] A good deal is descriptive, scientific, historical, anthropological, apologetical and polemical. With a few books in each of these kinds I propose to deal now.

The first which falls under my hand is written by a French official, who was formerly Chief of the Police Department for Morals in Paris.[8] M. Carlier, during ten years, had excellent opportunities for studying the habits of professional male prostitutes and their frequenters. He had condensed the results of his experience in seven very disagreeable chapters, which offer a revolting picture of vice and systematised extortion in the great metropolis.

"In the numerous books," says M. Carlier, "which treat of prostitution, the antiphysical passions have hitherto been always deliberately omitted. Officially, public opinion does not recognise them, the legislature will take no notice of them. The police are left alone to react against them; and the unequal combat may some day cease, since it is supported by no text of the code and no regulation of the state. When that happens, pæderasty will become a calamity far more dangerous, more scandalous, than female prostitution, the organisation of which it shares in full. A magistrate once declared that 'in Paris it is the school where the cleverest and boldest criminals are formed; and as a matter of fact, it produces associations of special scoundrels, who use it as the means of theft and _chantage_, not stopping short of murder in the execution of their plots.'"

It will be seen from this exordium that M. Carlier regards the subject wholly from the point of view of prostitution. He has proved abundantly that male prostitution is organised in Paris upon the same system as its female counterpart, and he has demonstrated that this system is attended with the same dangers to society.

A violent animus against antiphysical passions makes him exaggerate these dangers, for it is clear that normal vice is no less free from sordid demoralisation and crimes of violence than its abnormal twin-brother. Both are fornication; and everywhere, in Corinth as in Sodom, the prostitute goes hand in hand with the bully, the robber, and the cut-throat.

With reference to the legal position of these passions in France, he says: "Pæderasty is not punished by our laws. It can only come within the reach of the code by virtue of circumstances under which it may be practised. If the facts take place in the presence of witnesses, or in a place open to public observation, there will be an outrage to decency. If minors are seduced, there may be proof of the habitual incitement of minors to debauch, corruption, or even rape. But the passion itself is not subject to penalty; it is only a

vice arising from one of the seven deadly sins. We have no intention of analysing this perverted instinct. Since the law does not regard it, we will do like the law. We will pass in silence all its private details, occupying ourselves only with what meets the eye, with what may be called a veritable prostitution."

M. Carlier proceeds to describe the two main classes, which in France are known as _tantes_ and _amateurs_. The former are subdivided into minor branches, under the names of _jésus_, _petits jésus_, _corvettes_ (naval), soldiers. The latter, called also _rivettes_, are distinguished by their tastes for different sorts of _tantes_.

Those who are interested in such matters may turn to M. Carlier's pages for minute information regarding the habits, coteries, houses of debauch, bullies, earnings, methods of extortion, dwellings, balls, banquets, and even wedding-parties of these people. A peculiar world of clandestine vice in a great city is revealed; and the authentic documents, abundantly presented, render the picture vivid in its details. From the official papers which passed through M. Carlier's bureau during ten years (1860-70), he compiles a list of 6,342 pæderasts who came within the cognisance of the police: 2,049 Parisians, 3,709 provincials, 484 foreigners. Of these 3,532, or more than the half, could not be convicted of illegal acts.

While devoting most of his attention to professionals who dress like women, and have become exactly similar to the effeminated youth described in _Monsieur Vénus_,[9] Carlier gives some curious details about the French army. Soldiers are no less sought after in France than in England or in Germany, and special houses exist for military prostitution both in Paris and the garrison towns.[10] Upon this point it should be remarked that Carlier expresses a very strong opinion regarding the contagiousness of antiphysical passion. And certainly many facts known about the French army go to prove that these habits have been contracted in Algeria, and have spread to a formidable extent through whole regiments.[11]

In conclusion, M. Carlier, though he so strongly deplores the impunity extended by French law to sexual inversion, admits that this has not augmented the evil. Speaking about England, where legal penalties are heavy enough, he says; "Though they call it the _nameless crime_ there, it has in England at least as many votaries as in France, and they are quite as depraved."[12]

IV.

LITERATURE--MEDICO-FORENSIC.

Carlier's book deals with the external aspects of inverted sexuality, as this exists in Paris under the special form of prostitution. The author professes to know nothing more about the subject than what came beneath his notice in the daily practice of his trade as a policeman. He writes with excusable animosity. We see at once that he is neither a philosopher by nature, nor a man of science, but only a citizen, endowed with the normal citizen's antipathy for passions alien to his own. Placed at the head of the Bureau of Morals, Carlier was brought into collision with a tribe of people whom he could not legally arrest, but whom he cordially hated. They were patently vicious; and (what was peculiarly odious to the normal man) these degraded beings were all males. He saw that the public intolerance of "antiphysical passions," which he warmly shared, encouraged an organised system of _chantage_. Without entertaining the question whether public opinion might be modified, he denounced the noxious gang as pests of society. The fact that England, with her legal prohibitions, suffered to the same extent as France from the curse of "pæderasty," did not make him pause. Consequently, the light which he has thrown upon the subject of this treatise only illuminates the dark dens of male vice in a big city. He leaves us where we were about the psychological and ethical problem. He shows what deep roots the passion strikes in the centres of modern civilisation, and how it thrives under conditions at once painful to its victims and embarrassing to an agent of police.

Writers on forensic medicine take the next place in the row of literary witnesses. It is not their business to investigate the psychological condition of persons submitted to the action of the laws. They are concerned with the law itself, and with those physical circumstances which may bring the accused within its operation, or may dismiss him free from punishment.

Yet their function, by importing the quality of the physician into the sphere of jurisprudence, renders them more apprehensive of the underlying problem than a mere agent of police. We expect impartial scientific scrutiny in such authorities, and to some extent we find it.

The leading writers on forensic medicine at the present time in Europe are Casper (edited by Liman) for Germany, Tardieu for France, and Taylor for England. Taylor is so reticent upon the subject of unnatural crime that his handbook on "The Principles and Practice of Medical Jurisprudence" does not demand minute examination. It may, however, be remarked that he believes false

accusations to be even commoner in this matter than in the case of rape, since they are only too frequently made the means of blackmailing. For this reason he leaves the investigation of such crimes to the lawyers.

Both Casper and Tardieu discuss the topic of sexual inversion with antipathy. But there are notable points of difference in the method and in the conclusions of the two authors. Tardieu, perhaps because he is a Frenchman, educated in the school of Paris, which we have learned to know from Carlier, assumes that all subjects of the passion are criminal or vicious. He draws no psychological distinction between pæderast and pæderast. He finds no other name for them, and looks upon the whole class as voluntarily degraded beings who, for the gratification of monstrous desires, have unsexed themselves. A large part of his work is devoted to describing what he believes to be the signs of active and passive immorality in the bodies of persons addicted to these habits.[13] It is evident that imagination has acted powerfully in the formation of his theories. But this is not the place to discuss their details.[14]

Casper and Liman approach the subject with almost equal disgust, but with more regard for scientific truth than Tardieu. They point out that the term pæderast is wholly inadequate to describe the several classes of male persons afflicted with sexual inversion. They clearly expect, in course of time, a general mitigation of the penalties in force against such individuals. According to them, the penal laws of North Germany, on the occasion of their last revision, would probably have been altered, had not the jurists felt that the popular belief in the criminality of pæderasts ought to be considered.[15] Consequently, a large number of irresponsible persons, in the opinion of experts like Casper and Liman, are still exposed to punishment by laws enacted under the influence of vulgar errors.

These writers are not concerned with the framing of codes, nor again with the psychological diagnosis of accused persons. It is their business to lay down rules whereby a medical authority, consulted in a doubtful case, may form his own view as to the guilt or innocence of the accused. Their attention is therefore mainly directed to the detection of signs upon the bodies of incriminated individuals.

This question of physical diagnosis leads them into a severe critique of Tardieu. Their polemic attacks each of the points which he attempted to establish. I must content myself by referring to the passage of their work which deals with the important topic.[16] Suffice it here to say that they reject all signs as worse than doubtful, except a certain deformation of one part of the body, which may possibly be taken as the proof of habitual prostitution, when it occurs in quite young persons. Of course they admit that wounds, violent abrasions of the skin, in certain places, and some syphilitic affections strongly favour the presumption of a criminal act. Finally, after insisting on the insecurity of Tardieu's alleged signs, and pointing out the responsibility assumed by physicians who base a judgment on them, the two Germans sum up their conclusions in the following words (p. 178): "It is extremely remarkable that while Tardieu mentions 206 cases, and communicates a select list of 19, which appear to him to exhibit these peculiar conformations of the organs, he can only produce one single instance where the formation seemed indubitable. Let anyone peruse his 19 cases, and he will be horrified at the unhesitating condemnations pronounced by Tardieu." The two notes of exclamation which close this sentence in the original are fully justified. It is indeed horrifying to think that a person, implicated in some foul accusation, may have his doom fixed by a doctrinaire like Tardieu. Antipathy and ignorance in judges and the public, combined with erroneous canons of evidence in the expert, cannot fail to lead in such cases to some serious miscarriage of justice.

Passing from the problem of diagnosis and the polemic against Tardieu, it must be remarked that Casper was the first writer of this class to lay down the distinction between inborn and acquired perversion of the sexual instinct. The law does not recognise this distinction. If a criminal act be proved, the psychological condition of the agent is legally indifferent--unless it can be shown that he was clearly mad and irresponsible, in which case he may be consigned to a lunatic asylum instead of a jail. But Casper and Liman, having studied the question of sexual maladies in general, and given due weight to the works of Ulrichs, call attention to the broad differences which exist between persons in whom abnormal appetites are innate and those in whom they are acquired. Their companion sketches of the two types deserve to be translated and presented in a somewhat condensed form.[17]

"In the majority of persons who are subject to this vice, it is congenital; or at any rate the sexual inclination can be followed back into the years of childhood, like a kind of physical hermaphroditism. Sexual contact with a woman inspires them with real disgust. Their imagination delights in handsome young men, and statues or pictures of the same. In the case of this numerous class of pæderasts there is therefore no depraved fancy at work, no demoralisation through satiety of natural sexual appetite,[18] Their congenital impulse explains the fact, moreover, that very many pæderasts are addicted to what may be termed a Platonic voluptuousness, and feel themselves drawn towards the objects of their desire with a warmth of passion more fervent than is common in the relations of the opposed sexes; that, in other cases again, they are satisfied with embracements, from which they

derive a mutual pleasure. Westphal maintains that this anomalous direction of the sexual appetite is more often the symptom of a psychopathical, neuropathical condition than people commonly suppose."[19]

"In the case of another class of men, upon the contrary, the taste for this vice has been acquired in life, and is the result of over-satiety with natural pleasures. People of this stamp sometimes indulge their gross appetites alternately with either sex. I once observed a man, after contracting a venereal disease with women, adopt pæderasty out of fear of another infection; but he was, it must be admitted, a weak-minded individual. In all the great towns of Europe the vice goes creeping around, unobserved by the uninitiated. It appears that there is no inhabited spot of the globe where it may not be discovered. I said, unobserved by the uninitiated, advisedly. In antiquity the members of the sect had their own means of mutual recognition. And at the present time, these men know each other at first sight; moreover, they are found everywhere, in every station of society, without a single exception. 'We recognise each other at once,' says the writer of a report which I shall communicate below: 'A mere glance of the eye suffices; and I have never been deceived. On the Rigi, at Palermo, in the Louvre, in the Highlands of Scotland, in Petersburg, on disembarking at the port of Barcelona, I have found people, never seen by me before, and whom I discriminated in a second.' Several men of this sort whom I have known (continues Casper) are certainly accustomed to dress and adorn themselves in a rather feminine way. Nevertheless, there are indisputable pæderasts, who present an entirely different aspect, some of them elderly and negligent in their attire, and people of the lower classes, distinguished by absolutely nothing in their exterior from other persons of the same rank."

Medico-juristic science made a considerable step when Casper adopted this distinction of two types of sexual inversion. But, as is always the case in the analysis of hitherto neglected phenomena, his classification falls far short of the necessities of the problem. While treating of acquired sexual inversion, he only thinks of debauchees. He does not seem to have considered a deeper question--deeper in its bearing upon the way in which society will have to deal with the whole problem--the question of how far these instincts are capable of being communicated by contagion to persons in their fullest exercise of sexual vigour. Taste, fashion, preference, as factors in the dissemination of anomalous passions, he has left out of his account. It is also, but this is a minor matter, singular that he should have restricted his observations on the freemasonry among pæderasts to those in whom the instinct is acquired. That exists quite as much or even more among those in whom it is congenital.

The upshot of the whole matter, however, is that the best book on medical jurisprudence now extant repudiates the enormities of Tardieu's method, and lays it down for proved that "the majority of persons who are subject" to sexual inversion come into the world, or issue from the cradle, with their inclination clearly marked.

V.

LITERATURE--MEDICINE.

Medical writers upon this subject are comparatively numerous in French and German literature, and they have been multiplying rapidly of late years. The phenomenon of sexual inversion is usually regarded in these books from the point of view of psychopathic or neuropathic derangement, inherited from morbid ancestors, and developed in the patient by early habits of self-abuse.

What is the exact distinction between "psychopathic" and "neuropathic" I do not know. The former term seems intelligible in the theologian's mouth, the latter in a physician's. But I cannot understand both being used together to indicate different kinds of pathological diathesis. What is the soul, what are the nerves? We have probably to take the two terms as indicating two ways of considering the same phenomenon; the one subjective, the other objective; "psychopathic" pointing to the derangement as observed in the mind emotions of its subject; "neuropathic" to the derangement as observed in anomalies of the nervous system.

It would be impossible, in an essay of this kind, to review the whole mass of medical observation, inference and speculation which we have at our command. Nor is a layman, perhaps, well qualified for the task of criticism and comparison in a matter of delicacy where doctors differ as to details. I shall therefore content myself with giving an account of four of the most recent, most authoritative, and, as it seems to me, upon the whole most sensible studies. Moreau, Tarnowsky, Krafft-Ebing and Lombroso take very nearly similar views of the phenomenon; and between them they are gradually forming a theory which is likely to become widely accepted.

Des Aberrations du Sens Génésique, par le Dr. Paul Moreau, 4th edition, 1887.

Moreau starts with the proposition that there is a sixth sense, "le sens génital," which, like other senses, can be injured psychically and physically without the mental functions, whether affective or intellectual, suffering thereby. His book is therefore a treatise on the diseases of the sexual sense. These diseases are by no means of recent origin, he says. They have always and everywhere existed.

He begins with a historical survey, which, so far as antiquity is concerned, is very defective. Having quoted with approval the following passage about Greek society:--

"La sodomie se répand dans toute la Grèce; les écoles des philosophes deviennent des maisons de débauche, et les grands exemples d'amitié légués par le paganisme ne sont, pour la plupart, qu'une infâme turpitude voilée par une sainte apparence": having quoted these words of Dr. Descuret, Moreau leaves Greece alone, and goes on to Rome. The state of morals in Rome under the empire he describes as "une dépravation maladive, devenue par la force des choses héréditaire, endémique, épidémique." Then follows a short account of the emperors and their female relatives. "Cet éréthisme génésique qui, pendant près de deux siècles, régna a l'état épidémique dans Rome" he ascribes mainly to heredity. Of Julia, the daughter of Augustus, he says, "Peut-on lutter contre un état morbide héréditaire?" The union of unrestrained debauchery and ferocity with great mental gifts strikes him as a note of disease; and he winds up with this sentence: "Parmi les causes les plus fréquentes des aberrations du sens génital, l'hérédité tient la première place."

Then he passes to the middle ages, and dwells upon the popular belief in _incubi_ and _succubi_. It is curious to find him placing Leo X., François I., Henri IV., Louis XIV., among the neuropathics. When it comes to this, everybody with strong sexual instincts, and the opportunity of indulging them, is a nervous invalid. Modern times are illustrated by the debaucheries of the Regency, the reign of Louis XV., Russian ladies, the Marquis de Sade. The House of Orleans seems in truth to have been tainted with hereditary impudicity of a morbid kind. But if it was so at the end of the last century, it has since the Revolution remarkably recovered health--by what miracle?

Moreau now formulates the thesis he wishes to prove: "L'aberration pathologique des sentiments génésiques doit être assimilée complètement à une névrose, et, comme telle, son existence est compatible avec les plus hautes intelligences." He discovers hereditary taint universally present in these cases. "Hérédité directe, hérédité indirecte, hérédité transformée, se trouve chez les génésiaques."

Passing to etiology, he rests mainly upon an organism predisposed by ancestry, and placed in a milieu favourable to its morbid development. Provocative causes are not sufficient to awake the aberration in healthy organisms, but the least thing will set a predisposed organism on the track. This, I may observe, seems to preclude simple imitation, upon which Moreau afterwards lays considerable stress; for if none but the already tainted can be influenced by their milieu, none but the tainted will imitate.

What he calls "General Physical Causes" are (1) Extreme Poverty, (2) Age, (3) Constitution, (4) Temperament, (5) Seasons of the Year, (6) Climate, (7) Food.

Extreme poverty leads to indiscriminate vice, incest, sodomy, &c. That is true, and we know that our city poor and the peasants of some countries are habitually immoral. Yet Moreau proves too much here. For, according to his principles, hereditary neurosis ought by this time to have become chronic, epidemic, endemic, in all the city poor and in all the peasants of all countries; which is notably not the fact. Puberty and the approach of senility are pointed out as times when genesiac symptoms manifest themselves. His observations upon the other points are commonplace enough; and he repeats the current notion that inhabitants of hot climates are more lascivious than those of the North.

Among "Individual Physical Causes," Moreau treats of malformation of the sexual organs, diseases of those organs, injuries to the organism by wounds, blows, poisons, masturbation, excessive indulgence in venery, and exaggerated continence.

When we come to "General Moral Causes," heredity plays the first part. This may be direct, i.e., the son of a genesiac will have the same tastes as his father, or transformed; what is phthisis in one generation assuming the form of sexual aberration in another. Bad education and exposure to bad examples, together with imitation, are insisted on more vaguely.

The "Individual Moral Causes" include impressions received in early youth, on which I think perhaps Moreau does not lay sufficient stress, and certain tendencies to subjective preoccupations with ideal ideas, certain abnormal physical conditions which disturb the whole moral sensibility.

Passing to Pathological Anatomy, Moreau declares that it is as yet impossible to localise the sexual sense. The brain, the cerebellum, the spinal marrow? We do not know. He seems to incline toward the cerebellum.

It is not necessary to follow Moreau in his otherwise interesting account of the various manifestations of sexual disease. The greater part of these have no relation to the subject of my work. But what he says in passing about "pæderasts, sodomites, saphists," has to be resumed. He reckons them among "A class of individuals who cannot and ought not to be confounded either with men enjoying the fulness of their intellectual faculties, or yet with madmen properly so called. They form an intermediate class, a mixed class, constituting a real link of union between reason and madness, the nature and existence of which can most frequently be explained only by one word: Heredity" (p. 159). It is surprising, after this announcement, to discover that what he has to say about sexual inversion is limited to Europe and its moral system, "having nothing to do with the morals of other countries where pæderasty is accepted and admitted" (p. 172, note). Literally, then, he regards sexual inversion in modern Christian Europe as a form of hereditary neuropathy, a link between reason and madness; but in ancient Greece, in modern Persia and Turkey, he regards the same psychological anomaly from the point of view, not of disease, but of custom. In other words, an Englishman or a Frenchman who loves the male sex must be diagnosed as tainted with disease; while Sophocles, Pindar, Pheidias, Epaminondas, Plato, are credited with yielding to an instinct which was healthy in their times because society accepted it. The inefficiency of this distinction in a treatise of analytical science ought to be indicated. The bare fact that ancient Greece tolerated, and that modern Europe refuses to tolerate sexual inversion, can have nothing to do with the etiology, the pathology, the psychological definition of the phenomenon in its essence. What has to be faced is that a certain type of passion flourished under the light of day and bore good fruits for society in Hellas; that the same type of passion flourishes in the shade and is the source of misery and shame in Europe. The passion has not altered; but the way of regarding it morally and legally is changed. A scientific investigator ought not to take changes of public opinion into account when he is analysing a psychological peculiarity.

This point on which I am insisting--namely, that it is illogical to treat sexual inversion among the modern European races as a malady, when you refer its prevalence among Oriental peoples and the ancient Hellenes to custom--is so important that I shall illustrate it by a passage from one of Dr. W. R. Huggard's Essays.[20] "It may be said that the difference between the delusion of the overpowering impulse in the Fijian and in the insane Englishman is that, in the savage, the mental characters are due to education and surroundings; while, in the lunatic they are due to disease. In a twofold manner, however, would this explanation fail. On the one hand, even if in the Fijian there were disease, the question of insanity could not arise in regard to a matter considered by his society to be one of indifference. It would be absurd to talk of homicidal mania, of nymphomania, and of kleptomania, as forms of insanity, where murder, promiscuous intercourse, and stealing are not condemned. On the other hand, the assumption that insanity is always due to disease is not merely an unproved, but an improbable supposition. There must, of course, be some defect of organism; but there is every reason to think that, in many cases, the defect is of the nature of a congenital lack of balance between structures themselves healthy; and that many cases of insanity might properly be regarded as a kind of 'throwback' to a type of organisation now common among the lower races of mankind." Substitute any term to indicate sexual inversion for "nymphomania" in this paragraph, and the reasoning precisely suits my argument. It is interesting, by the way, to find this writer agreeing with Ulrichs in his suggestion of a "congenital lack of balance between structures themselves healthy," and with Lombroso in his supposition of atavistic reversion to savagery. Lombroso, we shall see, ultimately identifies congenital criminality (one form of which is sexual aberration in this theory) with moral insanity; and here Dr. Huggard is, unconsciously perhaps, in agreement with him; for he defines insanity to be "any mental defect that renders a person unable (and not capable of being made able by punishment) to conform to the requirements of society"--a definition which is no less applicable to the born criminal than to the madman.

How little Dr. Moreau has weighed the importance of ancient Greece in his discussion of this topic, appears from the omission of all facts supplied by Greek literature and history in the introduction to his Essay. He dilates upon the legends recorded by the Roman Emperors, because these seem to support his theory of hereditary malady. He uses Juvenal, Tacitus, Suetonius, and the Augustan Histories to support his position, although they form part of the annals of a people among whom "pæderasty was accepted and admitted." He ignores the biographies of the Spartan kings, the institutions of Crete, the Theban Sacred Band, the dialogues of Plato, the anecdotes related about Pheidias, Sophocles, Pindar, Demosthenes, Alcibiades, and so forth. Does he perhaps do so because they cannot in any way be made to square with his theory of morbidity? The truth is that ancient Greece offers insuperable difficulties to theorists who treat sexual inversion exclusively from the points of view of neuropathy, tainted heredity, and masturbation. And how incompetent Dr. Moreau is to deal with Greek matters may be seen in the grotesque synonym he has invented for pæderasty-_philopodie_ (p. 173). Properly the word is compounded of [Greek: philein] and [Greek: pous]; but I suppose it is meant to suggest [Greek: philein] and _podex_.

In a chapter on Legal Medicine, Moreau starts by observing that "The facts are so monstrous, so tainted with aberration, and yet their agents offer so strong an appearance of sound reason, occupy such respectable positions in the world, are reputed to enjoy such probity, such honourable sentiments, &c., that one hesitates to utter an opinion." Proceeding further, he considers it sufficiently established that: "Not unfrequently, under the influence of some vice of organism, generally of heredity, the moral faculties may undergo alterations, which, if they do not actually destroy the social relations of the individual, as happens in cases of declared insanity, yet modify them to a remarkable degree, and certainly demand to be taken into account, when we have to estimate the morality of these acts" (p. 301). His conclusion, therefore, is that the aberrations of the sexual sense, including its inversion, are matters for the physician rather than the judge, for therapeutics rather than punishment, and that representatives of the medical faculty ought to sit upon the bench as advisers or assessors when persons accused of outrages against decency come to trial. "While we blame and stigmatise these crimes with reason, the horrified intellect seeks an explanation and a moral excuse (nothing more) for such odious acts. It insists on asking what can have brought a man honourably known in society, enjoying (apparently at least) the fulness of his mental faculties, to these base and shameful self-indulgences. We answer: Such men for the most part are abnormal intelligences, veritable candidates for lunacy, and, what is more, they are the subjects of hereditary maladies. But let us cast a veil over a subject so humiliating to the honour of humanity!" (p. 177).

As the final result of this analysis, Moreau classifies sexual inversion with erotomania, nymphomania, satyriasis, bestiality, rape, profanation of corpses, &c., as the symptom of a grave lesion of the procreative sense. He seeks to save its victims from the prison by delivering them over to the asylum. His moral sentiments are so revolted that he does not even entertain the question whether their instincts are natural and healthy though abnormal. Lastly, he refuses to face the aspects of this psychological anomaly which are forced upon the student of ancient Hellas. He does not even take into account the fact, patent to experienced observers, that simple folk not unfrequently display no greater disgust for the abnormalities of sexual appetite than they do for its normal manifestations.[21]

Die krankhaften Erscheinungen des Geschlechtssinnes. B. Tarnowsky. Berlin, Hirschwald, 1886.

This is avowedly an attempt to distinguish the morbid kinds of sexual perversion from the merely vicious, and to enforce the necessity of treating the former not as criminal but as pathological. "The forensic physician discerns corruption, oversatiated sensuality, deep-rooted vice, perverse will, &c., where the clinical observer recognises with certainty a morbid condition of the patient marked by typical steps of development and termination. Where the one wishes to punish immorality, the other pleads for the necessity of methodical therapeutic treatment."

The author is a Russian, whose practice in St. Petersburg has brought him into close professional relations with the male prostitutes and habitual pæderasts of that capital.

He is able therefore to speak with authority, on the ground of a quite exceptional knowledge of the moral and physical disturbances connected with sodomy. I cannot but think that the very peculiarities of his experience have led him to form incomplete theories. He is too familiar with venal pathics, pædicators, and effeminates who prostitute their bodies in the grossest way, to be able to appreciate the subtler bearings of the problem.

Tarnowsky makes two broad divisions of sexual inversion. The first kind is inborn, dependent upon hereditary taint and neuropathic diathesis. He distinguishes three sorts of inborn perversity. In the most marked of its forms it is chronic and persistent, appearing with the earliest dawn of puberty, unmodified by education, attaining to its maximum of intensity in manhood, manifesting, in fact, all the signs of ordinary sexual inclination. In a second form it is not chronic and persistent, but periodical. The patient is subject to occasional disturbances of the nervous centres, which express themselves in violent and irresistible attacks of the perverted instinct. The third form is epileptical.

With regard to acquired sexual inversion, he dwells upon the influence of bad example, the power of imitation, fashion, corrupt literature, curiosity in persons jaded with normal excesses. Extraordinary details are given concerning the state of schools in Russia (pp. 63-65); and a particular case is mentioned, in which Tarnowsky himself identified twenty-nine passive pæderasts, between the ages of nine and fifteen, in a single school. He had been called in to pronounce upon the causes of an outbreak of syphilis among the pupils. Interesting information is also communicated regarding the prevalence of abnormal vice in St. Petersburg, where it appears that bath-men, cab-drivers, care-takers of houses, and artisans are particularly in request (pp. 98-101). The Russian people show no repugnance for what they call "gentlemen's tricks." Tarnowsky calls attention to ships, garrisons, prisons, as milieux well calculated for the development of this vice, when it had once been introduced by some one tainted with it. His view

about nations like the Greeks, the Persians, and the Afghans is that, through imitation, fashion, and social toleration, it has become endemic. But all the sorts of abnormality included under the title of acquired Tarnowsky regards as criminal. The individual ought, he thinks, to be punished by the law. He naturally includes under this category of acquired perversion the vices of old debauchees. At this point, however, his classification becomes confused; for he shows how senile tendencies to sodomitic passion are frequently the symptom of approaching brain disease, to which the reason and the constitution of the patient will succumb. French physicians call this "la pédérastie des ramollis."

Returning to what Tarnowsky says about the inborn species of sexual inversion, I may call attention to an admirable description of the type in general (pp. 11-15) I think, however, that he lays too great stress upon the passivity of the emotions in these persons, their effeminacy of press, habits, inclinations. He is clearly speaking from large experience. So it must be supposed that he has not come across frequent instances of men who feel, look, and act like men, the only difference between them and normal males being that they love their own sex. In describing a second degree of the aberration (pp. 16, 17), he still accentuates effeminacy in dress and habits beyond the point which general observation would justify. Careful study of the cases adduced in Krafft-Ebing's "Psychopathia" supplies a just measure for the criticism of Tarnowsky upon this head. From them we learn that effeminacy of physique and habit is by no means a distinctive mark of the born pæderast. Next it may be noticed that Tarnowsky believes even innate and hereditary tendencies can be modified and overcome by proper moral, and physique discipline in youth, and that the subjects of them will even be brought to marry in some cases (pp. 17, 18).

It would not serve any purpose of utility here to follow Tarnowsky into further details regarding the particular forms assumed by perverted appetite. But attention must be directed to his definition of hereditary predisposition (pp. 33-35). This is extraordinarily wide. He regards every disturbance of the nervous system in an ancestor as sufficient; epilepsy, brain disease, hysteria, insanity. He includes alcoholism, syphilitic affections, pneumonia, typhus, physical exhaustion, excessive anæmia, debauchery, "anything in short which is sufficient to enfeeble the nervous system and the sexual potency of the parent." At this point he remarks that long residence at high altitudes tends to weaken the sexual activity and to develop perversity, adducing an old belief of the Persians that pæderastia originated in the high plateau of Armenia (p. 35). It need hardly, I think, be said that these theories are contradicted to the fullest extent by the experience of those who have lived with the mountaineers of Central Europe. They are indeed capable of continence to a remarkable degree, but they are also vigorously procreative and remarkably free from sexual inversion.

Finally, it must be observed that Tarnowsky discusses the physical signs of active and passive sodomy at some length (108-135). His opportunities of physical observation in medical practice as the trusted physician of the St. Petersburg pæderasts gives him the right to speak with authority. The most decisive thing he says is that Casper, through want of familiarity with the phenomena, is too contemptuous toward one point in Tardieu's theory. In short, Tarnowsky feels sure that a habitual passive pæderast will show something like the sign in question, if examined by an expert in the proper position. But that is the only deformation of the body on which he relies.

Psychopathia Sexualis, mit besonderer Berücksichtigung der Conträren Sexualempfindung. Von Dr. R. v. Krafft-Ebing. Stuttgart, Enke, 1889.

Krafft-Ebing took the problem of sexual inversion up when it had been already investigated by a number of pioneers and predecessors. They mapped the ground out, and established a kind of psychical chart. We have seen the medical system growing in the works of Moreau and Tarnowsky. If anything, Krafft-Ebing's treatment suffers from too much subdivision and parade of classification. It is only, however, by following the author in his differentiation of the several species that we can form a conception of his general theory, and of the extent of the observations upon which this is based. He starts with (A) Sexual Inversion as an acquired morbid phenomenon. Then he reviews (B) Sexual Inversion as an inborn morbid phenomenon.

(A) "Sexual feeling and sexual instinct," he begins, "remain latent, except in obscure foreshadowings and impulses, until the time when the organs of procreation come to be developed. During the period of latency, when sex has not arrived at consciousness, is only potentially existent, and has no powerful organic bias, influences may operate, injurious to its normal and natural evolution. In that case the germinating sexual sensibility runs a risk of being both qualitatively and quantitatively impaired, and under certain circumstances may even be perverted into a false channel. Tarnowsky has already published this experience. I can thoroughly confirm it, and am prepared to define the conditions of this acquired, or, in other words, this cultivated perversion of the sexual instinct in the following terms. The fundamental or ground predisposition is a neuropathic hereditary bias. The exciting or efficient cause is sexual abuse, and more particularly onanism. The etiological centre of gravity has to be sought in hereditary disease; _and I think it is questionable whether an untainted individual is capable of homosexual feelings at all_."[22]

Krafft-Ebing's theory seems then to be that all cases of acquired sexual inversion may be ascribed in the first place to morbid predispositions inherited by the patient (_Belastung_), and in the second place to onanism as the exciting cause of the latent neuropathic ailment.

He excludes the hypothesis of a physiological and healthy deflection from the normal rule of sex. "I think it questionable," he says, "whether the untainted individual (_das unbelastete Individuum_) is capable of homosexual feelings at all." The importance of this sentence will be apparent when we come to deal with Krafft-Ebing's account of congenital sexual inversion, which he establishes upon a large induction of cases observed in his own practice.

For the present we have the right to assume that Krafft-Ebing regards sexual inversion, whether "acquired" or "congenital," as a form of inherited neuropathy (_Belastung_). In cases where it seems to be "acquired," he lays stress upon the habit of self-pollution.

This is how he states his theory of onanism as an exciting cause of inherited neuropathy, resulting in sexual inversion. The habit of self-abuse prepares the patient for abnormal appetites by weakening his nervous force, degrading his sexual imagination, and inducing hyper-sensibility in his sexual apparatus. Partial impotence is not unfrequently exhibited. In consequence of this sophistication of his nature, the victim of inherited neuropathy and onanism feels shy with women, and finds it convenient to frequent persons of his own sex. In other words, it is supposed to be easier for an individual thus broken down at the centres of his life to defy the law and to demand sexual gratification from men than to consort with venal women in a brothel.

Krafft-Ebing assumes that males who have been born with neuropathic ailments of an indefinite kind will masturbate, destroy their virility, and then embark upon a course of vice which offers incalculable dangers, inconceivable difficulties, and inexpressible repugnances. That is the theory. But whence, if not from some overwhelming appetite, do the demoralised victims of self-abuse derive courage for facing the obstacles which a career of sexual inversion carries with it in our civilisation? One would have thought that such people, if they could not approach a prostitute in a brothel, would have been unable to solicit a healthy man upon the streets. The theory seems to be constructed in order to elude the fact that the persons designated are driven by a natural impulse into paths far more beset with difficulties than those of normal libertines.

Krafft-Ebing gives the details of five cases of "acquired" sexual inversion. Three of these were the children of afflicted parents. One had no morbid strain in his ancestry, except pulmonary consumption. The fifth sprang from a strong father and a healthy mother. Masturbation entered into the history of all.

It must be observed, in criticising Krafft-Ebing's theory, that it is so constructed as to render controversy almost impossible. If we point out that a large percentage of males who practise onanism in their adolescence do not acquire sexual inversion, he will answer that these were not tainted with hereditary disease. The autobiographies of onanists and passionate woman-lovers (J. J. Rousseau, for example, who evinced a perfect horror of homosexual indulgence, and J. J. Bouchard, whose disgusting excentricities were directed toward females even in the period of his total impotence) will be dismissed with the remark that the ancestors of these writers must have shown a clean record.

It is difficult to square Krafft-Ebing's theory with the phenomena presented by schools, both public and private, in all parts of Europe. In these institutions not only is masturbation practised to a formidable extent, but it is also everywhere connected with some form of sexual inversion, either passionately Platonic or grossly sensual. Nevertheless, we know that few of the boys addicted to these practices remain abnormal after they have begun to frequent women. The same may be said about convict establishments, military prisons, and the like.[23] With such a body of facts staring us in the face, it cannot be contended that "only tainted individuals are capable of homosexual feelings." Where females are absent or forbidden, males turn for sexual gratification to males. And in certain conditions of society sexual inversion may become permanently established, recognised, all but universal. It would be absurd to maintain that all the boy-lovers of ancient Greece owed their instincts to hereditary neuropathy complicated with onanism.

The invocation of heredity in problems of this kind is always hazardous. We only throw the difficulty of explanation further back. At what point of the world's history was the morbid taste acquired? If none but tainted individuals are capable of homosexual feelings, how did these feelings first come into existence? On the supposition that neuropathy forms a necessary condition of abnormal instinct, is it generic neuropathy or a specific type of that disorder? If generic, can valid reasons be adduced for regarding nervous malady in any of its aspects (hysteria is the mother, insanity is the father) as the cause of so peculiarly differentiated an affection of the sexual appetite? If specific, that is, if the ancestors of the patient must have been afflicted with sexual inversion, in what way did

they acquire it, supposing all untainted individuals to be incapable of the feeling?

At this moment of history there is probably no individual in Europe who has not inherited some portion of a neuropathic stain. If that be granted, everybody is liable to sexual inversion, and the principle of heredity becomes purely theoretical.

That sexual inversion may be and actually is transmitted, like any other quality, appears to be proved by the history of well-known families both in England and in Germany. That it is not unfrequently exhibited by persons who have a bad ancestral record, may be taken for demonstrated. In certain cases we are justified, then, in regarding it as the sign or concomitant of nervous maladies. But the evidence of ancient Greece or Rome, of what Burton calls the "sotadic races" at the present time, of European schools and prisons, ought to make us hesitate before we commit ourselves to Krafft-Ebing's theory that hereditary affliction is a necessary predisposing cause.[24]

In like manner, masturbation may be credited with certain cases of acquired homosexual feeling. Undoubtedly the instinct is occasionally evoked in some obscure way by the depraved habit of inordinate self-abuse. Yet the autobiographies of avowed Urnings do not corroborate the view that they were originally more addicted to onanism than normal males. Ulrichs has successfully combated the theory advanced by Tarnowsky, Prager, and Krafft-Ebing, if considered as a complete explanation of the problem.[25] On the other hand, common experience shows beyond all doubt, that young men between 16 and 20 give themselves up to daily self-abuse without weakening their appetite for women. They love boys and practice mutual self-abuse with persons of their own sex; yet they crave all the while for women. Of the many who live thus during the years of adolescence, some have undoubtedly as bad a family record as the worst of Krafft-Ebing's cases show. Finally, as regards the onanism which is a marked characteristic of some adult Urnings, this must be ascribed in most cases to the repression of their abnormal instincts. They adopt the habit, as Krafft-Ebing himself says, _faute de mieux_.[26]

In justice to the theory I am criticising, it ought to be remarked that Krafft-Ebing does not contend that wherever hereditary taint and onanism concur, the result will be sexual inversion; but rather that wherever we have diagnosed an acquired form of sexual inversion, we shall discover hereditary taint and onanism. Considering the frequency of both hereditary taint and onanism in our civilisation, this is not risking much. Those factors are discoverable in a large percentage of male persons. What seems unwarranted by facts is the suggestion that inherited neuropathy is an indispensable condition and the fundamental cause of homosexual instincts. The evidence of ancient Greece, schools, prisons, and sotadic races, compels us to believe that normally healthy people are often born with these instincts or else acquire them by the way of custom. Again, his insinuation that onanism, regarded as the main exciting cause, is more frequent among young people of abnormal inclinations than among their normal brethren, will not bear the test of common observation and of facts communicated in the autobiographies of professed onanists and confessed Urnings.

The problem is too delicate, too complicated, also too natural and simple, to be solved by hereditary disease and self-abuse. When we shift the ground of argument from acquired to inborn sexual inversion, its puzzling character will become still more apparent. We shall hardly be able to resist the conclusion that theories of disease are incompetent to explain the phenomenon in modern Europe. Medical writers abandon the phenomenon in savage races, in classical antiquity, and in the sotadic zone. They strive to isolate it as an abnormal and specifically morbid exception in our civilisation. But facts tend to show that it is a recurring impulse of humanity, natural to some people, adopted by others, and in the majority of cases compatible with an otherwise normal and healthy temperament.

Krafft-Ebing calls attention to the phenomenon of permanent _effeminatio_, in males unsexed by constant riding and the exhaustion of their virility by friction of the genitals--a phenomenon observed by Herodotus among Scythians, and prevalent among some nomadic races of the Caucasus at the present day.[27] He claims this in support of his theory of masturbation; and within due limits, he has the right to do so. The destruction of the male apparatus for reproduction, whether it be by castration after puberty, or by an accident to the parts, or by a lesion of the spine, or by excessive equitation, as appears proved from the history of nomad tribes, causes men to approximate physically to the female type, and to affect feminine occupations and habits. In proportion as the masculine functions are interfered with, masculine characteristics tend to disappear; and it is curious to notice that the same result is reached upon so many divers ways.

Next he discusses a few cases in which it seems that sexual inversion displays itself episodically under the conditions of a psychopathical disturbance.[28] That is to say, three persons, two women and one man, have been observed by him, under conditions approaching mental alienation, to exchange their normal sexual inclination for abnormal appetite. In the analysis of the

problem these cases cannot be regarded as wholly insignificant. The details show that the subjects were clearly morbid. Therefore they have their value for the building up of a theory of sexual inversion upon the basis of inherited and active disease.

(B) Ultimately, Krafft-Ebing attacks the problem of what he calls "the innate morbid phenomenon" of sexual inversion.[29] While giving a general description of the subjects of this class, he remarks that the males display a pronounced sexual antipathy for women, and a strongly accentuated sympathy for men. Their reproductive organs are perfectly differentiated on the masculine type; but they desire men instinctively, and are inclined to express their bias by assuming characters of femininity. Women infected by a like inversion, exhibit corresponding anomalies.

Casper, continues Krafft-Ebing, thoroughly diagnosed the phenomenon. Griesinger referred it to hereditary affliction. Westphal defined it as "a congenital inversion of the sexual feeling, together with a consciousness of its morbidity." Ulrichs explained it by the presence of a feminine soul in a male body, and gave the name _Urning_[30] to its subjects. Gley suggested that a female brain was combined with masculine glands of sex. Magnan hypothesised a woman's brain in a man's body.

Krafft-Ebing asserts that hardly any of these Urnings are conscious of morbidity. They look upon themselves as unfortunate mainly because law and social prejudices stand in the way of their natural indulgence.[31] He also takes for proved, together with all the authorities he cites, that the abnormal sexual appetite is constitutional and inborn.

Krafft-Ebing, as might have been expected, refers the phenomenon to functional degeneration, dependent upon neuropathical conditions in the patient, which are mainly derived from hereditary affliction.

He confirms the account reported above from Casper as to the platonic or semi-platonic relations of the Urning with the men he likes, his abhorrence of coition, and his sexual gratification through acts of mutual embracement. The number of Urnings in the world, he says, is far greater than we can form the least conception of from present means of calculation.

At this point he begins to subdivide the subjects of congenital inversion. The first class he constitutes are called by him "Psychical Hermaphrodites." Born with a predominant inclination towards persons of their own sex, they possess rudimentary feelings of a semi-sexual nature for the opposite. These people not unfrequently marry; and Krafft-Ebing supposes that many cases of frigidity in matrimony, unhappy unions, and so forth, are attributable to the peculiar diathesis of the male--or it may be, of the female--in these marriages. They are distinguished from his previous class of "acquired" inversion by the fact that the latter start with instincts for the other sex, which are gradually obliterated; whereas the psychical hermaphrodites commence life with an attraction towards their own sex, which they attempt to overcome by making demands upon their rudimentary normal instincts. Five cases are given of such persons.[32]

In the next place he comes to true homosexual individuals, or Urnings in the strict sense of that phrase. With them there is no rudimentary appetite for the other sex apparent. They present a "grotesque" parallel to normal men and women, inverting or caricaturing natural appetites. The male of this class shrinks from the female, and the female from the male.[33] Each is vehemently attracted from earliest childhood to persons of the same sex. But they, in their turn, have to be subdivided into two sub-species. In the first of these, the sexual life alone is implicate; the persons who compose it do not differ in any marked or external characteristics from the type of their own sex; their habits and outward appearance remain unchanged. With the second sub-species the case is different. Here the character, the mental constitution, the habits, and the occupations of the subject have been altered by his or her predominant sexual inversion; so that a male addicts himself to a woman's work, assumes female clothes, acquires a shriller key of voice, and expresses the inversion of his sexual instinct in every act and gesture of his daily life.

It appears from Krafft-Ebing's recorded cases that the first of these sub-species yields nearly the largest number of individuals. He presents eleven detailed autobiographies of male Urnings, in whom the _vita sexualis_ alone is abnormal, and who are differentiated to common observation from normal men by nothing but the nature of their amorous proclivities. The class includes powerfully developed masculine beings, who are unsexed in no particular except that they possess an inordinate appetite for males, and will not look at females.

As regards the family history of the eleven selected cases, five could show a clear bill of health, some were decidedly bad, a small minority were uncertain.

One of these Urnings, a physician, informed Krafft-Ebing that he had consorted with at least six hundred men of his own stamp; many of them in high positions of respectability. In none had he observed an abnormal formation of the sexual organs; but frequently some approximation to the feminine type of body--hair sparingly distributed[34], tender complexion, and high tone of

voice. About ten per cent. eventually adopted love for women. Not ten per cent. exhibited any sign of the _habitus muliebris_ in their occupations, dress, and so forth. A large majority felt like men in their relations to men, and were even inclined toward active pæderasty. From the unmentionable act they were deterred by æsthetical repulsion and fear of the law.

The second of these sub-species embraces the individuals with whom the reader of Carlier is familiar, and whom Ulrichs calls Weiblinge. In their boyhood they exhibited a marked disinclination for the games of their school-fellows, and preferred to consort with girls. They helped their mothers in the household, learned to sew and knit, caught at every opportunity of dressing up in female clothes. Later on, they began to call themselves by names of women, avoided the society of normal comrades, hated sport and physical exercise, were averse to smoking and drinking, could not whistle. Whether they refrained from swearing is not recorded. Many of them developed a taste for music, and prided themselves upon their culture. Eventually, when they became unclassed, they occupied themselves with toilette, scandal, tea, and talk about their lovers--dressed as far as possible in female clothes, painted, perfumed and curled their hair--addressed each other in the feminine gender, adopted pseudonyms of Countess or of Princess, and lived the life of women of a dubious demi-monde.[35]

Yet they remained in their physical configuration males. Unlike the preceding sub-species, they did not feel as men feel towards their sweethearts, but on the contrary like women. They had no impulse toward active pæderasty, no inclination for blooming adolescents. What they wanted was a robust adult; and to him they submitted themselves with self-abandonment. Like all Urnings, they shrank from the act of coition for the most part, and preferred embracements which produced a brief and pleasurable orgasm. But some developed a peculiar liking for the passive act of sodomy or the anomalous act of fellatio.

In this characterisation I have overpassed the limits of the fifteen cases presented by Krafft-Ebing. In order to constitute the type, I have drawn upon one reliable, because sympathetic, source in Ulrichs, and on another reliable, because antipathetic, source in Carlier.

Sexual inversion, in persons of the third main species, has reached its final development. Descending, if we follow Krafft-Ebing's categories, from acquired to innate inversion, dividing the latter into psychopathic hermaphrodites and Urnings, subdividing Urnings into those who retain their masculine habit and those who develop a habit analogous to that of females, we come in this last class to the most striking phenomenon of inverted sex. Here the soul which is doomed to love a man, and is nevertheless imprisoned in a male body, strives to convert that body to feminine uses so entirely that the marks of sex, except in the determined organs of sex, shall be obliterated. And sometimes it appears that the singular operation of nature, with which we are occupied in this Essay, goes even further. The inverted bias given to the sexual appetite, as part of the spiritual nature of the man, can never quite transmute male organs into female organs of procreation. But it modifies the bony structure of the body, the form of the face, the fleshly and muscular integuments to such an obvious extent that Krafft-Ebing thinks himself justified in placing a separate class of androgynous beings (with their gynandrous correspondents) at the end of the extraordinary process.

At this point it will be well to present a scheme of his analysis under the form of a table.

{ Persistent. { Acquired { { { Episodical. { Sexual Inversion { { Psychopathic Hemaphrodites. { { { { { Male Habitus { { { (Mannlinge). { Congenital { Urnings { { { Female Habitus { { (Weiblinge). { { Androgyni.

What is the rational explanation of the facts presented to us by the analysis which I have formulated in this table cannot as yet be thoroughly determined. We do not know enough about the law of sex in human beings to advance a theory. Krafft-Ebing and writers of his school are at present inclined to refer them all to diseases of the nervous centres, inherited, congenital, excited by early habits of self-abuse. The inadequacy of this method I have already attempted to set forth; and I have also called attention to the fact that it does not sufficiently account for phenomena known to us through history and through every-day experience.

Presently we shall be introduced to a theory (that of Ulrichs) which is based upon a somewhat grotesque and metaphysical conception of nature, and which dispenses with the hypothesis of hereditary disease. I am not sure whether this theory, unsound as it may seem to medical specialists, does not square better with ascertained facts than that of inherited disorder in the nervous centres.

However that may be, the physicians, as represented by Krafft-Ebing, absolve all subjects of inverted sexuality from crime. They represent them to us as the subjects of ancestral malady. And this alters their position face to face with vulgar error, theological rancour, and the stringent indifference of legislators. A strong claim has been advanced for their treatment henceforth, not as delinquents, but as subjects of congenital depravity in the brain centres, over which they have no adequate control.

The fourth medical author, with whom we are about to be occupied, includes sexual inversion in his general survey of human crime, and connects it less with anomalies of the nervous centres than with atavistic reversion to the state of nature and savagery. In the end, it will be seen, he accepts a concordat with the hypothesis of "moral insanity."

Cesare Lombroso. "_Der Verbrecher in Anthropologischer, Aerztlicher und Juristischer Beziehung._"

This famous book, which has contributed no little to a revolution of opinion regarding crime and its punishment in Italy, contains a searching inquiry into the psychological nature, physical peculiarities, habits, and previous history of criminals.[36] It is, in fact, a study of the criminal temperament. Lombroso deals in the main, as is natural, with murder, theft, rape, cruelty, and their allied species. But he includes sexual inversion in the category of crimes, and regards the abnormal appetites as signs of that morbid condition into which he eventually revolves the criminal impulse.

Wishing to base his doctrine on a sound foundation, Lombroso begins with what may be termed the embryology of crime. He finds unnatural vices frequent among horses, donkeys, cattle, insects, fowls, dogs, ants. The phenomenon, he says, is usually observable in cases where the male animal has been excluded from intercourse with females. Having established his general position that what we call crimes of violence, robbery, murder, cruelty, blood-thirst, cannibalism, unnatural lust, and so forth, exist among the brutes--in fact, that most of these crimes form the rule and not the exception in their lives--he passes on to the consideration of the savage man. In following his analysis, I shall confine myself to what he says about abnormal sexual passion.

He points out that in New Caledonia the male savages meet together at night in huts for the purpose of promiscuous intercourse (p. 42). The same occurs in Tahiti, where the practice is placed under the protection of a god. Next he alludes to the ancient Mexicans; and then proceeds to Hellas and Rome, where this phase of savage immorality survived and became a recognised factor in social life (p. 43). At Rome, he says, the Venus of the sodomites received the title of Castina (p. 38).

Lombroso's treatment of sexual inversion regarded as a survival from prehistoric times is by no means exhaustive. It might be supplemented and confirmed by what we know about the manners of the Kelts, as reported by Aristotle (Pol. ii. 6. 5.)--Tartars, Persians, Afghans, North American Indians, &c. Diodorus Siculus, writing upon the morals of the Gauls, deserves attention in this respect.[37] It is also singular to find that the Norman marauders of the tenth century carried unnatural vices wherever they appeared in Europe.[38] The Abbot of Clairvaux, as quoted by Lombroso (p. 43), accused them of spreading their brutal habits through society. People accustomed to look upon these vices as a form of corruption in great cities will perhaps be surprised to find them prevalent among nomadic and warlike tribes. But, in addition to survival from half-savage periods of social life, the necessities of warriors thrown together with an insufficiency of women must be considered. I have already suggested that Greek love grew into a custom during the Dorian migration and the conquest of Crete and Peloponnesus by bands of soldiers.

Cannibalism, Lombroso points out (p. 68), originated in necessity, became consecrated by religion, and finally remained as custom and a form of gluttony. The same process of reasoning, when applied to sexual aberrations, helps us to understand how a non-ethical habit, based on scarcity of women, survived as a social and chivalrous institution among the civilised Hellenes.

Lombroso traces the growth of justice in criminal affairs, and the establishment of pains and penalties, up to the instinct of revenge and the despotic selfishness of chiefs in whom the whole property of savage tribes, including women, was vested. This section of his work concludes with the following remarkable sentence (p. 96): "The universal diffusion of crime which we have demonstrated at a certain remote epoch, and its gradual disappearance as a consequence of new crimes springing up, traces of which are still discoverable in our penal codes [he means revenge, the egotism of princes, and ecclesiastical rapacity], are calculated even more than the criminality of brutes to make us doubt of what metaphysicians call eternal justice, and indicate the real cause of the perpetual reappearance of crime among civilised races, namely atavism."

Having established this principle, Lombroso proceeds to trace the atavism of criminality in children. He shows that just as the human embryo passes through all forms of lower lives, so men and women in their infancy exactly reproduce the moral type of savages. Ungovernable rage, revengeful instincts, jealousy, envy, lying, stealing, cruelty, laziness, vanity, sexual proclivities, imperfect family affections, a general bluntness of the ethical sense, are common qualities of children, which the parent and the teacher strive to control or to eradicate by training. "The child, considered as a human being devoid of moral sense, presents a perfect picture of what doctors call moral insanity, and I prefer to classify as inborn crime" (p. 97). "All species of anomalous sexual appetite, with the exception of those dependent upon senile decadence, make their appearance in childhood, together with the other criminal tendencies" (p. 117).

Lombroso arrives, then, at the conclusion that what civilised humanity calls crime and punishes, is the law of nature in brutes, persists as a normal condition among savages, and displays itself in the habits and instincts of children. The moral instinct is therefore slowly elaborated out of crime in the course of generations by whole races, and in the course of infancy and adolescence in the individual. The habitual criminal, who remains a criminal in his maturity, in whom crime is inborn and ineradicable, who cannot develop a moral sense, he explains at first by atavism. A large section of his volume (pp. 124-136, 137-253) is devoted to anthropometrical observations upon the physical structure, the cranial and cerebral development, and the physiognomy of such criminals. Into this part of his work we need not enter. Nor is it necessary to follow his interesting researches in the biology and psychology of "born criminals"--chapters on tattooing, ways of thinking and feeling, passions, tendencies to suicide, religious sentiment, intelligence and culture, capacity of self-control, liability to relapse, and so forth. Many curious facts relating to sexual inversion are treated in the course of these enquiries; and one passage describing the general characteristics of pæderasts (p. 376) ought to be alluded to. Considering this subject solely as a phase of crime, Lombroso reveals a superficial conception of its perplexity.

It is more important to reflect upon his theory of crime in general. Having started with the hypothesis of atavism, and adopted the term "born criminal," he later on identifies "innate crime" with "moral insanity," and illustrates both by the phenomena of epilepsy.[39] This introduces a certain confusion and incoherence into his speculative system; for he frankly admits that he has only gradually and tardily been led to recognise the identity of what is called crime and what is called moral insanity. Criminal atavism might be defined as the sporadic reversion to savagery in certain individuals. It has nothing logically to connect it with distortion or disease--unless we assume that all our savage ancestors were malformed or diseased, and that the Greeks, in whom one form of Lombroso's criminal atavism became established, were as a nation morally insane. The appearance of structural defects in habitual criminals points less to atavistic reversion than to radical divergence from the normal type of humanity. In like manner the invocation of heredity as a principle (p. 135) involves a similar confusion. Hereditary taint is a thing different not in degree but in kind from savage atavism prolonged from childhood into manhood.

Be this as it may, whether we regard offenders against law and ethic as "born criminals," or as "morally insane," or whether we transcend the distinction implied in these two terms, Lombroso maintains that there is no good in trying to deal with them by punishment. They ought to be treated with life-long sequestration in asylums (p. 135), and rigidly forbidden to perpetuate the species. That is the conclusion to which the whole of his long argument is carried. He contends that the prevalent juristic conception of crime rests upon ignorance of nature, brute-life, savagery, and the gradual emergence of morality. So radical a revolution in ideas, which gives new meaning to the words sin and conscience, which removes moral responsibility, and which substitutes the anthropologist and the physician for the judge and jury, cannot be carried out, even by its fervent apostle, without some want of severe logic. Thus we find Lombroso frequently drawing distinctions between "habitual" or "born" criminals and what he calls "occasional" criminals, without explaining the phenomenon of "occasional crime," and saying how he thinks this ought to be regarded by society. Moreover, he almost wholly ignores the possibility of correcting criminal tendencies by appeal to reason, by establishing habits of self-restraint, and by the employment of such means as hypnotic suggestion.[40] Yet experience and the common practice of the world prove that these remedies are not wholly inefficacious; and indeed the passage from childish savagery to moralised manhood, on which he lays so great a stress, is daily effected by the employment of such measures in combination with the fear of punishment and the desire to win esteem.

The final word upon Lombroso's book is this: Having started with the natural history of crime, as a prime constituent in nature and humanity, which only becomes crime through the development of social morality, and which survives atavistically in persons ill adapted to their civilised environment, he suddenly turns round and identifies the crime thus analysed with morbid nerve-conditions, malformations and moral insanity. Logically, it is impossible to effect this coalition of two radically different conceptions. If crime was not crime but nature in the earlier stages, and only appeared as crime under the conditions of advancing culture, its manifestation as a survival in certain individuals ought to be referred to nature, and cannot be relegated to the category of physical or mental disease. Savages are savages, but not lunatics or epileptics.

NOTE TO THE FOREGOING SECTION.

At the close of this enquiry into medical theories of sexual inversion, all of which assume that the phenomenon is morbid, it may not be superfluous to append the protest of an Urning against that solution of the problem. I translate it from the original document published by Krafft-Ebing (pp. 216-219). He says that the writer is "a man of high position in London"; but whether the communication was made in German or in English, does not appear.

"You have no conception what sustained and difficult struggles we all of us (the thoughtful and refined among us most of all) have to carry on, and how terribly we are forced to suffer under the false opinions which still prevail regarding us and our so-called immorality.

"Your view that, in most cases, the phenomenon in question has to be ascribed to congenital morbidity, offers perhaps the easiest way of overcoming popular prejudices, and awakening sympathy instead of horror and contempt for us poor 'afflicted' creatures.

"Still, while I believe that this view is the most favourable for us in the present state of things, I am unable in the interest of science to accept the term _morbid_ without qualification, and venture to suggest some further distinctions bearing on the central difficulties of the problem.

"The phenomenon is certainly anomalous; but the term _morbid_ carries a meaning which seems to me inapplicable to the subject, or at all events to very many cases which have come under my cognisance. I will concede _à priori_ that a far larger proportion of mental disturbance, nervous hyper-sensibility, &c., can be proved in Urnings than in normal men. But ought this excess of nervous erethism to be referred necessarily to the peculiar nature of the Urning? Is not this the true explanation, in a vast majority of cases, that the Urning, owing to present laws and social prejudices, cannot like other men obtain a simple and easy satisfaction of his inborn sexual desires?

"To begin with the years of boyhood: an Urning, when he first becomes aware of sexual stirrings in his nature, and innocently speaks about them to his comrades, soon finds that he is unintelligible. So he wraps himself within his own thoughts. Or should he attempt to tell a teacher or his parents about these feelings, the inclination, which for him is as natural as swimming to a fish, will be treated by them as corrupt and sinful; he is exhorted at any cost to overcome and trample on it. Then there begins in him a hidden conflict, a forcible suppression of the sexual impulse; and in proportion as the natural satisfaction of his craving is denied, fancy works with still more lively efforts, conjuring up those seductive pictures which he would fain expel from his imagination. The more energetic is the youth who has to fight this inner battle, the more seriously must his whole nervous system suffer from it. It is this forcible suppression of an instinct so deeply rooted in our nature, it is this, in my humble opinion, which first originates the morbid symptoms, that may often be observed in Urnings. But such consequences have nothing in themselves to do with the sexual inversion proper to the Urning.

"Well then; some persons prolong this never-ending inner conflict, and ruin their constitutions in course of time; others arrive eventually at the conviction that an inborn impulse, which exists in them so powerfully, cannot possibly be sinful--so they abandon the impossible task of suppressing it. But just at this point begins in real earnest the Iliad of their sufferings and constant nervous excitations. The normal man, if he looks for means to satisfy his sexual inclinations, knows always where to find that without trouble. Not so the Urning. He sees the men who attract him; he dares not utter, nay, dares not even let it be perceived, what stirs him. He imagines that he alone of all the people in the world is the subject of emotions so eccentric. Naturally, he cultivates the society of young men, but does not venture to confide in them. So at last he is driven to seek some relief in himself, some makeshift for the satisfaction he cannot obtain. This results in masturbation, probably excessive, with its usual pernicious consequences to health. When, after the lapse of a certain time, his nervous system is gravely compromised, this morbid phenomenon ought not to be ascribed to sexual inversion in itself; far rather we have to regard it as the logical issue of the Urning's position, driven as he is by dominant opinion to forego the gratification which _for him_ is natural and normal, and to betake himself to onanism.

"But let us now suppose that the Urning has enjoyed the exceptional good-fortune of finding upon his path in life a soul who feels the same as he does, or else that he has been early introduced by some initiated friend into the circles of the Urning-world. In this case, it is possible that he will have escaped many painful conflicts; yet a long series of exciting cares and anxieties attend on every step he takes. He knows indeed now that he is by no means the only individual in the world who harbours these abnormal emotions; he opens his eyes, and marvels to discover how numerous are his comrades in all social spheres and every class of industry; he also soon perceives that Urnings, no less than normal men and women, have developed prostitution, and that male strumpets can be bought for money just as easily as females. Accordingly, there is no longer any difficulty for him in gratifying his sexual impulse. But how differently do things develop themselves in his case! How far less fortunate is he than normal man!

"Let us assume the luckiest case that can befall him. The sympathetic friend, for whom he has been sighing all his life, is found. Yet he cannot openly give himself up to this connection, as a young fellow does with the girl he loves. Both of the comrades are continually forced to hide their _liaison_; their anxiety on this point is incessant; anything like an excessive intimacy, which could arouse suspicion (especially when they are not of the same age, or do not belong to the same class in society), has to be

concealed from the external world. In this way, the very commencement of the relation sets a whole chain of exciting incidents in motion: and the dread lest the secret should be betrayed or divined, prevents the unfortunate lover from ever arriving at a simple happiness. Trifling circumstances, which would have no importance for another sort of man, make him tremble: lest suspicion should awake, his secret be discovered, and he become a social outcast, lose his official appointment, be excluded from his profession. Is it conceivable that this incessant anxiety and care should pass over him without a trace, and not react upon his nervous system?

"Another individual, less lucky, has not found a sympathetic comrade, but has fallen into the hands of some pretty fellow, who at the outset readily responded to his wishes, till he drew the very deepest secret of his nature forth. At that point the subtlest methods of blackmailing begin to be employed. The miserable persecuted wretch, placed between the alternative of paying money down or of becoming socially impossible, losing a valued position, seeing dishonour bursting upon himself and family, pays, and still the more he pays, the greedier becomes the vampire who sucks his life-blood, until at last there lies nothing else before him except total financial ruin or disgrace. Who will be astonished if the nerves of an individual in this position are not equal to the horrid strain?

"In some cases the nerves give way altogether: mental alienation sets in; at last the wretch finds in a madhouse that repose which life would not afford him. Others terminate their unendurable situation by the desperate act of suicide. How many unexplained cases of suicide in young men ought to be ascribed to this cause!

"I do not think I am far wrong when I maintain that at least half of the suicides of young men are due to this one circumstance. Even in cases where no merciless blackmailer persecutes the Urning, but a connection has existed which lasted satisfactorily on both sides, still in these cases even discovery, or the dread of discovery, leads only too often to suicide. How many officers, who have had connection with their subordinates, how many soldiers, who have lived in such relation with a comrade, when they thought they were about to be discovered, have put a bullet through their brains to avoid the coming disgrace! And the same thing might be said about all the other callings in life.

"In consequence of all this, it seems clear that if, as a matter of fact, mental abnormalities and real disturbances of the intellect are commoner with Urnings than in the case of other men, this does not establish an inevitable connection between the mental eccentricity and the Urning's specific temperament, or prove that the latter causes the former. According to my firm conviction, mental disturbances and morbid symptoms which may be observed in Urnings ought in the large majority of instances not to be referred to their sexual anomaly; the real fact is that they are educed in them by the prevalent false theory of sexual inversion, together with the legislation in force against Urnings and the reigning tone of public opinion. It is only one who has some approximate notion of the mental and moral sufferings, of the anxieties and perturbations, to which an Urning is exposed, who knows the never-ending hypocrisies and concealments he must practise in order to cloak his indwelling inclination, who comprehends the infinite difficulties which oppose the natural satisfaction of his sexual desire--it is only such a one, I say, who is able properly to wonder at the comparative rarity of mental aberrations and nervous ailments in the class of Urnings. The larger proportion of these morbid circumstances would certainly not be developed if the Urning, like the normal man, could obtain a simple and facile gratification of his sexual appetite, and if he were not everlastingly exposed to the torturing anxieties I have attempted to describe."

This is powerfully and temperately written. It confirms what I have attempted to establish while criticising the medical hypothesis; and raises the further question whether the phenomenon of sexual inversion ought not to be approached from the point of view of embryology rather than of psychical pathology. In other words, is not the true Urning to be regarded as a person born with sexual instincts improperly correlated to his sexual organs? This he can be without any inherited or latent morbidity; and the nervous anomalies discovered in him when he falls at last beneath the observation of physicians, may be not the evidence of an originally tainted constitution, but the consequence of unnatural conditions to which he has been exposed from the age of puberty.

VI.

LITERATURE--HISTORICAL, ANTHROPOLOGICAL.

No one has yet attempted a complete history of inverted sexuality in all ages and in all races. This would be well worth doing. Materials, though not extremely plentiful, lie to hand in the religious books and codes of ancient nations, in mythology and poetry and literature, in narratives of travel, and the reports of observant explorers.

Gibbon once suggested that: "A curious dissertation might be formed on the introduction of pæderasty after the time of Homer, its progress among the Greeks of Asia and Europe, the vehemence of their passions, and the thin device of virtue and friendship which amused the philosophers of Athens. But," adds the prurient prude, "Scelera ostendi oportet dum puniunter, abscondi flagitia."

Two scholars responded to this call. The result is that the chapter on Greek love has been very fairly written by equally impartial, equally learned, and independent authors, who approached the subject from somewhat different points of view, but who arrived in the main at similar conclusions.

The first of these histories is M. H. E. Meier's article on _Pæderastie_ in Ersch and Gruber's "Allgemeine Encyklopädie:" Leipzig, Brockhaus, 1837.

The second is a treatise entitled "A Problem in Greek Ethics," composed by an Englishman in English. The anonymous author was not acquainted with Meier's article before he wrote, and only came across it long after he had printed his own essay. This work is extremely rare, ten copies only having been impressed for private use.

Enquirers into the psychology and morality of sexual inversion should not fail to study one or other of these treatises. It will surprise many a well-read scholar, when he sees the whole list of Greek authorities and passages collected and co-ordinated, to find how thoroughly the manners and the literature of that great people were penetrated with pæderastia. The myths and heroic legends of prehistoric Hellas, the educational institutions of the Dorian state, the dialogues of Plato, the history of the Theban army, the biographies of innumerable eminent citizens--lawgivers and thinkers, governors and generals, founders of colonies and philosophers, poets and sculptors--render it impossible to maintain that this passion was either a degraded vice or a form of inherited neuropathy in the race to whom we owe so much of our intellectual heritage. Having surveyed the picture, we may turn aside to wonder whether modern European nations, imbued with the opinions I have described above in the section on Vulgar Errors, are wise in making Greek literature a staple of the higher education. Their motto is _Érasez l'infâme!_ Here the infamous thing clothes itself like an angel of light, and raises its forehead unabashed to heaven among the marble peristyles and olive-groves of an unrivalled civilization.

Another book, written from a medical point of view, is valuable upon the pathology of sexual inversion and cognate aberrations among the nations of antiquity. It bears the title "Geschichte der Lustseuche im Alterthume," and is composed by Dr. Julius Rosenbaum.[41] Rosenbaum attempts to solve the problem of the existence of syphilis and other venereal diseases in the remote past. This enquiry leads him to investigate the whole of Greek and Latin literature in its bearing upon sexual vice. Students will therefore expect from his pages no profound psychological speculations and no idealistic presentation of an eminently repulsive subject. One of the most interesting chapters of his work is devoted to what Herodotus called [Greek: Nousos phêleia] among the Scythians, a wide-spread effemination prevailing in a wild warlike and nomadic race. We have already alluded to Krafft-Ebing's remarks on this disease, which has curious points of resemblance with some of the facts of male prostitution in modern cities.[42]

Professed anthropologists have dealt with the subject, collecting evidence from many quarters, and in some cases attempting to draw general conclusions. Bastian's "Der Mensch der Geschichte"[43] and Herbert Spencer's Tables deserve special mention for their encyclopædic fulness of information regarding the distribution of abnormal sexuality and the customs of savage tribes.

In England an Essay appended to the last volume of Sir Richard Burton's "Arabian Nights" made a considerable stir upon its first appearance.[44] The author endeavoured to co-ordinate a large amount of miscellaneous matter, and to frame a general theory regarding the origin and prevalence of homosexual passions. His erudition, however, is incomplete; and though he possesses a copious store of anthropological details, he is not at the proper point of view for discussing the topic philosophically.[45] For example, he takes for granted that "Pederasty," as he calls it, is everywhere and always what the vulgar think it. He seems to have no notion of the complicated psychology of Urnings, revealed to us by their recently published confessions in French and German medical and legal works. Still his views deserve consideration.

Burton regards the phenomenon as "geographical and climatic, not racial." He summarises the result of his investigations in the following five conclusions.[46]

"(1) There exists what I shall call a 'Sotadic Zone,' bounded westwards by the northern shores of the Mediterranean (N. lat. 43°) and by the southern (N. lat. 30°). Thus the depth would be 780 to 800 miles, including meridional France, the Iberian Peninsula, Italy and Greece, with the coast-regions of Africa from Morocco to Egypt.

"(2) Running eastward the Sotadic Zone narrows, embracing Asia Minor, Mesopotamia and Chaldæa, Afghanistan, Sind, the Punjab, and Kashmir.

"(3) In Indo-China the belt begins to broaden, enfolding China, Japan, and Turkistan.

"(4) It then embraces the South Sea Islands and the New World, where, at the time of its discovery, Sotadic love was, with some exceptions, an established racial institution.

"(5) Within the Sotadic Zone the vice is popular and endemic, held at the worst to be a mere peccadillo, whilst the races to the North and South of the limits here defined practise it only sporadically, amid the opprobrium of their fellows, who, as a rule, are physically incapable of performing the operation, and look upon it with the liveliest disgust."

This is a curious and interesting generalisation, though it does not account for what history has transmitted regarding the customs of the Kelts, Scythians, Bulgars, Tartars, Normans, and for the acknowledged leniency of modern Slavs to this form of vice.

Burton advances an explanation of its origin. "The only physical cause for the practice which suggests itself to me, and that must be owned to be purely conjectural, is that within the Sotadic Zone there is a blending of the masculine and feminine temperament, a crasis which elsewhere occurs only sporadically."[47] So far as it goes, this suggestion rests upon ground admitted to be empirically sound by the medical writers we have already examined, and vehemently declared to be indisputable as a fact of physiology by Ulrichs, whom I shall presently introduce to my readers. But Burton makes no effort to account for the occurrence of this crasis of masculine and feminine temperaments in the Sotadic Zone at large, and for its sporadic appearance in other regions. Would it not be more philosophical to conjecture that the crasis, if that exists at all, takes place universally; but that the consequences are only tolerated in certain parts of the globe, which he defines as the Sotadic Zone? Ancient Greece and Rome permitted them. Modern Greece and Italy have excluded them to the same extent as Northern European nations. North and South America, before the Conquest, saw no harm in them. Since its colonisation by Europeans they have been discountenanced. The phenomenon cannot therefore be regarded as specifically geographical and climatic. Besides, there is one fact mentioned by Burton which ought to make him doubt his geographical theory. He says that, after the conquest of Algiers, the French troops were infected to an enormous extent by the habits they had acquired there, and from them it spread so far and wide into civilian society that "the vice may be said to have been democratised in cities and large towns."[48] This surely proves that north of the Sotadic Zone males are neither physically incapable of the acts involved in abnormal passion, nor gifted with an insuperable disgust for them. Law, and the public opinion generated by law and religious teaching, have been deterrent causes in those regions. The problem is therefore not geographical and climatic, but social. Again, may it not be suggested that the absence of "the Vice" among the negroes and negroid races of South Africa, noticed by Burton,[49] is due to their excellent customs of sexual initiation and education at the age of puberty--customs which it is the shame of modern civilisation to have left unimitated?

However this may be, Burton regards the instinct as natural, not _contre nature_, and says that its patients "deserve, not prosecution but the pitiful care of the physician and the study of the psychologist."[50]

Another distinguished anthropologist, Paolo Mantegazza, has devoted special attention to the physiology and psychology of what he calls "I pervertimenti dell'amore."[51] Starting with the vulgar error that all sexual inversion implies the unmentionable act of coition (for which, by the way, he is severely rebuked by Krafft-Ebing, Psy. Sex., p. 92), he explains anomalous passions by supposing that the nerves of pleasurable sensation, which ought to be carried to the genital organs, are in some cases carried to the rectum.[52] This malformation makes its subject desire _coitum per anum_. That an intimate connection exists between the nerves of the reproductive organs and the nerves of the rectum is known to anatomists and is felt by everybody. Probably some _cinædi_ are excited voluptuously in the mode suggested. Seneca, in his Epistles, records such cases; and it is difficult in any other way to account for the transports felt by male prostitutes of the Weibling type. Finally, writers upon female prostitution mention women who are incapable of deriving pleasure from any sexual act except _aversa venus_.

Mantegazza's observation deserves to be remembered, and ought to be tested by investigation. But, it is obvious, he pushes the corollary he draws from it, as to the prevalence of sexual inversion, too far.

He distinguishes three classes of sodomy: (1) Perpheric or anatomical, caused by an unusual distribution of the nerves passing from the spine to the reproductive organs and the rectum; (2) psychical, which he describes as "specific to intelligent men, cultivated, and frequently neurotic," but which he does not attempt to elucidate, though he calls it "not a vice, but a passion"; (3) luxurious or lustful, when the _aversa venus_ is deliberately chosen on account of what Mantegazza terms "la desolante larghezza"

of the female.[53]

Mantegazza winds up, like Burton, by observing that "sodomy, studied with the pitying and indulgent eye of the physician and the physiologist, is consequently a disease which claims to be cured, and can in many cases be cured."[54]

After perusing what physicians, historians, and anthropologists have to say about sexual inversion, there is good reason for us to feel uneasy as to the present condition of our laws. And yet it might be argued that anomalous desires are not always maladies, not always congenital, not always psychical passions. In some cases they must surely be vices deliberately adopted out of lustfulness, wanton curiosity, and seeking after sensual refinements. The difficult question still remains then--how to repress vice, without acting unjustly toward the naturally abnormal, the unfortunate, and the irresponsible.

I pass now to the polemical writings of a man who maintains that homosexual passions, even in their vicious aspects, ought not to be punished except in the same degree and under the same conditions as the normal passions of the majority.

VII.

LITERATURE--POLEMICAL.

It can hardly be said that inverted sexuality received a serious and sympathetic treatment until a German jurist, named Karl Heinrich Ulrichs, began his long warfare against what he considered to be prejudice and ignorance upon a topic of the greatest moment to himself. A native of Hanover, and writing at first under the assumed name of Numa Numantius, he kept pouring out a series of polemical, analytical, theoretical, and apologetical pamphlets between the years 1864 and 1870. The most important of these works is a lengthy and comprehensive Essay entitled "Memnon. Die Geschlechtsnatur des mannliebenden Urnings. Eine naturwissenschaftliche Darstellung. Schleiz, 1868." Memnon may be used as the text-book of its author's theories; but it is also necessary to study earlier and later treatises--Inclusa, Formatrix, Vindex, Ara Spei, Gladius Furens, Incubus, Argonauticus, Prometheus, Araxes, Kritische Pfeile--in order to obtain a complete knowledge of his opinions, and to master the whole mass of information he has brought together.

The object of Ulrichs in these miscellaneous writings is twofold. He seeks to establish a theory of sexual inversion upon the basis of natural science, proving that abnormal instincts are inborn and healthy in a considerable percentage of human beings; that they do not owe their origin to bad habits of any kind, to hereditary disease, or to wilful depravity; that they are incapable in the majority of cases of being extirpated or converted into normal channels; and that the men subject to them are neither physically, intellectually, nor morally inferior to normally constituted individuals. Having demonstrated these points to his own satisfaction, and supported his views with a large induction of instances and a respectable show of erudition, he proceeds to argue that the present state of the law in many states of Europe is flagrantly unjust to a class of innocent persons, who may indeed be regarded as unfortunate and inconvenient, but who are guilty of nothing which deserves reprobation and punishment. In this second and polemical branch of his exposition, Ulrichs assumes, for his juristic starting-point, that each human being is born with natural rights which legislation ought not to infringe but protect. He does not attempt to confute the utilitarian theory of jurisprudence, which regards laws as regulations made by the majority in the supposed interests of society. Yet a large amount of his reasoning is designed to invalidate utilitarian arguments in favour of repression, by showing that no social evil ensues in those countries which have placed abnormal sexuality upon the same footing as the normal, and that the toleration of inverted passion threatens no danger to the well-being of nations.

After this prelude, an abstract of Ulrichs' theory and his pleading may be given, deduced from the comparative study of his numerous essays.

The right key to the solution of the problem is to be found in physiology, in that obscure department of natural science which deals with the evolution of sex. The embryo, as we are now aware, contains an undetermined element of sex during the first months of pregnancy. This is gradually worked up into male and female organs of procreation; and these, when the age of puberty arrives, are generally accompanied by corresponding male and female appetites. That is to say, the man in an immense majority of cases desires the woman, and the woman desires the man. Nature, so to speak, aims at differentiating the undecided foetus into a human being of one or the other sex, the propagation of the species being the main object of life. Still, as Aristotle puts it, and as we observe in many of her operations, "Nature wishes, but has not always the power": [Greek: hê physis bouletai men all' ou dynatai]. Consequently in respect of physical structure, there come to light imperfect individuals, so-called hermaphrodites, whose sexual apparatus is so far undetermined that many a real male has passed a portion of his life under a mistake, has worn female clothes, and has cohabited by preference with men. Likewise, in respect of spiritual nature, there appear males who, notwithstanding their

marked masculine organisation, feel from the earliest childhood a sexual proclivity toward men, with a corresponding indifference for women. In some of these abnormal, but natural, beings, the appetite for men resembles the normal appetite of men for women; in others it resembles the normal appetite of women for men. That is to say, some prefer effeminate males, dressed in feminine clothes and addicted to female occupations. Others prefer powerful adults of an ultra-masculine stamp. A third class manifest their predilection for healthy young men in the bloom of adolescence, between nineteen and twenty. The attitude of such persons towards women also varies. In genuine cases of inborn sexual inversion a positive horror is felt when the woman has to be carnally known; and this horror is of the same sort as that which normal men experience when they think of cohabitation with a male.[55] In others the disinclination does not amount to repugnance; but the abnormal man finds considerable difficulty in stimulating himself to the sexual act with females, and derives a very imperfect satisfaction from the same. A certain type of man, in the last place, seems to be indifferent, desiring males at one time and females at another.

In order to gain clearness in his exposition, Ulrichs has invented names for these several species. The so-called hermaphrodite he dismisses with the German designation of _Zwitter_. Imperfect individuals of this type are not to be considered, because it is well known that the male or female organs are never developed in one and the same body. It is also, as we shall presently discover, an essential part of his theory to regard the problem of inversion psychologically.

The normal man he calls _Dioning_, the abnormal man _Urning_. Among Urnings, those who prefer effeminate males are christened by the name of _Mannling_; those who prefer powerful and masculine adults receive the name of _Weibling_; the Urning who cares for adolescents is styled a _Zwischen-Urning_. Men who seemed to be indifferently attracted by both sexes, he calls _Uranodioninge_. A genuine Dioning, who, from lack of women, or under the influence of special circumstances, consorts with persons of his own sex, is denominated _Uraniaster_. A genuine Urning, who has put restraint upon his inborn impulse, who has forced himself to cohabit with women, or has perhaps contracted marriage, is said to be _Virilisirt_--a virilised Urning.

These outlandish names, though seemingly pedantic and superfluous, have their technical value, and are necessary to the understanding of Ulrichs' system. He is dealing exclusively with individuals classified by common parlance as males without distinction. Ulrichs believes that he can establish a real natural division between men proper, whom he calls _Dioninge_, and males of an anomalous sexual development, whom he calls _Urninge_. Having proceeded so far, he finds the necessity of distinguishing three broad types of the Urning, and of making out the crosses between Urning and Dioning, of which he also find three species. It will appear in the sequel that whatever may be thought about his psychological hypothesis, the nomenclature he has adopted is useful in discussion, and corresponds to well-defined phenomena, of which we have abundant information. The following table will make his analysis sufficiently plain:--

{ (1) Man or Dioning ... Uraniaster, when { he has acquired the { tastes of the Urning. { The { { Mannling. Human { (2) Urning { Weibling. Male { { Zwischen-Urning. { { Virilised Urning. { { (3) Uranodioning. { (4) Hermaphrodite.

Broadly speaking, the male includes two main species: Dioning and Urning, men with normal and men with abnormal instincts. What, then, constitutes the distinction between them? How are we justified in regarding them as radically divergent?

Ulrichs replies that the phenomenon of sexual inversion is to be explained by physiology, and particularly by the evolution of the embryo.[56] Nature fails to complete her work regularly and in every instance. Having succeeded in differentiating a male with full-formed sexual organs from the undecided foetus, she does not always effect the proper differentiation of that portion of the psychical being in which resides the sexual appetite. There remains a female soul in a male body. _Anima muliebris virili corpore inclusa_, is the formula adopted by Ulrichs; and he quotes a passage from the "Vestiges of Creation," which suggests that a male is a more advanced product of sexual evolution than the female. The male instinct of sex is a more advanced product than the female instinct. Consequently men appear whose body has been differentiated as masculine, but whose sexual instinct has not progressed beyond the feminine stage.

Ulrichs' own words ought to be cited upon this fundamental part of his hypothesis, since he does not adopt the opinion that the Urning is a Dioning arrested at a certain point of development; but rather that there is an element of uncertainty attending the simultaneous evolution of physical and psychical factors from the indeterminate ground-stuff. "Sex," says he, "is only an affair of development. Up to a certain stage of embryonic existence all living mammals are hermaphroditic. A certain number of them advance to the condition of what I call man (Doining), others to what I call woman (Dioningin), a third class become what I call _Urning_ (including _Urningin_). It ensues therefrom that between these three sexes there are no primary, but only secondary differences. And yet true differences, constituting sexual species, exist as facts."[57] Man, Woman, and Urning--the third being

either a male or a female in whom we observe a real and inborn, not an acquired or a spurious, inversion of appetite--are consequently regarded by him as the three main divisions of humanity viewed from the point of view of sex. The embryonic ground-stuff in the case of each was homologous; but while the two former, Man and Woman, have been normally differentiated, the Urning's sexual instinct, owing to some imperfection in the process of development, does not correspond to his or her sexual organs.

The line of division between the sexes, even in adult life, is a subtle one; and the physical structure of men and women yields indubitable signs of their emergence from a common ground-stuff. Perfect men have rudimentary breasts. Perfect women carry a rudimentary penis in their clitoris. The raphé of the scrotum shows where the aperture, common at first to masculine and feminine beings, but afterwards only retained in the female vulva, was closed up to form a male. Other anatomical details of the same sort might be adduced. But these will suffice to make thinking persons reflect upon the mysterious dubiety of what we call sex. That gradual development, which ends in normal differentiation, goes on very slowly. It is only at the age of puberty that a boy distinguishes himself abruptly from a girl, by changing his voice and growing hair on parts of the body where it is not usually found in women. This being so, it is surely not surprising that the sexual appetite should sometimes fail to be normally determined, or in other words should be inverted.

Ulrichs maintains that the body of an Urning is masculine, his soul feminine, so far as sex is concerned. Accordingly, though physically unfitted for coition with men, he is imperatively drawn towards them by a natural impulse. Opponents meet him with this objection: "Your position is untenable. Body and soul constitute one inseparable entity." So they do, replies Ulrichs; but the way in which these factors of the person are combined in human beings differs extremely, as I can prove by indisputable facts. The body of a male is visible to the eyes, is mensurable and ponderable, is clearly marked in its specific organs. But what we call his soul--his passions, inclinations, sensibilities, emotional characteristics, sexual desires--eludes the observation of the senses. This second factor, like the first, existed in the undetermined stages of the foetus. And when I find that the soul, this element of instinct and emotion and desire existing in a male, had been directed in its sexual appetite from earliest boyhood towards persons of the male sex, I have the right to qualify it with the attribute of femininity. You assume that soul-sex is indissolubly connected and inevitably derived from body-sex. The facts contradict you, as I can prove by referring to the veracious autobiographies of Urnings and to known phenomena regarding them.

Such is the theory of Ulrichs; and though we may not incline to his peculiar mode of explaining the want of harmony between sexual organs and sexual appetite in Urnings, there can be no doubt that in some way or other their eccentric diathesis must be referred to the obscure process of sexual differentiation.[58] Perhaps he antedates the moment at which the aberration sometimes takes its origin, not accounting sufficiently for imperative impressions made on the imagination or the senses of boys during the years which precede puberty.

However this may be, the tendency to such inversion is certainly inborn in an extremely large percentage of cases. That can be demonstrated from the reports of persons whose instincts were directed to the male before they knew what sex meant. It is worth extracting passages from these confessions.[59] (1) "As a schoolboy of eight years, I sat near a comrade rather older than myself; and how happy was I, when he touched me. That was the first indefinite perception of an inclination which remained a secret for me till my nineteenth year." (2) "Going back to my seventh year, I had a lively feeling for a schoolfellow, two years older than myself; I was happy when I could be as close as possible to him, and in our games could place my head near to his private parts." (3) "At ten years of age he had a romantic attachment for a comrade; and the passion for people of his own sex became always more and more marked." (4) Another confessed that "already at the age of four he used to dream of handsome grooms." (5) A fifth said: "My passion for people of my own sex awoke at the age of eight. I used to enjoy my brother's nakedness; while bathing with other children, I took no interest at all in girls, but felt the liveliest attraction toward boys." (6) A sixth dates his experience from his sixth or seventh year. (7) A seventh remembers that "while yet a boy, before the age of puberty, sleeping in the company of a male agitated him to such an extent that he lay for hours awake." (8) An eighth relates that "while three years old, I got possession of a fashion book, cut out the pictures of men, and kissed them to tatters. The pictures of women I did not care to look at." (9) A ninth goes back to his thirteenth year, and a school friendship. (10) A tenth records the same about his seventh year. (11) An eleventh says that his inverted instincts awoke in early childhood, and that from his ninth year onward he fell over and over again in love with adult men. (12) A twelfth spoke as follows: "So far back as I can remember, I was always subject to this passion. Quite as a child, young men made deeper impression on me than women or girls. The earliest sensual perturbation of which I have any recollection was excited by a tutor, when I was nine or ten, and my greatest pleasure was to be allowed to ride astride upon his leg." (13) A thirteenth: "From the earliest childhood I have been haunted by visions of men, and only of men; never has a woman exercised the least influence

over me. At school I kept these instincts to myself, and lived quite retired." (14) A fourteenth can recollect "receiving a distinctly sensual impression at the age of four, when the man-servants caressed him." (15) A fifteenth says that at the age of thirteen, together with puberty, the inversion of appetite awoke in him. (16) A sixteenth confesses that he felt an unconquerable desire for soldiers in his thirteenth year. (17) A seventeenth remembers having always dreamed only of men; and at school, he says, "when my comrades looked at pretty girls and criticised them during our daily promenades, I could not comprehend how they found anything to admire in such creatures." On the other hand, the sight and touch of soldiers and strong fellows excited him enormously. (18) An eighteenth dates the awakening of passion in him at the age of eleven, when he saw a handsome man in church; and from that time forward his instinct never altered. (19) A nineteenth fell in love with an officer at the age of thirteen, and since then always desired vigorous adult males. (20) A twentieth confessed to have begun to love boys of his own age, sensually, while only eight years of age. (21) A twenty-first records that, when he was eight, he began to crave after the sight of naked men.

In addition to these cases a great many might be culled from the writings of Ulrichs, who has published a full account from his own early experience.[60] "I was fifteen years and ten and a half months old," he says, "when the first erotic dream announced the arrival of puberty. Never before that period had I known sexual gratification of any kind whatever. The occurrence was therefore wholly normal. From a much earlier time, however, I had been subject to emotions, partly romantic, partly sensual, without any definite desire, and never for one and the same young man. These aimless yearnings of the senses plagued me in my solitary hours, and I could not overcome them. During my fifteenth year, while at school at Detmold, the vague longing took a twofold shape. First, I came across Norman's 'Säulenordnungen,' and there I was vehemently attracted by the figure of a Greek god or hero, standing in naked beauty. Secondly, while studying in my little room, or before going to sleep, the thought used suddenly and irresistibly to rise up in my mind--If only a soldier would clamber through the window and come into my room! I then painted in my fancy the picture of a splendid soldier of twenty to twenty-two years old. And yet I had no definite idea of why I wanted him; nor had I ever come in contact with soldiers. About two years after this, I happened to sit next a soldier in a post-carriage. The contact with his thigh excited me to the highest degree." Ulrichs also relates that in his tenth year he conceived an enthusiastic and romantic friendship for a boy two years his senior.

That experiences of the kind are very common, every one who has at all conversed with Urnings knows well. From private sources of unquestionable veracity, these may be added. _A_ relates that, before eight years old, reverie occurred to him during the day, and dreams at night, of naked sailors. When he began to study Latin and Greek, he dreamed of young gods, and at the age of fourteen, became deeply enamoured of the photograph of the Praxitelian Erôs in the Vatican. He had a great dislike for physical contact with girls; and with boys was shy and reserved, indulging in no acts of sense. _B_ says that during his tenderest boyhood, long before the age of puberty, he fell in love with a young shepherd on one of his father's farms, for whom he was so enthusiastic that the man had to be sent to a distant moor. _C_ at the same early age, conceived a violent affection for a footman; _D_ for an officer, who came to stay at his home; _E_ for the bridegroom of his eldest sister.

In nearly all the cases here cited, the inverted sexual instinct sprang up spontaneously. Only a few of the autobiographies record seduction by an elder man as the origin of the affection. In none of them was it ever wholly overcome. Only five out of the twenty-seven men married. Twenty declare that, tortured by the sense of their dissimilarity to other males, haunted by shame and fear, they forced themselves to frequent public women soon after the age of puberty. Some found themselves impotent. Others succeeded in accomplishing their object with difficulty, or by means of evoking the images of men on whom their affections were set. All, except one, concur in emphatically asserting the superior attraction which men have always exercised for them over women. Women leave them, if not altogether disgusted, yet cold and indifferent. Men rouse their strongest sympathies and instincts. The one exception just alluded to is what Ulrichs would call an Uranodioning. The others are capable of friendship with women, some even of æsthetic admiration, and the tenderest regard for them, but not of genuine sexual desire. Their case is literally an inversion of the ordinary.

Some observations may be made on Ulrichs' theory. It is now recognised by the leading authorities, medical and medico-juristic, in Germany, by writers like Casper-Liman and Krafft-Ebing, that sexual inversion is more often than not innate. So far, without discussing the physiological or metaphysical explanations of this phenomenon, without considering whether Ulrichs is right in his theory of _anima muliebris inclusa in corpore virili_, or whether heredity, insanity, and similar general conditions are to be held responsible for the fact, it may be taken as admitted on all sides that the sexual diathesis in question is in a very large number of instances congenital. But Ulrichs seems to claim too much for the position he has won. He ignores the frequency of acquired habits. He shuts his eyes to the force of fashion and depravity. He reckons men like Horace and Ovid and Catullus, among the ancients, who were clearly indifferent in their tastes (as indifferent as the modern Turks) to the account of Uranodionings. In one

word, he is so enthusiastic for his physiological theory that he overlooks all other aspects of the question. Nevertheless, he has acquired the right to an impartial hearing, while pleading in defence of those who are acknowledged by all investigators of the problem to be the subjects of an inborn misplacement of the sexual appetite.

Let us turn, then, to the consideration of his arguments in favour of freeing Urnings from the terrible legal penalties to which they are at present subject, and, if this were possible, from the no less terrible social condemnation to which they are exposed by the repugnance they engender in the normally constituted majority. Dealing with these exceptions to the kindly race of men and women, these unfortunates who have no family ties knotted by bonds by mutual love, no children to expect, no reciprocity of passion to enjoy, mankind, says Ulrichs, has hitherto acted just in the same way as a herd of deer acts when it drives the sickly and the weakly out to die in solitude; burdened with contumely, and cut off from common sympathy.

From the point of view of morality and law, he argues, it does not signify whether we regard the sexual inversion of an Urning as morbid or as natural. He has become what he is in the dawn and first emergence of emotional existence. You may contend, that he derives perverted instincts from his ancestry, that he is the subject of a psychical disorder, that from the cradle he is predestined by atavism or disease to misery. I maintain that he is one of nature's sports, a creature healthy and well organised, evolved in her superb indifference to aberrations from the normal type. We need not quarrel over our solutions of the problem. The fact that he is there, among us, and that he constitutes an ever-present factor in our social system, has to be faced. How are we to deal with him? Has society the right to punish individuals sent into the world with homosexual instincts? Putting the question at its lowest point, admitting that these persons are the victims of congenital morbidity, ought they to be treated as criminals? It is established that their appetites, being innate, are _to them_ at least natural and undepraved; the common appetites, being excluded from their sexual scheme, are _to them_ unnatural and abhorrent. Ought not such beings, instead of being hunted down and persecuted by legal bloodhounds, to be regarded with pitying solicitude as among the most unfortunate of human beings, doomed as they are to inextinguishable longings and life-long deprivation of that which is the chief prize of man's existence on this planet, a reciprocated love? As your laws at present stand, you include all cases of sexual inversion under the one domination of crime. You make exceptions in some special instances, and treat the men involved as lunatics. But the Urning is neither criminal nor insane. He is only less fortunate than you are, through an accident of birth, which is at present obscure to our imperfect science of sexual determination.

So far Ulrichs is justified in his pleading. When it has been admitted that sexual inversion is usually a fact of congenital diathesis, the criminal law stands in no logical relation to the phenomenon. It is monstrous to punish people as wilfully wicked because, having been born with the same organs and the same appetites as their neighbours, they are doomed to suffer under the frightful disability of not being able to use their organs or to gratify their appetites in the ordinary way.

But here arises a difficulty, which cannot be ignored, since upon it is based the only valid excuse for the position taken up by society in dealing with this matter. Not all men and women possessed by abnormal sexual desires can claim that these are innate. It is certain that the habits of sodomy are frequently acquired under conditions of exclusion from the company of persons of the other sex--as in public schools, barracks, prisons, convents, ships. In some cases they are deliberately adopted by natures tired of normal sexual pleasure. They may even become fashionable and epidemic. Lastly, it is probable that curiosity and imitation communicate them to otherwise normal individuals at a susceptible moment of development. Therefore society has the right to say: Those who are the unfortunate subjects of inborn sexual inversion shall not be allowed to indulge their passions, lest the mischief should spread, and a vicious habit should contaminate our youth. From the utilitarian point of view, society is justified in protecting itself against a minority of exceptional beings whom it regards as pernicious to the general welfare. From any point of view, the majority is strong enough to coerce to inborn instincts and to trample on the anguish of a few unfortunates. But, asks Ulrichs, is this consistent with humanity, is it consistent with the august ideal of impartial equity? Are people, sound in body, vigorous in mind, wholesome in habit, capable of generous affections, good servants of the state, trustworthy in all the ordinary relations of life, to be condemned at law as criminals because they cannot feel sexually as the majority feel, because they find some satisfaction for their inborn want in ways which the majority dislike?

Seeking a solution of the difficulty stated in the foregoing paragraph, Ulrichs finds it in fact and history. His answer is that if society leaves nature to take her course, with the abnormal as well as with the normal subjects of sexual inclination, society will not suffer. In countries where legal penalties have been removed from inverted sexuality, where this is placed upon the same footing as the normal--in France, Bavaria (?), the Netherlands (?)--no inconvenience has hitherto arisen.[61] There has ensued no sudden and flagrant outburst of a depraved habit, no dissemination of a spreading moral poison. On the other hand, in countries where these penalties exist and are enforced--in England, for example, and in the metropolis of England, London--inverted sexuality runs riot,

despite of legal prohibitions, despite of threats of prison, dread of exposure, and the intolerable pest of organised _chantage_. In the eyes of Ulrichs, society is engaged in sitting on a safety-valve, which if nature were allowed to operate unhindered would do society no harm, but rather good. The majority, he thinks, are not going to become Urnings, for the simple reason that they have not the unhappy constitution of the Urning. Cease to persecute Urnings, accept them as inconsiderable, yet real, factors, in the social commonwealth, leave them to themselves, and you will not be the worse for it, and will also not carry on your conscience the burden of intolerant vindictiveness.

Substantiating this position, Ulrichs demonstrates that acquired habits of sexual inversion are almost invariably thrown off by normal natures. Your boys at public schools, he says, behave as though they were Urnings. In the lack of women, at the time when their passions are predominant, they yield themselves up together to mutual indulgences which would bring your laws down with terrible effect upon adults. You are aware of this. You send your sons to Eton and to Harrow, and you know very well what goes on there. Yet you remain untroubled in your minds. And why? Because you feel convinced that they will return to their congenital instincts.

When the school, the barrack, the prison, the ship has been abandoned, the male reverts to the female. This is the truth about Dionings. The large majority of men and women remain normal, simply because they were made normal. They cannot find the satisfaction of their nature in those inverted practices to which they yielded for a time through want of normal outlet. Society risks little by the occasional caprice of the school, the barrack, the prison, and the ship. Some genuine Urnings may, indeed, discover their inborn inclination by means of the process to which you subject them. But you are quite right in supposing that a Dioning, though you have forced him to become for a time an Uraniaster, will never in the long run appear as an Urning. The extensive experience which English people possess regarding such matters, owing to the notorious condition of their public schools, goes to confirm Ulrichs' position. Headmasters know how many Uraniasters they have dealt with, what excellent Dionings they become, and how comparatively rare, and yet how incorrigibly steadfast, are the genuine Urnings in their flock.

The upshot of this matter is that we are continually forcing our young men into conditions under which, if sexual inversion were an acquired attribute, it would become stereotyped in their natures. Yet it does not do so. Provisionally, because they are shut off from girls, because they find no other outlet for their sex at the moment of its most imperious claims, they turn toward males, and treat their younger school-fellows in ways which would consign an adult to penal servitude. They are Uraniasters by necessity and _faute de mieux_. But no sooner are they let loose upon the world than the majority revert to normal channels. They pick up women in the streets, and form connections, as the phrase goes. Some undoubtedly, in this fiery furnace through which they have been passed, discover their inborn sexual inversion. Then, when they cannot resist the ply of their proclivity, you condemn them as criminals in their later years. Is that just? Would it not be better to revert from our civilisation to the manners of the savage man--to initiate youths into the mysteries of sex, and to give each in his turn the chance of developing a normal instinct by putting him during his time of puberty freely and frankly to the female? If you abhor Urnings, as you surely do, you are at least responsible for their mishap by the extraordinary way in which you bring them up. At all events, when they develop into the eccentric beings which they are, you are the last people in the world who have any right to punish them with legal penalties and social obloquy.

Considering the present state of the law in most countries to be inequitable toward a respectable minority of citizens, Ulrichs proposes that Urnings should be placed upon the same footing as other men. That is to say, sexual relations between males and males should not be treated as criminal, unless they be attended with violence (as in the case of rape), or be carried on in such a way as to offend the public sense of decency (in places of general resort or on the open street), or thirdly be entertained between an adult and a boy under age (the protected age to be decided as in the case of girls). What he demands is that when an adult male, freely and of his own consent, complies with the proposals of an adult person of his own sex, and their intercourse takes place with due regard for public decency, neither party shall be liable to prosecution and punishment at law. In fact he would be satisfied with the same conditions as those prevalent in France, and since June, 1889, in Italy.

If so much were conceded by the majority of normal people to the abnormal minority, continues Ulrichs, an immense amount of misery and furtive vice would be at once abolished. And it is difficult to conceive what evil results would follow. A defender of the present laws of England, Prussia, &c., might indeed reply: "This is opening a free way to the seduction and corruption of young men." But young men are surely at least as capable of defending themselves against seduction and corruption as young women are. Nay, they are far more able, not merely because they are stronger, but because they are not usually weakened by an overpowering sexual instinct on which the seducer plays. Yet the seduction and corruption of young women is tolerated, in spite of the attendant consequences of illegitimate childbirth, and all which that involves. This toleration of the seduction of women by men springs from the assumption that only the normal sexual appetite is natural. The seduction of a man by a male passes for criminal,

because the inverted sexual instinct is regarded as unnatural, depraved, and wilfully perverse. On the hypothesis that individuals subject to perverted instincts can suppress them at pleasure or convert them into normal appetite, it is argued that they must be punished. But when the real facts come to be studied, it will be found: first, that these instincts are inborn in Urnings, and are therefore in their case natural; secondly, that the suppression of them is tantamount to life-long abstinence under the constant torture of sexual solicitation; thirdly, that the conversion of them into normal channels is in a large percentage of cases totally impossible, in nearly all where it has been attempted is only partially successful, and where marriage ensues has generally ended in misery for both parties. Ulrichs, it will be noticed, does not distinguish between Urnings, in whom the inversion is admitted to be congenital, and Uraniasters, in whom it has been acquired or deliberately adopted. And it would be very difficult to frame laws which should take cognisance of these two classes. The Code Napoleon legalises the position of both, theoretically at any rate. The English code treats both as criminal, doing thereby, it must be admitted, marked injustice to recognised Urnings, who at the worst are morbid or insane, or sexually deformed, through no fault of their own.

In the present state of things, adds Ulrichs, the men who yield their bodies to abnormal lovers, do not merely do so out of compliance, sympathy, or the desire for reasonable reward. Too often they speculate upon the illegality of the connection, and have their main object in the extortion of money by threats of exposure. Thus the very basest of all trades, that of _chantage_, is encouraged by the law. Alter the law, and instead of increasing vice, you will diminish it; for a man who should then meet the advances of an Urning, would do so out of compliance, or, as is the case with female prostitutes, upon the expectation of a reasonable gain. The temptation to ply a disgraceful profession with the object of extorting money would be removed. Moreover, as regards individuals alike abnormally constituted, voluntary and mutually satisfying relations, free from degrading risks, and possibly permanent, might be formed between responsible agents. Finally, if it be feared that the removal of legal disabilities would turn the whole male population into Urnings, consider whether London is now so much purer in this respect than Paris?

One serious objection to recognising and tolerating sexual inversion has always been that it tends to check the population. This was a sound political and social argument in the time of Moses, when a small and militant tribe needed to multiply to the full extent of its procreative capacity. It is by no means so valid in our age, when the habitable portions of the globe are rapidly becoming overcrowded.[62] Moreover, we must bear in mind that society, under the existing order, sanctions female prostitution, whereby men and women, the normally procreative, are sterilised to an indefinite extent. Logic, in these circumstances, renders it equitable and ridiculous to deny a sterile exercise of sex to abnormal men and women, who are by instinct and congenital diathesis non-procreative.

As the result of these considerations, Ulrichs concludes that there is no real ground for the persecution of Urnings except as may be found in the repugnance by the vast numerical majority for an insignificant minority. The majority encourages matrimony, condones seduction, sanctions prostitution, legalises divorce in the interests of its own sexual proclivities. It makes temporary or permanent unions illegal for the minority whose inversion of instinct it abhors. And this persecution, in the popular mind at any rate, is justified, like many other inequitable acts of prejudice or ignorance, by theological assumptions and the so-called mandates of revelation.

In the next place it is objected that inversed sexuality is demoralising to the manhood of a nation, that it degrades the dignity of a man, and that it is incapable of moral elevation. Each of these points may be taken separately. They are all of them at once and together contradicted by the history of ancient Greece. There the most warlike sections of the race, the Dorians of Crete and Sparta, and the Thebans, organised the love of male for male because of the social and military advantages they found in it. Their annals abound in eminent instances of heroic enthusiasm, patriotic devotion, and high living, inspired by homosexual passion. The fighting peoples of the world, Kelts in ancient story, Normans, Turks, Afghans, Albanians, Tartars, have been distinguished by the frequency among them of what popular prejudice regards as an effeminate vice.

With regard to the dignity of man, is there, asks Ulrichs, anything more degrading to humanity in sexual acts performed between male and male than in similar acts performed between male and female. In a certain sense all sex has an element of grossness which inspires repugnance. The gods, says Swinburne,

"Have strewed one marriage-bed with tears and fire, For extreme loathing and supreme desire."

It would not be easy to maintain that a curate begetting his fourteenth baby on the body of a worn-out wife is a more elevating object of mental contemplation than Harmodius in the embrace of Aristogeiton, or that a young man sleeping with a prostitute picked up in the Haymarket is cleaner than his brother sleeping with a soldier picked up in the Park. Much of this talk about the

dignity of man, says Ulrichs, proceeds from a vulgar misconception as to the nature of inverted sexual desire. People assume that Urnings seek their pleasure only or mainly in an act of unmentionable indecency. The exact opposite, he assures them, is the truth. The act in question is no commoner between men and men than it is between men and women. Ulrichs, upon this point, may be suspected, perhaps, as an untrustworthy witness. His testimony, however, is confirmed by Krafft-Ebing, who, as we have seen, has studied sexual inversion long and minutely from the point of view of psychical pathology. "As regards the nature of their sexual gratification," he writes, "it must be established at the outset that the majority of them are contented with reciprocal embraces; the act commonly ascribed to them they generally abhor as much as normal men do; and, inasmuch as they always prefer adults, they are in no sense specially dangerous to boys."[63] This author proceeds to draw a distinction between Urnings in whom sexual inversion is congenital, and old debauchees or half-idiotic individuals, who are in the habit of misusing boys. The vulgar have confounded two different classes; and everybody who studies the psychology of Urnings is aware that this involves a grave injustice to the latter.

"But, after all," continues the objector, "you cannot show that inverted sexuality is capable of any moral elevation." Without appealing to antiquity, the records of which confute this objection overwhelmingly, one might refer to the numerous passages in Ulrich's writings where he relates the fidelity, loyalty, self-sacrifice, and romantic enthusiasm which frequently accompany such loves, and raises them above baseness. But, since here again he may be considered a suspicious witness, it will suffice, as before, to translate a brief passage from Krafft-Ebing. "The Urning loves, idolizes his friend, quite as much as the normal man loves and idolizes his girl. He is capable of making for him the greatest sacrifices. He suffers the pangs of unhappy, often unreturned, affection; feels jealousy, mourns under the fear of his friend's infidelity."[64] When the time comes for speaking about Walt Whitman's treatment of this topic, it will appear that the passion of a man for his comrade has been idealised in fact and deed, as well as in poetry. For the present it is enough to remark that a kind of love, however spontaneous and powerful, which is scouted, despised, tabooed, banned, punished, relegated to holes and corners, cannot be expected to show its best side to the world. The sense of sin and crime and danger, the humiliation and repression and distress to which the unfortunate pariahs of inverted sexuality are daily and hourly exposed must inevitably deteriorate the nobler elements in their emotion. Give abnormal love the same chance as normal love, subject it to the wholesome control of public opinion, allow it to be self-respecting, draw it from dark slums into the light of day, strike off its chains and set it free--and I am confident says Ulrichs, that it will exhibit analogous virtues, checkered, of course, by analogous vices, to those with which you are familiar in the mutual love of male and female. The slave has of necessity a slavish soul. The way to elevate is to emancipate him.

"All that may be true," replies the objector: "it is even possible that society will take the hard case of your Urnings into consideration, and listen to their bitter cry. But, in the meanwhile, supposing these inverted instincts to be inborn, supposing them to be irrepressible and inconvertible, supposing them to be less dirty and nasty than they are commonly considered, is it not the plain duty of the individual to suppress them, so long as the law of his country condemns them?" No, rejoins Ulrichs, a thousand times no! It is only the ignorant antipathy of the majority which renders such law as you speak of possible. Go to the best books of medical jurisprudence, go to the best authorities on psychical deviations from the normal type. You will find that these support me in my main contention. These, though hostile in their sentiments and chilled by natural repugnance, have a respect for science, and they agree with me in saying that the Urning came into this world an Urning, and must remain till the end of his life an Urning still. To deal with him according to your code is no less monstrous than if you were to punish the colour-blind, or the deaf and dumb, or albinoes, or crooked-back cripples. "Very well," answers the objector: "But I will quote the words of an eloquent living writer, and appeal to your generous instincts and your patriotism. Professor Dowden observes that 'self-surrender is at times sternly enjoined, and if the egoistic desires are brought into conflict with social duties, the individual life and joy within us, at whatever cost of personal suffering, must be sacrificed to the just claims of our fellows.'[65] What have you to say to that?" In the first place, replies Ulrichs, I demur in this case to the phrases _egoistic desires_, _social duties_, _just claims of our fellows_. I maintain that in trying to rehabilitate men of my own stamp and to justify their natural right to toleration I am not egoistic. It is begging the question to stigmatise their inborn desire as selfish. The social duties of which you speak are not duties, but compliances to law framed in blindness and prejudice. The claims of our fellows, to which you appeal, are not just, but cruelly inequitous. My insurgence against all these things makes me act indeed as an innovator; and I may be condemned, as a consequence of my rashness, to persecution, exile, defamation, proscription. But let me remind you that Christ was crucified, and that he is now regarded as a benefactor. "Stop," breaks in the objector: "We need not bring most sacred names into this discussion. I admit that innovators have done the greatest service to society. But you have not proved that you are working for the salvation of humanity at large. Would it not be better to remain quiet, and to sacrifice your life and joy, the life and joy of an avowed minority, for the sake of the immense majority who cannot tolerate you, and who dread your innovation? The Catholic priesthood is vowed to celibacy; and

unquestionably there are some adult men in that order who have trampled out the imperious appetite of the male for the female. What they do for the sake of their vow will not you accomplish, when you have so much of good to gain, of evil to escape?" What good, what evil? rejoins Ulrichs. You are again begging the question; and now you are making appeals to my selfishness, my personal desire for tranquillity, my wish to avoid persecution and shame. I have taken no vow of celibacy. If I have taken any vow at all, it is to fight for the rights of an innocent, harmless, downtrodden group of outraged personalities. The cross of a Crusade is sewn upon the sleeve of my right arm. To expect from me and from my fellows the renouncement voluntarily undertaken by a Catholic priest is an absurdity, when we join no order, have no faith to uphold, no ecclesiastical system to support. We maintain that we have the right to exist after the fashion in which nature made us. And if we cannot alter your laws, we shall go on breaking them. You may condemn us to infamy, exile, prison--as you formerly burned witches. You may degrade our emotional instincts and drive us into vice and misery. But you will not eradicate inverted sexuality. Expel nature with a fork, and you know what happens. "That is enough," says the objector: "We had better close this conversation. I am sorry for you, sorry that you will not yield to sense and force. The Urning must be punished."

VIII.

LITERATURE--IDEALISTIC.

To speak of Walt Whitman at all in connection with Ulrichs and sexual inversion seems paradoxical. At the outset it must be definitely stated that he has nothing to do with anomalous, abnormal, vicious, or diseased forms of the emotion which males entertain for males. Yet no man in the modern world has expressed so strong a conviction that "manly attachment," "athletic love," "the high towering love of comrades," is a main factor in human life, a virtue upon which society will have to rest, and a passion equal in its permanence and intensity to sexual affection.

He assumes, without raising the question, that the love of man for man co-exists with the love of man for woman in one and the same individual. The relation of the two modes of feeling is clearly stated in this poem:--

"Fast-anchored, eternal, O love! O woman I love! O bride! O wife! More resistless than I can tell, the thought of you Then separate, as disembodied, or another born, Ethereal, the last athletic reality, my consolation; I ascend--I float in the regions of your love, O man, O sharer of my roving life."

Neuropathical Urnings are not hinted at in any passage of his works. As his friend and commentator Mr. Burroughs puts it: "The sentiment is primitive, athletic, taking form in all manner of large and homely out-of-door images, and springs, as anyone may see, directly from the heart and experience of the poet."

This being so, Whitman never suggests that comradeship may occasion the development of physical desires. But then he does not in set terms condemn these desires, or warn his disciples against them. To a Western boy he says:--

"If you be not silently selected by lovers, and do not silently seek lovers, Of what use is it that you seek to become eleve of mine."

Like Plato, in the Phædrus, Whitman describes an enthusiastic type of masculine emotion, leaving its private details to the moral sense and special inclination of the person concerned.[66]

The language of "Calamus" (that section of "Leaves of Grass" which is devoted to the gospel of comradeship) has a passionate glow, a warmth of emotional tone, beyond anything to which the modern world is used in the celebration of the love of friends. It recalls to our mind the early Greek enthusiasm--that fellowship in arms which flourished among Dorian tribes, and made a chivalry for prehistoric Hellas. Nor does the poet himself appear to be unconscious that there are dangers and difficulties involved in the highly-pitched emotions he is praising. The whole tenor of two mysterious compositions, entitled "Whoever you are, Holding me now in Hand," and "Trickle, Drops," suggests an underlying sense of spiritual conflict. The following poem, again, is sufficiently significant and typical to call for literal transcription:--

"Earth, my likeness!

Though you look so impressive, ample and spheric here, I now suspect that is not all; I now suspect there is something fierce in you, eligible to burst forth; For an athletic is enamoured of me--and I of him, But toward him there is something fierce and terrible in me, eligible to burst forth, I dare not tell it in words--not even in these songs."

The reality of Whitman's feeling, the intense delight which he derives from the personal presence and physical contact of a beloved man, find expression in "A Glimpse," "Recorders ages hence," "When I heard at the Close of Day," "I saw in Louisiana a Live Oak growing," "Long I thought that Knowledge alone would content me,"[67] "O Tan-faced Prairie Boy," and "Vigil Strange I kept on the Field one Night."[68]

It is clear, then, that in his treatment of comradeship, or the impassioned love of man for man, Whitman has struck a keynote, to the emotional intensity of which the modern world is unaccustomed. It therefore becomes of much importance to discover the poet-prophet's _Stimmung_--his radical instinct with regard to the moral quality of the feeling he encourages. Studying his works by their own light, and by the light of their author's character, interpreting each part by reference to the whole and in the spirit of the whole, an impartial critic will, I think, be drawn to the conclusion that what he calls the "adhesiveness" of comradeship is meant to have no interblending with the "amativeness" of sexual love. Personally, it is undeniable that Whitman possesses a specially keen sense of the fine restraint and continence, the cleanliness and chastity, that are inseparable from the perfectly virile and physically complete nature of healthy manhood. Still, we may predicate the same ground-qualities in the early Dorians, those martial founders of the institution of Greek Love; and it is notorious to students of Greek civilisation that the lofty sentiment of their chivalry was intertwined with singular anomalies in its historical development.

To remove all doubt about Whitman's own intentions when he composed "Calamus," and promulgated his doctrine of impassioned comradeship, I wrote to him, frankly posing the questions which perplexed my mind. The answer I received, dated Camden, New Jersey, U.S.A., August 19, 1890, and which he permits me to make use of, puts the matter beyond all debate, and confirms the conclusions to which I had been led by criticism. He writes as follows: "About the questions on 'Calamus,' &c., they quite daze me. 'Leaves of Grass' is only to be rightly construed by and within its own atmosphere and essential character--all its pages and pieces so coming strictly under. That the Calamus part has ever allowed the possibility of such construction as mentioned is terrible. I am fain to hope the pages themselves are not to be even mentioned for such gratuitous and quite at the time undreamed and unwished possibility of morbid inferences--which are disavowed by me and seem damnable."

No one who knows anything about Walt Whitman will for a moment doubt his candour and sincerity. Therefore the man who wrote "Calamus," and preached the gospel of comradeship, entertains feelings at least as hostile to sexual inversion as any law-abiding humdrum Anglo-Saxon could desire. It is obvious that he has not even taken the phenomena of abnormal instinct into account. Else he must have foreseen that, human nature being what it is, we cannot expect to eliminate all sexual alloy from emotions raised to a high pitch of passionate intensity, and that permanent elements within the midst of our society will emperil the absolute purity of the ideal he attempts to establish.

These considerations do not, however, affect the spiritual nature of that ideal. After acknowledging, what Whitman has omitted to perceive, that there are inevitable points of contact between sexual inversion and his doctrine of comradeship, the question now remains whether he has not suggested the way whereby abnormal instincts may be moralised and raised to higher value. In other words, are those instincts provided in "Calamus" with the means of their salvation from the filth and mire of brutal appetite? It is difficult to answer this question; for the issue involved is nothing less momentous than the possibility of evoking a new chivalrous enthusiasm, analogous to that of primitive Hellenic society, from emotions which are at present classified among the turpitudes of human nature.

Let us look a little closer at the expression which Whitman has given to his own feelings about friendship. The first thing that strikes us is the mystic emblem he has chosen for masculine love. That is the water-plant, or scented rush, called Calamus, which springs in wild places, "in paths untrodden, in the growth by margins of pond-waters" He has chosen these "emblematic and capricious blades" because of their shyness, their aromatic perfume, their aloofness from the patent life of the world. He calls them "sweet leaves, pink-tinged roots, timid leaves," "scented herbage of my breast." Finally, he says:--[69]

"Here my last words, and the most baffling, Here the frailest leaves of me, and yet my strongest-lasting, Here I shade down and hide my thoughts--I do not expose them, And yet they expose me more than all my other poems."

The manliness of the emotion, which is thus so shyly, mystically indicated, appears in the magnificent address to soldiers at the close of the great war: "Over the Carnage rose Prophetic a Voice."[70] Its tenderness emerges in the elegy on a slain comrade--:[71]

"Vigil for boy of responding kisses (never again on earth responding), Vigil for comrade swiftly slain--vigil I never forget, how as day brightened, I rose from the chill ground, and folded my soldier well in his blanket, And buried him where he fell."

Its pathos and clinging intensity transpire through the first lines of the following piece, which may have been suggested by the legends of David and Jonathan, Achilles and Patroclus, Oretes and Pylades:--[72]

"When I pursue the conquered fame of heroes, and the victories of mighty generals, I do not envy the generals, Nor the president in his Presidency, nor the rich in his great house; But when I read of the brotherhood of lovers, how it was with them, How through life, through dangers, odium, unchanging, long and long, Through youth, and through middle and old age, how unfaltering, how affectionate and faithful they were, Then I am pensive--I hastily put down the book, and walk away, filled with the bitterest envy."

But Whitman does not conceive of comradeship as a merely personal possession, delightful to the friends it links in bonds of amity. He regards it essentially as a social and political virtue. This human emotion is destined to cement society and to render commonwealths inviolable. Reading some of his poems, we are carried back to ancient Greece--to Plato's Symposium, to Philip gazing on the Sacred Band of Thebans after the fight at Chæronea.[73]

"I dream'd in a dream, I saw a city invincible to the attacks of the whole of the rest of the earth; I dream'd that was the new City of Friends; Nothing was greater there than the quality of robust love--it led the rest; It was seen every hour in the actions of the men of that city, And in all their looks and words."

And again:[74]

"I believe the main purport of these States is to found a superb friendship, exalté, previously unknown, Because I perceive it waits, and has been always waiting, latent in all men."

And once again:--[75]

"Come, I will make the continent indissoluble; I will make the most splendid race the sun ever yet shone upon; I will make divine magnetic lands, With the love of comrades, With the life-long love of comrades. I will plant companionship thick as trees all along the shores of America, and along the shores of the great lakes, and all over the prairies; I will make inseparable cities, with their arms about each other's necks; By the love of comrades, By the manly love of comrades. For you these from me, O Democracy, to serve you ma femme! For you, for you I am thrilling these songs."

In the company of Walt Whitman we are very far away from Gibbon and Carlier, from Tardieux and Casper-Liman, from Krafft-Ebing and Ulrichs. What indeed has this "superb friendship, exalté, previously unknown," which "waits, and has been always waiting, latent in all men," that "something fierce in me, eligible to burst forth," "ethereal comradeship," "the last athletic reality"--what has all this in common with the painful topic of the preceding sections of my Essay?

It has this in common with it. Whitman recognises among the sacred emotions and social virtues, destined to regenerate political life and to cement nations, an intense, jealous, throbbing, sensitive, expectant love of man for man: a love which yearns in absence, droops under the sense of neglect, revives at the return of the beloved; a love that finds honest delight in hand-touch, meeting lips, hours of privacy, close personal contact. He proclaims this love to be not only a daily fact in the present, but also a saving and ennobling aspiration. While he expressly repudiates, disowns, and brands as "damnable" all "morbid inferences" which may be drawn by malevolence or vicious cunning from his doctrine, he is prepared to extend the gospel of comradeship to the whole human race. He expects Democracy, the new social and political medium, the new religious ideal of mankind, to develop and extend "that fervid comradeship," and by its means to counterbalance and to spiritualise what is vulgar and materialistic in the modern world. "Democracy," he maintains, "infers such loving comradeship, as its most inevitable twin or counterpart, without which it will be incomplete, in vain, and incapable of perpetuating itself."[76]

If this be not a dream, if he is right in believing that "threads of manly friendship, fond and loving, pure and sweet, strong and life-long, carried to degrees hitherto unknown," will penetrate the organism of society, "not only giving tone to individual character, and making it unprecedentedly emotional, muscular, heroic, and refined, but having deepest relations to general politics"--then are we perhaps justified in foreseeing here the advent of an enthusiasm which shall rehabilitate those outcast instincts, by giving them a spiritual atmosphere, an environment of recognised and healthy emotions, wherein to expand at liberty and purge away the grossness and the madness of their pariahdom?

This prospect, like all ideals, until they are realised in experience, may seem fantastically visionary. Moreover, the substance of human nature is so mixed that it would perhaps be fanatical to expect from Whitman's chivalry of "adhesiveness" a more immaculate purity than was attained by the mediæval chivalry of "amativeness." Still that mediæval chivalry, the great emotional

product of feudalism, though it fell short of its own aspiration, bequeathed incalculable good to modern society by refining and clarifying the crudest of male appetites. In like manner, the democratic chivalry, announced by Whitman, may be destined to absorb, control, and elevate those darker, more mysterious, apparently abnormal appetites, which we have seen to be widely diffused and ineradicable in the ground-work of human nature.

Returning from the dream, the vision of a future possibility, it will at any rate be conceded that Whitman has founded comradeship, the enthusiasm which binds man to man in fervent love, upon a natural basis. Eliminating classical associations of corruption, ignoring the perplexed questions of a guilty passion doomed by law and popular antipathy to failure, he begins anew with sound and primitive humanity. There he discovers "a superb friendship, exalté, previously unknown." He perceives that "it waits, and has been always waiting, latent in all men." His method of treatment, fearless and uncowed by any thought of evil, his touch upon the matter, chaste and wholesome and aspiring, reveal the possibility of restoring in all innocence to human life a portion of its alienated or unclaimed moral birthright. The aberrations we have been discussing in this treatise are perhaps the morbid symptoms of suppression, of hypertrophy, of ignorant misregulation, in a genuine emotion capable of being raised to good by sympathetic treatment.

It were well to close upon this note. The half, as the Greeks said, is more than the whole; and the time has not yet come to raise the question whether the love of man for man shall be elevated through a hitherto unapprehended chivalry to nobler powers, even as the barbarous love of man for woman once was. This question at the present moment is deficient in actuality. The world cannot be invited to entertain it.[77]

IX.

EPILOGUE.

The conclusions to which I am led by this enquiry into sexual inversion are that its several manifestations may be classified under the following categories: (1) Forced abstinence from intercourse with females, or _faute de mieux;_ (2) Wantonness and curious seeking after novel pleasure; (3) Pronounced morbidity; (4) Inborn instinctive preference for the male and indifference to the female sex; (5) Epochs of history when the habit has become established and endemic in whole nations.

Under the first category we group the phenomena presented by schools, prisons, convents, ships, garrisons in solitary stations, nomadic tribes of marauding conquerors.[78]

To the second belong those individuals who amuse themselves with experiments in sensual pleasure, men jaded with ordinary sexual indulgence, and indifferent voluptuaries. It is possible that something morbid or abnormal usually marks this class.

To the third we assign clear cases of hereditary malady, in which a want of self-control is prominent, together with sufferers from nervous lesion, wounds, epilepsy, senile brain-softening, in so far as these physical disturbances are complicated with abnormal passions.[79]

The fourth includes the whole class of Urnings, who have been hitherto ignored by medical investigators, and on whose numerical importance Ulrichs has perhaps laid exaggerated stress. These individuals behave precisely like persons of normal sexual proclivities, display no signs of insanity, and have no morbid constitutional diathesis to account for their peculiarity.

Under the existing conditions of European Society, these four categories exist sporadically. That is to say, the members of them are found scattered through all communities, but are nowhere recognised except by the penal code and the medical profession. In the fifth category we are brought face to face with the problem offered by ancient Hellas, by Persia, by Afghan, by the peoples of what Burton calls the Sotadic Zone. However we may account for the origin of sexual inversion, the instinct has through usage, tradition, and social toleration passed here into the nature of the race; so that the four previous categories are confounded, or, if distinguished, are only separable in the same way as the vicious and morbid affections of the ordinary sexual appetite may be differentiated from its healthier manifestations.

Returning to the first four categories, which alone have any importance for a modern European, we perceive that only one of them, the third, is positively morbid, and only one, the second, is _ipso facto_ vicious. The first is immoral in the same sense as all incontinence, including self-abuse, fornication, and so forth, practised _faute de mieux_, is immoral; but it cannot be called either morbid or positively vicious, because the habit in question springs up under extra-social circumstances. The members of the fourth category are abnormal through their constitution. Whether we refer that abnormality to atavism, or to some hitherto unapprehended

deviation from the rule in their sexual conformation, there is no proof that they are the subjects of disease. At the same time it is certain that they are not deliberately vicious.

The treatment of sexual inversion by society and legislation follows the view taken of its origin and nature. Ever since the age of Justinian, it has been regarded as an unqualified crime against God, the order of the world, and the State. This opinion, which has been incorporated in the codes of all the Occidental races, sprang originally from the conviction that sterile passions are injurious to the tribe by checking propagation. Religion adopted this view, and, through the legend of Sodom and Gomorrah, taught that God was ready to punish whole nations with violent destruction if they practised the "unmentionable vice." Advancing civilisation, at the same time, sought in every way to limit and regulate the sexual appetite; and while doing so, it naturally excluded those forms which were not agreeable to the majority, which possessed no obvious utility, and which _prima facie_ seemed to violate the cardinal laws of human nature.

Social feeling, moulded by religion, by legislation, by civility, and by the persistent antipathies of the majority regards sexual inversion with immitigable abhorrence. It does not distinguish between the categories I have indicated, but includes all species under the common condemnation of crime.

Meanwhile, of late years, we have come to perceive that the phenomena presented by sexual inversion, cannot be so roughly dealt with. Two great nations, the French and the Italian, by the "Code Napoleon" and the "Codice Penale" of 1889, remove these phenomena from the category of crime into that of immorality at worst. That is to say, they place the intercourse of males with males upon the same legal ground as the normal sexual relation. They punish violence, protect minors, and provide for the maintenance of public decency. Within these limitations, they recognise the right of adults to deal as they choose with their persons.

The new school of anthropologists and psychological physicians study sexual inversion partly on the lines of historical evolution, and partly from the point of view of disease. Mixing up atavism and heredity with nervous malady in the individual, they wish to substitute medical treatment for punishment, life-long sequestration in asylums for terms of imprisonment differing in duration according to the offence.

Neither society nor science entertains the notion that those instincts which the laws of France and Italy tolerate, under certain restrictions, can be simply natural in a certain percentage of male persons. Up to the present time the Urning has not been considered as a sport of nature in her attempt to differentiate the sexes. Ulrichs is the only European who has maintained this view in a long series of polemical and imperfectly scientific works. Yet facts brought daily beneath the notice of open-eyed observers prove that Ulrichs is justified in his main contention. Society lies under the spell of ancient terrorism and coagulated errors. Science is either wilfully hypocritical or radically misinformed.

Walt Whitman, in America, regards what he calls "manly love" as destined to be a leading virtue of democratic nations, and the source of a new chivalry. But he does not define what he means by "manly love." And he emphatically disavows any "morbid inferences" from his doctrine as "damnable."

This is how the matter stands now. The one thing which seems clear is that sexual inversion is no subject for legislation, and that the example of France and Italy might well be followed by other nations. The problem ought to be left to the physician, the moralist, the educator, and finally to the operation of social opinion.

X.

SUGGESTIONS ON THE SUBJECT OF SEXUAL INVERSION IN RELATION TO LAW AND EDUCATION.

I.

The laws in force against what are called unnatural offences derive from an edict of Justinian, A.D. 538. The Emperor treated these offences as criminal, on the ground that they brought plagues, famines, earthquakes, and the destruction of whole cities, together with their inhabitants, upon the nations who tolerated them.

II.

A belief that sexual inversion is a crime against God, nature, and the State pervades all subsequent legislation on the subject. This belief rests on (1) theological conceptions derived from the Scriptures; (2) a dread of decreasing the population; (3) the antipathy of the majority for the tastes of the minority; (4) the vulgar error that antiphysical desires are invariably voluntary, and the result either of inordinate lust or of satiated appetites.

III.

Scientific investigation has proved in recent years that a very large proportion of persons in whom abnormal sexual inclinations are manifested possess them from their earliest childhood, that they cannot divert them into normal channels, and that they are powerless to get rid of them. In these cases, then, legislation is interfering with the liberty of individuals, under a certain misconception regarding the nature of their offence.

IV.

Those who support the present laws are therefore bound to prove that the coercion, punishment, and defamation of such persons are justified either (1) by any injury which these persons suffer in health of body or mind, or (2) by any serious danger arising from them to the social organism.

V.

Experience, confirmed by scientific observation, proves that the temperate indulgence of abnormal sexuality is no more injurious to the individual than a similar indulgence of normal sexuality.

VI.

In the present state of over-population, it is not to be apprehended that a small minority of men exercising sterile and abnormal sexual inclinations should seriously injure society by limiting the increase of the human race.

VII.

Legislation does not interfere with various forms of sterile intercourse between men and women: (1) prostitution, (2) cohabitation in marriage during the period of pregnancy, (3) artificial precautions against impregnation, and (4) some abnormal modes of congress with the consent of the female. It is therefore in an illogical position, when it interferes with the action of those who are naturally sterile, on the ground of maintaining the numerical standard of the population.

VIII.

The danger that unnatural vices, if tolerated by the law, would increase until whole nations acquired them, does not seem to be formidable. The position of women in our civilisation renders sexual relations among us occidentals different from those of any country--ancient Greece and Rome, modern Turkey and Persia--where antiphysical habits have hitherto become endemic.

IX.

In modern France, since the promulgation of the Code Napoleon, sexual inversion has been tolerated under the same restrictions as normal sexuality. That is to say, violence and outrages to public decency are punished, and minors are protected, but adults are allowed to dispose as they like of their own persons. The experience of nearly a century shows that in France, where sexual inversion is not criminal _per se_, there has been no extension of it through society. Competent observers, like agents of police, declare that London, in spite of our penal legislation, is no less notorious for abnormal vice than Paris.

X.

Italy, by the Penal Code of 1889, adopted the principles of the Code Napoleon on this point. It would be interesting to know what led to this alteration of the Italian law. But it cannot be supposed that the results of the Code Napoleon in France were not fully considered.

XI.

The severity of the English statutes render them almost incapable of being put in force. In consequence of this the law is not unfrequently evaded, and crimes are winked at.

XII.

At the same time our laws encourage blackmailing upon false accusation; and the presumed evasion of their execution places from time to time a vile weapon in the hands of unscrupulous politicians, to attack the Government in office. Examples: the Dublin Castle Scandals of 1884, the Cleveland Street Scandals of 1889.

XIII.

Those who hold that our penal laws are required by the interests of society must turn their attention to the higher education. This still rests on the study of the Greek and Latin classics, a literature impregnated with pæderastia. It is carried on at public schools, where young men are kept apart from females, and where homosexual vices are frequent. The best minds of our youth are therefore exposed to the influences of a pæderastic literature at the same time that they acquire the knowledge and experience of unnatural practices. Nor is any trouble taken to correct these adverse influences by physiological instruction in the laws of sex.

XIV.

The points suggested for consideration are whether England is still justified in restricting the freedom of adult persons, and rendering certain abnormal forms of sexuality criminal, by any real dangers to society: after it has been shown (1) that abnormal inclinations are congenital, natural, and ineradicable in a large percentage of individuals; (2) that we tolerate sterile intercourse of various types between the two sexes; (3) that our legislation has not suppressed the immorality in question; (4) that the operation of the Code Napoleon for nearly a century has not increased this immorality in France; (5) that Italy, with the experience of the Code Napoleon to guide her, adopted its principles in 1889; (6) that the English penalties are rarely inflicted to their full extent; (7) that their existence encourages blackmailing, and their non-enforcement gives occasion for base political agitation; (8) that our higher education is in open contradiction to the spirit of our laws.[80]

FINIS.

FOOTNOTES:

[1] Vindices Flammæ.

[2] Stieber, "Practisches Lehrbuch der Criminal-Polizei," 1860, cap. 19, quoted by Ulrichs, "Araxes," p. 9. It is not necessary to multiply evidences upon a point so patent to every man of the world. But I will nevertheless translate a striking passage from Mantegazza (_op. cit._, p. 148). "Nor is this infamous abomination confined to the vilest classes of our society. It soars into the highest spheres of wealth and intelligence. Within the narrow range of my own experience I have known among the most scandalous sodomites a French journalist, a German poet, an Italian statesman, and a Spanish jurist; all of these men of exquisite taste and profound culture!" It would not be difficult to draw up a list of English kings, bishops, deans, nobles of the highest rank, poets, historians, dramatists, officers in the army and navy, civil servants, schoolmasters in the most fashionable schools, physicians, members of Parliament, journalists, barristers, who in their lifetime were, as Dante says, "d'un medesmo peccato al mondo lerci." Many belonging to the past are notorious; and no good could come of mentioning the names of the living.

[3] This accusation against men who feel a sexual inclination for males loses some of its significance when we consider how common the practice of _Venus aversa_ is among libertines who love women. Parent-Duchatelet asserts that no prostitute after a certain age has escaped it. Coffignon, in his book on, "La Corruption à Paris" (p. 324), says: "Chaque année, il passe en traîtement a l'hôpital de Lourcine une centaine de femmes sodomistes.... Je suis persuadé qu'à l'hôpital de St. Lazare la proportion des sodomistes est encore beaucoup plus grande.... Les maîtresses de maison, professant cet odieux principe que la clientèle doit être satisfaite, ne permettent pas à une fille de se refuser à une acte de sodomie." Tardieu (Attentats, &c., p. 198) observes: "Chose singulière! c'est principalement des rapports conjugaux que se sont produits les faits de cette nature."

[4] See Casper-Liman, vol. i., p. 182, at the end of Case 71.

[5] While studying what Germans call the _Casuistik_ of this question in medical, forensic, and anthropological works, we often meet with cases where inverted sexuality exhibits extraordinary symptoms of apparent craziness--strange partialities for particular

kinds of dress, occupations in the beloved object, nastinesses, and so forth. But it must be remarked first that the same symptoms are exhibited by sexually normal natures (Krafft-Ebing, Observations 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, and the cases recorded in footnote to page 90); and, secondly, that if they should appear to be more frequent in the abnormal, this can in a great measure be ascribed to the fact that these latter cases only come under the observation of medical men and judges when the patients have already for many years been suffering from all the pangs of a coerced and defrauded instinct. There is nothing in the copious history of Greece and Rome upon this subject to lead us to suppose that in a society which tolerated sexual inversion, its subjects were more conspicuous for filthy and degrading or insane proclivities than ordinary men and women were. Those who can bring themselves to enquire into such matters may convince themselves by reading Forberg's annotations to "Hermaphroditus," Rosenbaum's "Lustseuche," the pseudo-Meursius, and the pornographical dialogues of Aretino. It will appear conclusively that both in ancient and in modern times the normal sexual instinct has been subject to the wildest freaks and aberrations; not in actually diseased persons, but simply in lustful wantons and the epicures of new sensations. The curious things we know about flagellation and cruelty in connection with the ordinary appetite should also be remembered. As a final note on this topic, I will refer to a passage quoted by Tarnowsky from a work of Taxil, describing a peculiarly repulsive class of fashionable libertines in Paris called "les stercoraires" (_op. cit._, p. 70). Compare what Mantegazza reports of a "gentile ufficiale francese" (Gli amore degli uomini, vol. i. p. 117).

[6] See upon this point Tardieu, "Attentats aux Moeurs," Rosenbaum, "Die Lustseuche."

[7] Ancient literature abounds in prose and poetry which are both of them concerned with homosexual love. Only a portion of this can be called pornographic: among the Greeks, the [Greek: Mousa Paidikê], parts of Lucian, and occasional hints in Athenæus and Aristophanes perhaps deserve the name; among the Romans, the Priapeia, the Satyricon of Petronius, some elegies and satires, certainly do so. Italian literature can show the Rime Burlesche, Beccadelli's Hermaphroditus, the Canti Carnascialeschi, the maccaronic poems of Fidentius, and the remarkably outspoken romance entitled "Alcibiade fanciullo a scolla." Balzac has treated the theme, but with reserve and delicacy. Mirabeau's "Erotika Biblion" is a kind of classic on the subject. In English literature, if we except Shakespeare's Sonnets, George Barnfield's Poems, parts of Marlowe, "Roderick Random," Churchill's Satire "The Times," homosexual passions have been rarely handled, and none of these works are pornographic. In Germany, Count von Platen, Heine's victim, was certainly an Urning; but his homosexual imitations of Persian poetry are pure, though passionate. I am not acquainted with more than the titles of some distinctly pornographic German books. The following appears to be of this sort: "Mannesliebe, oder drei Jahre aus dem Leben eines jungen Mannes."

[8] Les Deux Prostitutions, par F. Carlier, Ancien Chef du Service actif des Moeurs à la Préfecture de Police. Paris. Dentu. 1889.

[9] Paris, Brossier, 1889.

[10] In the recently published military novel "Sous Offs." (by Lucien Descaves, Paris, Tresse et Stock, 1890) some details are given regarding establishments of this nature. See pp. 322, 412, 417, for a description of the drinking-shop called "Aux Amis de l'Armée," where a few maids were kept for show, and also of its frequenters, including in particular the adjutant Laprévotte (cp. 44).

[11] On the morals of the Foreign Legions, see Ulrichs, Ara Spei, p. 20; Memnon, p. 27. Also General Brossier's report, quoted by Burton, Arabian Nights, vol. x. p. 251

[12] P. 459.

[13] Tardieu, _op. cit._, pp. 213-255.

[14] In dealing with Tardieu, Casper-Liman, and Tarnowsky, I have directed the reader to passages in the works of the three medical authorities who have spoken most decidedly upon this topic. After comparing their evidence, the case seems to me to stand thus. Both male and female prostitutes are exposed to considerable risks of physical deformation in the exercise of their illicit trade. But males and females, if they keep their vicious propensities within the bounds of temperance, offer no physical deformations to observation. Only those men who for years have practised promiscuous prostitution earn epithets like the Greek slang [Greek: euryprôktos], or the Italian _culo rotto_.

[15] Casper-Liman, _op. cit._, vol. i. p. 164.

[16] Casper-Liman, _op. cit._, vol. i. pp. 174-181.

[17] _Op. cit._, vol. i. pp. 164-166.

[18] Having criticised Tardieu for his use of the phrase _pæderast_, Casper and Liman can find no better.

[19] Westphal: Die Conträre Sexualempfindung. Archiv für Psychatrie, vol. ii. I.

[20] The Standard of Sanity, Br. Med. Journal, Nov. 28, 1885.

[21] See Tarnowsky about the opinion of the lower classes in St. Petersburg, _op. cit._, p. 99. "Ueberhaupt verhalten sich die gemeinen ungebildeten Leute, dem Ausspruch aller mir bekannten Päderasten gemäss, äusserat nachsichtig gegen unzüchtige Anträge--'herrschaft-liche Spielerei,' wie sie es nennen." This is true not only of Russia, but of countries where we should least expect to find the compliance in question.

[22] P. 73. The italics are the translator's. The adjective _homosexual_, though ill-compounded of a Greek and a Latin word, is useful, and has been adopted by medical writers on this topic. _Unisexual_ would perhaps be better.

[23] A note upon this subject has to be written; and it may be introduced here as well as elsewhere. Balzac, in _Une dernière incarnation de Vautrin_, describes the morals of the French _bagnes_. Dostoieffsky, in _Prison Life in Siberia_, touches on the same topic. See his portrait of Sirotkin, p. 52, _et seq._, p. 120 (edn. J. & R. Maxwell, London). We may compare Carlier, _op. cit._, pp. 300, 301, for an account of the violence of homosexual passions in French prisons. The initiated are familiar with the facts in English prisons. There is a military prison on the Lido at Venice, where incorrigible lovers of their own sex, amongst other culprits, are confined. A man here said: "All our loves in this place are breech-loaders." Bouchard, in his _Confessions_ (Paris, Liseux, 1881), describes the convict station at Marseilles in 1630. The men used to be allowed to bring women on board the galleys. At that epoch they "les besognoient avant tout le monde, les couchant sous le banc sur leur 'capot. Mais depuis quelques années en ca, le general a defendu entrée aux femmes. De sorte qu'il ne se pêche plus maintenant là-dedans qu'en sodomie, mollesse, irrumation, et autres pareilles tendresses" (p. 151). The same Frenchman, speaking of the Duc d'Orléans' pages at Paris, says that this was a "cour extrèmemen impie et débauchée, surtout pour les garçons, M. d'Orléans deffendoit à ses pages de se besogner ni branler la pique; leur donnant au reste congé de voir les femmes tant qu'ils voudroient, et quelquefois venant de nuict heurter à la porte de leur chambre, avec cinq ou six garses, qu'il enfermoit avec eux une heure à deux" (p. 88). This prince was of the same mind as Campanella, who, in the _Città del Sole_, laid it down that young men ought to be freely admitted to women, for the avoidance of sexual aberrations. Aretino and Berni enable us to comprehend the sexual immorality of males congregated together in the courts of Roman prelates. As regards military service, the facts related by Ulrichs about the French Foreign Legion in Algeria, on the testimony of a credible witness, who had been a pathic in his regiment, deserve attention (_Ara Spei_, p. 20; _Memnon_, p. 27). This man, who was a German, told Ulrichs that the Spanish, French, and Italian soldiers were the lovers, the Swiss and German their beloved. See General Brossier, cited above, p. 19. Ulrichs reports that in the Austrian army lectures on homosexual vices are regularly given to cadets and conscripts (_Memnon_, p. 20).

[24] See above, p. 33, my criticism of Moreau upon this point, with special reference to Greece.

[25] Prometheus, pp. 20-26, _et seq._

[26] Without having recourse to Ulrichs, it may be demonstrated from Krafft-Ebing's own cases of genuine Urnings that early onanism is by no means more frequent among them than among normal males. Five marked specimens showed no inclination for self-abuse. The first (p. 128) says: "As I never masturbated and felt no inclination for it, I sometimes had a nocturnal pollution." The second (p. 155): "You will be surprised to hear that before my twenty-eighth year I never had any ejaculation of semen, either by nocturnal emissions, or by masturbation, or by contact with a man." The third (p. 172): "Onanism is a miserable makeshift, and pernicious, whereas homosexual love elevates the moral and strengthens the physical nature." The fourth (p. 163): "I had an internal horror of onanism, although from the very first appearance of puberty I was sensually very excitable and troubled with persistent erections." The fifth (p. 142) is not so clear; but it is obvious from his remarks that the first ejaculation of semen which happened to him did so at the sight of a handsome soldier: "feeling my parts moistened, I was horribly frightened and thought it was a hæmorrhage." Some of the cases do not mention the subject at all. A good many seem to have begun to masturbate early; but the proportion is not excessive to the whole number. One Urning explains the _faute de mieux_ system (p. 115): "If we have no friend, whose sexual company has become needful to the preservation of our health, and if we abandon ourselves at last to masturbation alone with our imagination, then indeed do we become ill." Another speaks as follows (p. 151): "Homosexual indulgence with a man gave me enjoyment and a consequent feeling of well-being, whereas onanism _faute de mieux_ produced an opposite result."

[27] P. 82. Herodotus called it "the female disease."

[28] P. 86, _et seq._

[29] P. 88, _et seq._

[30] Henceforward we may use the word Urning without apology; for however the jurists and men of science repudiate Ulrichs' doctrine, they have adopted his designation for a puzzling and still unclassified member of the human race. A Dr. Kaserer, of Vienna, is said to have invented the term Urning.

[31] This is a hit at Westphal, Krafft-Ebing's predecessor, who laid down the doctrine that Urnings are conscious of their own morbidity. Of course, both authorities are equally right. Approach an Urning with terrors of social opinion and law; and he will confess his dreadful apprehensions. Approach him from the point of view of science; and he will declare that, within four closed walls, he has no thought of guilt.

[32] Pp. 97-106.

[33] The physical repugnance of true Urnings for women may be illustrated by passages from three of Krafft-Ebing's cases (pp. 117, 123, 163), which I will translate. (1) "I had observed that a girl was madly in love with me, and longed intensely to yield herself up to me. I gave her an assignation in my house, hoping that I should succeed better with a girl who sought me out of love than I had with public women. After her first fiery caresses, I did indeed feel a little less frigid; but when it came to thinking about copulation, all was over--the same stark frost set in, and my part was played out. I sent her away, deeply excited, with some moral remarks; and I have never tried the like experiments again. On all these occasions _the specific odour of the female added to my horror_." (2) "The proximity of wenches aroused in me qualms and nausea; _in particular I could not bear to smell them_." (3) "It seems to me absurd to set up the female form as the prototype of human beauty. I regard a woman's person as displeasing, the formation of her hips as ugly and unæsthetic. Dancing is therefore an abomination to me. _I loathe the odour which the so-called fair sex exhales when heated by the dance._" The disgust inspired in these three Urnings by the smell of the female is highly significant; since we know that the sense of smell acts powerfully upon the sexual appetite of normal individuals. It may be remarked that in all the instances of pronounced Urnings, sexual congress with women seems to have been followed with disgust, nervous exhaustion, and the sense of an unnatural act performed without pleasure. This is true even of those who have brought themselves to marriage.

[34] A sign, by the way, which may be observed in the most masculine of athletes. This is very noticeable in the nude photographs of Sandow.

[35] Englishmen know the type as Mariannes, and had occasion to study their habits in the Boulton and Park trial. For the type in Paris, consult Carlier, _op. cit._, pp. 323-326, 339-351, 463.

[36] I have used the German version of Lombroso's work, because of the translator's preface and occasional annotations.

[37] See Dufour, "Histoire de la Prostitution," vol. iii. (France, ch. i.) p. 193.

[38] See Dufour, "Histoire de la Prostitution," (France, chs. 6 and 7).

[39] See above, p. 35, for an ingenious definition by Dr. Huggard, which covers both classes as born criminals and moral madmen.

[40] His German translator calls attention to this omission; p. 153 footnote.

[41] Third edition. Halle a. S., 1882.

[42] Psych. Sex., p. 82.

[43] Leipzig, Wigand, 1860.

[44] Arabian Nights, 1885, vol. x., pp. 205-254.

[45] Burton's acquaintance with what he called "le Vice" was principally confined to Oriental nations. He started on his enquiries, imbued with vulgar errors; and he never weighed the psychical theories examined by me in the foregoing section of this Essay. Nevertheless, he was led to surmise a crasis of the two sexes in persons subject to sexual inversion. Thus he came to speak of "the third sex." During conversations I had with him less than three months before his death, he told me that he had begun a

general history of "le Vice"; and at my suggestion he studied Ulrichs and Krafft-Ebing. It is to be lamented that life failed before he could apply his virile and candid criticism to those theories, and compare them with the facts and observations he had independently collected.

[46] I give the author's own text, p. 206.

[47] P. 208.

[48] P. 251.

[49] P. 222.

[50] Pp. 204, 209.

[51] Gli amori degli Uomini, Milano, 1886, vol. i. cap. 5.

[52] _Ibid._, p. 149.

[53] Pp. 148-154.

[54] P. 154.

[55] See above, p. 55, note.

[56] The notion that human beings were originally hermaphrodite is both ancient and wide-spread. We find it in the Book of Genesis, unless, indeed, there be a confusion here between two separate theories of creation. God is said to have first made man in his own image, male and female in one body, and to have bidden them multiply. Later on he created the woman out of part of the primitive man. The myth related by Aristophanes in Plato's _Symposium_ has a curious bearing upon Ulrichs' speculations. There were originally human beings of three sexes: men, the children of the sun; women, the children of the earth; and hermaphrodites, the children of the moon. They were round, with two faces, four hands, four feet and two sets of reproductive organs apiece. In the case of the third sex, one set was male, the other female. Zeus, on account of their strength and insolence, sliced them into halves. Since that time the halves of each sort have always striven to unite with their corresponding halves, and have found some satisfaction in carnal congress--males with males, females with females, and males and females with each other: "They who are a section of the male follow the male, and while they are young, being slices of the original man, they hang about men and embrace them, and they are themselves the best of boys and youths, because they have the most manly nature. And when they reach manhood, they are lovers of youth, and are not naturally inclined to marry or beget children, which they do, if at all, only in obedience to the law, but they are satisfied if they may be allowed to live with one another unwedded; and such a nature is prone to love and ready to return love, always embracing that which is akin to him." (Symp. 191-2, Jowett's translation.) Then follows a glowing description of Greek Love, the whole reminding us very closely of the confessions made by Urnings in modern times, and preserved by medical or forensic writers on sexual inversion.

[57] Memnon, section xix.

[58] See above, p. 36, the suggestion quoted from Dr. Huggard of "a congenital lack of balance between structures themselves healthy." It might be queried whether this "imperfect sexual differentiation," or this "congenital lack of balance between structures themselves healthy," is not the result of an evolutionary process arriving through heredity and casual selection at an abnormal, but not of necessity a morbid, phenomenon in certain individuals.

[59] The first two from Casper-Liman, Handbuch der gerichtlichen Medicin, vol. i. pp. 166-169. The others from Krafft-Ebing, Psychopathia Sexualis.

[60] Memnon, section lxxiii. p. 54.

[61] Since Ulrichs left off writing, Italy (by the "Nuovo Codice Penale" of 1889) has adopted the principles of the Code Napoleon, and has placed sexual inversion under the same legal limitations as the normal sexual instinct.

[62] Dr. W. Ogle, on the 18th March, 1890, read a paper before the Statistical Society upon "Marriage Rates and Ages." The conclusion he arrived at, with regard to the rapidly-advancing over-population of England, was that, in order to equalise the death-rate with the birth-rate (or in other words, to maintain the population at its present level), we must look forward either to (1) an

increase of emigration which would involve social revolution, or (2) to the advance of the average age at which women marry to the point of thirty years, or (3) to an exclusion of 45 per cent. of those who now marry from matrimony at any period of life. In the face of these calculations, after admitting their possible exaggeration, it seems illogical to punish with severe legal penalties those members of the male sex who do not want to marry, and who can satisfy their natural desires in ways which involve no detriment to the State and no violation of the rights of individuals.

[63] Psych. Sex., p. 108. I have condensed the sense of four short paragraphs, to translate which in full would have involved a disagreeable use of medical language.

[64] Psych. Sex., p. 107.

[65] Studies in Literature, p. 119.

[66] In this relation it is curious to note what one of Casper-Liman's correspondents says about the morals of North America (_op. cit._, vol. i. p. 173). "Half a year after my return I went to North America, to try my fortune. There the unnatural vice in question is more ordinary than it is here; and I was able to indulge my passions with less fear of punishment or persecution. The American's tastes in this matter resemble my own; and I discovered, in the United States, that I was always immediately recognised as a member of the confraternity." The date of this man's visit to America was the year 1871-72. He had just returned from serving as a volunteer in the great Franco-German war of 1870-71.

[67] Not included in the "Complete Poems and Prose." It will be found in "Leaves of Grass," Boston, 1860-1861.

[68] The two last are from "Drum-Taps."

[69] This I cannot find in "Complete Poems and Prose." It is included in the Boston edition, 1860-61, and the Camden edition, 1876.

[70] "Drum-Taps." Complete Poems, p. 247.

[71] _Ibid._, p, 238.

[72] "Leaves of Grass." Complete Poems, p. 107.

[73] Complete Poems, p. 109. Compare, "I hear it was charged against me," _ibid._, p. 107.

[74] Complete Poems, p. 110.

[75] Camden edition, 1876, p. 127. Complete Poems, p. 99. Compare "Democratic Vistas," Complete Prose, p. 247, note.

[76] These prose passages are taken from "Democratic Vistas," cited above, p. 119, note.

[77] While these sheets were going through the press, I communicated Whitman's reply to a judicious friend, whose remarks upon it express my own opinion more clearly and succinctly than I have done above: "I do not feel that this answer throws light on the really interesting question; does the sentiment of 'Calamus' represent, in its own way, the ideal which we should aim at impressing on passionate affections between men, as certainly liable to take other objectionable forms? Is there sufficient affinity between the actual and the ideal for this to be practicable? That is what I have never felt sure about when we have discussed these matters. But I do not feel that my doubts have been resolved in any negative direction by Walt Whitman."

[78] Kelts, Scythians, Dorians, Tartars, Normans.

[79] It ought to be borne in mind that they are by no means invariably complicated with abnormal sexuality, but quite as often with normal sexuality in some extravagant shape, as well as with other kinds of moral aberration.

[80] It may not be superfluous to recapitulate the main points of English legislation on this topic. (1) Sodomy is a felony, defined as the carnal knowledge (per anum) of any man or of any woman by a male person; punishable with penal servitude for life as a maximum, for ten years as a minimum. (2) The attempt to commit sodomy is punishable with ten years' penal servitude as a maximum. (3) The commission, in public or private, by any male person with another male person, of "any act of gross indecency," is punishable with two years' imprisonment and hard labour."

ACKNOWLEDGMENT

The author wishes to express her deep obligation to Rheta Childe Dorr for invaluable editorial services performed in the preparation of this volume, especially the American edition.

FOREWORD

The closing paragraphs of this book were written in the late summer of 1914, when the armies of every great power in Europe were being mobilised for savage, unsparing, barbarous warfare--against one another, against small and unaggressive nations, against helpless women and children, against civilisation itself. How mild, by comparison with the despatches in the daily newspapers, will seem this chronicle of women's militant struggle against political and social injustice in one small corner of Europe. Yet let it stand as it was written, with peace--so-called, and civilisation, and orderly government as the background for heroism such as the world has seldom witnessed. The militancy of men, through all the centuries, has drenched the world with blood, and for these deeds of horror and destruction men have been rewarded with monuments, with great songs and epics. The militancy of women has harmed no human life save the lives of those who fought the battle of righteousness. Time alone will reveal what reward will be allotted to the women.

This we know, that in the black hour that has just struck in Europe, the men are turning to their women and calling on them to take up the work of keeping civilisation alive. Through all the harvest fields, in orchards and vineyards, women are garnering food for the men who fight, as well as for the children left fatherless by war. In the cities the women are keeping open the shops, they are driving trucks and trams, and are altogether attending to a multitude of business.

When the remnants of the armies return, when the commerce of Europe is resumed by men, will they forget the part the women so nobly played? Will they forget in England how women in all ranks of life put aside their own interests and organised, not only to nurse the wounded, care for the destitute, comfort the sick and lonely, but actually to maintain the existence of the nation? Thus far, it must be admitted, there are few indications that the English Government are mindful of the unselfish devotion manifested by the women. Thus far all Government schemes for overcoming unemployment have been directed towards the unemployment of men. The work of women, making garments, etc., has in some cases been taken away.

At the first alarm of war the militants proclaimed a truce, which was answered half-heartedly by the announcement that the Government would release all suffrage prisoners who would give an undertaking "not to commit further crimes or outrages." Since the truce had already been proclaimed, no suffrage prisoner deigned to reply to the Home Secretary's provision. A few days later, no doubt influenced by representations made to the Government by men and women of every political faith--many of them never having been supporters of revolutionary tactics--Mr. McKenna announced in the House of Commons that it was the intention of the Government, within a few days, to release unconditionally, all suffrage prisoners. So ends, for the present, the war of women against men. As of old, the women become the nurturing mothers of men, their sisters and uncomplaining helpmates. The future lies far ahead, but let this preface and this volume close with the assurance that the struggle for the full enfranchisement of women has not been abandoned; it has simply, for the moment, been placed in abeyance. When the clash of arms ceases, when normal, peaceful, rational society resumes its functions, the demand will again be made. If it is not quickly granted, then once more the women will take up the arms they to-day generously lay down. There can be no real peace in the world until woman, the mother half of the human family, is given liberty in the councils of the world.

BOOK I

THE MAKING OF A MILITANT

Mrs. Pankhurst's Own Story

CHAPTER I

Those men and women are fortunate who are born at a time when a great struggle for human freedom is in progress. It is an added good fortune to have parents who take a personal part in the great movements of their time. I am glad and thankful that this was my case.

One of my earliest recollections is of a great bazaar which was held in my native city of Manchester, the object of the bazaar being to raise money to relieve the poverty of the newly emancipated negro slaves in the United States. My mother took an active part in this effort, and I, as a small child, was entrusted with a lucky bag by means of which I helped to collect money.

Young as I was--I could not have been older than five years--I knew perfectly well the meaning of the words slavery and emancipation. From infancy I had been accustomed to hear pro and con discussions of slavery and the American Civil War. Although the British government finally decided not to recognise the Confederacy, public opinion in England was sharply divided on the questions both of slavery and of secession. Broadly speaking, the propertied classes were pro-slavery, but there were many exceptions to the rule. Most of those who formed the circle of our family friends were opposed to slavery, and my father, Robert Goulden, was always a most ardent abolitionist. He was prominent enough in the movement to be appointed on a committee to meet and welcome Henry Ward Beecher when he arrived in England for a lecture tour. Mrs. Harriet Beecher Stowe's novel, "Uncle Tom's Cabin," was so great a favourite with my mother that she used it continually as a source of bedtime stories for our fascinated ears. Those stories, told almost fifty years ago, are as fresh in my mind to-day as events detailed in the morning's papers. Indeed they are more vivid, because they made a much deeper impression on my consciousness. I can still definitely recall the thrill I experienced every time my mother related the tale of Eliza's race for freedom over the broken ice of the Ohio River, the agonizing pursuit, and the final rescue at the hands of the determined old Quaker. Another thrilling tale was the story of a negro boy's flight from the plantation of his cruel master. The boy had never seen a railroad train, and when, staggering along the unfamiliar railroad track, he heard the roar of an approaching train, the clattering car-wheels seemed to his strained imagination to be repeating over and over again the awful words, "Catch a nigger--catch a nigger--catch a nigger--" This was a terrible story, and throughout my childhood, whenever I rode in a train, I thought of that poor runaway slave escaping from the pursuing monster.

These stories, with the bazaars and the relief funds and subscriptions of which I heard so much talk, I am sure made a permanent impression on my brain and my character. They awakened in me the two sets of sensations to which all my life I have most readily responded: first, admiration for that spirit of fighting and heroic sacrifice by which alone the soul of civilisation is saved; and next after that, appreciation of the gentler spirit which is moved to mend and repair the ravages of war.

I do not remember a time when I could not read, nor any time when reading was not a joy and a solace. As far back as my memory runs I loved tales, especially those of a romantic and idealistic character. "Pilgrim's Progress" was an early favourite, as well as another of Bunyan's visionary romances, which does not seem to be as well known, his "Holy War." At nine I discovered the Odyssey and very soon after that another classic which has remained all my life a source of inspiration. This was Carlyle's "French Revolution," and I received it with much the same emotion that Keats experienced when he read Chapman's translation of Homer--" ... like some watcher of the skies, When a new planet swims into his ken."

I never lost that first impression, and it strongly affected my attitude toward events which were occurring around my childhood. Manchester is a city which has witnessed a great many stirring episodes, especially of a political character. Generally speaking, its citizens have been liberal in their sentiments, defenders of free speech and liberty of opinion. In the late sixties there occurred in Manchester one of those dreadful events that prove an exception to the rule. This was in connection with the Fenian Revolt in Ireland. There was a Fenian riot, and the police arrested the leaders. These men were being taken to the jail in a prison van. On the way the van was stopped and an attempt was made to rescue the prisoners. A man fired a pistol, endeavouring to break the lock of the van door. A policeman fell, mortally wounded, and several men were arrested and were charged with murder. I distinctly remember the riot, which I did not witness, but which I heard vividly described by my older brother. I had been spending the afternoon with a young playmate, and my brother had come after tea to escort me home. As we walked through the deepening November twilight he talked excitedly of the riot, the fatal pistol shot, and the slain policeman. I could almost see the man bleeding on the ground, while the crowd swayed and groaned around him.

The rest of the story reveals one of those ghastly blunders which justice not infrequently makes. Although the shooting was done without any intent to kill, the men were tried for murder and three of them were found guilty and hanged. Their execution, which greatly excited the citizens of Manchester, was almost the last, if not the last, public execution permitted to take place in the city. At the time I was a boarding-pupil in a school near Manchester, and I spent my week-ends at home. A certain Saturday afternoon stands out in my memory, as on my way home from school I passed the prison where I knew the men had been confined. I saw that a part of the prison wall had been torn away, and in the great gap that remained were evidences of a gallows recently removed. I was transfixed with horror, and over me there swept the sudden conviction that that hanging was a mistake--worse, a crime. It was my awakening to one of the most terrible facts of life--that justice and judgment lie often a world apart.

I relate this incident of my formative years to illustrate the fact that the impressions of childhood often have more to do with character and future conduct than heredity or education. I tell it also to show that my development into an advocate of militancy was largely a sympathetic process. I have not personally suffered from the deprivations, the bitterness and sorrow which bring so many men and women to a realisation of social injustice. My childhood was protected by love and a comfortable home. Yet, while still a very young child, I began instinctively to feel that there was something lacking, even in my own home, some false conception of family relations, some incomplete ideal.

This vague feeling of mine began to shape itself into conviction about the time my brothers and I were sent to school. The education of the English boy, then as now, was considered a much more serious matter than the education of the English boy's sister. My parents, especially my father, discussed the question of my brothers' education as a matter of real importance. My education and that of my sister were scarcely discussed at all. Of course we went to a carefully selected girls' school, but beyond the facts that the head mistress was a gentlewoman and that all the pupils were girls of my own class, nobody seemed concerned. A girl's education at that time seemed to have for its prime object the art of "making home attractive"--presumably to migratory male relatives. It used to puzzle me to understand why I was under such a particular obligation to make home attractive to my brothers. We were on excellent terms of friendship, but it was never suggested to them as a duty that they make home attractive to me. Why not? Nobody seemed to know.

The answer to these puzzling questions came to me unexpectedly one night when I lay in my little bed waiting for sleep to overtake me. It was a custom of my father and mother to make the round of our bedrooms every night before going themselves to bed. When they entered my room that night I was still awake, but for some reason I chose to feign slumber. My father bent over me, shielding the candle flame with his big hand. I cannot know exactly what thought was in his mind as he gazed down at me, but I heard him say, somewhat sadly, "What a pity she wasn't born a lad."

My first hot impulse was to sit up in bed and protest that I didn't want to be a boy, but I lay still and heard my parents' footsteps pass on toward the next child's bed. I thought about my father's remark for many days afterward, but I think I never decided that I regretted my sex. However, it was made quite clear that men considered themselves superior to women, and that women apparently acquiesced in that belief.

I found this view of things difficult to reconcile with the fact that both my father and my mother were advocates of equal suffrage. I was very young when the Reform Act of 1866 was passed, but I very well remember the agitation caused by certain circumstances attending it. This Reform Act, known as the Household Franchise Bill, marked the first popular extension of the ballot in England since 1832. Under its terms, householders paying a minimum of ten pounds a year rental were given the Parliamentary vote. While it was still under discussion in the House of Commons, John Stuart Mill moved an amendment to the bill to include women householders as well as men. The amendment was defeated, but in the act as passed the word "man," instead of the usual "male person," was used. Now, under another act of Parliament it had been decided that the word "man" always included "woman" unless otherwise specifically stated. For example, in certain acts containing rate-paying clauses, the masculine noun and pronoun are used throughout, but the provisions apply to women rate-payers as well as to men. So when the Reform Bill with the word "man" in it became law, many women believed that the right of suffrage had actually been bestowed upon them. A tremendous amount of discussion ensued, and the matter was finally tested by a large number of women seeking to have their names placed upon the register as voters. In my city of Manchester 3,924 women, out of a total of 4,215 possible women voters, claimed their votes, and their claim was defended in the law courts by eminent lawyers, including my future husband, Dr. Pankhurst. Of course the women's claim was settled adversely in the courts, but the agitation resulted in a strengthening of the woman-suffrage agitation all over the country.

I was too young to understand the precise nature of the affair, but I shared in the general excitement. From reading newspapers aloud to my father I had developed a genuine interest in politics, and the Reform Bill presented itself to my young intelligence as something that was going to do the most wonderful good to the country. The first election after the bill became law was naturally a memorable occasion. It is chiefly memorable to me because it was the first one in which I ever participated. My sister and I had just been presented with new winter frocks, green in colour, and made alike, after the custom of proper British families. Every girl child in those days wore a red flannel petticoat, and when we first put on our new frocks I was struck with the fact that we were wearing red and green--the colours of the Liberal party. Since our father was a Liberal, of course the Liberal party ought to carry the election, and I conceived a brilliant scheme for helping its progress. With my small sister trotting after me, I walked the better part of a mile to the nearest polling-booth. It happened to be in a rather rough factory district, but we did not notice that. Arrived there, we two children picked up our green skirts to show our scarlet petticoats, and brimful of importance, walked up and down before the

assembled crowds to encourage the Liberal vote. From this eminence we were shortly snatched by outraged authority in the form of a nursery-maid. I believe we were sent to bed into the bargain, but I am not entirely clear on this point.

I was fourteen years old when I went to my first suffrage meeting. Returning from school one day, I met my mother just setting out for the meeting, and I begged her to let me go along. She consented, and without stopping to lay my books down I scampered away in my mother's wake. The speeches interested and excited me, especially the address of the great Miss Lydia Becker, who was the Susan B. Anthony of the English movement, a splendid character and a truly eloquent speaker. She was the secretary of the Manchester committee, and I had learned to admire her as the editor of the _Women's Suffrage Journal_, which came to my mother every week. I left the meeting a conscious and confirmed suffragist.

I suppose I had always been an unconscious suffragist. With my temperament and my surroundings I could scarcely have been otherwise. The movement was very much alive in the early seventies, nowhere more so than in Manchester, where it was organised by a group of extraordinary men and women. Among them were Mr. and Mrs. Jacob Bright, who were always ready to champion the struggling cause. Mr. Jacob Bright, a brother of John Bright, was for many years member of Parliament for Manchester, and to the day of his death was an active supporter of woman suffrage. Two especially gifted women, besides Miss Becker, were members of the committee. These were Mrs. Alice Cliff Scatcherd and Miss Wolstentholm, now the venerable Mrs. Wolstentholm-Elmy. One of the principal founders of the committee was the man whose wife, in later years, I was destined to become, Dr. Richard Marsden Pankhurst.

When I was fifteen years old I went to Paris, where I was entered as a pupil in one of the pioneer institutions in Europe for the higher education of girls. This school, one of the founders of which was Madame Edmond Adam, who was and is still a distinguished literary figure, was situated in a fine old house in the Avenue de Neuilly. It was under the direction of Mlle. Marchef-Girard, a woman distinguished in education, and who afterward was appointed government inspector of schools in France. Mlle. Marchef-Girard believed that girls' education should be quite as thorough and even more practical than the education boys were receiving at that time. She included chemistry and other sciences in her courses, and in addition to embroidery she had her girls taught bookkeeping. Many other advanced ideas prevailed in this school, and the moral discipline which the pupils received was, to my mind, as valuable as the intellectual training. Mlle. Marchef-Girard held that women should be given the highest ideals of honour. Her pupils were kept to the strictest principles of truth-telling and candour. Myself she understood and greatly benefited by an implicit trust which I am sure I could not have betrayed, even had I felt for her less real affection.

My roommate in this delightful school was an interesting young girl of my own age, Noemie Rochefort, daughter of that great Republican, Communist, journalist, and swordsman, Henri Rochefort. This was very shortly after the Franco-Prussian War, and memories of the Empire's fall and of the bloody and disastrous Commune were very keen in Paris. Indeed my roommate's illustrious father and many others were then in exile in New Caledonia for participation in the Commune. My friend Noemie was torn with anxiety for her father. She talked of him constantly, and many were the blood-curdling accounts of daring and of patriotism to which I listened. Henri Rochefort was, in fact, one of the moving spirits of the Republican movement in France, and after his amazing escape in an open boat from New Caledonia, he lived through many years of political adventures of the most lively and picturesque character. His daughter and I remained warm friends long after our school-days ended, and my association with her strengthened all the liberal ideas I had previously acquired.

I was between eighteen and nineteen when I finally returned from school in Paris and took my place in my father's home as a finished young lady. I sympathised with and worked for the woman-suffrage movement, and came to know Dr. Pankhurst, whose work for woman suffrage had never ceased. It was Dr. Pankhurst who drafted the first enfranchisement bill, known as the Women's Disabilities Removal Bill, and introduced into the House of Commons in 1870 by Mr. Jacob Bright. The bill advanced to its second reading by a majority vote of thirty-three, but it was killed in committee by Mr. Gladstone's peremptory orders. Dr. Pankhurst, as I have already said, with another distinguished barrister, Lord Coleridge, acted as counsel for the Manchester women, who tried in 1868 to be placed on the register as voters. He also drafted the bill giving married women absolute control over their property and earnings, a bill which became law in 1882.

My marriage with Dr. Pankhurst took place in 1879.

I think we cannot be too grateful to the group of men and women who, like Dr. Pankhurst, in those early days lent the weight of their honoured names to the suffrage movement in the trials of its struggling youth. These men did not wait until the movement became popular, nor did they hesitate until it was plain that women were roused to the point of revolt. They worked all their lives with those

who were organising, educating, and preparing for the revolt which was one day to come. Unquestionably those pioneer men suffered in popularity for their feminist views. Some of them suffered financially, some politically. Yet they never wavered.

My married life lasted through nineteen happy years. Often I have heard the taunt that suffragists are women who have failed to find any normal outlet for their emotions, and are therefore soured and disappointed beings. This is probably not true of any suffragist, and it is most certainly not true of me. My home life and relations have been as nearly ideal as possible in this imperfect world. About a year after my marriage my daughter Christabel was born, and in another eighteen months my second daughter Sylvia came. Two other children followed, and for some years I was rather deeply immersed in my domestic affairs.

I was never so absorbed with home and children, however, that I lost interest in community affairs. Dr. Pankhurst did not desire that I should turn myself into a household machine. It was his firm belief that society as well as the family stands in need of women's services. So while my children were still in their cradles I was serving on the executive committee of the Women's Suffrage Society, and also on the executive board of the committee which was working to secure the Married Women's Property Act. This act having passed in 1882, I threw myself into the suffrage work with renewed energy. A new Reform Act, known as the County Franchise Bill, extending the suffrage to farm labourers, was under discussion, and we believed that our years of educational propaganda work had prepared the country to support us in a demand for a women's suffrage amendment to the bill. For several years we had been holding the most splendid meetings in cities all over the kingdom. The crowds, the enthusiasm, the generous response to appeals for support, all these seemed to justify us in our belief that women's suffrage was near. In fact, in 1884, when the County Franchise Bill came before the country, we had an actual majority in favour of suffrage in the House of Commons.

But a favourable majority in the House of Commons by no means insures the success of any measure. I shall explain this at length when I come to our work of opposing candidates who have avowed themselves suffragists, a course which has greatly puzzled our American friends. The Liberal party was in power in 1884, and a great memorial was sent to the Prime Minister, the Right Honourable William E. Gladstone, asking that a women's suffrage amendment to the County Franchise Bill be submitted to the free and unbiased consideration of the House. Mr. Gladstone curtly refused, declaring that if a women's suffrage amendment should be carried, the Government would disclaim responsibility for the bill. The amendment was submitted nevertheless, but Mr. Gladstone would not allow it to be freely discussed, and he ordered Liberal members to vote against it. What we call a whip was sent out against it, a note virtually commanding party members to be on hand at a certain hour to vote against the women's amendment. Undismayed, the women tried to have an independent suffrage bill introduced, but Mr. Gladstone so arranged Parliamentary business that the bill never even came up for discussion.

I am not going to write a history of the woman suffrage movement in England prior to 1903, when the Women's Social and Political Union was organised. That history is full of repetitions of just such stories as the one I have related. Gladstone was an implacable foe of woman suffrage. He believed that women's work and politics lay in service to men's parties. One of the shrewdest acts of Mr. Gladstone's career was his disruption of the suffrage organisation in England. He accomplished this by substituting "something just as good," that something being Women's Liberal Associations. Beginning in 1881 in Bristol, these associations spread rapidly through the country and, in 1887, became a National Women's Liberal Federation. The promise of the Federation was that by allying themselves with men in party politics, women would soon earn the right to vote. The avidity with which the women swallowed this promise, left off working for themselves, and threw themselves into the men's work was amazing.

The Women's Liberal Federation is an organisation of women who believe in the principles of the Liberal party. (The somewhat older Primrose League is a similar organisation of women who adhere to Conservative party principles.) Neither of these organisations have woman suffrage for their object. They came into existence to uphold party ideas and to work for the election of party candidates.

I am told that women in America have recently allied themselves with political parties, believing, just as we did, that such action would break down opposition to suffrage by showing the men that women possess political ability, and that politics is work for women as well as men. Let them not be deceived. I can assure the American women that our long alliance with the great parties, our devotion to party programmes, our faithful work at elections, never advanced the suffrage cause one step. The men accepted the services of the women, but they never offered any kind of payment.

As far as I am concerned, I did not delude myself with any false hopes in the matter. I was present when the Women's Liberal Federation came into existence. Mrs. Gladstone presided, offering the meeting many consolatory words for the absence of "our great leader," Mr. Gladstone, who of course had no time to waste on a gathering of women. At Mrs. Jacob Bright's request I joined

the Federation. At this stage of my development I was a member of the Fabian Society, and I had considerable faith in the permeating powers of its mild socialism. But I was already fairly convinced of the futility of trusting to political parties. Even as a child I had begun to wonder at the _naive_ faith of party members in the promises of their leaders. I well remember my father returning home from political meetings, his face aglow with enthusiasm. "What happened, father?" I would ask, and he would reply triumphantly, "Ah! We passed the resolution."

"Then you'll get your measure through the next session," I predicted.

"I won't say that," was the usual reply. "Things don't always move as quickly as that. But we passed the resolution."

Well, the suffragists, when they were admitted into the Women's Liberal Federation must have felt that they had passed their resolution. They settled down to work for the party and to prove that they were as capable of voting as the recently enfranchised farm labourers. Of course a few women remained loyal to suffrage. They began again on the old educational lines to work for the cause. Not one woman took counsel with herself as to how and why the agricultural labourers had won their franchise. They had won it, as a matter of fact, by burning hay-ricks, rioting, and otherwise demonstrating their strength in the only way that English politicians can understand. The threat to march a hundred thousand men to the House of Commons unless the bill was passed played its part also in securing the agricultural labourer his political freedom. But no woman suffragist noticed that. As for myself, I was too young politically to learn the lesson then. I had to go through years of public work before I acquired the experience and the wisdom to know how to wring concessions from the English Government. I had to hold public office. I had to go behind the scenes in the government schools, in the workhouses and other charitable institutions; I had to get a close-hand view of the misery and unhappiness of a man-made world, before I reached the point where I could successfully revolt against it. It was almost immediately after the collapse of the woman suffrage movement in 1884 that I entered upon this new phase of my career.

CHAPTER II

In 1885, a year after the failure of the third women's suffrage bill, my husband, Dr. Pankhurst, stood as the Liberal candidate for Parliament in Rotherline, a riverside constituency of London. I went through the campaign with him, speaking and canvassing to the best of my ability. Dr. Pankhurst was a popular candidate, and unquestionably would have been returned but for the opposition of the Home-Rulers. Parnell was in command, and his settled policy was opposition to all Government candidates. So, in spite of the fact that Dr. Pankhurst was a staunch upholder of home rule, the Parnell forces were solidly opposed to him, and he was defeated. I remember expressing considerable indignation, but my husband pointed out to me that Parnell's policy was absolutely right. With his small party he could never hope to win home rule from a hostile majority, but by constant obstruction he could in time wear out the Government, and force it to surrender. That was a valuable political lesson, one that years later I was destined to put into practice.

The following year found us living in London, and, as usual, interesting ourselves with labour matters and other social movements. This year was memorable for a great strike of women working in the Bryant and May match factories. I threw myself into this strike with enthusiasm, working with the girls and with some women of prominence, among these the celebrated Mrs. Annie Besant. The strike was a successful one, the girls winning substantial improvements in their working conditions.

It was a time of tremendous unrest, of labour agitations, of strikes and lockouts. It was a time also when a most stupid reactionary spirit seemed to take possession of the Government and the authorities. The Salvation Army, the Socialists, the trade-unionists--in fact, all bodies holding outdoor meetings--were made special objects of attack. As a protest against this policy a Law and Liberty League was formed in London, and an immense Free Speech meeting was held in Trafalgar Square, John Burns and Cunningham Graham being the principal speakers. I was present at this meeting, which resulted in a bloody riot between the police and the populace. The Trafalgar Square Riot is historic, and to it Mr. John Burns owes, in large part, his subsequent rise to political eminence. Both John Burns and Cunningham Graham served prison sentences for the part they played in the riot, but they gained fame, and they did much to establish the right of free speech for English men. English women are still contending for that right.

In 1890 my last child was born in London. I now had a family of five young children, and for a time I was less active in public work. On the retirement of Mrs. Annie Besant from the London School Board I had been asked to stand as candidate for the vacancy, but although I should have enjoyed the work, I decided not to accept this invitation. The next year, however, a new suffrage association, the Women's Franchise League, was formed, and I felt it my duty to become affiliated with it The League was preparing a new suffrage bill, the provisions of which I could not possibly approve, and I joined with old friends, among whom were

Mrs. Jacob Bright, Mrs. Wolstentholm-Elmy, who was a member of the London School Board, and Mrs. Stanton Blatch, then resident in England, in an effort to substitute the original bill drafted by Dr. Pankhurst. As a matter of fact, neither of the bills was introduced into Parliament that year. Mr. (now Lord) Haldane, who had the measure in charge, introduced one of his own drafting. It was a truly startling bill, royally inclusive in its terms. It not only enfranchised all women, married and unmarried, of the householding classes, but it made them eligible to all offices under the Crown. The bill was never taken seriously by the Government, and indeed it was never intended that it should be, as we were later made to understand. I remember going with Mrs. Stanton Blatch to the law courts to see Mr. Haldane, and to protest against the introduction of a measure that had not the remotest chance of passing.

"All, that bill," said Haldane, "is for the future."

All their woman suffrage bills are intended for the future, a future so remote as to be imperceptible. We were beginning to understand this even in 1891. However, as long as there was a bill, we determined to support it. Accordingly, we canvassed the members, distributed a great deal of literature, and organised and addressed meetings. We not only made speeches ourselves, but we induced friendly members of Parliament to go on our platforms. One of these meetings, held in an East End Radical club, was addressed by Mr. Haldane and a young man who accompanied him. This young man, Sir Edward Grey, then in the beginning of his career, made an eloquent plea for woman's suffrage. That Sir Edward Grey should, later in life, become a bitter foe of woman's suffrage need astonish no one. I have known many young Englishmen who began their political life as suffrage speakers and who later became anti-suffragists or traitorous "friends" of the cause. These young and aspiring statesmen have to attract attention in some fashion, and the espousal of advanced causes, such as labour or women's suffrage, seems an easy way to accomplish that end.

Well, our speeches and our agitation did nothing at all to assist Mr. Haldane's impossible bill. It never advanced beyond the first reading.

Our London residence came to an end in 1893. In that year we returned to our Manchester home, and I again took up the work of the Suffrage Society. At my suggestion the members began to organise their first out-of-door meetings, and we continued these until we succeeded in working up a great meeting that filled Free Trade Hall, and overflowed into and crowded a smaller hall near at hand. This marked the beginning of a campaign of propaganda among working people, an object which I had long desired to bring about.

And now began a new and, as I look back on it, an absorbingly interesting stage of my career. I have told how our leaders in the Liberal Party had advised the women to prove their fitness for the Parliamentary franchise by serving in municipal offices, especially the unsalaried offices. A large number of women had availed themselves of this advice, and were serving on Boards of Guardians, on school boards, and in other capacities. My children now being old enough for me to leave them with competent nurses, I was free to join these ranks. A year after my return to Manchester I became a candidate for the Board of Poor Law Guardians. Several weeks before, I had contested unsuccessfully for a place on the school board. This time, however, I was elected, heading the poll by a very large majority.

For the benefit of American readers I shall explain something of the operation of our English Poor Law. The duty of the law is to administer an act of Queen Elizabeth, one of the greatest reforms effected by that wise and humane monarch. When Elizabeth came to the throne she found England, the Merrie England of contemporary poets, in a state of appalling poverty. Hordes of people were literally starving to death, in wretched hovels, in the streets, and at the very gates of the palace. The cause of all this misery was the religious reformation under Henry VIII, and the secession from Rome of the English Church. King Henry, it is known, seized all the Church lands, the abbeys and the convents, and gave them as rewards to those nobles and favourites who had supported his policies. But in taking over the Church's property the Protestant nobles by no means assumed the Church's ancient responsibilities of lodging wayfarers, giving alms, nursing the sick, educating youths, and caring for the young and the superannuated. When the monks and the nuns were turned out of their convents these duties devolved on no one. The result, after the brief reign of Edward VI and the bloody one of Queen Mary, was the social anarchy inherited by Elizabeth.

This great queen and great woman, perceiving that the responsibility for the poor and the helpless rightfully rests on the community, caused an act to be passed creating in the parishes public bodies to deal with local conditions of poverty. The Board of Poor Law Guardians disburses for the poor the money coming from the Poor Rates (taxes), and some additional moneys allowed by the local government board, the president of which is a cabinet minister. Mr. John Burns is the present incumbent of the office. The Board of

Guardians has control of the institution we call the workhouse. You have, I believe, almshouses, or poorhouses, but they are not quite so extensive as our workhouses, which are all kinds of institutions in one. We had, in my workhouse, a hospital with nine hundred beds, a school with several hundred children, a farm, and many workshops.

When I came into office I found that the law in our district, Chorlton, was being very harshly administered. The old board had been made up of the kind of men who are known as rate savers. They were guardians, not of the poor but of the rates, and, as I soon discovered, not very astute guardians even of money. For instance, although the inmates were being very poorly fed, a frightful waste of food was apparent. Each inmate was given each day a certain weight of food, and bread formed so much of the ration that hardly anyone consumed all of his portion. In the farm department pigs were kept on purpose to consume this surplus of bread, and as pigs do not thrive on a solid diet of stale bread the animals fetched in the market a much lower price than properly fed farm pigs. I suggested that, instead of giving a solid weight of bread in one lump, the loaf be cut in slices and buttered with margarine, each person being allowed all that he cared to eat. The rest of the board objected, saying that our poor charges were very jealous of their rights, and would suspect in such an innovation an attempt to deprive them of a part of their ration. This was easily overcome by the suggestion that we consult the inmates before we made the change. Of course the poor people consented, and with the bread that we saved we made puddings with milk and currants, to be fed to the old people of the workhouse. These old folks I found sitting on backless forms, or benches. They had no privacy, no possessions, not even a locker. The old women were without pockets in their gowns, so they were obliged to keep any poor little treasures they had in their bosoms. Soon after I took office we gave the old people comfortable Windsor chairs to sit in, and in a number of ways we managed to make their existence more endurable.

These, after all, were minor benefits. But it does gratify me when I look back and remember what we were able to do for the children of the Manchester workhouse. The first time I went into the place I was horrified to see little girls seven and eight years old on their knees scrubbing the cold stones of the long corridors. These little girls were clad, summer and winter, in thin cotton frocks, low in the neck and short sleeved. At night they wore nothing at all, night dresses being considered too good for paupers. The fact that bronchitis was epidemic among them most of the time had not suggested to the guardians any change in the fashion of their clothes. There was a school for the children, but the teaching was of the poorest order. They were forlorn enough, these poor innocents, when I first met them. In five years' time we had changed the face of the earth for them. We had bought land in the country and had built a cottage system home for the children, and we had established for them a modern school with trained teachers. We had even secured for them a gymnasium and a swimming-bath. I may say that I was on the building committee of the board, the only woman member.

Whatever may be urged against the English Poor Law system, I maintain that under it no stigma of pauperism need be applied to workhouse children. If they are treated like paupers of course they will be paupers, and they will grow up paupers, permanent burdens on society; but if they are regarded merely as children under the guardianship of the state, they assume quite another character. Rich children are not pauperized by being sent to one or another of the free public schools with which England is blest. Yet a great many of those schools, now exclusively used for the education of upper middle-class boys, were founded by legacies left to educate the poor--girls as well as boys. The English Poor Law, properly administered, ought to give back to the children of the destitute what the upper classes have taken from them, a good education on a self-respecting basis.

The trouble is, as I soon perceived after taking office, the law cannot, in existing circumstances, do all the work, even for children, that it was intended to do. We shall have to have new laws, and it soon became apparent to me that we can never hope to get them until women have the vote. During the time I served on the board, and for years since then, women guardians all over the country have striven in vain to have the law reformed in order to ameliorate conditions which break the hearts of women to see, but which apparently affect men very little. I have spoken of the little girls I found scrubbing the workhouse floors. There were others at the hateful labour who aroused my keenest pity. I found that there were pregnant women in that workhouse, scrubbing floors, doing the hardest kind of work, almost until their babies came into the world. Many of them were unmarried women, very, very young, mere girls. These poor mothers were allowed to stay in the hospital after confinement for a short two weeks. Then they had to make a choice of staying in the workhouse and earning their living by scrubbing and other work, in which case they were separated from their babies; or of taking their discharges. They could stay and be paupers, or they could leave--leave with a two-weeks-old baby in their arms, without hope, without home, without money, without anywhere to go. What became of those girls, and what became of their hapless infants? That question was at the basis of the women guardians' demand for a reform of one part of the Poor Law.

That section deals with the little children who are boarded out, not by the workhouse, but by the parents, that parent being almost always the mother. It is from that class of workhouse mothers--mostly young servant girls--which thoughtless people say all working girls ought to be; it is from that class more than from any other that cases of illegitimacy come. Those poor little servant girls, who

can get out perhaps only in the evening, whose minds are not very cultivated, and who find all the sentiment of their lives in cheap novelettes, fall an easy prey to those who have designs against them. These are the people by whom the babies are mostly put out to nurse, and the mothers have to pay for their keep. Of course the babies are very badly protected. The Poor Law Guardians are supposed to protect them by appointing inspectors to visit the homes where the babies are boarded. But, under the law, if a man who ruins a girl pays down a lump sum of twenty pounds, less than a hundred dollars, the boarding home is immune from inspection. As long as a baby-farmer takes only one child at a time, the twenty pounds being paid, the inspectors cannot inspect the house. Of course the babies die with hideous promptness, often long before the twenty pounds have been spent, and then the baby-farmers are free to solicit another victim. For years, as I have said, women have tried in vain to get that one small reform of the Poor Law, to reach and protect all illegitimate children, and to make it impossible for any rich scoundrel to escape future liability for his child because of the lump sum he has paid down. Over and over again it has been tried, but it has always failed, because the ones who really care about the thing are mere women.

I thought I had been a suffragist before I became a Poor Law Guardian, but now I began to think about the vote in women's hands not only as a right but as a desperate necessity. These poor, unprotected mothers and their babies I am sure were potent factors in my education as a militant. In fact, all the women I came in contact with in the workhouse contributed to that education. Very soon after I went on the board I saw that the class of old women who came into the workhouse were in many ways superior to the kind of old men who came into the workhouse. One could not help noticing it. They were, to begin with, more industrious. In fact, it was quite touching to see their industry and patience. Old women, over sixty and seventy years of age, did most of the work of that place, most of the sewing, most of the things that kept the house clean and which supplied the inmates with clothing. I found that the old men were different. One could not get very much work out of them. They liked to stop in the oakum picking-room, where they were allowed to smoke; but as to real work, very little was done by our old men.

I began to make inquiries about these old women. I found that the majority of them were not women who had been dissolute, who had been criminal, but women who had lead perfectly respectable lives, either as wives and mothers, or as single women earning their own living. A great many were of the domestic-servant class, who had not married, who had lost their employment, and had reached a time of life when it was impossible to get more employment. It was through no fault of their own, but simply because they had never earned enough to save. The average wage of working women in England is less than two dollars a week. On this pittance it is difficult enough to keep alive, and of course it is impossible to save. Every one who knows anything about conditions under which our working women live knows that few of them can ever hope to put by enough to keep them in old age. Besides, the average working woman has to support others than herself. How can she save?

Some of our old women were married. Many of them, I found, were widows of skilled artisans who had had pensions from their unions, but the pensions had died with the men. These women, who had given up the power to work for themselves, and had devoted themselves to working for their husbands and children, were left penniless. There was nothing for them to do but to go into the workhouse. Many of them were widows of men who had served their country in the army or the navy. The men had had pensions from the government, but the pensions had died with them, and so the women were in the workhouse.

We shall not in future, I hope, find so many respectable old women in English workhouses. We have an old-age pension law now, which allows old women as well as old men the sum of five shillings--$1.20--a week; hardly enough to live on, but enough to enable the poor to keep their old fathers and mothers out of the workhouse without starving themselves or their children. But when I was a Poor Law Guardian there was simply nothing to do with a woman when her life of toil ceased except make a pauper of her.

I wish I had space to tell you of other tragedies of women I witnessed while I was on that board. In our out-relief department, which exists chiefly for able-bodied poor and dependent persons, I was brought into contact with widows who were struggling desperately to keep their homes and families together. The law allowed these women relief of a certain very inadequate kind, but for herself and one child it offered no relief except the workhouse. Even if the woman had a baby at her breast she was regarded, under the law, as an able-bodied man. Women, we are told, should stay at home and take care of their children. I used to astound my men colleagues by saying to them: "When women have the vote they will see that mothers _can_ stay at home and care for their children. You men have made it impossible for these mothers to do that."

I am convinced that the enfranchised woman will find many ways in which to lessen, at least, the curse of poverty. Women have more practical ideas about relief, and especially of prevention of dire poverty, than men display. I was struck with this whenever I attended the District Conferences and the annual Poor Law Union Meetings. In our discussions the women showed themselves much more capable, much more resourceful, than the men. I remember two papers which I prepared and which caused

considerable discussion. One of these was on the Duties of Guardians in Times of Unemployment, in which I pointed out that the government had one reserve of employment for men which could always be used. We have, on our northwest coast, a constant washing away of the fore shore. Every once in a while the question of coast reclamation comes up for discussion, but I had never heard any man suggest coast reclamation as a means of giving the unemployed relief.

In 1898 I suffered an irreparable loss in the death of my husband. His death occurred suddenly and left me with the heavy responsibility of caring for a family of children, the eldest only seventeen years of age. I resigned my place on the Board of Guardians, and was almost immediately appointed to the salaried office of Registrar of Births and Deaths in Manchester. We have registrars of births, deaths and marriages in England, but since the act establishing the last named contains the words "male person," a woman may not be appointed a registrar of marriages. The head of this department of the government is the registrar-general, with offices at Somerset House, London, where all vital statistics are returned and all records filed.

It was my duty as registrar of births and deaths to act as chief census officer of my district; I was obliged to receive all returns of births and deaths, record them, and send my books quarterly to the office of the registrar-general. My district was in a working-class quarter, and on this account I instituted evening office hours twice a week. It was touching to observe how glad the women were to have a woman registrar to go to. They used to tell me their stories, dreadful stories some of them, and all of them pathetic with that patient and uncomplaining pathos of poverty. Even after my experience on the Board of Guardians, I was shocked to be reminded over and over again of the little respect there was in the world for women and children. I have had little girls of thirteen come to my office to register the births of their babies, illegitimate, of course. In many of these cases I found that the child's own father or some near male relative was responsible for her state. There was nothing that could be done in most cases. The age of consent in England is sixteen years, but a man can always claim that he thought the girl was over sixteen. During my term of office a very young mother of an illegitimate child exposed her baby, and it died. The girl was tried for murder and was sentenced to death. This was afterwards commuted, it is true, but the unhappy child had the horrible experience of the trial and the sentence "to be hanged by the neck, until you are dead." The wretch who was, from the point of view of justice, the real murderer of the baby, received no punishment at all.

I needed only one more experience after this one, only one more contact with the life of my time and the position of women, to convince me that if civilisation is to advance at all in the future, it must be through the help of women, women freed of their political shackles, women with full power to work their will in society. In 1900 I was asked to stand as a candidate for the Manchester School Board. The schools were then under the old law, and the school boards were very active bodies. They administered the Elementary Education Act, bought school sites, erected buildings, employed and paid teachers. The school code and the curriculum were framed by the Board of Education, which is part of the central government. Of course this was absurd. A body of men in London could not possibly realise all the needs of boys and girls in remote parts of England. But so it was.

As a member of the school board I very soon found that the teachers, working people of the higher grade, were in exactly the same position as the working people of the lower grades. That is, the men had all the advantage. Teachers had a representative in the school board councils. Of course that representative was a man teacher, and equally of course, he gave preference to the interests of the men teachers. Men teachers received much higher salaries than the women, although many of the women, in addition to their regular class work, had to teach sewing and domestic science into the bargain. They received no extra pay for their extra work. In spite of this added burden, and in spite of the lower salaries received, I found that the women cared a great deal more about their work, and a great deal more about the children than the men. It was a winter when there was a great deal of poverty and unemployment in Manchester. I found that the women teachers were spending their slender salaries to provide regular dinners for destitute children, and were giving up their time to waiting on them and seeing that they were nourished. They said to me, quite simply: "You see, the little things are too badly off to study their lessons. We have to feed them before we can teach them."

Well, instead of seeing that women care more for schools and school children than men do and should therefore have more power in education, the Parliament of 1900 actually passed a law which took education in England entirely out of the hands of women. This law abolished the school board altogether and placed the administration of schools in the hands of the municipalities. Certain corporations had formerly made certain grants to technical education--Manchester had built a magnificent technical college--and now the corporations had full control of both elementary and secondary education.

The law did indeed provide that the corporations should co-opt at least one woman on their education boards. Manchester co-opted four women, and at the strong recommendation of the Labour Party, I was one of the women chosen. At their urgent solicitation I was appointed to the Committee on Technical Instruction, the one woman admitted to this committee. I learned that the Manchester

Technical College, called the second best in Europe, spending thousands of pounds annually for technical training, had practically no provision for training women. Even in classes where they might easily have been admitted, bakery and confectionery classes and the like, the girls were kept out because the men's trades unions objected to their being educated for such skilled work. It was rapidly becoming clear to my mind that men regarded women as a servant class in the community, and that women were going to remain in the servant class until they lifted themselves out of it. I asked myself many times in those days what was to be done. I had joined the Labour Party, thinking that through its councils something vital might come, some such demand for the women's enfranchisement that the politicians could not possibly ignore. Nothing came.

All these years my daughters had been growing up. All their lives they had been interested in women's suffrage. Christabel and Sylvia, as little girls, had cried to be taken to meetings. They had helped in our drawing-room meetings in every way that children can help. As they grew older we used to talk together about the suffrage, and I was sometimes rather frightened by their youthful confidence in the prospect, which they considered certain, of the success of the movement. One day Christabel startled me with the remark: "How long you women have been trying for the vote. For my part, I mean to get it."

Was there, I reflected, any difference between trying for the vote and getting it? There is an old French proverb, "If youth could know; if age could do." It occurred to me that if the older suffrage workers could in some way join hands with the young, unwearied and resourceful suffragists, the movement might wake up to new life and new possibilities. After that I and my daughters together sought a way to bring about that union of young and old which would find new methods, blaze new trails. At length we thought we had found a way.

CHAPTER III

In the summer of 1902--I think it was 1902--Susan B. Anthony paid a visit to Manchester, and that visit was one of the contributory causes that led to the founding of our militant suffrage organisation, the Women's Social and Political Union. During Miss Anthony's visit my daughter Christabel, who was very deeply impressed, wrote an article for the Manchester papers on the life and works of the venerable reformer. After her departure Christabel spoke often of her, and always with sorrow and indignation that such a splendid worker for humanity was destined to die without seeing the hopes of her lifetime realised. "It is unendurable," declared my daughter, "to think of another generation of women wasting their lives begging for the vote. We must not lose any more time. We must act."

By this time the Labour Party, of which I was still a member, had returned Mr. Keir Hardie to Parliament, and we decided that the first step in a campaign of action was to make the Labour Party responsible for a new suffrage bill. At a recent annual conference of the party I had moved a resolution calling upon the members to instruct their own member of Parliament to introduce a bill for the enfranchisement of women. The resolution was passed, and we determined to organise a society of women to demand immediate enfranchisement, not by means of any outworn missionary methods, but through political action.

It was in October, 1903, that I invited a number of women to my house in Nelson street, Manchester, for purposes of organisation. We voted to call our new society the Women's Social and Political Union, partly to emphasise its democracy, and partly to define its object as political rather than propagandist. We resolved to limit our membership exclusively to women, to keep ourselves absolutely free from any party affiliation, and to be satisfied with nothing but action on our question. Deeds, not words, was to be our permanent motto.

To such a pass had the women's suffrage cause come in my country that the old leaders, who had done such fine educational work in the past, were now seemingly content with expressions of sympathy and regret on the part of hypocritical politicians. This fact was thrust upon me anew by an incident that occurred almost at the moment of the founding of the Women's Social and Political Union. In our Parliament no bill has a chance of becoming a law unless it is made a Government measure. Private members are at liberty to introduce measures of their own, but these rarely reach the second reading, or debatable stage. So much time is given to discussion of Government measures that very little time can be given to any private bills. About one day in a week is given over to consideration of private measures, to which, as we say, the Government give facilities; and since there are a limited number of weeks in a session, the members, on the opening days of Parliament, meet and draw lots to determine who shall have a place in the debates. Only these successful men have a chance to speak to their bills, and only those who have drawn early chances have any prospect of getting much discussion on their measures.

Now, the old suffragists had long since given up hope of obtaining a Government suffrage bill, but they clung to a hope that a private member's bill would some time obtain consideration. Every year, on the opening day of Parliament, the association sent a deputation of women to the House of Commons, to meet so-called friendly members and consider the position of the women's suffrage cause. The ceremony was of a most conventional, not to say farcical character. The ladies made their speeches and the members made theirs. The ladies thanked the friendly members for their sympathy, and the members renewed their assurances that they believed in women's suffrage and would vote for it when they had an opportunity to do so. Then the deputation, a trifle sad but entirely tranquil, took its departure, and the members resumed the real business of life, which was support of their party's policies.

Such a ceremony as this I attended soon after the founding of the W. S. P. U. Sir Charles M'Laren was the friendly member who presided over the gathering, and he did his full duty in the matter of formally endorsing the cause of women's suffrage. He assured the delegation of his deep regret, as well as the regret of numbers of his colleagues, that women so intelligent, so devoted, etc., should remain unenfranchised. Other members did likewise. The ceremonies drew to a close, but I, who had not been asked to speak, determined to add something to the occasion.

"Sir Charles M'Laren," I began abruptly, "has told us that numbers of his colleagues desire the success of the women's suffrage cause. Now every one of us knows that at this moment the members of the House of Commons are balloting for a place in the debates. Will Sir Charles M'Laren tell us if any member is preparing to introduce a bill for women's suffrage? Will he tell us what he and the other members will pledge themselves to _do_ for the reform they so warmly endorse?"

Of course, the embarrassed Sir Charles was not prepared to tell us anything of the kind, and the deputation departed in confusion and wrath. I was told that I was an interloper, an impertinent intruder. Who asked me to say anything? And what right had I to step in and ruin the good impression they had made? No one could tell how many friendly members I had alienated by my unfortunate remarks.

I went back to Manchester and with renewed energy continued the work of organising for the W. S. P. U.

In the spring of 1904 I went to the annual conference of the Independent Labour Party, determined if possible to induce the members to prepare a suffrage bill to be laid before Parliament in the approaching session. Although I was a member of the National Administrative Council and presumably a person holding some influence in the party, I knew that my plan would be bitterly opposed by a strong minority, who held that the Labour Party should direct all its efforts toward securing universal adult suffrage for both men and women. Theoretically, of course, a Labour party could not be satisfied with anything less than universal adult suffrage, but it was clear that no such sweeping reform could be effected at that time, unless indeed the Government made it one of their measures. Besides, while a large majority of members of the House of Commons were pledged to support a bill giving women equal franchise rights with men, it was doubtful whether a majority could be relied upon to support a bill giving adult suffrage, even to men. Such a bill, even if it were a Government measure, would probably be difficult of passage.

After considerable discussion, the National Council decided to adopt the original Women's Enfranchisement Bill, drafted by Dr. Pankhurst, and advanced in 1870 to its second reading in the House of Commons. The Council's decision was approved by an overwhelming majority of the conference.

The new session of Parliament, so eagerly looked forward to, met on February 13, 1905. I went down from Manchester, and with my daughter Sylvia, then a student at the Royal College of Art, South Kensington, spent eight days in the Strangers' Lobby of the House of Commons, working for the suffrage bill. We interviewed every one of the members who had pledged themselves to support a suffrage bill when it should be introduced, but we found not one single member who would agree that his chance in the ballot, if he drew such a chance, should be given to introducing the bill. Every man had some other measure he was anxious to further. Mr. Keir Hardie had previously given us his pledge, but his name, as we had feared, was not drawn in the ballot. We next set out to interview all the men whose names had been drawn, and we finally induced Mr. Bamford Slack, who held the fourteenth place, to introduce our bill. The fourteenth place was not a good one, but it served, and the second reading of our bill was set down for Friday, May 12th, the second order of the day.

This being the first suffrage bill in eight years, a thrill of excitement animated not only our ranks but all the old suffrage societies. Meetings were held, and a large number of petitions circulated. When the day came for consideration on our bill, the Strangers' Lobby could not hold the enormous gathering of women of all classes, rich and poor, who flocked to the House of Commons. It was pitiful to see the look of hope and joy that shone on the faces of many of these women. We knew that our poor little measure had

the very slightest chance of being passed. The bill that occupied the first order of the day was one providing that carts travelling along public roads at night should carry a light behind as well as before. We had tried to induce the promoters of this unimportant little measure to withdraw it in the interests of our bill, but they refused. We had tried also to persuade the Conservative Government to give our bill facilities for full discussion, but they also refused. So, as we fully anticipated, the promoters of the Roadway Lighting Bill were allowed to "talk out" our bill. They did this by spinning out the debate with silly stories and foolish jokes. The members listened to the insulting performance with laughter and applause.

When news of what was happening reached the women who waited in the Strangers' Lobby, a feeling of wild excitement and indignation took possession of the throng. Seeing their temper, I felt that the moment had come for a demonstration such as no old-fashioned suffragist had ever attempted. I called upon the women to follow me outside for a meeting of protest against the government. We swarmed out into the open, and Mrs. Wolstenholm-Elmy, one of the oldest suffrage workers in England, began to speak. Instantly the police rushed into the crowd of women, pushing them about and ordering them to disperse. We moved on as far as the great statue of Richard Coeur de Lion that guards the entrance to the House of Lords, but again the police intervened. Finally the police agreed to let us hold a meeting in Broad Sanctuary, very near the gates of Westminster Abbey. Here we made speeches and adopted a resolution condemning the Government's action in allowing a small minority to talk out our bill. This was the first militant act of the W. S. P. U. It caused comment and even some alarm, but the police contented themselves with taking our names.

The ensuing summer was spent in outdoor work. By this time the Women's Social and Political Union had acquired some valuable accessions, and money began to come to us. Among our new members was one who was destined to play an important role in the unfolding drama of the militant movement. At the close of one of our meetings at Oldham a young girl introduced herself to me as Annie Kenney, a mill-worker, and a strong suffrage sympathiser. She wanted to know more of our society and its objects, and I invited her and her sister Jenny, a Board School teacher, to tea the next day. They came and joined our Union, a step that definitely changed the whole course of Miss Kenney's life, and gave us one of our most distinguished leaders and organisers. With her help we began to carry our propaganda to an entirely new public.

In Lancashire there is an institution known as the Wakes, a sort of travelling fair where they have merry-go-rounds, Aunt-Sallies, and other festive games, side-shows of various kinds, and booths where all kinds of things are sold. Every little village has its Wakes-week during the summer and autumn, and it is the custom for the inhabitants of the villages to spend the Sunday before the opening of the Wakes walking among the booths in anticipation of tomorrow's joys. On these occasions the Salvation Army, temperance orators, venders of quack medicines, pedlars, and others, take advantage of the ready-made audience to advance their propaganda. At Annie Kenney's suggestion we went from one village to the other, following the Wakes and making suffrage speeches. We soon rivalled in popularity the Salvation Army, and even the tooth-drawers and patent-medicine pedlars.

The Women's Social and Political Union had been in existence two years before any opportunity was presented for work on a national scale. The autumn of 1905 brought a political situation which seemed to us to promise bright hopes for women's enfranchisement. The life of the old Parliament, dominated for nearly twenty years by the Conservative Party, was drawing to an end, and the country was on the eve of a general election in which the Liberals hoped to be returned to power. Quite naturally the Liberal candidates went to the country with perfervid promises of reform in every possible direction. They appealed to the voters to return them, as advocates and upholders of true democracy, and they promised that there should be a Government united in favour of people's rights against the powers of a privileged aristocracy.

Now repeated experiences had taught us that the only way to attain women's suffrage was to commit a Government to it. In other words, pledges of support from candidates were plainly useless. They were not worth having. The only object worth trying for was pledges from responsible leaders that the new Government would make women's suffrage a part of the official programme. We determined to address ourselves to those men who were likely to be in the Liberal Cabinet, demanding to know whether their reforms were going to include justice to women.

We laid our plans to begin this work at a great meeting to be held in Free Trade Hall, Manchester, with Sir Edward Grey as the principal speaker. We intended to get seats in the gallery, directly facing the platform and we made for the occasion a large banner with the words: "Will the Liberal Party Give Votes for Women?" We were to let this banner down over the gallery rails at the moment when our speaker rose to put the question to Sir Edward Grey. At the last moment, however, we had to alter the plan because it was impossible to get the gallery seats we wanted. There was no way in which we could use our large banner, so, late in the afternoon on the day of the meeting, we cut out and made a small banner with the three-word inscription: "Votes for Women." Thus,

quite accidentally, there came into existence the present slogan of the suffrage movement around the world.

Annie Kenney and my daughter Christabel were charged with the mission of questioning Sir Edward Grey. They sat quietly through the meeting, at the close of which questions were invited. Several questions were asked by men and were courteously answered. Then Annie Kenney arose and asked: "If the Liberal party is returned to power, will they take steps to give votes for women?" At the same time Christabel held aloft the little banner that every one in the hall might understand the nature of the question. Sir Edward Grey returned no answer to Annie's question, and the men sitting near her forced her rudely into her seat, while a steward of the meeting pressed his hat over her face. A babel of shouts, cries and catcalls sounded from all over the hall.

As soon as order was restored Christabel stood up and repeated the question: "Will the Liberal Government, if returned, give votes to women?" Again Sir Edward Grey ignored the question, and again a perfect tumult of shouts and angry cries arose. Mr. William Peacock, chief constable of Manchester, left the platform and came down to the women, asking them to write their question, which he promised to hand to the speaker. They wrote: "Will the Liberal Government give votes to working-women? Signed, on behalf of the Women's Social and Political Union, Annie Kenney, member of the Oldham committee of the card-and blowing-room operatives." They added a line to say that, as one of 96,000 organised women textile-workers, Annie Kenney earnestly desired an answer to the question.

Mr. Peacock kept his word and handed the question to Sir Edward Grey, who read it, smiled, and passed it to the others on the platform. They also read it with smiles, but no answer to the question was made. Only one lady who was sitting on the platform tried to say something, but the chairman interrupted by asking Lord Durham to move a vote of thanks to the speaker. Mr. Winston Churchill seconded the motion, Sir Edward Grey replied briefly, and the meeting began to break up. Annie Kenney stood up in her chair and cried out over the noise of shuffling feet and murmurs of conversation: "Will the Liberal Government give votes to women?" Then the audience became a mob. They howled, they shouted and roared, shaking their fists fiercely at the woman who dared to intrude her question into a man's meeting. Hands were lifted to drag her out of her chair, but Christabel threw one arm about her as she stood, and with the other arm warded off the mob, who struck and scratched at her until her sleeve was red with blood. Still the girls held together and shouted over and over: "The question! The question! Answer the question!"

Six men, stewards of the meeting, seized Christabel and dragged her down the aisle, past the platform, other men following with Annie Kenney, both girls still calling for an answer to their question. On the platform the Liberal leaders sat silent and unmoved while this disgraceful scene was taking place, and the mob were shouting and shrieking from the floor.

Flung into the streets, the two girls staggered to their feet and began to address the crowds, and to tell them what had taken place in a Liberal meeting. Within five minutes they were arrested on a charge of obstruction and, in Christabel's case, of assaulting the police. Both were summonsed to appear next morning in a police court, where, after a trial which was a mere farce, Annie Kenney was sentenced to pay a fine of five shillings, with an alternative of three days in prison, and Christabel Pankhurst was given a fine of ten shillings or a jail sentence of one week.

Both girls promptly chose the prison sentence. As soon as they left the court-room I hurried around to the room where they were waiting, and I said to my daughter: "You have done everything you could be expected to do in this matter. I think you should let me pay your fines and take you home." Without waiting for Annie Kenney to speak, my daughter exclaimed: "Mother, if you pay my fine I will never go home." Before going to the meeting she had said, "We will get our question answered or sleep in prison to-night." I now knew her courage remained unshaken.

Of course the affair created a tremendous sensation, not only in Manchester, where my husband had been so well known and where I had so long held public office, but all over England. The comments of the press were almost unanimously bitter. Ignoring the perfectly well-established fact that men in every political meeting ask questions and demand answers of the speakers, the newspapers treated the action of the two girls as something quite unprecedented and outrageous. They generally agreed that great leniency had been shown them. Fines and jail-sentences were too good for such unsexed creatures. "The discipline of the nursery" would have been far more appropriate. One Birmingham paper declared that "if any argument were required against giving ladies political status and power it had been furnished in Manchester." Newspapers which had heretofore ignored the whole subject now hinted that while they had formerly been in favour of women's suffrage, they could no longer countenance it. The Manchester incident, it was said, had set the cause back, perhaps irrevocably.

This is how it set the cause back. Scores of people wrote to the newspapers expressing sympathy with the women. The wife of Sir Edward Grey told her friends that she considered them quite justified in the means they had taken. It was stated that Winston

Churchill, nervous about his own candidacy in Manchester, visited Strangeways Gaol, where the two girls were imprisoned, and vainly begged the governor to allow him to pay their fines. On October 20, when the prisoners were released, they were given an immense demonstration in Free-Trade Hall, the very hall from which they had been ejected the week before. The Women's Social and Political Union received a large number of new members. Above all, the question of women's suffrage became at once a live topic of comment from one end of Great Britain to the other.

We determined that from that time on the little "Votes For Women" banners should appear wherever a prospective member of the Liberal Government rose to speak, and that there should be no more peace until the women's question was answered. We clearly perceived that the new Government, calling themselves Liberal, were reactionary so far as women were concerned, that they were hostile to women's suffrage, and would have to be fought until they were conquered, or else driven from office.

We did not begin to fight, however, until we had given the new Government every chance to give us the pledge we wanted. Early in December the Conservative Government had gone out, and Sir Henry Campbell-Bannerman, the Liberal leader, had formed a new Cabinet. On December 21 a great meeting was held in Royal Albert Hall, London, where Sir Henry, surrounded by his cabinet, made his first utterance as Prime Minister. Previous to the meeting we wrote to Sir Henry and asked him, in the name of the Women's Social and Political Union, whether the Liberal Government would give women the vote. We added that our representatives would be present at the meeting, and we hoped that the Prime Minister would publicly answer the question. Otherwise we should be obliged publicly to protest against his silence.

Of course Sir Henry Campbell-Bannerman returned no reply, nor did his speech contain any allusion to women's suffrage. So, at the conclusion, Annie Kenney, whom we had smuggled into the hall in disguise, whipped out her little white calico banner, and called out in her clear, sweet voice: "Will the Liberal Government give women the vote?"

At the same moment Theresa Billington let drop from a seat directly above the platform a huge banner with the words: "Will the Liberal Government give justice to working-women?" Just for a moment there was a gasping silence, the people waiting to see what the Cabinet Ministers would do. They did nothing. Then, in the midst of uproar and conflicting shouts, the women were seized and flung out of the hall.

This was the beginning of a campaign the like of which was never known in England, or, for that matter, in any other country. If we had been strong enough we should have opposed the election of every Liberal candidate, but being limited both in funds and in members we concentrated on one member of the Government, Mr. Winston Churchill. Not that we had any animus against Mr. Churchill. We chose him simply because he was the only important candidate standing for constituencies within reach of our headquarters. We attended every meeting addressed by Mr. Churchill. We heckled him unmercifully; we spoiled his best points by flinging back such obvious retorts that the crowds roared with laughter. We lifted out little white banners from unexpected corners of the hall, exactly at the moment when an interruption was least desired. Sometimes our banners were torn from our hands and trodden under foot. Sometimes, again, the crowds were with us, and we actually broke up the meeting. We did not succeed in defeating Mr. Churchill, but he was returned by a very small majority, the smallest of any of the Manchester Liberal candidates.

We did not confine our efforts to heckling Mr. Churchill. Throughout the campaign we kept up the work of questioning Cabinet Ministers at meetings all over England and Scotland. At Sun Hall, Liverpool, addressed by the Prime Minister, nine women in succession asked the important question, and were thrown out of the hall; this in the face of the fact that Sir Campbell-Bannerman was an avowed suffragist. But we were not questioning him as to his private opinions on the suffrage; we were asking him what his Government were willing to do about suffrage. We questioned Mr. Asquith in Sheffield, Mr. Lloyd-George in Altrincham, Cheshire, the Prime Minister again in Glasgow, and we interrupted a great many other meetings as well. Always we were violently thrown out and insulted. Often we were painfully bruised and hurt.

What good did it do? We have often been asked that question, even by the women our actions spurred into an activity they had never before thought themselves capable of. For one thing, our heckling campaign made women's suffrage a matter of news--it had never been that before. Now the newspapers were full of us. For another thing, we woke up the old suffrage associations. During the general election various groups of non-militant suffragists came back to life and organised a gigantic manifesto in favour of action from the Liberal Government. Among others, the manifesto was signed by the Women's Co-operative Guild with nearly 21,000 members; the Women's Liberal Federation, with 76,000 members; the Scottish Women's Liberal Federation, with 15,000 members; the North-of-England Weavers' Association, with 100,000 members; the British Women's Temperance Association, with nearly 110,000 members; and the Independent Labour Party with 20,000 members. Surely it was something to have inspired all

this activity.

We decided that the next step must be to carry the fight to London, and Annie Kenney was chosen to be organiser there. With only two pounds, less than ten dollars, in her pocket the intrepid girl set forth on her mission. In about a fortnight I left my official work as registrar in the hands of a deputy and went down to London to see what had been accomplished. To my astonishment I found that Annie, working with my daughter Sylvia, had organised a procession of women and a demonstration to be held on the opening day of Parliament. The confident young things had actually engaged Caxton Hall, Westminster; they had had printed a large number of handbills to announce the meeting, and they were busily engaged in working up the demonstration. Mrs. Drummond, who had joined the Union shortly after the imprisonment of Annie Kenney and Christabel, sent word from Manchester that she was coming to help us. She had to borrow the money for her railroad-fare, but she came, and, as ever before and since, her help was invaluable.

How we worked, distributing handbills, chalking announcements of the meeting on pavements, calling on every person we knew and on a great many more we knew only by name, canvassing from door to door!

At length the opening day of Parliament arrived. On February 19, 1906, occurred the first suffrage procession in London. I think there were between three and four hundred women in that procession, poor working-women from the East End, for the most part, leading the way in which numberless women of every rank were afterward to follow. My eyes were misty with tears as I saw them, standing in line, holding the simple banners which my daughter Sylvia had decorated, waiting for the word of command. Of course our procession attracted a large crowd of intensely amused spectators. The police, however, made no attempt to disperse our ranks, but merely ordered us to furl our banners. There was no reason why we should not have carried banners but the fact that we were women, and therefore could be bullied. So, bannerless, the procession entered Caxton Hall. To my amazement it was filled with women, most of whom I had never seen at any suffrage gathering before.

Our meeting was most enthusiastic, and while Annie Kenney was speaking, to frequent applause, the news came to me that the King's speech (which is not the King's at all, but the formally announced Government programme for the session) had been read, and that there was in it no mention of the women's suffrage question. As Annie took her seat I arose and made this announcement, and I moved a resolution that the meeting should at once proceed to the House of Commons to urge the members to introduce a suffrage measure. The resolution was carried, and we rushed out in a body and hurried toward the Strangers' Entrance. It was pouring rain and bitterly cold, yet no one turned back, even when we learned at the entrance that for the first time in memory the doors of the House of Commons were barred to women. We sent in our cards to members who were personal friends, and some of them came out and urged our admittance. The police, however, were obdurate. They had their orders. The Liberal government, advocates of the people's rights, had given orders that women should no longer set foot in their stronghold.

Pressure from members proved too great, and the government relented to the extent of allowing twenty women at a time to enter the lobby. Through all the rain and cold those hundreds of women waited for hours their turn to enter. Some never got in, and for those of us who did there was small satisfaction. Not a member could be persuaded to take up our cause.

Out of the disappointment and dejection of that experience I yet reaped a richer harvest of happiness than I had ever known before. Those women had followed me to the House of Commons. They had defied the police. They were awake at last. They were prepared to do something that women had never done before--fight for themselves. Women had always fought for men, and for their children. Now they were ready to fight for their own human rights. Our militant movement was established.

CHAPTER IV

To account for the phenomenal growth of the Women's Social and Political Union after it was established in London, to explain why it made such an instant appeal to women hitherto indifferent, I shall have to point out exactly wherein our society differs from all other suffrage associations. In the first place, our members are absolutely single minded; they concentrate all their forces on one object, political equality with men. No member of the W. S. P. U. divides her attention between suffrage and other social reforms. We hold that both reason and justice dictate that women shall have a share in reforming the evils that afflict society, especially those evils bearing directly on women themselves. Therefore, we demand, before any other legislation whatever, the elementary justice of votes for women.

There is not the slightest doubt that the women of Great Britain would have been enfranchised years ago had all the suffragists adopted this simple principle. They never did, and even to-day many English women refuse to adopt it. They are party members

first and suffragists afterward; or they are suffragists part of the time and social theorists the rest of the time. We further differ from other suffrage associations, or from others existing in 1906, in that we clearly perceived the political situation that solidly interposed between us and our enfranchisement.

For seven years we had had a majority in the House of Commons pledged to vote favourably on a suffrage bill. The year before, they had voted favourably on one, yet that bill did not become law. Why? Because even an overwhelming majority of private members are powerless to enact law in the face of a hostile Government of eleven cabinet ministers. The private member of Parliament was once possessed of individual power and responsibility, but Parliamentary usage and a changed conception of statesmanship have gradually lessened the functions of members. At the present time their powers, for all practical purposes, are limited to helping to enact such measures as the Government introduces or, in rare instances, private measures approved by the Government. It is true that the House can revolt, can, by voting a lack of confidence in the Government, force them to resign. But that almost never happens, and it is less likely now than formerly to happen. Figureheads don't revolt.

This, then, was our situation: the Government all-powerful and consistently hostile; the rank and file of legislators impotent; the country apathetic; the women divided in their interests. The Women's Social and Political Union was established to meet this situation, and to overcome it. Moreover we had a policy which, if persisted in long enough, could not possibly fail to overcome it. Do you wonder that we gained new members at every meeting we held?

There was little formality about joining the Union. Any woman could become a member by paying a shilling, but at the same time she was required to sign a declaration of loyal adherence to our policy and a pledge not to work for any political party until the women's vote was won. This is still our inflexible custom. Moreover, if at any time a member, or a group of members, loses faith in our policy; if any one begins to suggest, that some other policy ought to be substituted, or if she tries to confuse the issue by adding other policies, she ceases at once to be a member. Autocratic? Quite so. But, you may object, a suffrage organisation ought to be democratic. Well the members of the W. S. P. U. do not agree with you. We do not believe in the effectiveness of the ordinary suffrage organisation. The W. S. P. U. is not hampered by a complexity of rules. We have no constitution and by-laws; nothing to be amended or tinkered with or quarrelled over at an annual meeting. In fact, we have no annual meeting, no business sessions, no elections of officers. The W. S. P. U. is simply a suffrage army in the field. It is purely a volunteer army, and no one is obliged to remain in it. Indeed we don't want anybody to remain in it who does not ardently believe in the policy of the army.

The foundation of our policy is opposition to a Government who refuse votes to women. To support by word or deed a Government hostile to woman suffrage is simply to invite them to go on being hostile. We oppose the Liberal party because it is in power. We would oppose a Unionist government if it were in power and were opposed to woman suffrage. We say to women that as long as they remain in the ranks of the Liberal party they give their tacit approval to the Government's anti-suffrage policy. We say to members of Parliament that as long as they support any of the Government's policies they give their tacit approval to the anti-suffrage policy. We call upon all sincere suffragists to leave the Liberal party until women are given votes on equal terms with men. We call upon all voters to vote against Liberal candidates until the Liberal Government does justice to women.

We did not invent this policy. It was most successfully pursued by Mr. Parnell in his Home Rule struggle more than thirty-five years ago. Any one who is old enough to remember the stirring days of Parnell may recall how, in 1885, the Home Rulers, by persistently voting against the Government in the House of Commons, forced the resignation of Mr. Gladstone and his Cabinet. In the general election which followed, the Liberal party was again returned to power, but by the slender majority of eighty-four, the Home Rulers having fought every Liberal candidate, even those, who, like my husband, were enthusiastic believers in Home Rule. In order to control the House and keep his leadership, Mr. Gladstone was obliged to bring in a Government Home Rule Bill. The downfall, through private intrigue, and the subsequent death of Parnell prevented the bill from becoming law. For many years afterward the Irish Nationalists had no leader strong enough to carry on Parnell's anti-government policy, but within late years it was resumed by Mr. James Redmond, with the result that the Commons passed a Home Rule Bill.

The contention of the old-fashioned suffragists, and of the politicians as well, has always been that an educated public opinion will ultimately give votes to women without any great force being exerted in behalf of the reform. We agree that public opinion must be educated, but we contend that even an educated public opinion is useless unless it is vigorously utilised. The keenest weapon is powerless unless it is courageously wielded. In the year 1906 there was an immensely large public opinion in favour of woman suffrage. But what good did that do the cause? We called upon the public for a great deal more than sympathy. We called upon it to demand of the Government to yield to public opinion and give women votes. And we declared that we would wage war, not only on all anti-suffrage forces, but on all neutral and non-active forces. Every man with a vote was considered a foe to woman suffrage

unless he was prepared to be actively a friend.

Not that we believed that the campaign of education ought to be given up. On the contrary, we knew that education must go on, and in much more vigorous fashion than ever before. The first thing we did was to enter upon a sensational campaign to arouse the public to the importance of woman suffrage, and to interest it in our plans for forcing the Government's hands. I think we can claim that our success in this regard was instant, and that it has proved permanent. From the very first, in those early London days, when we were few in numbers and very poor in purse, we made the public aware of the woman suffrage movement as it had never been before. We adopted Salvation Army methods and went out into the highways and the byways after converts. We threw away all our conventional notions of what was "ladylike" and "good form," and we applied to our methods the one test question, Will it help? Just as the Booths and their followers took religion to the street crowds in such fashion that the church people were horrified, so we took suffrage to the general public in a manner that amazed and scandalised the other suffragists.

We had a lot of suffrage literature printed, and day by day our members went forth and held street meetings. Selecting a favourable spot, with a chair for a rostrum, one of us would ring a bell until people began to stop to see what was going to happen. What happened, of course, was a lively suffrage speech, and the distribution of literature. Soon after our campaign had started, the sound of the bell was a signal for a crowd to spring up as if by magic. All over the neighbourhood you heard the cry: "Here are the Suffragettes! Come on!" We covered London in this way; we never lacked an audience, and best of all, an audience to which the woman-suffrage doctrine was new. We were increasing our favourable public as well as waking it up. Besides these street meetings, we held many hall and drawing-room meetings, and we got a great deal of press publicity, which was something never accorded the older suffrage methods.

Our plans included the introduction of a Government suffrage bill at the earliest possible moment, and in the spring of 1906 we sent a deputation of about thirty of our members to interview the Prime Minister, Sir Henry Campbell-Bannerman. The Prime Minister, it was stated, was not at home; so in a few days we sent another deputation. This time the servant agreed to carry our request to the Prime Minister. The women waited patiently on the doorstep of the official residence, No. 10 Downing Street, for nearly an hour. Then the door opened and two men appeared. One of the men addressed the leader of the deputation, roughly ordering her and the others to leave. "We have sent a message to the Prime Minister," she replied, "and we are waiting for the answer." "There will be no answer," was the stern rejoinder, and the door closed.

"Yes, there will be an answer," exclaimed the leader, and she seized the door-knocker and banged it sharply. Instantly the men reappeared, and one of them called to a policeman standing near, "Take this woman in charge." The order was obeyed, and the peaceful deputation saw its leader taken off to Canon Row Station.

Instantly the women protested vigorously. Annie Kenney began to address the crowd that had gathered, and Mrs. Drummond actually forced her way past the doorkeeper into the sacred residence of the Prime Minister of the British Empire! Her arrest and Annie's followed. The three women were detained at the police station for about an hour, long enough, the Prime Minister probably thought, to frighten them thoroughly and teach them not to do such dreadful things again. Then he sent them word that he had decided not to prosecute them, but would, on the contrary, receive a deputation from the W. S. P. U., and, if they cared to attend, from other suffrage societies as well.

All the suffrage organisations at once began making preparations for the great event. At the same time two hundred members of Parliament sent a petition to the Prime Minister, asking him to receive their committee that they might urge upon him the necessity of a Government measure for woman suffrage. Sir Henry fixed May 19th as the day on which he would receive a joint deputation from Parliament and from the women's suffrage organisations.

The W. S. P. U. determined to make the occasion as public as possible, and began preparations for a procession and a demonstration. When the day came we assembled at the foot of the beautiful monument to the warrior-queen, Boadicea, that guards the entrance to Westminster Bridge, and from there we marched to the Foreign Office. At the meeting eight women spoke in behalf of an immediate suffrage measure, and Mr. Keir Hardie presented the argument for the suffrage members of Parliament. I spoke for the W. S. P. U., and I tried to make the Prime Minister see that no business could be more pressing than ours. I told him that the group of women organised in our Union felt so strongly the necessity for women enfranchisement that they were prepared to sacrifice for it everything they possessed, their means of livelihood, their very lives, if necessary. I begged him to make such a sacrifice needless by doing us justice now.

What answer do you think Sir Henry Campbell-Bannerman made us? He assured us of his sympathy with our cause, his belief in its justice, and his confidence in our fitness to vote. And then he told us to have patience and wait; he could do nothing for us because some of his Cabinet were opposed to us. After a few more words the usual vote of thanks was moved, and the deputation was dismissed. I had not expected anything better, but it wrung my heart to see the bitter disappointment of the W. S. P. U. women who had waited in the street to hear from the leaders the result of the deputation. We held a great meeting of protest that afternoon, and determined to carry on our agitation with increased vigor.

Now that it had been made plain that the Government were resolved not to bring in a suffrage bill, there was nothing to do but to continue our policy of waking up the country, not only by public speeches and demonstrations, but by a constant heckling of Cabinet Ministers. Since the memorable occasion when Christabel Pankhurst and Annie Kenney were thrown out of Sir Edward Grey's meeting in Manchester, and afterward imprisoned for the crime of asking a courteous question, we had not lost an opportunity of addressing the same question to every Cabinet Minister we could manage to encounter. For this we have been unmercifully criticised, and in a large number of cases most brutally handled.

In almost every one of my American meetings I was asked the question, "What good do you expect to accomplish by interrupting meetings?" Is it possible that the time-honoured, almost sacred English privilege of interrupting is unknown in America? I cannot imagine a political meeting from which "the Voice" was entirely absent. In England it is invariably present. It is considered the inalienable right of the opposition to heckle the speaker and to hurl questions at him which are calculated to spoil his arguments. For instance, when Liberals attend a Conservative gathering they go prepared to shatter by witticisms and pointed questions all the best effects of the Conservative orators. The next day you will read in Liberal newspapers headlines like these: "The Voice in Fine Form," "Short Shrift for Tory Twaddle," "Awkward Answers from the Enemy's Platform." In the body of the article you will learn that "Lord X found that the Liberals at his meeting were more than a match for him," that "there was continued interruption during Sir So-and-so's speech," that "Lord M fared badly last night in his encounter with the Voice," or that "Captain Z had the greatest difficulty in making himself heard."

In accordance with this custom we heckle Cabinet Ministers. Mr. Winston Churchill, for example, is speaking. "One great question," he exclaims, "remains to be settled."

"And that is woman suffrage," shouts a voice from the gallery.

Mr. Churchill struggles on with his speech: "The men have been complaining of me----"

"The women have been complaining of you, too, Mr. Churchill," comes back promptly from the back of the hall.

"In the circumstances what can we do but----"

"Give votes to women."

Our object, of course, is to keep woman suffrage in the foreground of interest and to insist on every possible occasion that no other reform advocated is of such immediate importance.

From the first the women's interruptions have been resented with unreasoning anger. I remember hearing Mr. Lloyd-George saying once of a man who interrupted him:

"Let him remain. I like interruptions. They show that people holding different opinions to mine are present, giving me a chance to convert them." But when suffragists interrupt Mr. Lloyd-George he says something polite like this: "Pay no attention to those cats mewing."

Some of the ministers are more well bred in their expressions, but all are disdainful and resentful. All see with approval the brutal ejection of the women by the Liberal stewards.

At one meeting where Mr. Lloyd-George was speaking, we interrupted with a question, and he claimed the sympathy of the audience on the score that he was a friend to woman suffrage. "Then why don't you do something to give votes to women?" was the obvious retort. But Mr. Lloyd-George evaded this by the counter query: "Why don't they go for their enemies? Why don't they go for their greatest enemy?" Instantly, all over the hall, voices shouted, "Asquith! Asquith!" For even at that early day it was known that the then Chancellor of the Exchequer was a stern foe of women's independence.

In the summer of 1906, together with other members of the W. S. P. U., I went to Northampton, where Mr. Asquith was holding a large meeting in behalf of the Government's education bills. We organised a number of outdoor meetings, and of course prepared to attend Mr. Asquith's meeting. In conversation with the president of the local Women's Liberal Association, I mentioned the fact that we expected to be put out, and she indignantly declared that such a thing could not happen in Northampton, where the women had done so much for the Liberal party. I told her that I hoped she would be at the meeting.

I had not intended to go myself, my plans being to hold a meeting of my own outside the door. But our members, before Mr. Asquith began to speak, attempted to question him, and were thrown out with violence. So then, turning my meeting over to them, I slipped quietly into the hall and sat down in the front row of a division set apart for wives and women friends of the Liberal leaders. I sat there in silence, hearing men interrupt the speaker and get answers to their questions. At the close of the speech I stood up and, addressing the chairman, said: "I should like to ask Mr. Asquith a question about education." The chairman turned inquiringly to Mr. Asquith, who frowningly shook his head. But without waiting for the chairman to say a word, I continued: "Mr. Asquith has said that the parents of children have a right to be consulted in the matter of their children's education, especially upon such questions as the kind of religious instruction they should receive. Women are parents. Does not Mr. Asquith think that women should have the right to control their children's education, as men do, through the vote?" At this point the stewards seized me by the arms and shoulders and rushed me, or rather dragged me, for I soon lost my footing, to the door and threw me out of the building.

The effect on the president of the Northampton Women's Liberal Association was most salutary. She resigned her office and became a member of the W. S. P. U. Perhaps her action was influenced further by the press reports of the incident. Mr. Asquith was reported as saying, after my ejection, that it was difficult to enter into the minds of people who thought they could serve a cause which professed to appeal to the reason of the electors of the country by disturbing public meetings. Apparently he could enter into the minds of the men who disturbed public meetings.

To our custom of public heckling of the responsible members of the hostile Government we added the practice of sending deputations to them for the purpose of presenting orderly arguments in favour of our cause. After Mr. Asquith had shown himself so uninformed as to the objects of the suffragists, we decided to ask him to receive a deputation from the W. S. P. U. To our polite letter Mr. Asquith returned a cold refusal to be interviewed on any subject not connected with his particular office. Whereupon we wrote again, reminding Mr. Asquith that as a member of the Government he was concerned with all questions likely to be dealt with by Parliament. We said that we urgently desired to put our question before him, and that we would send a deputation to his house hoping that he would feel it his duty to receive us.

Our first deputation was told that Mr. Asquith was not at home. He had, in fact, escaped from the house through the back door, and had sped away in a fast motor-car. Two days later we sent a larger deputation, of about thirty women, to his house in Cavendish Square. To be accurate, the deputation got as near the house as the entrance to Cavendish Square; there the women met a strong force of police, who told them that they would not be permitted to go farther.

Many of the women were carrying little "Votes for Women" banners, and these the police tore from them, in some cases with blows and insults. Seeing this, the leader of the deputation cried out: "We will go forward. You have no right to strike women like that." The reply, from a policeman near her, was a blow in the face. She screamed with pain and indignation, whereupon the man grasped her by the throat and choked her against the park railings until she was blue in the face. The young woman struggled and fought back, and for this she was arrested on a charge of assaulting the police. Three other women were arrested, one because, in spite of the police, she succeeded in ringing Mr. Asquith's door-bell and another because she protested against the laughter of some ladies who watched the affair from a drawing-room window. She was a poor working-woman, and it seemed to her a terrible thing that rich and protected women should ridicule a cause that to her was so profoundly serious. The fourth woman was taken in charge, because after she had been pushed off the pavement, she dared to step back. Charged with disorderly conduct, these women were sentenced to six weeks in the Second Division. They were given the option of a fine, it is true, but the payment of a fine would have been an acknowledgment of guilt, which made such a course impossible. The leader of the deputation was given a two months' sentence, with the option of a fine of ten pounds. She, too, refused to pay, and was sent to prison; but some unknown friend paid the fine secretly, and she was released before the expiration of her sentence.

About the time these things were happening in London, similar violence was offered our women in Manchester, where John Burns, Lloyd-George, and Winston Churchill, all three Cabinet Ministers, were addressing a great Liberal demonstration. The women were there, as usual, to ask government support for our measure. There, too, they were thrown out of the meeting, and three of them were sent to prison.

There are people in England, plenty of them, who will tell you that the Suffragettes were sent to prison for destroying property. The fact is that hundreds of women were arrested for exactly such offences as I have described before it ever occurred to any of us to destroy property. We were determined, at the beginning of our movement, that we would make ourselves heard, that we would force the Government to take up our question and answer it by action in Parliament. Perhaps you will see some parallel to our case in the stand taken in Massachusetts by the early Abolitionists, Wendell Phillips and William Lloyd Garrison. They, too, had to fight bitterly, to face insult and arrest, because they insisted on being heard. And they were heard; and so, in time, were we.

I think we began to be noticed in earnest after our first success in opposing a Liberal candidate. This was in a by-election held at Cockermouth in August, 1906. I shall have to explain that a by-election is a local election to fill a vacancy in Parliament caused by a death or a resignation. The verdict of a by-election is considered as either an indorsement or a censure of the manner in which the Government have fulfilled their pre-election pledges. So we went to Cockermouth and told the voters how the Liberal party had fulfilled its pledges of democracy and lived up to its avowed belief in the rights of all the people. We told them of the arrests in London and Manchester, of the shameful treatment of women in Liberal meetings, and we asked them to censure the Government who had answered so brutally our demand for a vote. We told them that the only rebuke that the politicians would notice was a lost seat in Parliament, and that on that ground we asked them to defeat the Liberal candidate.

How we were ridiculed! With what scorn the newspapers declared that "those wild women" could never turn a single vote. Yet when the election was over it was found that the Liberal candidate had lost the seat, which, at the general election a little more than a year before, had been won by a majority of 655. This time the Unionist candidate was returned by a majority of 609. Tremendously elated, we hurried our forces off to another by-election.

Now the ridicule was turned to stormy abuse. Mind you, the Liberal Government still refused to notice the women's question; they declared through the Liberal press that the defeat at Cockermouth was insignificant, and that anyhow it wasn't caused by the Suffragettes; yet the Liberal leaders were furiously angry with the W. S. P. U. Many of our members had been Liberals, and it was considered by the men that these women were little better than traitors. They were very foolish and ill-advised, into the bargain, the Liberals said, because the vote, if won at all, must be gained from the Liberal party; and how did the women suppose the Liberal party would ever give the vote to open and avowed enemies? This sage argument was used also by the women Liberals and the constitutional suffragists. They advised us that the proper way was to work for the party. We retorted that we had done that unsuccessfully for too many years already, and persisted with the opposite method of persuasion.

Throughout the summer and autumn we devoted ourselves to the by-election work, sometimes actually defeating the Liberal candidate, sometimes reducing the Liberal majority, and always raising a tremendous sensation and gaining hundreds of new members to the Union. In almost every neighbourhood we visited we left the nucleus of a local union, so that before the year was out we had branches all over England and many in Scotland and Wales. I especially remember a by-election in Wales at which Mr. Samuel Evans, who had accepted an officership under the Crown, had to stand for re-election. Unfortunately no candidate had been brought out against him. So there was nothing for my companions and me to do but make his campaign as lively as possible. Mr.--now Sir Samuel--Evans was the man who had incensed women by talking out a suffrage resolution introduced into the House by Keir Hardie. So we went to two of his meetings and literally talked him out, breaking up the gatherings amid the laughter and cheers of delighted crowds.

On October 23d Parliament met for its autumn session, and we led a deputation to the House of Commons in another effort to induce the Government to take action on woman suffrage. In accordance with orders given the police, only twenty of us were admitted to the Strangers' Lobby. We sent in for the chief Liberal whip, and asked him to take a message to the Prime Minister, the message being the usual request to grant women the vote that session. We also asked the Prime Minister if he intended to include the registration of qualified women voters in the provisions of the plural voting bill, then under consideration. The Liberal whip came back with the reply that nothing could be done for women that session.

[Illustration: MRS. PANKHURST ADDRESSING A BY-ELECTION CROWD]

"Does the Prime Minister," I asked, "hold out any hope for the women for any session during this Parliament, or at any future time?" The Prime Minister, you will remember, called himself a suffragist.

The Liberal whip replied, "No, Mrs. Pankhurst, the Prime Minister does not."

What would a deputation of unenfranchised men have done in these circumstances--men who knew themselves to be qualified to exercise the franchise, who desperately needed the protection of the franchise, and who had a majority of legislators in favour of giving them the franchise? I hope they would have done at least as much as we did, which was to start a meeting of protest on the spot. The newspapers described our action as creating a disgraceful scene in the lobby of the House of Commons, but I think that history will otherwise describe it. One of the women sprang up on a settee and began to address the crowd. In less than a minute she was pulled down, but instantly another woman took her place; and after she had been dragged down, still another sprang to her place, and following her another and another, until the order came to clear the lobby, and we were all forced outside.

In the melee I was thrown to the floor and painfully hurt. The women, thinking me seriously injured, crowded around me and refused to move until I was able to regain myself. This angered the police, who were still more incensed when they found that the demonstration was continued outside. Eleven women were arrested, including Mrs. Pethick Lawrence, our treasurer, Mrs. Cobden Sanderson, Annie Kenney and three more of our organisers; and they were all sent to Holloway for two months. But the strength of our movement was proved by the number of volunteers who immediately came forward to carry on the work. Mrs. Tuke, now Hon. Secretary of the W. S. P. U., joined the Union at this time. It had not occurred to the authorities that their action would have this effect. They thought to crush the Union at a blow, but they gave it the greatest impetus it had yet received. The leaders of the older suffrage organisations for the time forgot their disapproval of our methods, and joined with women writers, physicians, actresses, artists, and other prominent women in denouncing the affair as barbarous.

One more thing the authorities failed to take into account. The condition of English prisons was known to be very bad, but when two of our women were made so ill in Holloway that they had to be released within a few days, the politicians began to tremble for their prestige. Questions were asked in Parliament concerning the advisability of treating the Suffragettes not as common criminals but as political offenders with the right to confinement in the First Division. Mr. Herbert Gladstone, the Home Secretary, replied to these questions that he had no power to interfere with the magistrates' decisions, and could do nothing in the matter of the suffragettes' punishment. I shall ask you to remember this statement of Mr. Herbert Gladstone's, as later we were able to prove it a deliberate falsehood--although really the falsehood proved itself when the women, by Government order, were released from prison when they had served just half their sentences. The reason for this was that an important by-election was being held in the north of England, and we had distributed broadcast throughout the constituency hand bills telling the electors that nine women, including the daughter of Richard Cobden, were being held as common criminals by the Liberal Government who were asking for their votes.

I took a group of the released prisoners to Huddersfield, and they told prison stories to such effect that the Liberal majority was reduced by 540 votes. As usual the Liberal leaders denied that our work had anything to do with the slender majority by which the party retained the seat, but among our souvenirs is a handbill, one of thousands given out from Liberal headquarters:

+------------------------------+ | MEN OF HUDDERSFIELD | | DON'T BE MISLED | | BY SOCIALISTS, SUFFRAGETTES | | OR TORIES | | VOTE FOR SHERWELL | +------------------------------+

Meanwhile, other demonstrations had taken place before the House of Commons, and at Christmas time twenty-one suffragettes were in Holloway Prison, though they had committed no crime. The Government professed themselves unmoved, and members of Parliament spoke with sneers of the "self-made martyrs." However, a considerable group of members, strongly moved by the passion and unquenchable ardor of this new order of suffragists, met during the last week of the year and formed a committee whose object it was to press upon the government the necessity of giving the franchise to women during that Parliament. The committee resolved that its members would work to educate a wider public opinion on the question, and especially to advocate suffrage when addressing meetings in their constituencies, to take Parliamentary action on every possible occasion, and to induce as many members of Parliament as possible to ballot for the introduction of a suffrage bill or motion next session.

Our first year in London had borne wonderful fruits. We had grown from a mere handful of women, a "family party" the newspapers had derisively called us, to a strong organisation with branches all over the country, permanent headquarters in Clements Inn, Strand; we had found good financial backing, and above all, we had created a suffrage committee in the House of Commons.

BOOK II

FOUR YEARS OF PEACEFUL MILITANCY

CHAPTER I

The campaign of 1907 began with a Women's Parliament, called together on February 13th in Caxton Hall, to consider the provisions of the King's speech, which had been read in the national Parliament on the opening day of the session, February 12th. The King's speech, as I have explained, is the official announcement of the Government's programme for the session. When our Women's Parliament met at three o'clock on the afternoon of the thirteenth we knew that the Government meant to do nothing for women during the session ahead.

I presided over the women's meeting, which was marked with a fervency and a determination of spirit at that time altogether unprecedented. A resolution expressing indignation that woman suffrage should have been omitted from the King's speech, and calling upon the House of Commons to give immediate facilities to such a measure, was moved and carried. A motion to send the resolution from the hall to the Prime Minister was also carried. The slogan, "Rise up, women," was cried from the platform, the answering shout coming back as from one woman, "Now!" With copies of the resolution in their hands, the chosen deputation hurried forth into the February dusk, ready for Parliament or prison, as the fates decreed.

Fate did not leave them very long in doubt. The Government, it appeared, had decided that not again should their sacred halls of Parliament be desecrated by women asking for the vote, and orders had been given that would henceforth prevent women from reaching even the outer precincts of the House of Commons. So when our deputation of women arrived in the neighbourhood of Westminster Abbey they found themselves opposed by a solid line of police, who, at a sharp order from their chief, began to stride through and through the ranks of the procession, trying to turn the women back. Bravely the women rallied and pressed forward a little farther. Suddenly a body of mounted police came riding up at a smart trot, and for the next five hours or more, a struggle, quite indescribable for brutality and ruthlessness, went on.

The horsemen rode directly into the procession, scattering the women right and left. But still the women would not turn back. Again and again they returned, only to fly again and again from the merciless hoofs. Some of the women left the streets for the pavements, but even there the horsemen pursued them, pressing them so close to walls and railings that they were obliged to retreat temporarily to avoid being crushed. Other strategists took refuge in doorways, but they were dragged out by the foot police and were thrown directly in front of the horses. Still the women fought to reach the House of Commons with their resolution. They fought until their clothes were torn, their bodies bruised, and the last ounce of their strength exhausted. Fifteen of them did actually fight their way through those hundreds on hundreds of police, foot and mounted, as far as the Strangers' Lobby of the House. Here they attempted to hold a meeting, and were arrested. Outside, many more women were taken into custody. It was ten o'clock before the last arrest was made, and the square cleared of the crowds. After that the mounted men continued to guard the approaches to the House of Commons until the House rose at midnight.

The next morning fifty-seven women and two men were arraigned, two and three at a time, in Westminster police court. Christabel Pankhurst was the first to be placed in the dock. She tried to explain to the magistrate that the deputation of the day before was a perfectly peaceful attempt to present a resolution, which, sooner or later, would be presented and acted upon. She assured him that the deputation was but the beginning of a campaign that would not cease until the Government yielded to the women's demand. "There can be no going back for us," she declared, "and more will happen if we do not get justice."

The magistrate, Mr. Curtis Bennett, who was destined later to try women for that "more," rebuked my daughter sternly, telling her that the Government had nothing to do with causing the disorders of the day before, that the women were entirely responsible for what had occurred, and finally, that these disgraceful scenes in the street must cease--just as King Canute told the ocean that it must roll out instead of in. "The scenes can be stopped in only one way," replied the prisoner. His sole reply to that was, "Twenty shillings or fourteen days," Christabel chose the prison sentence, and so did all the other prisoners. Mrs. Despard, who headed the deputation, and Sylvia Pankhurst, who was with her, were given three weeks in prison.

Of course the raid, as it was called, gave the Women's Social and Political Union an enormous amount of publicity, on the whole, favourable publicity. The newspapers were almost unanimous in condemning the Government for sending mounted troops out against unarmed women. Angry questions were asked in Parliament, and our ranks once more increased in size and ardour. The old-fashioned suffragists, men as well as women, cried out that we had alienated all our friends in Parliament; but this proved to be untrue. Indeed, it was found that a Liberal member, Mr. Dickinson, had won the first place in the ballot, and had announced that he intended to use it to introduce a women's suffrage bill. More than this, the prime minister, Sir Henry Campbell-Bannerman, promised to give the bill his support. For a time, a very short time, it is true, we felt that the hour of our freedom might be at hand, that our prisoners had perhaps already won us our precious symbol--the vote.

Soon, however, a number of professed suffragists in the House began to complain that Mr. Dickinson's bill, practically the original bill, was not "democratic" enough, that it would enfranchise only the women of the upper classes--to which, by the way, most of them belonged. That this was not true had been proved again and again from the municipal registers, which showed a majority of working women's names as qualified householders. The contention was but a shallow excuse, and we knew it. Therefore we were not surprised when Sir Henry Campbell-Bannerman departed from his pledge of support, and allowed the bill to be talked out.

Following this event, the second Women's Parliament assembled, on the afternoon of March 20, 1907. As before, we adopted a resolution calling upon the Government to introduce an official suffrage measure, and again we voted to send the resolution from the hall to the Prime Minister. Lady Harberton was chosen to lead the deputation, and instantly hundreds of women sprang up and volunteered to accompany her. This time the police met the women at the door of the hall, and another useless, disgraceful scene of barbarous, brute-force opposition took place. Something like one thousand police had been sent out to guard the House of Commons from the peaceful invasion of a few hundred women. All afternoon and evening we kept Caxton Hall open, the women returning every now and again, singly and in small groups, to have their bruises bathed, or their torn clothing repaired. As night fell the crowds in the street grew denser, and the struggle between the women and the police became more desperate. Lady Harberton, we heard, had succeeded in reaching the entrance to the House of Commons, nay, had actually managed to press past the sentries into the lobby, but her resolution had not been presented to the Prime Minister. She and many others were arrested before the police at last succeeded in clearing the streets, and the dreadful affair was over.

The next day, in Westminster police court, the magistrate meted out sentences varying from twenty shillings or fourteen days to forty shillings or one month's imprisonment. Two of the women, Miss Woodlock and Mrs. Chatterton, who had left Holloway only a week before, were, as "old offenders," given thirty days without the option of a fine. Another woman, Mary Leigh, was given thirty days because she offended the magistrate's dignity by hanging a "Votes for Women" banner over the edge of the dock. Those of my readers who are unable to connect the word "militancy" with anything milder than arson are invited to reflect that within the first two months of the year 1907 the English Government sent to prison one hundred and thirty women whose "militancy" consisted merely of trying to carry a resolution from a hall to the Prime Minister in the House of Commons. Our crime was called obstructing the police. It will be seen that it was the police who did the obstructing.

It may be asked why neither of these deputations was led by me personally. The reason was that I was needed in another capacity, that of leader and supervisor of the suffrage forces in the field to defeat Government candidates at by-elections. On the night of the second "riot," while our women were still struggling in the streets, I left London for Hexham in Northumberland, where by our work the majority of the Liberal candidate was reduced by a thousand votes. Seven more by-elections followed in rapid succession.

Our by-election work was such a new thing in English politics that we attracted an enormous amount of attention wherever we went. It was our custom to begin work the very hour we entered a town. If, on our way from the station to the hotel, we encountered a group of men, say, in the market-place, we either stopped and held a meeting on the spot, or else we stayed long enough to tell them when and where our meetings were to be held, and to urge them to attend. The usual first step, after securing lodgings, was to hire a vacant shop, fill the windows with suffrage literature, and fling out our purple, green, and white flag. Meanwhile, some of us were busy hiring the best available hall. If we got possession of the battle-ground before the men, we sometimes "cornered" all the good halls and left the candidate nothing but schoolhouses for his indoor meetings. Truth to tell, our meetings were so much more popular than theirs that we really needed the larger halls. Often, a candidate with the Suffragettes for rivals spoke to almost empty benches. The crowds were away listening to the women.

Naturally, this greatly displeased the politicians, and it scandalised many of the old-fashioned Liberal partisans. In one place, I think it was Colne Valley in Yorkshire, an amusing instance of masculine hostility occurred. We had arrived on a day when both Conservative and Liberal committees were choosing their candidates, and we thought it a good opportunity to hold a series of outdoor meetings. We tried to get a lorry for a rostrum, but the only man in town who had these big vans to let disapproved of Suffragettes so violently that he wouldn't let us have one. So we borrowed a chair from a woman shopkeeper, and went at it. Soon we had a large crowd and an interested audience. We also got the attention of a number of small boys with pea-shooters, and had to make our speeches under a blistering fire of dried peas.

While I was speaking the fire ceased, to my relief--for dried peas sting. I continued my speech with renewed vigor, only to have one of my best points spoiled by roars of laughter from the crowd. I finished somehow, and sat down; and then it was explained to me that the pea-shooters had been financed by one of the prominent Liberals of the town, another man who disapproved of our policy of opposing the Government. As soon as the ammunition gave out this man furnished the boys with a choice supply of rotten

oranges. These were not so easily handled, it appeared, for the very first one went wild, and struck the chivalrous gentleman violently in the neck. This it was that had caused the laughter, and stopped the attack on the women.

We met with some pretty rough horse-play, and even with some brutality, in several by-elections, but on the whole we found the men ready, and the women more than ready, to listen to us. We tamed and educated a public that had always been used to violence at elections. We even tamed the boys, who came to the meetings on purpose to skylark. When we were in Rutlandshire that spring three schoolboys came to see me and told me, shyly, that they were interested in suffrage. They had had a debate on the subject at their school, and although the decision had been for the other side, all the boys wanted to know more about it. Wouldn't I please have a meeting especially for them? Of course I consented, and I found my boy audience quite delightful. Indeed, I hope they liked me half as well as I did them.

All through the spring our by-election work continued with amazing success, although our part in the Government losses was rarely admitted by the politicians. The voters knew, however. At an election in Suffolk, where we helped to double the Unionist vote, the successful candidate, speaking to the crowd from his hotel window, said, "What has been the cause of the great and glorious victory?" Instantly the crowd roared, "Votes for Women!"--"Three cheers for the Suffragettes!" This was not at all what the successful candidate had intended, but he waved his hand graciously and said, "No doubt the ladies had something to do with it."

The newspaper correspondents were not so reluctant to acknowledge our influence. Even when they condemned our policy, they were unsparing in their admiration for our energy, and the courage and ardour of our workers. Said the correspondent of the London _Tribune_, a Liberal paper hostile to our tactics: "Their staying power, judging them by the standards of men, is extraordinary. By taking afternoon as well as evening meetings, they have worked twice as hard as the men. They are up earlier, they retire just as late. Women against men, they are better speakers, more logical, better informed, better phrased, with a surer insight for the telling argument."

After a summer spent in strengthening our forces, organising new branches, holding meetings--something like three thousand of these between May and October--invading meetings of Cabinet Ministers--we managed to do that about once every day--electioneering, and getting up huge demonstrations in various cities, we arrived at the end of the year. In the last months of the year, I directed several hotly contested by-elections, at one of which I met with one of the most serious misadventures of my life.

This by-election was held in the division of Mid-Devon, a stronghold of Liberalism. In fact, since its creation in 1885, the seat has never been held by any except a Liberal member. The constituency is a large one, divided into eight districts. The population of the towns is a rough and boisterous one, and its devotion, blind and unreasoning, to the Liberal party has always reflected the rude spirit of the voters. A Unionist woman told me, shortly after my arrival, that my life would be unsafe if I dared openly to oppose the Liberal candidate. She had never dared, she assured me, to wear her party colours in public. However, I did speak--in our headquarters at Newton Abbott, the principal town of the division, at Hull, and at Bovey Tracey. We held meetings twice a day, calling upon the voters to "beat the Government in Mid-Devon, as a message that women must have votes next year." Although some of the meetings were turbulent, we were treated with much more consideration than either of the candidates, who, not infrequently, were howled down and put to flight. Often the air of their meetings was thick with decayed vegetables and dirty snowballs. We had some rather lively sessions, too. Once, at an outdoor meeting, some young roughs dragged our lorry round and round until it seemed that we must be upset, and several times the language hurled at us from the crowd was quite unfit for me to repeat. Still, we escaped actual violence until the day of the election, when it was announced that the Unionist candidate had won the seat by a majority of twelve hundred and eighty. We knew instantly that the deepest resentment of the Liberals would be aroused, but it did not occur to us that the resentment would be directed actively against us.

After the declaration at the polls, my companion, Mrs. Martel, and I started to walk to our lodgings. Some of our friends stopped us, and drew our attention to the newly elected Unionist member of Parliament, who was being escorted from the polling place by a strong guard of police. We were warned that our safety demanded an immediate flight from the town. I laughingly assured our friends that I was never afraid to trust myself in a crowd, and we walked on. Suddenly we were confronted by a crowd of young men and boys, clay-cutters from the pits on the edge of town. These young men, who wore the red rosettes of the Liberal party, had just heard of their candidate's defeat, and they were mad with rage and humiliation. One of them pointed to us, crying: "They did it! Those women did it!" A yell went up from the crowd, and we were deluged with a shower of clay and rotten eggs. We were not especially frightened, but the eggs were unbearable, and to escape them we rushed into a little grocer's shop close at hand. The grocer's wife closed and bolted the door, but the poor grocer cried out that his place would be wrecked. I did not want that to

happen, of course, so I asked them to let us out by the back door. They led us out the door, into a small back yard which led into a little lane, whence we expected to make our escape. But when we reached the yard we found that the rowdies, anticipating our move, had surged round the corner, and were waiting for us.

They seized Mrs. Martel first, and began beating her over the head with their fists, but the brave wife of the shopkeeper, hearing the shouts and the oaths of the men, flung open the door and rushed to our rescue. Between us we managed to tear Mrs. Martel from her captors and get her into the house. I expected to get into the house, too, but as I reached the threshold a staggering blow fell on the back of my head, rough hands grasped the collar of my coat, and I was flung violently to the ground. Stunned, I must have lost consciousness for a moment, for my next sensation was of cold, wet mud seeping through my clothing. Sight returning to me, I perceived the men, silent now, but with a dreadful, lowering silence, closing in a ring around me. In the centre of the ring was an empty barrel, and the horrid thought occurred to me that they might intend putting me in it. A long time seemed to pass, while the ring of men slowly drew closer. I looked at them, in their drab clothes smeared with yellow pit-clay, and they appeared so underfed, so puny and sodden, that a poignant pity for them swept over me. "Poor souls," I thought, and then I said suddenly, "Are none of you _men_?" Then one of the youths darted toward me, and I knew that whatever was going to happen to me was about to begin.

At that very moment came shouts, and a rush of police who had fought their way through hostile crowds to rescue us. Of course the mob turned tail and fled, and I was carried gently into the shop, which the police guarded for two hours, before it was deemed safe for us to leave in a closed motor-car. It was many months before either Mrs. Martel or I recovered from our injuries.

The rowdies, foiled of their woman prey, went to the Conservative Club, smashed all the windows in the house, and kept the members besieged there through the night. The next morning the body of a man, frightfully bruised about the head, was found in the mill-race. Throughout all this disorder and probable crime, not a man was arrested. Contrast this, if you like, with the treatment given our women in London.

The King opened Parliament in great state on January 29, 1908. Again his speech omitted all mention of woman suffrage, and again the W. S. P. U. issued a call for a Women's Parliament, for February 11th, 12th and 13th. Before it was convened we heard that an excellent place in the ballot had been won by a friend of the movement, Mr. Stanger, who promised to introduce a suffrage bill, February 28th was the day fixed for the second reading, and we realised that strong pressure would have to be brought to bear to prevent the bill being wrecked, as the Dickinson bill had been the previous year. Therefore, on the first day of the Women's Parliament, almost every woman present volunteered for the deputation, which was to try to carry the resolution to the prime minister. Led by two well-known portrait painters, the deputation left Caxton Hall and proceeded in orderly ranks, four abreast, toward the House of Commons. The crowds in the streets were enormous, thousands of sympathisers coming out to help the women, thousands of police determined that the women should not be helped, and thousands of curious spectators. When the struggle was over, fifty women were locked up in police-court cells.

The next morning, when the cases were tried, Mr. Muskett, who prosecuted for the Crown, and who was perhaps a little tired of telling the Suffragettes that these scenes in the streets must cease, and then seeing them go on exactly as if he had not spoken, made a very severe and terrifying address. He told the women that this time they would be subject to the usual maximum of two months' imprisonment, with the option of a fine of five pounds, but that, in case they ever offended again, the law had worse terrors in store for them. It was proposed to revive, for the benefit of the Suffragettes, an Act passed in the reign of Charles II, which dealt with "Tumultuous Petitions, either to the Crown or Parliament." This Act provided that no person should dare to go to the King or to Parliament "with any petition, complaint, remonstrance, declaration or other address" accompanied with a number of persons above twelve. A fine of one hundred pounds, or three months' imprisonment, might be imposed under this law. The magistrate then sentenced all but two of the women to be bound over for twelve months, or to serve six weeks in the second division. Two other women, "old offenders," were given one month in the third division, or lowest class. All the prisoners, except two who had very ill relatives at home, chose the prison sentence.

The next day's session of the Women's Parliament was one of intense excitement, as the women reviewed the events of the previous day, the trials, and especially the threat to revive the obsolete Act of Charles II, an act _which was passed to obstruct the progress of the Liberal party, which came into existence under the Stuarts, and under the second Charles was fighting for its life_. It was an amazing thing that the political descendants of these men were proposing to revive the Act to obstruct the advance of the women's cause, fighting for its life under George V and his Liberal government. At least, it was evidence that the Government were baffled in their attempt to crush our movement. Christabel Pankhurst, presiding over the second session of the Women's Parliament, said: "At last it is realized that women are fighting for freedom, as their fathers fought. If they want twelve women, aye,

and more than twelve, if a hundred women are wanted to be tried under that act and sent to prison for three months, they can be found."

I was not present at this session, nor had I been present at the first one. I was working in a by-election at South Leeds, the last of several important by-elections in great industrial centres, where our success was unquestioned, except by the Liberal press. The elections had wound up with a great procession, and a meeting of 100,000 people on Hounslet Moor. The most wonderful enthusiasm marked that meeting. I shall never forget what splendid order the people kept, in spite of the fact that no police protection was given us; how the vast crowd parted to let our procession through; how the throngs of mill women kept up a chorus in broad Yorkshire: "Shall us win? Shall us have the vote? We shall!" No wonder the old people shook their beads, and declared that "there had never been owt like it."

CHAPTER II

With those brave shouts in my ears, I hurried down to London for the concluding session of the parliament, for I had determined that I must be the first person to challenge the Government to carry out their threat to revive the old Act of Charles II. I made a long speech to the women that day, telling them something of my experiences of the past months, and how all that I had seen and heard throughout the country had only deepened my conviction of the necessity for women's votes. "I feel," I concluded, "that the time has come when I must act, and I wish to be one of those to carry our resolution to Parliament this afternoon. My experience in the country, and especially in South Leeds, has taught me things that Cabinet Ministers, who have not had that experience, do not know, and has made me feel that I must make one final attempt to see them, and to urge them to reconsider their position before some terrible disaster has occurred."

Amid a good deal of excitement and emotion, we chose the requisite thirteen women, who were prepared to be arrested and tried under the Charles II "Tumultuous Petitions" Act. I had not entirely recovered from the attack made upon me at Mid-Devon, and my wrenched ankle was still too sensitive to make walking anything but a painful process. Seeing me begin almost at once to limp badly, Mrs. Drummond, with characteristic, blunt kindness, called to a man driving a dog-cart and asked him if he would drive me to the House of Commons. He readily agreed, and I mounted to the seat behind him, the other women forming in line behind the cart. We had not gone far when the police, who already surrounded us in great force, ordered me to dismount. Of course I obeyed and walked, or rather limped along with my companions. They would have supported me, but the police insisted that we should walk single-file. Presently I grew so faint from the pain of the ankle that I called to two of the women, who took hold of my arms and helped me on my way. This was our one act of disobedience to police orders. We moved with difficulty, for the crowd was of incredible size. All around, as far as eye could see, was the great moving, swaying, excited multitude, and surrounding us on all sides were regiments of uniformed police, foot and mounted. You might have supposed that instead of thirteen women, one of them lame, walking quietly along, the town was in the hands of an armed mob.

We had progressed as far as the entrance to Parliament Square, when two stalwart policemen suddenly grasped my arms on either side and told me that I was under arrest. My two companions, because they refused to leave me, were also arrested, and a few minutes later Annie Kenney and five other women suffered arrest. That night we were released on bail, and the next morning we were arraigned in Westminster police court for trial under the Charles II Act. But, as it turned out, the authorities, embarrassed by our readiness to test the act, announced that they had changed their minds, and would continue, for the present, to treat us as common street brawlers.

This was my first trial, and I listened, with a suspicion that my ears were playing tricks with my reason, to the most astonishing perjuries put forth by the prosecution. I heard that we had set forth from Caxton Hall with noisy shouts and songs, that we had resorted to the most riotous and vulgar behaviour, knocking off policemen's helmets, assaulting the officers right and left as we marched. Our testimony, and that of our witnesses, was ignored. When I tried to speak in my own defence, I was cut short rudely, and was told briefly that I and the others must choose between being bound over or going to prison, in the second division, for six weeks.

I remember only vaguely the long, jolting ride across London to Holloway Prison. We stopped at Pentonville, the men's prison, to discharge several men prisoners, and I remember shuddering at the thought of our women, many of them little past girlhood, being haled to prison in the same van with criminal men. Arriving at the prison, we groped our way through dim corridors into the reception-ward, where we were lined up against the wall for a superficial medical examination. After that we were locked up in separate cells, unfurnished, except for low, wooden stools.

It seemed an endless time before my cell door was opened by a wardress, who ordered me to follow her. I entered a room where another wardress sat at a table, ready to take an inventory of my effects. Obeying an order to undress, I took off my gown, then paused. "Take off everything," was the next order. "Everything?" I faltered. It seemed impossible that they expected me to strip. In fact, they did allow me to take off my last garments in the shelter of a bath-room. I shivered myself into some frightful underclothing, old and patched and stained, some coarse, brown woollen stockings with red stripes, and the hideous prison dress stamped all over with the broad arrow of disgrace. I fished a pair of shoes out of a big basket of shoes, old and mostly mismates. A pair of coarse but clean sheets, a towel, a mug of cold cocoa, and a thick slice of brown bread were given me, and I was conducted to my cell.

My first sensations when the door was locked upon me were not altogether disagreeable. I was desperately weary, for I had been working hard, perhaps a little too hard, for several strenuous months. The excitement and fatigue of the previous day, and the indignation I had suffered throughout the trial, had combined to bring me to the point of exhaustion, and I was glad to throw myself on my hard prison bed and close my eyes. But soon the relief of being alone, and with nothing to do, passed from me. Holloway Prison is a very old place, and it has the disadvantages of old places which have never known enough air and sunshine. It reeks with the odours of generations of bad ventilation, and it contrives to be at once the stuffiest and the draughtiest building I have ever been in. Soon I found myself sickening for fresh air. My head began to ache. Sleep fled. I lay all night suffering with cold, gasping for air, aching with fatigue, and painfully wide awake.

The next day I was fairly ill, but I said nothing about it. One does not expect to be comfortable in prison. As a matter of fact, one's mental suffering is so much greater than any common physical distress that the latter is almost forgotten. The English prison system is altogether mediaeval and outworn. In some of its details the system has improved since they began to send the Suffragettes to Holloway. I may say that we, by our public denunciation of the system, have forced these slight improvements. In 1907 the rules were excessively cruel. The poor prisoner, when she entered Holloway, dropped, as it were, into a tomb. No letters and no visitors were allowed for the first month of the sentence. Think of it--a whole month, more than four weeks, without sending or receiving a single word. One's nearest and dearest may have gone through dreadful suffering, may have been ill, may have died, meantime. One was given plenty of time to imagine all these things, for the prisoner was kept in solitary confinement in a narrow, dimly-lit cell, twenty-three hours out of the twenty-four. Solitary confinement is too terrible a punishment to inflict on any human being, no matter what his crime. Hardened criminals in the men's prisons, it is said, often beg for the lash instead. Picture what it must be to a woman who has committed some small offence, for most of the women who go to Holloway are small offenders, sitting alone, day after day, in the heavy silence of a cell--thinking of her children at home--thinking, thinking. Some women go mad. Many suffer from shattered nerves for a long period after release. It is impossible to believe that any woman ever emerged from such a horror less criminal than when she entered it.

Two days of solitary confinement, broken each day by an hour of silent exercise in a bitterly cold courtyard, and I was ordered to the hospital. There I thought I should be a little more comfortable. The bed was better, the food a little better, and small comforts, such as warm water for washing, were allowed. I slept a little the first night. About midnight I awoke, and sat up in bed, listening. A woman in the cell next mine was moaning in long, sobbing breaths of mortal pain. She ceased for a few minutes, then moaned again, horribly. The truth flashed over me, turning me sick, as I realised that a life was coming into being, there in that frightful prison. A woman, imprisoned by men's laws, was giving a child to the world. A child born in a cell! I shall never forget that night, nor what I suffered with the birth-pangs of that woman, who, I found later, was simply waiting trial on a charge which was found to be baseless.

The days passed very slowly, the nights more slowly still. Being in hospital, I was deprived of chapel, and also of work. Desperate, at last I begged the wardress for some sewing, and she kindly gave me a skirt of her own to hem, and later some coarse knitting to do. Prisoners were allowed a few books, mostly of the "Sunday-school" kind. One day I asked the chaplain if there were not some French or German books in the library, and he brought me a treasure, "_Autour de mon Jardin_," by Jules Janin. For a few days I was quite happy, reading my book and translating it on the absurd little slate they gave us in lieu of paper and pencil. That slate was, after all, a great comfort. I did all kinds of things with it. I kept a calendar, I wrote all the French poetry I could remember on it, I even recorded old school chorals and old English exercises. It helped wonderfully to pass the endless hours until my release. I even forgot the cold, which was the harder to bear because of the fur coat, which I knew was put away, ticketed with my name. I begged them for the coat, but they wouldn't let me have it.

At last the time came when they gave me back all my things, and let me go free. At the door the Governor spoke to me, and asked me if I had any complaints to make. "Not of you," I replied, "nor of any of the wardresses. Only of this prison, and all of men's prisons. We shall raze them to the ground."

Back in my comfortable home, surrounded by loving friends, I would have rested quietly for a few days, but there was a great meeting that night at Albert Hall, to mark the close of a week of self-denial to raise money for the year's campaign. Women had sold papers, flowers, toys, swept crossings, and sung in the streets for the cause. Many women, well known in the world of art and letters, did these things. I felt that I should be doing little if I merely attended the meeting. So I went. My release was not expected until the following morning, and no one thought of my appearing at the meeting. My chairman's seat was decorated with a large placard with the inscription, "Mrs. Pankhurst's Chair." After all the others were seated, the speakers, and hundreds of ex-prisoners. I walked quietly onto the stage, took the placard out of the chair and sat down. A great cry went up from the women as they sprang from their seats and stretched their hands toward me. It was some time before I could see them for my tears, or speak to them for the emotion that shook me like a storm.

The next morning I, with the other released prisoners, drove off to Peckham, a constituency of London, where the W. S. P. U. members were fighting a vigorous by-election. In open brakes we paraded the streets, dressed in our prison clothes, or exact reproductions of them. Naturally, we attracted a great deal of attention and sympathy, and our daily meetings on Peckham Rye, as their common is known, drew enormous crowds. When polling day came our members were stationed at every polling booth, and many men as they came to the booths told us that they were, for the first time, voting "for the women," by which they meant against the Government. That night, amid great excitement, it was made known that the Liberal majority of 2,339 at the last general election had been turned into a Conservative majority of 2,494. Letters poured into the newspapers, declaring that the loss of this important Liberal seat was due almost entirely to the work of the Suffragettes, and many prominent Liberals called upon party leaders to start doing something for women before the next general election. The Liberal leaders, with the usual perspicacity of politicians, responded not at all. Instead they beheld with approval the rise to highest power the arch-enemy of the suffragists, Mr. Asquith.

Mr. Asquith became prime minister about Easter time, 1908, on the resignation, on account of ill health, of Sir Henry Campbell-Bannerman. Mr. Asquith was chosen, not because of any remarkable record of statesmanship, nor yet because of great personal popularity--for he possessed neither--but simply because no better man seemed available just then. He was known as a clever, astute, and somewhat unscrupulous lawyer. He had filled several high offices to the satisfaction of his party, and under Sir Henry Campbell-Bannerman had been Chancellor of the Exchequer, a post which is generally regarded as a stepping-stone to the Premiership. The best thing the Liberal press found to say of the new Premier was that he was a "strong" man. Generally in politics this term is used to describe an obstinate man, and this we already knew Mr. Asquith to be. He was a bluntly outspoken opponent of woman suffrage, and it was sufficiently plain to us that no methods of education or persuasion would ever prove successful where he was concerned. Therefore the necessity of action on our part was greater than ever.

Such an opportunity presented itself at once through changes that took place in the new Cabinet. According to English law, all new comers into the Cabinet are obliged to resign their seats in Parliament and offer themselves to their constituencies for re-election. Besides these vacancies there were several others, on account of death or elevations to the peerage. This made necessary a number of by-elections, and the Women's Social and Political Union once more went into the field against the Liberal candidates. I shall deal no further with these by-elections than is necessary to show the effect of our work on the Government, and its subsequent effect on our movement--which was to force us into more and more militancy. I shall leave it to the honest judgment of my readers to place where it ought rightly to be placed the responsibility for those first broken windows.

We selected as our first candidate for defeat Mr. Winston Churchill, who was about to appeal to his constituency of North West Manchester to sanction his appointment as president of the Board of Trade. My daughter Christabel took charge of this election, and the work of herself and her forces was so successful that Mr. Churchill lost his seat by 420 votes. All the newspapers acknowledged that it was the Suffragettes who had defeated Mr. Churchill, and one Liberal newspaper, the London _Daily News_, called upon the party to put a stop to an intolerable state of affairs by granting the women's demand for votes.

Another seat was immediately secured for Mr. Churchill, that of Dundee, then strongly--in the merely party sense--Liberal, and therefore safe. Nevertheless, we determined to fight Mr. Churchill there, to defeat him if possible, and to bring down the Liberal majority in any case. I took personal charge of the campaign, holding a very large meeting in Kinnaird Hall on the evening before Mr. Churchill's arrival. Although he felt absolutely sure of election in this Scottish constituency, Mr. Churchill dreaded the effect of our presence on the Liberal women. The second meeting he addressed in Dundee was held for women only, and instead of asking

for support of the various measures actually on the government's programme, the politician's usual method, he talked about the certainty of securing, within a short time, the Parliamentary franchise for women. "No one," he declared, "can be blind to the fact that at the next general election woman suffrage will be a real, practical issue; and the next Parliament, I think, ought to see the gratification of the women's claims. I do not exclude the possibility of the suffrage being dealt with in this Parliament." Mr. Churchill earnestly reiterated his claim to be considered a true friend of the women's cause; but when pressed for a pledge that his Government would take action, he urged his inability to speak for his colleagues.

This specious promise, or rather, prophecy of woman suffrage at some indefinite time, won over a great many of the Liberal women, who forthwith went staunchly to work for Mr. Churchill's election. Dundee has a large population of extremely poor people, workers in the jute mills and the marmalade factories. Some concessions in the matter of the sugar tax, timely made, and the announcement that the new Government meant to establish old age pensions, created an immense wave of Liberal enthusiasm that swept Mr. Churchill into office in spite of our work, which was untiring. We held something like two hundred meetings, and on election eve, five huge demonstrations--four of them in the open air and one which filled a large drill hall. Polling day, May 9th, was very exciting. For every Suffragette at the polling-booths there were half a dozen Liberal men and women, handing out bills with such legends as "Vote for Churchill, and never mind the women," and "Put Churchill in and keep the women out." Yet for all their efforts, Mr. Churchill polled 2200 votes less than his Liberal predecessor had polled at the general election.

In the first seven by-elections following Mr. Asquith's elevation to the premiership, we succeeded in pulling down the Liberal vote by 6663. Then something happened to check our progress. Mr. Asquith received a deputation of Liberal members of Parliament, who urged him to allow the Stanger suffrage bill, which had passed its second reading by a large majority, to be carried into law. Mr. Asquith replied that he himself did not wish to see women enfranchised, and that it would not be possible for the Government to give the required facilities to Mr. Stanger's bill. He added that he was fully alive to the many defects of the electoral system, and that the Government intended, "barring accidents," to bring in a reform bill before the close of that Parliament. Woman suffrage would have no place in it, but it would be so worded that a woman-suffrage amendment might be added if any member chose to move one. In that case, said Mr. Asquith, he should not consider it the duty of the Government to oppose the amendment if it were approved by a majority of the House of Commons--_provided_ that the amendment was on democratic lines, and that it had back of it the support, the strong and undoubted support, of the women of the country as well as the present electorate.

One would not suppose that such an evasive utterance as this would be regarded in any quarter as a promise that woman suffrage would be given any real chances of success under the Asquith Government. That it was, by many, taken quite seriously is but another proof of the gullibility of the party-blinded public. The Liberal press lauded Mr. Asquith's "promise," and called for a truce of militancy in order that the Government might have every opportunity to act. Said the _Star_, in a leader typical of many others: "The meaning of Mr. Asquith's pledge is plain. Woman's suffrage will be passed through the House of Commons before the present Government goes to the country."

As for the women's Liberal Associations, they were quite delirious with joy. In a conference called for the purpose of passing resolutions of gratitude, Lady Carlisle said: "This is a glorious day of rejoicing. Our great Prime Minister, all honour to him, has opened a way to us by which we can enter into that inheritance from which we have been too long debarred."

At the two following by-elections, the last of the series, enormous posters were exhibited, "Premier's Great Reform Bill: Votes for Women." We tried to tell the electors that the pledge was false on the face of it; that the specious proviso that the amendment be "democratic" left no doubt that the Government would cause the rejection of any practical amendment that might be moved. Our words fell on deaf ears, and the Liberal majorities soared.

Just a week later Mr. Asquith was questioned in the House of Commons by a slightly alarmed anti-suffragist member. The member asked Mr. Asquith whether he considered himself pledged to introduce the reform hill during that Parliament, whether he meant to allow such a bill to carry a woman-suffrage amendment, if such were moved, and whether, in that case, the suffrage amendment would become part of the Government policy. Evasive as ever, the Prime Minister, after some sparring, replied, "My honourable friend has asked me a question with regard to a remote and speculative future." Thus was our interpretation of Mr. Asquith's "promise" justified from his own lips. Yet the Liberal women still clung to the hope of Government action, and the Liberal press pretended to cling to it. As for the Women's Social and Political Union, we prepared for more work. We had to strike out along a new line, since it was evident that the Government could, for a time at least, neutralise our by-election work by more false promises. Consistent with our policy, of never going further than the Government compelled us to go, we made our first action a perfectly peaceable one.

On the day when the Stanger bill had reached its second reading in the House, and several days after I had gone to Holloway for the first time, Mr. Herbert Gladstone, the Home Secretary, made a speech which greatly interested the Suffragettes. He professed himself a suffragist, and declared that he intended to vote for the bill. Nevertheless, he was confident that it could not pass, because of the division in the Cabinet, and because it had no political party united either for or against it. Woman suffrage, said Mr. Gladstone, must advance to victory through all the stages that are required for great reforms to mature. First academic discussion, then effective action, was the history of men's suffrage; it must be the same with women's suffrage. "Men," declared Mr. Gladstone, "have learned this lesson and know the necessity for demonstrating the greatness of their movement, and for establishing that _force majeure_ which actuates and arms a Government for effective work. That is the task before the supporters of this great movement. Looking back at the great political crises in the thirties, the sixties and the eighties, it will be found that the people did not go about in small crowds, nor were they content with enthusiastic meetings in large halls; they assembled in their tens of thousands all over the country.

"Of course," added Mr. Gladstone, "it is not to be expected that women can assemble in such masses, but power belongs to masses, and through this power a Government can be influenced into more effective action than a Government will be likely to take under present conditions."

The Women's Social and Political Union determined to answer this challenge. If assembling in great masses was all that was necessary to convince the Government that woman suffrage had passed the academic stage and now demanded political action, we thought we could undertake to satisfy the most skeptical member of the Cabinet. We knew that we could organise a demonstration that would out-rival any of the great franchise demonstrations held by men in the thirties, sixties, and eighties. The largest number of people ever gathered in Hyde Park was said to have approximated 72,000. We determined to organise a Hyde Park demonstration of at least 250,000 people. Sunday, June 21, 1908, was fixed for the date of this demonstration, and for many months we worked to make it a day notable in the history of the movement. Our example was emulated by the non-militant suffragists, who organised a fine procession of their own, about a week before our demonstration. Thirteen thousand women, it was said, marched in that procession.

On our demonstration we spent, for advertising alone, over a thousand pounds, or five thousand dollars. We covered the hoardings of London and of all the principal provincial cities with great posters bearing portraits of the women who were to preside at the twenty platforms from which speeches were to be made; a map of London, showing the routes by which the seven processions were to advance, and a plan of the Hyde Park meeting-place were also shown. London, of course, was thoroughly organised. For weeks a small army of women was busy chalking announcements on sidewalks, distributing handbills, canvassing from house to house, advertising the demonstration by posters and sandwich boards carried through the streets. We invited everybody to be present, including both Houses of Parliament. A few days before the demonstration Mrs. Drummond and a number of other women hired and decorated a launch and sailed up the Thames to the Houses of Parliament, arriving at the hour when members entertain their women friends at tea on the terrace. Everyone left the tables and crowded to the water's edge as the boat stopped, and Mrs. Drummond's strong, clear voice pealed out her invitation to the Cabinet and the members of Parliament to join the women's demonstration in Hyde Park. "Come to the park on Sunday," she cried. "You shall have police protection, and there will be no arrests, we promise you." An alarmed someone telephoned for the police boats, but as they appeared, the women's boat steamed away.

What a day was Sunday, June 21st--clear, radiant, filled with golden sunshine! As I advanced, leading, with the venerable Mrs. Wolstenholm-Elmy, the first of the seven processions, it seemed to me that all London had turned out to witness our demonstration. And a goodly part of London followed the processions. When I mounted my platform in Hyde Park, and surveyed the mighty throngs that waited there and the endless crowds that were still pouring into the park from all directions, I was filled with amazement not unmixed with awe. Never had I imagined that so many people could be gathered together to share in a political demonstration. It was a gay and beautiful as well as an awe-inspiring spectacle, for the white gowns and flower-trimmed hats of the women, against the background of ancient trees, gave the park the appearance of a vast garden in full bloom.

The bugles sounded, and the speakers at each of the twenty platforms began their addresses, which could not have been heard by more than half or a third of the vast audience. Notwithstanding this, they remained to the end. At five o'clock the bugles sounded again, the speaking ceased, and the resolution calling upon the Government to bring in an official woman-suffrage bill without delay was carried at every platform, often without a dissenting vote. Then, with a three-times-repeated cry of "Votes for Women!" from the assembled multitude, the great meeting dispersed.

The London _Times_ said next day: "Its organisers had counted on an audience of 250,000. That expectation was certainly fulfilled, and probably it was doubled, and it would be difficult to contradict any one who asserted that it was trebled. Like the distances and the number of the stars, the facts were beyond the threshold of perception."

The _Daily Express_ said: "It is probable that so many people never before stood in one square mass anywhere in England. Men who saw the great Gladstone meeting years ago said that compared with yesterday's multitude it was as nothing."

We felt that we had answered the challenge in Mr. Gladstone's declaration that "power belongs to the masses," and that through this power the Government could be influenced; so it was with real hope that we despatched a copy of the resolution to the Prime Minister, asking him what answer the Government would make to that unparalleled gathering of men and women. Mr. Asquith replied formally that he had nothing to add to his previous statement--that the Government intended, at some indefinite time, to bring in a general reform bill which _might_ be amended to include woman suffrage. Our wonderful demonstration, it appeared, had made no impression whatever upon him.

CHAPTER III

Now we had reached a point where we had to choose between two alternatives. We had exhausted argument. Therefore either we had to give up our agitation altogether, as the suffragists of the eighties virtually had done, or else we must act, and go on acting, until the selfishness and the obstinacy of the Government was broken down, or the Government themselves destroyed. Until forced to do so, the Government, we perceived, would never give women the vote.

We realised the truth of John Bright's words, spoken while the reform bill of 1867 was being agitated. Parliament, John Bright then declared, had never been hearty for any reform. The Reform Act of 1832 had been wrested by force from the Government of that day, and now before another, he said, could be carried, the agitators would have to fill the streets with people from Charing Cross to Westminster Abbey. Acting on John Bright's advice, we issued a call to the public to join us in holding a huge demonstration, on June 30th outside the House of Commons. We wanted to be sure that the Government saw as well as read of our immense following. A public proclamation from the Commissioner of Police, warning the public not to assemble in Parliament Square and declaring that the approaches to the Houses of Parliament must be kept open, was at once issued.

We persisted in announcing that the demonstration would take place, and I wrote a letter to Mr. Asquith telling him that a deputation would wait upon him at half-past four on the afternoon of June 30th. We held the usual Women's Parliament in Caxton Hall, after which Mrs. Pethick Lawrence, eleven other women, and myself, set forth. We met with no opposition from the police, but marched through cheering crowds of spectators to the Strangers' Entrance to the House of Commons. Here we were met by a large group of uniformed men commanded by Inspector Scantlebury, of the police. The inspector, whom I knew personally, stepped forward and demanded officially, "Are you Mrs. Pankhurst, and is this your deputation?"

"Yes," I replied.

"My orders are to exclude you from the House of Commons."

"Has Mr. Asquith received my letter?" I asked.

For answer the inspector drew my letter from his pocket and handed it to me.

"Did Mr. Asquith return no message, no kind of reply?" I inquired.

"No," replied the inspector.

We turned and walked back to Caxton Hall, to tell the waiting audience what had occurred. We resolved that there was nothing to do but wait patiently until evening, and see how well the public would respond to our call to meet in Parliament Square. Already we knew that the streets were filled with people, and early as it was the crowds were increasing rapidly. At eight we went out in groups from Caxton Hall, to find Parliament Square packed with a throng, estimated next day at least 100,000. From the steps of public buildings, from stone copings, from the iron railings of the Palace Yard, to which they clung precariously, our women made speeches until the police pulled them down and flung them into the moving, swaying, excited crowds. Some of the women were arrested, others were merely ordered to move on. Mingled cheers and jeers rose from the spectators. Some of the men were roughs who had come out to amuse themselves. Others were genuinely sympathetic, and tried valiantly to help us to reach the House of Commons. Again and again the police lines were broken, and it was only as the result of repeated charges by mounted

police that the people's attacks were repelled. Many members of Parliament, including Mr. Lloyd-George, Mr. Winston Churchill, and Mr. Herbert Gladstone, came out to witness the struggle, which lasted until midnight and resulted in the arrest of twenty-nine women. Two of these women were arrested after they had each thrown a stone through a window of Mr. Asquith's official residence in Downing Street, the value of the windows being about $2.40.

This was the first window-breaking in our history. Mrs. Mary Leigh and Miss Edith New, who had thrown the stones, sent word to me from the police court that, having acted without orders, they would not resent repudiation from headquarters. Far from repudiating them, I went at once to see them in their cells, and assured them of my approval of their act. The smashing of windows is a time-honoured method of showing displeasure in a political situation. As one of the newspapers, commenting on the affair, truly said, "When the King and Queen dine at Apsley on the 13th inst. they will be entertained in rooms the windows of which the Duke of Wellington was obliged to protect with iron shutters from the fury of his political opponents."

In Winchester a few years ago, to give but one instance, a great riot took place as a protest against the removal of a historic gun from one part of the town to another. In the course of this riot windows were broken and other property of various kinds was destroyed, very serious damage being done. No punishment was administered in respect of this riot and the authorities, bowing to public opinion thus riotously expressed, restored the gun to its original situation.

Window-breaking, when Englishmen do it, is regarded as honest expression of political opinion. Window-breaking, when Englishwomen do it, is treated as a crime. In sentencing Mrs. Leigh and Miss New to two months in the first division, the magistrate used very severe language, and declared that such a thing must never happen again. Of course the women assured him that it would happen again. Said Mrs. Leigh: "We have no other course but to rebel against oppression, and if necessary to resort to stronger measures. This fight is going on."

The summer of 1908 is remembered as one of the most oppressively hot seasons the country had known for years. Our prisoners in Holloway suffered intensely, some being made desperately ill from the heat, the bad air, and the miserable food. We who spent the summer campaigning suffered also, but in less degree. It was a tremendous relief when the cool days of autumn set in, and it was with renewed vigour that we prepared for the opening day of Parliament, which was October 12th. Again we resolved to send a deputation to the Prime Minister, and again we invited the general public to take part in the demonstration. We had printed thousands of little handbills bearing this inscription: "Men and Women, Help the Suffragettes to Rush the House of Commons, on Tuesday Evening, October 13th, at 7:30."

On Sunday, October 11th, we held a large meeting in Trafalgar Square, my daughter Christabel, Mrs. Drummond and I speaking from the plinth of the Nelson monument. Mr. Lloyd-George, as we afterward learned, was a member of the audience. The police were there, taking ample notes of our speeches. We had not failed to notice that they were watching us daily, dogging our footsteps, and showing in numerous ways that they were under orders to keep track of all our movements. The climax came at noon on October 12th, when Christabel, Mrs. Drummond and I were each served with an imposing legal document which read, "Information has been laid this day by the Commissioner of Police that you, in the month of October, in the year 1908, were guilty of conduct likely to provoke a breach of the peace by initiating and causing to be initiated, by publishing and causing to be published, a certain handbill, calling upon and inciting the public to do a certain wrongful and illegal act, viz., to rush the House of Commons at 7:30 P.M. on October 13th inst."

[Illustration: MRS. PANKHURST AND CHRISTABEL HIDING FROM THE POLICE ON THE ROOF GARDEN AT CLEMENTS INN

October, 1908]

The last paragraph was a summons to appear at Bow Street police station that same afternoon at three o'clock. We did not go to Bow Street police station. We went instead to a crowded "At Home" at Queen's Hall, where it can be imagined that our news created great excitement. The place was surrounded by constables, and the police reporters were on hand to take stenographic reports of everything that was said from the platform. Once an excited cry was raised that a police inspector was coming in to arrest us. But the officer merely brought a message that the summons had been adjourned until the following morning.

It did not suit our convenience to obey the adjourned summons quite so early, so I wrote a polite note to the police, saying that we would be in our headquarters, No. 4 Clements Inn, the next evening at six o'clock, and would then be at his disposal. Warrants for our arrests were quickly issued, and Inspector Jarvis was instructed to execute them at once. This he found impossible to do, for Mrs. Drummond was spending her last day of liberty on private business, while my daughter and I had retreated to another part of

Clements Inn, which is a big, rambling building. There, in the roof-garden of the Pethick Lawrence's private flat, we remained all day, busy, under the soft blue of the autumn sky, with our work and our preparations for a long absence. At six we walked downstairs, dressed for the street. Mrs. Drummond arrived promptly, the waiting officers read the warrants, and we all proceeded to Bow Street in cabs. It was too late for the trial to be held. We asked for bail, but the authorities had no mind to allow us to take part in the "rush" which we had incited, so we were obliged to spend the night in the police station. All night I lay awake, thinking of the scenes which were going on in the streets.

The next morning, in a courtroom crowded to its utmost capacity, my daughter rose to conduct her first case at law. She had earned the right to an LL.B. after her name, but as women are not permitted to practise law in England, she had never appeared at the bar in any capacity except that of defendant. Now she proposed to combine the two roles of defendant and lawyer, and conduct the case for the three of us. She began by asking the magistrate not to try the case in that court, but to send it for trial before a judge and jury. We had long desired to take the Suffragettes' cases before bodies of private citizens, because we had every reason to suspect that the police-court officials acted under the direct commands of the very persons against whom our agitation was directed. Jury trial was denied us; but after the preliminary examination was over the magistrate, Mr. Curtis Bennett, allowed a week's adjournment for preparation of the case.

On October 21st the trial was resumed, with the courtroom as full as before and the press table even more crowded, for it had been widely published that we had actually subpoenaed two members of the Government, who had witnessed the scenes on the night of October 13th. The first witness to enter the box was Mr. Lloyd-George. Christabel examined him at some length as to the meaning and merits of the word rush, and succeeded in making him very uncomfortable--and the charge against ourselves look very flimsy. She then questioned him about the speeches he had heard at Trafalgar Square, and as to whether there had been any suggestion that property be destroyed or personal violence used. He admitted that the speeches were temperate and the crowds orderly. Then Christabel suddenly asked, "There were no words used so likely to incite to violence as the advice you gave at Swansea, that the women should be ruthlessly flung out of your meeting?" Mr. Lloyd-George looked black, and answered nothing. The magistrate hastened to the protection of Mr. Lloyd-George. "This is quite irrelevant," he said. "That was a private meeting." It was a public meeting, and Christabel said so. "It was a private meeting _in a sense_," insisted the magistrate.

Mr. Lloyd-George assumed an air of pompous indignation when Christabel asked him, "Have we not received encouragement from you, and if not from you from your colleagues, to take action of this kind?" Mr. Lloyd-George rolled his eyes upward as he replied, "I should be very much surprised to hear that, Miss Pankhurst."

"Is it not a fact," asked Christabel, "that you yourself have set us an example of revolt?" "I never incited a crowd to violence," exclaimed the witness. "Not in the Welsh graveyard case?" she asked. "No!" he cried angrily. "You did not tell them to break down a wall and disinter a body?" pursued Christabel. He could not deny this but, "I gave advice which was found by the Court of Appeal to be sound legal advice," he snapped, and turned his back as far as he could in the narrow witness-box.

Mr. Herbert Gladstone had asked to be allowed to testify early, as he was being detained from important public duties. Christabel asked to question one witness before Mr. Gladstone entered the box. The witness was Miss Georgiana Brackenbury, who had recently suffered six weeks' imprisonment for the cause, and had since met and had a talk with Mr. Horace Smith, the magistrate, who had made to her a most important and damaging admission of the government's interference in suffragists' trials. Christabel asked her one question. "Did Mr. Horace Smith tell you in sentencing you that he was doing what he had been told to do?" "You must not put that question!" exclaimed the magistrate. But the witness had already answered "Yes." There was an excited stir in the courtroom. It had been recorded under oath that a magistrate had admitted that Suffragettes were being sentenced not by himself, according to the evidence and according to law, but by the Government, for no one could possibly doubt where Mr. Horace Smith's orders came from.

Mr. Gladstone, plump, bald, and ruddy, in no way resembles his illustrious father. He entered the witness-box smiling and confident, but his complacence vanished when Christabel asked him outright if the Government had not ordered the Commissioner of Police to take this action against us. Of course the magistrate intervened, and Mr. Gladstone did not answer the question. Christabel tried again. "Did you instruct Mr. Horace Smith to decide against Miss Brackenbury, and to send her to prison for six weeks?" That too was objected to, as were all questions on the subject.

All through the examination the magistrate constantly intervened to save the Cabinet Minister from embarrassment, but Christabel finally succeeded in making Mr. Gladstone admit, point by point, that he had said that women could never get the vote because

they could not fight for it as men had fought.

A large number of witnesses testified to the orderly nature of the demonstration on the 13th, and then Christabel rose to plead. She began by declaring that these proceedings had been taken, as the legal saying is, "in malice and vexation," in order to lame a political enemy. She declared that, under the law, the charge which might properly be brought against us was that of illegal assembly, but the Government had not charged us with this offence, because the Government desired to keep the case in a police court.

"The authorities dare not see this case come before a jury," she declared, "because they know perfectly well that if it were heard before a jury of our countrymen we should be acquitted, just as John Burns was acquitted years ago for taking action far more dangerous to the public peace than we have taken. We are deprived of trial by jury. We are also deprived of the right to appeal against the magistrate's decision. Very carefully has this procedure been thought out."

Of the handbill she said: "We do not deny that we issued this bill; none of us three has wished to deny responsibility. We did issue the bill; we did cause it to be circulated; we did put upon it the words 'Come and help the suffragettes rush the House of Commons.' For these words we do not apologise. It is very well known that we took this action in order to press forward a claim, which, according to the British constitution, we are well entitled to make."

In all that the Suffragettes had done, in all that they might ever do, declared my daughter, they would only be following in the footsteps of men now in Parliament. "Mr. Herbert Gladstone has told us in the speech I read to him that the victory of argument alone is not enough. As we cannot hope to win by force of argument alone, it is necessary to overcome by other means the savage resistance of the Government to our claim for citizenship. He says, 'Go on, fight as the men did.' And then, when we show our power and get the people to help us, he takes proceedings against us in a manner that would have been disgraceful even in the old days of coercion. Then there is Mr. Lloyd-George, who, if any man has done so, has set us an example. His whole career has been a series of revolts. He has said that if we do not get the vote--mark these words--we should be justified in adopting the methods the men had to adopt, namely, pulling down the Hyde Park railings." She quoted Lord Morley as saying of the Indian unrest: "'We are in India in the presence of a living movement, and a movement for what? For objects which we ourselves have taught them to think are desirable objects; and unless we can somehow reconcile order with satisfaction of those ideals and aspirations, the fault will not be theirs, it will be ours--it will mark the breakdown of British statesmanship.'--Apply those words to our case," she continued.

[Illustration: CHRISTABEL, MRS. DRUMMOND AND MRS. PANKHURST IN THE DOCK, FIRST CONSPIRACY TRIAL

October, 1908]

"Remember that we are demanding of Liberal statesmen that which is for us the greatest boon and the most essential right--and if the present Government cannot reconcile order with our demand for the vote without delay, it will mark the breakdown of their statesmanship. Yes, their statesmanship has broken down already. They are disgraced. It is only in this court that they have the smallest hope of being supported."

My daughter had spoken with passion and fervour, and her righteous indignation had moved her to words that caused the magistrate's face to turn an angry crimson. When I rose to address the Court I began by assuming an appearance of calmness which I did not altogether feel. I endorsed all that Christabel had said of the unfairness of our trial and the malice of the Government; I protested against the trial of political offenders in a common police court, and I said that we were not women who would come into the court as ordinary law-breakers. I described Mrs. Drummond's worthy career as a wife, a mother, and a self-sustaining business woman. I said, "Before you decide what is to be done with us, I should like you to hear from me a statement of what has brought me into the dock this morning." And then I told of my life and experiences, many of which I have related in these pages of what I had seen and known as a Poor Law Guardian and a registrar of births and deaths; of how I had learned the burning necessity of changing the status of women, of altering the laws under which they and their children live, and of the essential justice of making women self-governing citizens.

"I have seen," I said, "that men are encouraged by law to take advantage of the helplessness of women. Many women have thought as I have, and for many, many years have tried, by that influence of which we have been so often reminded, to alter these laws, but we find that influence counts for nothing. When we went to the House of Commons we used to be told, when we were persistent, that members of Parliament were not responsible to women, they were responsible only to voters, and that their time was too fully occupied to reform those laws, although they agreed that they needed reforming.

"We women have presented larger petitions in support of our enfranchisement than were ever presented for any other reform; we have succeeded in holding greater public meetings than men have ever held for any reform, in spite of the difficulty which women have in throwing off their natural diffidence, that desire to escape publicity which we have inherited from generations of our foremothers. We have broken through that. We have faced hostile mobs at street corners, because we were told that we could not have that representation for our taxes that men have won unless we converted the whole of the country to our side. Because we have done this, we have been misrepresented, we have been ridiculed, we have had contempt poured upon us, and the ignorant mob have been incited to offer us violence, which we have faced unarmed and unprotected by the safeguards which Cabinet Ministers enjoy. We have been driven to do this; we are determined to go on with this agitation because we feel in honour bound. Just as it was the duty of your forefathers, it is our duty to make the world a better place for women than it is to-day.

"Lastly, I want to call attention to the self-restraint which was shown by our followers on the night of the 13th, after we had been arrested. Our rule has always been to be patient, exercise self-restraint, show our so-called superiors that we are not hysterical; to use no violence, but rather to offer ourselves to the violence of others.

"That is all I have to say to you, sir. We are here, not because we are law-breakers; we are here in our efforts to become law-makers."

The burly policemen, the reporters, and most of the spectators were in tears as I finished. But the magistrate, who had listened part of the time with his hand concealing his face, still held that we were properly charged in a common police court as inciters to riot. Since we refused to be bound over to keep the peace, he sentenced Mrs. Drummond and myself to three months' imprisonment, and Christabel to ten weeks' imprisonment. It was destined to be a kind of imprisonment the authorities had never yet been called upon to deal with.

CHAPTER IV

My first act on reaching Holloway was to demand that the Governor be sent for. When he came I told him that the Suffragettes had resolved that they would no longer submit to being treated as ordinary law-breakers. In the course of our trial two Cabinet Ministers had admitted that we were political offenders, and therefore we should henceforth refuse to be searched or to undress in the presence of the wardresses. For myself I claimed the right, and I hoped the others would do likewise, to speak to my friends during exercise, or whenever I came in contact with them. The Governor, after reflection, yielded to the first two demands, but said that he would have to consult the Home Office before permitting us to break the rule of silence. We were accordingly allowed to change our clothing privately, and, as a further concession, were placed in adjoining cells. This was little advantage to me, however, since within a few days I was removed to a hospital cell, suffering from the illness which prison life always inflicts on me. Here the Governor visited me with the unwelcome news that the Home Secretary had refused to allow me the privilege of speech with my fellow prisoners. I asked him if I might, when I was strong enough to walk, take exercise with my friends. To this he assented, and I soon had the joy of seeing my daughter and the other brave comrades, and walking with them in the dismal courtyard of the prison. Single file we walked, at a distance of three or four feet from one another, back and forth under the stony eyes of the wardresses. The rough flags of the pavement hurt our feet, shod in heavy, shapeless prison boots. The autumn days were cold and cheerless, and we shivered violently under our scanty cloaks. But of all our hardships the ceaseless silence of our lives was worst.

At the end of the second week I decided I would no longer endure it. That afternoon at exercise I suddenly called my daughter by name and bade her stand still until I came up to her. Of course she stopped, and when I reached her side we linked arms and began to talk in low tones. A wardress ran up to us, saying: "I shall listen to everything you say." I replied: "You are welcome to do that, but I shall insist on my right to speak to my daughter." Another wardress had hastily left the yard, and now she returned with a large number of wardresses. They seized me and quickly removed me to my cell, while the other suffrage prisoners cheered my action at the top of their voices. For their "mutiny" they got three days' solitary confinement, and I, for mine, a much more severe punishment. Unrepentant, I told the Governor that, in spite of any punishment he might impose on me, I would never again submit to the silence rule. To forbid a mother to speak to her daughter was infamous. For this I was characterised as a "dangerous criminal" and was sent into solitary confinement, without exercise or chapel, while a wardress was stationed constantly at my cell door to see that I communicated with no one.

[Illustration: MRS. PANKHURST AND MISS CHRISTABEL PANKHURST IN PRISON DRESS]

It was two weeks before I saw any of my friends again, and meantime the health of Mrs. Drummond had been so seriously impaired that she was released for hospital treatment. My daughter also, I learned, was ill, and in desperation I made application to the Board of Visiting Magistrates to be allowed to see her. After a long conference, during which I was made to wait outside in the corridor, the magistrates returned a refusal, saying that I might renew my application in a month. The answer then, they said, would depend on my conduct. A month! My girl might be dead by that time. My anxiety sent me to bed ill again, but, although I did not know it, relief was already on its way. I had told the visiting magistrates that I would wait until public opinion got within those walls, and this happened sooner than I had dared to hope. Mrs. Drummond, as soon as she was able to appear in public, and the other suffrage prisoners, as they were released, spread broadcast the story of our mutiny, and of a subsequent one led by Miss Wallace Dunlop, which sent a large number of women into solitary confinement. The Suffragettes marched by thousands to Holloway, thronging the approaches to the prison street. Round and round the prison they marched, singing the Women's Marseillaise and cheering. Faintly the sound came to our ears, infinitely lightening our burden of pain and loneliness. The following week they came again, so we afterwards learned, but this time the police turned them back long before they reached the confines of the prison.

The demonstrations, together with a volley of questions asked in the House of Commons, told at last. Orders came from the Home Office that I was to see my daughter, and that we were to be allowed to exercise and to talk together for one hour each day. In addition, we were to be permitted the rare privilege of reading a daily newspaper. Then, on December 8th, the day of Christabel's release, orders came that I, too, should be discharged, two weeks before the expiration of my sentence.

At the welcome breakfast given us, as released prisoners, at Lincoln's Inn Hotel, I told our members that henceforth we should all insist on refusing to abide by ordinary prison rules. We did not propose to break laws and then shirk punishment. We simply meant to assert our right to be recognised as political prisoners. We reached this point after due reflection. We first set ourselves not to complain of prison, not to say anything about it, to avoid it, to keep away from all side issues, to keep along the straight path of political reform, to get the vote; because we knew that when we had won it we could reform prisons and a great many other abuses as well. But now that we had had in the witness box the admission of Cabinet Ministers that we are political offenders, we should in future demand the treatment given to men political offenders in all civilised countries. "If nations," I said, "are still so governed that they make political offenders, then Great Britain is going to treat her political offenders as well as political offenders are treated by other nations. If it were the custom to treat political offenders as ordinary offenders against the well-being of society are treated, we should not have complained if we were treated like that; but it is not the international custom to do it, and so, for the dignity of the women of the country, and for the sake of the consciences of the men of the country, and for the sake of our nation amongst the nations of the earth, we are not going to allow the Liberal government to treat us like ordinary law-breakers in future."

I said the same thing that night in a great meeting held in Queen's Hall to welcome the released prisoners, and, although we all knew that our determination involved a bitter struggle, our women endorsed it without a moment's hesitation. Had they been able to look forward to the events which were even then overshadowing us, could they have foreseen the new forms of suffering and danger that lay in waiting, I am certain that they would still have done the same thing, for our experiences had taught us to dispense with fear. Whatever of timidity, of shrinking from pain or hardship any of us had originally possessed, it had all vanished. There were no terrors that we were not now ready to face.

The year 1909 marks an important point in our struggle, partly because of this decision of ours, never again to submit to be classed with criminals; and partly because in this year we forced the Liberal Government to go on record, publicly, in regard to the oldest of popular rights, the right of petition. We had long contemplated this step, and now the time seemed ripe for taking it.

In the closing days of 1908 Mr. Asquith, speaking on the policy to be carried out in 1909, commented on the various deputations he was obliged at that time to receive. They called on him, he said, "from all quarters and in all causes, on an average of something like two hours on three days in every week." The deputations all asked for different things, and, although all of the things could not possibly be included in the King's speech, Mr. Asquith was inclined to agree that many of them ought to be included. This declaration from the Prime Minister that he was constantly receiving deputations of men, and listening favourably to their suggestions of what policies to pursue, aroused in the Suffragettes feelings of deep indignation. This in part they expressed on January 25th, when the first meeting of the Cabinet Council took place. A small deputation from the W. S. P. U. proceeded to Downing Street to claim the right to be heard, as men were heard. For knocking at the door of the official residence four of the women, including my sister, Mrs. Clark, were arrested and sent to prison for one month.

A month later the seventh of our Women's Parliaments was called against this and against the fact that no mention of women had been included in the King's speech. Led by Mrs. Pethick Lawrence, Lady Constance Lytton and Miss Daisy Solomon, a deputation

of women endeavoured to carry the resolution to the House of Commons. They were promptly arrested and, next day, were sent to prison on sentences of from one to two months. The time was rapidly approaching when the legality of these arrests would have to be tested. In June of the year 1909 the test was made.

It will be remembered that we had endeavoured to force the authorities to make good their threat to charge us under the obsolete Charles II "Tumultuous Petitions Act," which prescribes severe penalties for persons proceeding to Parliament in groups of more than twelve for the purpose of presenting petitions. It had been stated that if we were charged under that act our case would be given a hearing before a judge and jury instead of a police magistrate. Since this was exactly what we desired to have happen we had sent deputation after deputation of more than twelve persons, but always they were tried in police courts, and were sent to prison often for periods as long as that prescribed in the Charles II Act. Now we determined to do something still more ambitious; we resolved to test, not the Charles II Act, but the constitutional right of the subject to petition the Prime Minister as the seat of power.

The right of petition, which has existed in England since the earliest known period, was written into the Bill of Rights which became law in 1689 on the accession of William and Mary. It was, in fact, one of the conditions attaching to the accession of the joint monarchs. According to the Bill of Rights, "It is the right of subjects to petition the King and all commitments, and prosecutions for such petitionings are illegal." The power of the King having passed almost completely into the hands of Parliament, the Prime Minister now stands where the King's majesty stood in former times. Clearly, then, the right of the subject to petition the Prime Minister cannot be legally denied. Thus were we advised, and in order to keep within the strict letter of the law, we accepted the limitations of the right of petition laid down in the Charles II Act, and decided that our petition should be carried to the House of Commons by small groups of women.

Again I called together, on the evening of June 29th, a Parliament of women. Previously I had written to Mr. Asquith stating that a deputation of women would wait on him at the House of Commons at eight o'clock in the evening. I wrote him further that we were not to be refused, as we insisted upon our constitutional right to be received. To my note the Prime Minister returned a formal note declining to receive us. Nevertheless we continued our preparations, because we knew that the Prime Minister would continue to decline, but that in the end he would be forced to receive us.

An incident which occurred a week before the date of the deputation was destined to have important consequences. Miss Wallace Dunlop went to St. Stephen's Hall in the House of Commons, and marked with printer's ink on the stone work of the Hall an extract from the Bill of Rights. The first time she made the attempt she was interrupted by a policeman, but two days later she succeeded in stamping on the ancient walls the reminder to Parliament that women as well as men possess constitutional rights, and that they were proposing to exercise those rights. She was arrested and sentenced to prison for one month, in the third division. The option of a heavy fine was given her, which of course she refused. Miss Wallace Dunlop's prison term began on June 22d. Perhaps her deed had something to do with the unusual interest taken in the approaching deputation, an interest which was shown not only by the public but by many members of Parliament. In the House of Commons a strong feeling that the women ought this time to be received manifested itself in many questions put to the Government. One member even asked leave to move the adjournment of the House on a matter of urgent public importance, namely the danger to the public peace, owing to the refusal of the Prime Minister to receive the deputation. This was denied, however, and the Government mendaciously disclaimed all responsibility for what action the police might take toward the deputation. The Home Secretary, Mr. Gladstone, when asked by Mr. Kier Hardie to give instructions that the deputation, if orderly, should be admitted to St. Stephen's, replied: "I cannot say what action the police ought to take in the matter." Our Women's Parliament met at half past seven on the evening of June 29th, and the petition to the Prime Minister was read and adopted. Then our deputation set forth. Accompanying me as leader were two highly respectable women of advanced years, Mrs. Saul Solomon, whose husband had been Prime Minister at the Cape, and Miss Neligan, one of the foremost of the pioneer educators of England. We three and five other women were preceded by Miss Elsie Howey, who, riding fast, went on horse-back to announce our coming to the enormous crowds that filled the streets. She, we afterward learned, progressed as far as the approaches to the House of Commons before being turned back by the police. As for the deputation, it pressed on through the crowd as far as St. Margaret's Church, Westminster, where we found a long line of police blocking the road. We paused for a moment, gathering strength for the ordeal of trying to push through the lines, when an unexpected thing happened. An order was given from some one, and instantly the police lines parted, leaving a clear space through which we walked towards the House. We were escorted on our way by Inspector Wells, and as we passed the crowd broke into vociferous cheering, firmly believing that we were after all to be received. As for myself I did little speculating as to what was about to happen. I simply led my deputation on as far as the entrance to St. Stephen's Hall. There we encountered another strong force of police commanded

by our old acquaintance, Inspector Scantlebury, who stepped forward and handed me a letter. I opened it and read in aloud to the women. "The Prime Minister, for the reasons which he has already given in a written reply to their request, regrets that he is unable to receive the proposed deputation."

I dropped the note to the ground and said: "I stand upon my rights, as a subject of the King, to petition the Prime Minister, and I am firmly resolved to stand here until I am received."

[Illustration: INSPECTOR WELLS CONDUCTING MRS. PANKHURST TO THE HOUSE OF COMMONS

June, 1908]

Inspector Scantlebury turned away and walked rapidly towards the door of the Strangers' Entrance. I turned to Inspector Jarvis, who remained, to several members of Parliament and some newspaper men who stood looking on, and begged them to take my message to the Prime Minister, but no one responded, and the Inspector, seizing my arm, began to push me away. I now knew that the deputation would not be received and that the old miserable business of refusing to leave, of being forced backward, and returning again and again until arrested, would have to be re-enacted. I had to take into account that I was accompanied by two fragile old ladies, who, brave as they were to be there at all, could not possibly endure what I knew must follow. I quickly decided that I should have to force an immediate arrest, so I committed an act of technical assault on the person of Inspector Jarvis, striking him very lightly on the cheek. He said instantly, "I understand why you did that," and I supposed then that we would instantly be taken. But the other police apparently did not grasp the situation, for they began pushing and jostling our women. I said to the inspector: "Shall I have to do it again?" and he said "Yes." So I struck him lightly a second time, and then he ordered the police to make the arrests.

The matter did not end with the arrest of our deputation of eight women. In recurring deputations of twelve the Suffragettes again and again pressed forward in vain endeavour to reach the House of Commons. In spite of the fact that the crowds were friendly and did everything they could to aid the women, their deputations were broken up by the police and many of the women arrested. By nine o'clock Parliament Square was empty, an enormous force of mounted police having beaten the people back into Victoria Street and across Westminster Bridge. For a short time all looked tranquil, but soon little groups of women, seven or eight at a time, kept appearing mysteriously and making spirited dashes toward the House. This extraordinary procedure greatly exasperated the police, who could not unravel the mystery of where the women came from. As a matter of bygone history the explanation is that the W. S. P. U. had hired thirty offices in the neighborhood, in the shelter of which the women waited until it was time for them to sally forth. It was a striking demonstration of the ingenuity of women opposing the physical force of men, but it served still another purpose. It diverted the attention of the police from another demonstration which was going on. Other Suffragettes had gone to the official residence of the First Lord of the Admiralty, to the Home Office, the Treasury and Privy Council Offices, and had registered their contempt for the Government's refusal to receive the deputation by the time-honoured method of breaking a window in each place.

One hundred and eight women were arrested that night, but instead of submitting to arrests and trial, the Women's Social and Political Union announced that they were prepared to prove that the Government and not the women had broken the law in refusing to receive the petition. My case, coupled with that of the Hon. Mrs. Haverfield, was selected as a test case for all the others, and Lord Robert Cecil was retained for the defence. Mr. Muskett, who conducted the case for the prosecution, tried to prove that our women had not gone to the House of Commons to present a petition, but this was easily demonstrated to be an unwarranted claim. The speeches of the leader, the official articles published in our newspaper, _Votes for Women_, and the letters sent to Mr. Asquith, not to speak of the indisputable facts that every member of the deputation carried a copy of the petition in her hand, furnished evidence enough of the nature of our errand. The whole case of the subject's right of petition was then brought forward for discussion. Mr. Muskett spoke first, then our council, Mr. Henle, then Lord Robert Cecil. Last of all I spoke, describing the events of June 29th. I told the magistrate that should he decide that we and not the Government had been guilty of an infraction of the law, we should refuse to be bound over, but should all choose to go to prison. In that case we should not submit to being treated like criminals. "There are one hundred and eight of us here to-day," I said, pointing to the benches where my fellow-prisoners sat, "and just as we have thought it is our duty to defy the police in the street, so when we get into prison, as we are political prisoners, we shall do our best to bring back into the twentieth century the treatment of political prisoners which was thought right in the case of William Cobbett, and other political offenders of his time."

The magistrate, Sir Albert de Rutzen, an elderly, amiable man, rather bewildered by this unprecedented situation, then gave his decision. He agreed with Mr. Henle and Lord Robert Cecil that the right of petition was clearly guaranteed to every subject, but he thought that when the women were refused permission to enter the House of Commons, and when Mr. Asquith had said that he would not receive them, the women acted wrongly to persist in their demands. He should, therefore, fine them five pounds each, or sentence them to prison for one month in the second division. The sentence would be suspended for the present until learned counsel could obtain a decision from a higher court on the legal point of the right of petition.

I then put in a claim for all the prisoners, and asked that all their cases might be held over until the test case was decided, and this was agreed to, except in regard to fourteen women charged with window-breaking. They were tried separately and sent to prison on sentences varying from six weeks to two months. Of them later.

The appeal against Sir Albert de Rutzen's decision was tried in a Divisional Court early in December of that year. Lord Robert Cecil again appeared for the defence, and in a masterly piece of argumentation, contended that in England there was and always had been the right of petition, and that the right had always been considered a necessary condition of a free country and a civilised Government. The right of petition, he pointed out, had three characteristics: In the first place, it was the right to petition the actual repositories of power; in the second place, it was the right to petition in person; and in the third place, the right must be exercised reasonably. A long list of historical precedents were offered in support of the right to petition in person, but Lord Robert argued that even if these did not exist, the right was admitted in the Charles II "Tumultuous Petitions Act," which provides "That no person or persons whatsoever shall repair to His Majesty or both or either Houses of Parliament upon pretence of presenting or delivering any petition, complaint, remonstrance, or declaration or other address, accompanied with excessive number of people ..." etc. The Bill of Rights had specially confirmed the right of petition in so far as the King personally was concerned. "The women," pursued Lord Robert, "had gone to Parliament Square on June 29th in the exercise of a plain constitutional right, and that in going there with a petition they had acted according to the only constitutional method they possessed, being voteless, for the redress of their grievances."

If then it were true, as contended, the subject not only possessed the right to petition, but to petition in person, the only point to be considered was whether the right had been exercised reasonably. If persons desired to interview the Prime Minister, it was surely reasonable to go to the House of Commons, and to present themselves at the Strangers' Entrance. Mrs. Pankhurst, Mrs. Haverfield and the others had, as the evidence showed, proceeded along the public highway and had been escorted to the door of the House of Commons by an officer of the police, and could not therefore, up to that point, have been acting in an unlawful manner. The police had kept clear a large open space opposite the House of Commons, the crowd being kept at a certain distance away. Within the open space there were only persons having business in the House of Commons, members of the police force and the eight women who formed the deputation. It could not possibly be contended that these eight women had caused an obstruction. It was true that a police officer told them that the Prime Minister was not in the House of Commons, but when one desired an interview with a Member of Parliament one did not make his request of a casual policeman in the street. Moreover, the police did not possess any authority to stop anyone from going into the House of Commons.

The letter given the women, in which the Prime Minister said that he could not or would not see them, had been cited. Now, had the Prime Minister, in his letter, said that he could not or would not see the women at that time, that the time was not convenient; but that he would at some future time, at a more convenient time, receive them, that would have been a sufficient answer. The women would not have been justified in refusing to accept such an answer, because the right to petition must be exercised reasonably. But the letter contained an unqualified refusal, and that, if we allow the right of petition to exist, was no answer at all. Last of all Lord Robert argued that if there is a right to petition a Member of Parliament, then it must be incumbent on the part of a Member of Parliament to receive the petition, and that no one has a right to interfere with the petitioner. If the eight women were legally justified in presenting their petition, then they were also justified in refusing to obey the orders of the police to leave the place.

In an address full of bias, and revealing plainly that he had no accurate knowledge of any of the events that had led up to the case in hand, the Lord Chief Justice delivered judgment. He said that he entirely agreed with Lord Robert Cecil as to the right to present a petition to the Prime Minister, either as Prime Minister or as a Member of Parliament; and he agreed also that petitions to the King should be presented to the Prime Minister. But the claim of the women, he said, was not merely to present a petition, but to be received in a deputation. He did not think it likely that Mr. Asquith would have refused to receive a petition from the women, but his refusal to receive the deputation was not unnatural, "in consequence of what we know did happen on previous occasions."[1]

Referring to the Metropolitan Police Act of 1839, which provides that it shall be lawful for the Commissioner of Police to make regulations and to give instructions to the constable for keeping order, and for preventing any obstruction of thoroughfares in the immediate neighbourhood of the House of Commons, and the Sessional Order empowering the police to keep clear the approaches to the House of Commons, the Lord Chief Justice decided that I and the other women were guilty of an infraction of the law when we insisted on a right to enter the House of Commons. The Lord Chief Justice therefore ruled that our conviction in the lower court had been proper, and our appeal was dismissed with costs.

Thus was destroyed in England the ancient constitutional right of petition, secured to the people by the Bill of Rights, and cherished by uncounted generations of Englishmen. I say the right was destroyed, for of how much value is a petition which cannot be presented in person? The decision of the high court was appalling to the members of the W. S. P. U., as it closed the last approach, by constitutional means, to our enfranchisement. Far from discouraging or disheartening us, it simply spurred us on to new and more aggressive forms of militancy.

FOOTNOTE:

[1] Mr. Asquith had never, since becoming Prime Minister, received a deputation of women, nor had he ever received a deputation of the W. S. P. U. So it was absurd of the Lord Chief Justice to speak of "what did happen, on previous occasions."

CHAPTER V

Between the time of the arrest in June and the handing down of the absurd decision of the Lord Chief Justice that although we, as subjects, possessed the right of petition, yet we had committed an offence in exercising that right, nearly six months had passed. In that interval certain grave developments had lifted the militant movement onto a new and more heroic plane. It will be remembered that a week before our deputation to test the Charles II Act, Miss Wallace Dunlop had been sent to prison for one month for stamping an extract from the Bill of Rights on the stone walls of St. Stephen's Hall. On arriving at Holloway on Friday evening, July 2nd, she sent for the Governor and demanded of him that she be treated as a political offender. The Governor replied that he had no power to alter the sentence of the magistrate, whereupon Miss Wallace Dunlop informed him that it was the unalterable resolution of the Suffragettes never again to submit to the prison treatment given to ordinary offenders against the law. Therefore she should, if placed in the second division as a common criminal, refuse to touch food until the Government yielded her point. It is hardly likely that the Government or the prison authorities realised the seriousness of Miss Wallace Dunlop's action, or the heroic mould of the Suffragettes' character. At all events the Home Secretary paid no attention to the letter sent him by the prisoner, in which she explained simply but clearly her motives for her desperate act, and the prison authorities did nothing except seek means of breaking down her resistance. The ordinary prison diet was replaced by the most tempting food, and this instead of being brought to her cell at intervals, was kept there night and day, but always untouched. Several times daily the doctor came to feel her pulse and observe her growing weakness. The doctor, as well as the Governor and the wardresses argued, coaxed and threatened, but without effect. The week passed without any sign of surrender on the part of the prisoner. On Friday the doctor reported that she was rapidly reaching a point at which death might at any time supervene. Hurried conferences were carried on between the prison and the Home Office, and that evening, June 8th, Miss Wallace Dunlop was sent home, having served one-fourth of her sentence, and having ignored completely all the terms of her imprisonment.

On the day of her release the fourteen women who had been convicted of window breaking received their sentences, and learning of Miss Wallace Dunlop's act, they, as they were being taken to Holloway in the prison van, held a consultation and agreed to follow her example. Arrived at Holloway they at once informed the officials that they would not give up any of their belongings, neither would they put on prison clothing, perform prison labour, eat prison food or keep the rule of silence.

The Governor agreed for the moment to allow them to retain their property and to wear their own clothing, but he told them that they had committed an act of mutiny and that he would have to so charge them at the next visit of the magistrates. The women then addressed petitions to the Home Secretary, demanding that they be given the prison treatment universally allowed political offenders. They decided to postpone the hunger strike until the Home Secretary had had time to reply. Meanwhile, after a vain appeal for more fresh air, for the weather was stiflingly hot, the women committed one more act of mutiny, they broke the windows of their cells.

We learned this from the prisoners themselves. Several days after they had gone to prison, my daughter Christabel and Mrs. Tuke, filled with anxiety for their fate, gained admission to an upper story room of a house overlooking the prison. Calling at the top of

their voices and waving a flag of the Union, they succeeded in attracting the prisoners' attention. The women thrust their arms through the broken panes, waving handkerchiefs, Votes for Women badges, anything they could get hold of, and in a few shouted words told their tale. That same day the visiting magistrates arrived, and the mutineers were sentenced to terms of seven to ten days of solitary confinement in the punishment cells. In these frightful cells, dark, unclean, dripping with moisture, the prisoners resolutely hunger struck. At the end of five days one of the women was reduced to such a condition that the Home Secretary ordered her released. The next day several more were released, and before the end of the week the last of the fourteen had gained their liberty.

The affair excited the greatest sympathy all over England, sympathy which Mr. Gladstone tried to divert by charging two of the prisoners with kicking and biting the wardresses. In spite of their vigorous denials these two women were sentenced, on these charges, one to ten days and the other to a month in prison. Although still very weak from the previous hunger strike, they at once entered upon a second hunger strike, and in three days had to be released.

After this each succeeding batch of Suffragette prisoners, unless otherwise directed, followed the example of these heroic rebels. The prison officials, seeing their authority vanish, were panic stricken. Holloway and other women's prisons throughout the Kingdom became perfect dens of violence and brutality. Hear the account given by Lucy Burns of her experience:

"We remained quite still when ordered to undress, and when they told us to proceed to our cells we linked arms and stood with our backs to the wall. The Governor blew his whistle and a great crowd of wardresses appeared, falling upon us, forcing us apart and dragging us towards the cells. I think I had twelve wardresses for my share, and among them they managed to trip me so that I fell helplessly to the floor. One of the wardresses grasped me by my hair, wound the long braid around her wrist and literally dragged me along the ground. In the cell they fairly ripped the clothing from my back, forcing on me one coarse cotton garment and throwing others on the bed for me to put on myself. Left alone exhausted by the dreadful experience I lay for a time gasping and shivering on the floor. By and by a wardress came to the door and threw me a blanket. This I wrapped around me, for I was chilled to the bone by this time. The single cotton garment and the rough blanket were all the clothes I wore during my stay in prison. Most of the prisoners refused everything but the blanket. According to agreement we all broke our windows and were immediately dragged off to the punishment cells. There we hunger struck, and after enduring great misery for nearly a week, we were one by one released."

How simply they tell it. "After enduring great misery--" But no one who has not gone through the awful experience of the hunger strike can have any idea of how great that misery is. In an ordinary cell it is great enough. In the unspeakable squalor of the punishment cells it is worse. The actual hunger pangs last only about twenty-four hours with most prisoners. I generally suffer most on the second day. After that there is no very desperate craving for food. Weakness and mental depression take its place. Great disturbances of digestion divert the desire for food to a longing for relief from pain. Often there is intense headache, with fits of dizziness, or slight delirium. Complete exhaustion and a feeling of isolation from earth mark the final stages of the ordeal. Recovery is often protracted, and entire recovery of normal health is sometimes discouragingly slow.

The first hunger strike occurred in early July. In the two months that followed scores of women adopted the same form of protest against a Government who would not recognise the political character of their offences. In some cases the hunger strikers were treated with unexampled cruelty. Delicate women were sentenced, not only to solitary confinement, but to wear handcuffs for twenty-four hours at a stretch. One woman on refusing prison clothes was put into a straightwaistcoat.

The irony of all this appears the greater when it is considered that, at this precise time, the leaders of the Liberal Party in the House of Commons were in the midst of their first campaign against the veto power of the Lords.

On September 17th a great meeting was held in Birmingham, on which occasion Mr. Asquith was to throw down his challenge to the Lords, and to announce that their veto was to be abolished, leaving the people's will paramount in England. Of course the Suffragettes seized this opportunity for a demonstration. This course was perfectly logical. Denied the right of petition, shut out now from every Cabinet Minister's meeting, the women were forced to take whatever means that remained to urge their cause upon the Government. Mrs. Mary Leigh and a group of Birmingham members addressed a warning to the public not to attend Mr. Asquith's meeting as disturbances were likely to happen. From the time that the Prime Minister and his Cabinet left the House of Commons until the train drew in to the station at Birmingham they were completely surrounded with detectives and policemen. The precautions taken to guard Mr. Asquith have never been equalled except in the case of the Tsar during outbreaks of revolution in Russia. From the station he was taken by an underground passage a quarter of a mile in length to his hotel, where he dined in solitary state, after having been carried upstairs in a luggage lift. Escorted to the Bingley Hall by a strong guard of mounted police,

he was so fearful of encountering the Suffragettes that he entered by a side door. The hall was guarded as for a siege. Over the glass roof a thick tarpaulin had been stretched. Tall ladders were placed on either side of the building, and firemen's hose were laid in readiness--not to extinguish fires, but to play upon the Suffragettes should they appear at an inaccessible spot on the roof. The streets on every hand were barricaded, and police, in regiments, were drawn up to defend the barricades against the onslaughts of the women. Nobody was allowed to pass the barricades without showing his entrance tickets to long files of police, and then the ticket holders were squeezed through the narrow doors one by one.

Their precautions were in vain, for the determined Suffragettes found more than one way in which to turn Mr. Asquith's triumph into a fiasco. Although no women gained access to the hall, there were plenty of men sympathisers present, and before the meeting had proceeded far thirteen men had been violently thrown out for reminding the Prime Minister that "the people" whose right to govern he was professing to uphold, included women as well as men. Outside, mingling in the vast crowds, bands of women attacked the barricades, the outer barricades being thrown down in spite of the thousands of police. From the roof of a neighbouring house Mrs. Leigh and Charlotte Marsh tore up dozens of slates and threw them on the roof of Bingley Hall and in the streets below, taking care, however, to strike no one. As Mr. Asquith drove away the women hurled slates at the guarded motor car. The fire hose was brought forth and the firemen were ordered to turn the water on the women. They refused, to their credit be it said, but the police, infuriated by their failure to keep the peace, did not scruple to play the cold water on the women as they crouched and clung to the dangerous slope of the roof. Roughs in the streets flung bricks at them, drawing blood. Eventually the women were dragged down by the police and in their dripping garments marched through the streets to the police station.

The Suffragettes who had rushed the barricades and flung stones at Mr. Asquith's departing train received sentences from a fortnight to one month, but Miss Marsh and Mrs. Leigh were sent to prison for three and four months respectively. All of the prisoners adopted the hunger strike, as we knew they would.

Several days later we were horrified to read in the newspapers that these prisoners were being forcibly fed by means of a rubber tube thrust into the stomach. Members of the Union applied at once both at the prison and at the Home Office to learn the truth of the report, but all information was refused. On the following Monday at our request, Mr. Keir Hardie, at question time in the House, insisted on information from the Government. Mr. Masterman, speaking for the Home Secretary, reluctantly admitted that, in order to preserve the dignity of the Government and at the same time save the lives of the prisoners, "hospital treatment" was being administered. "Hospital treatment" was the term used to draw attention from one of the most disgusting and brutal expedients ever resorted to by prison authorities. No law allows it except in the case of persons certified to be insane, and even then when the operation is performed by skilled nursing attendants under the direction of skilled medical men, it cannot be called safe. In fact, the asylum cases usually die after a short time. _The Lancet_, perhaps the best known medical journal in the language, published a long list of opinions from distinguished physicians and surgeons who condemned the practice as applied to the suffrage prisoners as unworthy of civilisation. One physician told of a case which had come under his observation in which death had occurred almost as soon as the tube had been inserted. Another cited a case where the tongue, twisted behind the feeding tube, had, in the struggle, been almost bitten off. Cases where food had been injected into the lungs were not unknown. Mr. C. Mansell-Moullin, M.D., F.R.C.S., wrote to _The Times_ that as a hospital surgeon of more than thirty years' experience he desired indignantly to protest against the Government's term "Hospital treatment" in connection with the forcible feeding of women. It was a foul libel, he declared, for violence and brutality have no place in hospitals. A memorial signed by 116 well-known physicians was addressed to the Prime Minister protesting against the practice of forcible feeding, and pointing out to him in detail the grave dangers attaching to it.

So much for medical testimony against a form of brutality which continued and still continues in our English prisons, as a punishment for women who are there for consciences' sake. As for the testimony of the victims, it makes a volume of most revolting sort. Mrs. Leigh, the first victim, is a woman of sturdy constitution, else she could scarcely have survived the experience. Thrown into Birmingham prison after the Asquith demonstration, she had broken the windows of her cell, and as a punishment was sent to a dark and cold punishment cell. Her hands were handcuffed, behind her during the day, and at night in front of her body _with the palms out_. She refused to touch the food that was brought to her, and three days after her arrival she was taken to the doctor's room. What she saw was enough to terrify the bravest. In the centre of the room was a stout chair resting on a cotton sheet. Against the wall, as if ready for action stood four wardresses. The junior doctor was also on hand. The senior doctor spoke, saying: "Listen carefully to what I have to say. I have orders from my superior officers that you are not to be released even on medical grounds. If you still refrain from food I must take other measures to compel you to take it." Mrs. Leigh replied that she did still refuse, and she said further that she knew that she could not legally be forcibly fed because an operation could not be performed

without the consent of the patient if sane. The doctor repeated that he had his orders and would carry them out. A number of wardresses then fell upon Mrs. Leigh, held her down and tilted her chair backward. She was so taken by surprise that she could not resist successfully that time. They managed to make her swallow a little food from a feeding cup. Later two doctors and the wardresses appeared in her cell, forced Mrs. Leigh down to the bed and held her there. To her horror the doctors produced a rubber tube, two yards in length, and this he began to stuff up her nostril. The pain was so dreadful that she shrieked again and again. Three of the wardresses burst into tears and the junior doctor begged the other to desist. Having had his orders from the Government, the doctor persisted and the tube was pushed down into the stomach. One of the doctors, standing on a chair and holding the tube high poured liquid food through a funnel almost suffocating the poor victim. "The drums of my ears," she said afterwards, "seemed to be bursting. I could feel the pain to the end of the breast bone. When at last the tube was withdrawn it felt as if the back of my nose and throat were being torn out with it."

In an almost fainting condition Mrs. Leigh was taken back to the punishment cell and laid on her plank bed. The ordeal was renewed day after day. The other prisoners suffered similar experiences.

CHAPTER VI

The militant movement was at this point when, in October, 1909, I made my first visit to the United States. I shall never forget the excitement of my landing, the first meeting with the American "reporter," an experience dreaded by all Europeans. In fact the first few days seemed a bewildering whirl of reporters and receptions, all leading up to my first lecture at Carnegie Hall on October 25th. The huge hall was entirely filled, and an enormous crowd of people thronged the streets outside for blocks. With me on the stage were several women whom I had met in Europe, and in the chair was an old friend, Mrs. Stanton Blatch, whose early married life had been spent in England. The great crowd before me, however, was made up of strangers, and I could not know how they would respond to my story. When I rose to speak a deep hush fell, but at my first words: "I am what you call a hooligan--" a great shout of warm and sympathetic laughter shook the walls. Then I knew that I had found friends in America. And this all the rest of the tour demonstrated. In Boston the committee met me with a big grey automobile decorated in the colours of our Union, and that night at Tremont Temple I spoke to an audience of 2,500 people all most generous in their responsiveness. In Baltimore professors, and students from Johns Hopkins University acted as stewards of the meeting. I greatly enjoyed my visit to Bryn Mawr College and to Rosemary Hall, a wonderful school for girls in Connecticut. In Chicago, I met, among other notable people, Miss Jane Addams and Mrs. Ella Flagg Young, superintendent of schools. My visit to Canada will always be remembered, especially Toronto, where the mayor, dressed in the chains of his office, welcomed me. I met too the venerable Goldwin Smith, since dead.

Everywhere I found the Americans kind and keen, and I cannot say too much for the wonderful hospitality they showed me. The women I found were remarkably interested in social welfare. The work of the women's clubs struck me very favourably, and I thought these institutions a perfect basis for a suffrage movement. But at that time, 1909, the suffrage movement in the United States was in a curious state of quiescence. A large number of women with whom I came in contact appeared to think it only just that they should have a vote, but few seemed to realise any actual need of it. Some, it is true, were beginning to connect the vote with the reforms for which they were working so unselfishly and so devotedly. It was when talking with the younger women that I came to feel that under the surface of things in America, a strong suffrage movement was stirring. Those young women, leaving their splendid colleges to begin life were realising in a very intelligent fashion that they needed and would be obliged to secure for themselves a political status.

On December 1st I sailed on the _Mauretania_ for England, and on arriving I learned that the prison sentence which hung over me while the petitions case had been argued, was discharged, some unknown friend having paid my fine while I was on the ocean.

The year 1910 began with a general election, precipitated by the House of Lords' rejection of Mr. Lloyd-George's 1909 budget. The Liberal Party went to the country with promises of taxes on land values. They promised also abolition of the veto power of the Lords, Irish Home Rule, disestablishment of the Church of Wales, and other reforms. Woman suffrage was not directly promised, but Mr. Asquith pledged that, if retained in office, he would introduce an electoral reform bill which could be amended to include woman suffrage. The Unionists under the leadership of Mr. Balfour, had tariff reform for their programme, and they offered not even a vague promise of a possible suffrage measure. Yet we, as usual, went into the constituencies and opposed the Liberal Party. We had no faith in Mr. Asquith's pledge, and besides, if we had failed to oppose the party in power we should but have invited Mr. Asquith and Mr. Balfour to enter into an agreement not to deal with the suffrage, with the view of keeping the cause permanently outside practical politics. We were in something of the same position as the Irish Nationalists in 1885, when neither the Liberal nor

the Conservative leaders would include home rule in their programme. The Irish opposed the Liberal Party, with the result that it was returned by such a narrow majority that the Liberal Government was dependent on the Irish vote in Parliament in order to remain in office. On this account they were obliged to bring in a Home Rule Bill.

The other suffrage societies and many of the Liberal women begged us not to oppose the Liberal party at this election. We were implored to waive our claim "just this once" in view of the importance of the struggle between the Commons and the House of Lords over the budget. We replied that the same plea had been made in 1906 when we were implored to waive our claim "just this once" on account of the fiscal issue. For women there was only one political issue, we said, and that was the issue of their own enfranchisement. The dispute between the Lords and the Commons was far less vital than the claims of the people--represented in this case by women--to be admitted to citizenship. From our point of view both Houses of Parliament were unrepresentative until women had a voice in choosing legislators and influencing law making.

We opposed Liberal candidates in forty constituencies, and in almost every one of these the Liberal majorities were reduced and no less than eighteen seats were wrested from the Liberal candidates. It really was a terrible election for the Government. Mr. Asquith travelled from one constituency to another accompanied by a body guard of detectives, and official "chuckers out," whose sole duty was to eject women, and men as well, who interrupted his meetings on the question of Votes for Women. The halls where he spoke had the windows boarded up or the glass covered with strong wire netting. Every thoroughfare leading to the halls was barricaded, traffic was suspended, and large forces of police were on guard. The most extraordinary precautions were taken to protect the Prime Minister. At one place he went to his meeting strongly guarded and by way of a secret pathway that led through gooseberry bushes and a cabbage patch to a back door. After the meeting he escaped through the same door and was solemnly guided along a path heavily laid with sawdust to deaden his footsteps, to a concealed motor car, where he sat until the crowd had all dispersed.

The other ministers had to resort to similar precautions. They lived under the constant protection of body-guards. Their meetings were policed in a manner without precedent. Of course no women were admitted to their meetings, but they got in just the same. Two women hid for twenty-five hours in the rafters of a hall in Louth where Mr. Lloyd-George spoke. They were arrested, but not until after they had made their demonstration. Two others hid under a platform for twenty-two hours in order to question the Prime Minister. I could continue this record almost indefinitely.

We had printed a wonderful poster showing the process of forcible feeding, and we used it on hoardings everywhere. We told the electors that the "Liberal Party," the people's friend, had imprisoned 450 women for the crime of asking for a vote. They were torturing women at that time in Holloway. It was splendid ammunition and it told. The Liberal Party was returned to power, but with their majority over all sections of the House of Commons swept away. The Asquith Government were dependent now for their very existence on the votes of the Labour Party and the Irish Nationalists.

CHAPTER VII

The first months of 1910 were occupied by the re-elected Government in a struggle to keep control of affairs. A coalition with the Irish party, the leaders of which agreed, if the Home Rule bill were advanced, to stand by the budget. No publicly announced coalition with the Labour Party was made at that time, Keir Hardie, at the annual conference of the party, announcing that they would continue to be independent of the Government. This was important to us because it meant that the Labour Party, instead of entering into an agreement to give general support to all Government measures, would be free to oppose the Government in the event of the continued withholding of a franchise bill. Other things combined to make us hopeful that the tide had turned in our favour. It was hinted to us that the Government were weary of our opposition and were ready to end the struggle in the only possible way, providing they could do so without appearing to yield to coercion. We therefore, early in February, declared a truce to all militancy.

Parliament met on February 15th and the King's speech was read on February 21st. No mention of women's suffrage was made in the speech nor was any private member successful in winning a place in the ballot for a suffrage bill. However, since the situation, on account of the proposed abolition of the Lord's power of veto, was strained and abnormal, we decided to wait patiently for a while. It was confidently expected that another general election would have to be held before the contentions between the two Houses of Parliament were settled, and this event unquestionably would have occurred, not later than June, but for the unexpected death of King Edward VII. This interrupted the strained situation. The passing of the King served as an occasion for the temporary softening of animosities and produced a general disposition to compromise on all troubled issues. The question of women's enfranchisement was taken up again in this spirit, and in a manner altogether creditable to the members with whom the movement

originated.

A strictly non-party committee on women's suffrage had been established in the House of Commons in 1887, mainly through the efforts of Miss Lydia Becker, whom I have mentioned before as the Susan B. Anthony of the English suffrage movement. In 1906, for reasons not necessary to enumerate, the original committee had been allowed to lapse, the Liberal supporters of women's suffrage forming a committee of their own. Now, in this period of good feeling, at the suggestion of certain members, led by Mr. H. N. Brailsford, not himself a member of Parliament, formed another non-party body which they called the Conciliation Committee. Its object was declared to be the bringing together of the full strength of suffragists of the House of Commons, regardless of party affiliation, and of framing a suffrage measure that could be passed by their united effort. The Earl of Lytton accepted the chairmanship of the committee and Mr. Brailsford was made its secretary. The committee consisted of twenty-five Liberals, seventeen Conservatives, six Irish Nationalists, and six members of the Labour Party. Under difficulties which I can hardly hope to make clear to American readers the committee laboured to frame a bill which should win the support of all sections of the House. The Conservatives insisted on a moderate bill, whilst the Liberals were concerned lest the terms of the bill should add to the power of the propertied classes. The original suffrage bill, drafted by my husband. Dr. Pankhurst, giving the vote to women on equal terms with men, was abandoned, and a bill was drawn up along the lines of the existing municipal franchise law. The basis of the municipal franchise is occupation, and the Conciliation Bill, as first drafted, proposed to extend the Parliamentary vote to women householders, and to women occupiers of business premises paying ten pounds rental and upwards. It was estimated that about ninety-five per cent. of the women who would be enfranchised under the bill were householders. This, in England, does not mean a person occupying a whole house. Any one who inhabits even a single room over which he or she exercises full control is a householder.

The text of the Conciliation Bill was submitted to all the suffrage societies and other women's organisations, and it was accepted by every one of them. Our official newspaper said editorially: "We of the Women's Social and Political Union are prepared to share in this united and peaceful action. The new bill does not give us all that we want, but we are for it if others are also for it."

It seemed certain that an overwhelming majority of the House of Commons were for the bill, and were prepared to vote it into law. Although we knew that it could not possibly pass unless the Government agreed that it should, we hoped that the leaders of all parties and the majority of their followers would unite in an agreement that the bill should pass. This settlement by consent is rare in the English Parliament, but some extremely important and hard fought measures have been carried thus. The extension of the franchise in 1867 is a case in point.

The Conciliation Bill was introduced into the House of Commons on June 14th, 1910, by Mr. D. J. Shackleton, and was received with the most extraordinary enthusiasm. The newspapers remarked on the feeling of reality which marked the attitude of the House towards the bill. It was plain that the members realised that here was no academic question upon which they were merely to debate and to register their opinions, but a measure which was intended to be carried through all its stages and to be written into English law. The enthusiasm of the House swept all over the Kingdom. The medical profession sent in a memorial in its favour, signed by more than three hundred of the most distinguished men and women in the profession. Memorials from writers, clergymen, social workers, artists, actors, musicians, were also sent. The Women's Liberal Federation met and unanimously resolved to ask the Prime Minister to give full facilities to the bill. Some advanced spirits in the Federation actually proposed to send then and there a deputation to the House of Commons with the resolution, but this proposal was rejected as savouring too much of militancy. A request for an interview was sent to Mr. Asquith, and he replied promising to receive, at an early day, representatives of both the Liberal Women's Federation and of the National Union of Women's Suffrage Societies.

The joint deputation was received by Mr. Asquith on June 21st, and Lady M'Laren, as a representative of the Women's Liberal Federation, spoke very directly to her party's leader. She said in part: "If you refuse our request we shall have to go to the country and say you, who are against the veto of the House of Lords, are placing a veto on the House of Commons by refusing to allow a second reading of this bill."

Mr. Asquith replied warily that he could not decide alone on such a serious matter, but would have to consult his Cabinet, the majority of whom, he admitted, were suffragists. Their decision, he said, would be given in the House of Commons.

[Illustration: OVER 1,000 WOMEN HAD BEEN IN PRISON--BROAD ARROWS IN THE 1910 PARADE]

The Women's Social and Political Union arranged a demonstration in support of the Conciliation Bill, the greatest that had, up to that time, been made. It was a national, indeed an inter-national affair in which all the suffrage groups took part, and its massed

ranks were so great that the procession required an hour and a half to pass a given point. At the head marched six hundred and seventeen women, white clad and holding long silver staves tipped with the broad arrow. These were the women who had suffered imprisonment for the cause, and all along the line of march they received a tribute of cheers from the public. The immense Albert Hall, the largest hall in England, although it was packed from orchestra to the highest gallery, was not large enough to hold all the marchers. Amid great joy and enthusiasm Lord Lytton delivered a stirring address in which he confidently predicted the speedy advance of the bill. The women, he declared, had every reason to believe that their enfranchisement was actually at hand.

It was true that the time for passing a suffrage bill was ripe. Not in fifty years had the way been so clear, because the momentary absence of ordinary legislation left the field open for an electoral reform bill. Yet when the Prime Minister was asked in the House of Commons whether he would give the members an early opportunity for discussion, the answer was not encouraging. The Government, said Mr. Asquith, were prepared to give time before the close of the session for full debate and division on second reading, but they could not allow any further facilities. He stated frankly that he personally did not want the bill to pass, but the Government realised that the House of Commons ought to have an opportunity, if that was their deliberate desire, for effectively dealing with the whole question.

This cryptic utterance was taken by the majority of the suffragists, by the press and by the public generally to mean that the Government were preparing gracefully to yield to the undoubted desire of the House of Commons to pass the bill. But the Women's Social and Political Union were doubtful. Mr. Asquith's remark was ambiguous, and was capable of being interpreted in several ways. It could mean that he was prepared to accept the verdict of the majority and let the bill pass through all its stages. That of course would be the only way to allow the House opportunity effectively to deal with the whole question. On the other hand Mr. Asquith might be intending to let the bill pass through its debating stages and be afterwards smothered in committee. We feared treachery, but in view of the announcement that the Government had set apart July 11 and 12 for debate on the second reading, we preserved a spirit of waiting calm. July 26th had been fixed as the day for the adjournment of Parliament, and if the bill was voted on favourably on the 12th there would be ample time to take it through its final stages. When a bill passes its second reading it is normally sent upstairs to a Grand Committee which sits while the House of Commons is transacting other business, and thus the committee stage can proceed without special facilities. The bill does not go back to the House until the report stage is reached, at which time the third and last reading occurs. After that the bill goes to the House of Lords. A week at most is all that is required for this procedure. A bill may be referred to the Whole House, and in this case it cannot be brought up for its committee stage unless it is given special facilities. In our paper and in many public speeches we urged that the members vote to send the bill to a Grand Committee.

Some days before the bill reached its second reading it was rumoured that Mr. Lloyd-George was going to speak against it, but we refused to credit this. Unfair to women as Mr. Lloyd-George had shown himself in various ways, he had consistently posed as a staunch friend of women's suffrage, and we could not believe that he would turn against us at the eleventh hour. Mr. Winston Churchill, whose speech to the women of Dundee I quoted in a previous chapter, the promoters of the Bill also counted upon, as it was known that he had more than once expressed sympathy with its objects. But when the debates began we found both of these ardent suffragists arrayed against the bill. Mr. Churchill, after making a conventional anti-suffrage speech, in which he said that women did not need the ballot, and that they really had no grievances, attacked the Conciliation Bill because the class of women who would be enfranchised under it did not suit him. Some women, he conceded, ought to be enfranchised, and he thought the best plan would be to select "some of the best women of all classes" on considerations of property, education and earning capacity. These special franchises would be carefully balanced, "so as not on the whole to give undue advantage to the property vote against the wage earning vote." A more fantastic proposal and one less likely to find favour in the House of Commons could not possibly be imagined. Mr. Churchill's second objection to the bill was that it was anti-democratic! It seemed to us that anything was more democratic than his proposed "fancy" franchises.

Mr. Lloyd-George said that he agreed with everything Mr. Churchill had said "both relevant and irrelevant." He made the amazing assertion that the Conciliation Committee that had drafted the bill was a "committee of women meeting outside the House." And that this committee said to the House of Commons not only that they must vote for a women's suffrage bill but "You must vote for the particular form upon which we agree, and we will not even allow you to deliberate upon any other form."

Of course these statements were wholly false. The Conciliation Bill was drafted by men, and it was introduced because the Government had refused to bring in a party measure. The suffragists would have been only too glad to have had the Government deliberate on a broader form of suffrage. Because they refused to deliberate on any form, this private bill was introduced.

This fact was brought forward in the course of Mr. Lloyd-George's speech. It had been urged, said he, that this bill was better than none at all, but why should that be the alternative? "What is the other?" called out a member, but Mr. Lloyd-George dodged the question with a careless "Well, I cannot say for the present."

Later on he said: "If the promoters of this bill say that they regard the second reading merely as an affirmation of the principle of women's suffrage, and if they promise that when they re-introduce the bill it will be in a form which will enable the House of Commons to move any amendment either for restriction or extension I shall be happy to vote for this bill."

Mr. Philip Snowden, replying to this, said: "We will withdraw this bill if the Right Honourable gentleman, on behalf of the Government, or the Prime Minister himself will undertake to give to this House the opportunity of discussing and carrying through its various stages another form of franchise bill. If we cannot get that, then we shall prosecute this bill."

The Government made no reply at all to this, and the debate proceeded. Thirty-nine speeches were made, the Prime Minister showing plainly in his speech that he intended to use all his power to prevent the bill becoming law. He began by saying that a franchise measure ought never to be sent to a Grand Committee, but to one of the Whole House. He said also that his conditions, that the majority of women should show beyond any doubt that they desired the franchise, and that the bill be democratic in its terms, had not been complied with.

When the division was taken it was seen that the Conciliation Bill had passed its second reading by a majority of 109, a larger majority than the Government's far famed budget or the House of Lords Resolution had received. In fact no measure during that Parliament had received so great a majority--299 members voted for it as against 190 opposed. Then the question arose as to which committee should deal with the bill. Mr. Asquith had said that all franchise bills should go to a Committee of the Whole House, so that in the division his words moved many sincere friends of the bill to send it there. Others understood that this was a mischievous course, but were afraid of incurring the anger of the Prime Minister. Of course all the anti-suffragists voted the same way, and thus the bill went to the Whole House.

Even then the bill could have been advanced to its final reading. The House had time on their hands, as virtually all important legislative work was halted because of the deadlock between the Lords and the Commons. Following the death of the King a conference of leaders of the Conservative and the Liberal Parties had been arranged to adjust the matters at issue, and this conference had not yet reported. Hence Parliament had little business on hand. The strongest possible pressure was brought to bear upon the Government to give facilities to the Conciliation Bill. A number of meetings were held in support of the bill. The Men's Political Union for Women's Enfranchisement, the Men's League for Women's Suffrage and the Conciliation Committee held a joint meeting in Hyde Park. Some of the old school of suffragists held another large meeting in Trafalgar Square. The Women's Social and Political Union, on July 23rd, which was the anniversary of the day in 1867 on which working men, agitating for their vote, had pulled down the Hyde Park railings, held another enormous demonstration there. A space of half a square mile was cleared, forty platforms erected, and two great processions marched from east and west to the meeting. Many other suffrage societies co-operated with us on this occasion. On the very day of that meeting Mr. Asquith wrote to Lord Lytton refusing to allow any more time for the bill during that session.

Those who still had faith that the Government could be induced to do justice to women set their hopes on the autumn session of Parliament. Resolutions urging the Government to give the bill facilities during the autumn were sent, not only by the suffrage associations but from many organisations of men. The Corporations of thirty-eight cities, including Liverpool, Manchester, Glasgow, Dublin and Cork, sent resolutions to this effect. Cabinet Ministers were besieged with requests to receive deputations of women, and since the country was on the verge of a general election, and the Liberal Party wanted the services of women, their requests could not altogether be ignored. Mr. Asquith, early in October, received a deputation of women from his own constituency of East Fife, but all he had to tell them was that the bill could not be advanced that year. "What about next year?" They asked, and he replied shortly: "Wait and see."

It had been exceedingly difficult, during these troublous days, to hold all the members of the W. S. P. U. to the truce, and when it became perfectly apparent that the Conciliation Bill was doomed, war was again declared. At a great meeting held in Albert Hall on November 10th, I myself threw down the gage of battle. I said, because I wanted the whole matter to be clearly understood by the public as well as by our members: "This is the last constitutional effort of the Women's Social and Political Union to secure the passage of the bill into law. If the Bill, in spite of our efforts, is killed by the Government, then first of all, I have to say there is an end of the truce. If we are met by the statement that there is no power to secure on the floor of the House of Commons time for our

measure, then our first step is to say, 'We take it out of your hands, since you fail to help us, and we resume the direction of the campaign ourselves.'"

Another deputation, I declared, must go to the House of Commons to carry a petition to the Prime Minister. I myself would lead, and if no one cared to follow me I would go alone. Instantly, all over the hall, women sprang to their feet crying out, "Mrs. Pankhurst, I will go with you!" "I will go!" "I will go!" And I knew that our brave women were as ever ready to give themselves, their very lives, if need be, for the cause of freedom.

The autumn session convened on Friday, November 18th, and Mr. Asquith announced that Parliament would be adjourned on November 28th. While his speech was in progress, 450 women, in small groups, to keep within the strict letter of the law, were marching from Caxton Hall and from the headquarters of the Union.

[Illustration: THE HEAD OF THE DEPUTATION ON BLACK FRIDAY

November, 1910]

How to tell the story of that dreadful day, Black Friday, as it lives in our memory--how to describe what happened to English women at the behest of an English Government, is a difficult task. I will try to tell it as simply and as accurately as possible. The plain facts, baldly stated, I am aware will strain credulity.

Remember that the country was on the eve of a general election, and that the Liberal Party needed the help of Liberal women. This fact made the wholesale arrest and imprisonment of great numbers of women, who were demanding the passage of the Conciliation Bill, extremely undesirable from the Government's point of view. The Women's Liberal Federations also wanted the passage of the Conciliation Bill, although they were not ready to fight for it. What the Government feared, was that the Liberal women would be stirred by our sufferings into refraining from doing election work for the party. So the Government conceived a plan whereby the Suffragettes were to be punished, were to be turned back and defeated in their purpose of reaching the House, but would not be arrested. Orders were evidently given that the police were to be present in the streets, and that the women were to be thrown from one uniformed or ununiformed policeman to another, that they were to be so rudely treated that sheer terror would cause them to turn back. I say orders were given and as one proof of this I can first point out that on all previous occasions the police had first tried to turn back the deputations and when the women persisted in going forward, had arrested them. At times individual policemen had behaved with cruelty and malice toward us, but never anything like the unanimous and wholesale brutality that was shown on Black Friday.

The Government very likely hoped that the violence of the police towards the women would be emulated by the crowds, but instead the crowds proved remarkably friendly. They pushed and struggled to make a clear pathway for us, and in spite of the efforts of the police my small deputation actually succeeded in reaching the door of the Strangers' Entrance. We mounted the steps to the enthusiastic cheers of the multitudes that filled the streets, and we stood there for hours gazing down on a scene which I hope never to look upon again.

At intervals of two or three minutes small groups of women appeared in the square, trying to join us at the Strangers' Entrance. They carried little banners inscribed with various mottoes, "Asquith Has Vetoed Our Bill," "Where There's a Bill There's a Way," "Women's Will Beats Asquith's Won't," and the like. These banners the police seized and tore in pieces. Then they laid hands on the women and literally threw them from one man to another. Some of the police used their fists, striking the women in their faces, their breasts, their shoulders. One woman I saw thrown down with violence three or four times in rapid succession, until at last she lay only half conscious against the curb, and in a serious condition was carried away by kindly strangers. Every moment the struggle grew fiercer, as more and more women arrived on the scene. Women, many of them eminent in art, in medicine and science, women of European reputation, subjected to treatment that would not have been meted out to criminals, and all for the offence of insisting upon the right of peaceful petition.

[Illustration: FOR HOURS SCENES LIKE THIS WERE ENACTED ON BLACK FRIDAY

November, 1910]

This struggle lasted for about an hour, more and more women successfully pushing their way past the police and gaining the steps of the House. Then the mounted police were summoned to turn the women back. But, desperately determined, the women, fearing not the hoofs of the horses or the crushing violence of the police, did not swerve from their purpose. And now the crowds began to

murmur. People began to demand why the women were being knocked about; why, if they were breaking the law, they were not arrested; why, if they were not breaking the law, they were not permitted to go on unmolested. For a long time, nearly five hours, the police continued to hustle and beat the women, the crowds becoming more and more turbulent in their defence. Then, at last the police were obliged to make arrests. One hundred and fifteen women and four men, most of them bruised and choked and otherwise injured, were arrested.

While all this was going on outside the House of Commons, the Prime Minister was obstinately refusing to listen to the counsels of some of the saner and more justice-loving members of the House. Keir Hardie, Sir Alfred Mondell and others urged Mr. Asquith to receive the deputation, and Lord Castlereagh went so far as to move as an amendment to a Government proposal, another proposal which would have compelled the Government to provide immediate facilities to the Conciliation Bill. We heard of what was going on, and I sent in for one and another friendly member and made every possible effort to influence them in favour of Lord Castlereagh's amendment. I pointed to the brutal struggle that was going on in the square, and I begged them to go back and tell the others that it must be stopped. But, distressed as some of them undoubtedly were, they assured me that there was not the slightest chance for the amendment.

"Is there not a single _man_ in the House of Commons," I cried, "one who will stand up for us, who will make the House see that the amendment must go forward?"

Well, perhaps there were men there, but all save fifty-two put their party loyalty before their manhood, and, because Lord Castlereagh's proposal would have meant censure of the Government, they refused to support it. This did not happen, however, until Mr. Asquith had resorted to his usual crafty device of a promise of future action. In this instance he promised to make a statement on behalf of the Government on the following Tuesday.

The next morning the suffrage prisoners were arraigned in police court. Or rather, they were kept waiting outside the court room while Mr. Muskett, who prosecuted on behalf of the Chief Commissioner of Police, explained to the astounded magistrate that he had received orders from the Home Secretary that the prisoners should all be discharged. Mr. Churchill it was declared, had had the matter under careful consideration, and had decided that "no public advantage would be gained by proceeding with the prosecution, and accordingly no evidence would be given against the prisoners."

Subdued laughter and, according to the newspapers, some contemptuous booing were raised in the court, and when order was restored the prisoners were brought in in batches and told that they were discharged.

On the following Tuesday the W. S. P. U. held another meeting of the Women's Parliament in Caxton Hall to hear the news from the House of Commons. Mr. Asquith said: "The Government will, if they are still in power, give facilities in the next Parliament for effectively proceeding with a franchise bill which is so framed as to admit of free amendment." He would not promise that this would be done during the first year of Parliament.

We had demanded facilities for the Conciliation Bill, and Mr. Asquith's promise was too vague and too ambiguous to please us. The Parliament now about to be dissolved had lasted a scant ten months. The next one might not last longer. Therefore, Mr. Asquith's promise, as usual, meant nothing at all. I said to the women, "I am going to Downing Street. Come along, all of you." And we went.

We found a small force of police in Downing Street, and we easily broke through their line and would have invaded the Prime Minister's residence had not reinforcements of police arrived on the scene. Mr. Asquith himself appeared unexpectedly, and as we thought, very opportunely. Before he could have realised what was happening he found himself surrounded by angry Suffragettes. He was well hooted and, it is said, well shaken, before he was rescued by the police. As his taxicab rushed away some object struck one of the windows, smashing it.

Another Cabinet Minister, Mr. Birrell, unwittingly got into the midst of the melee, and I am obliged to record that he was pretty thoroughly hustled. But it is not true that his leg was injured by the women. His haste to jump into a taxicab resulted in a slightly sprained ankle.

That night and the following day windows were broken in the houses of Sir Edward Grey, Mr. Winston Churchill, Mr. Lewis Harcourt and Mr. John Burns; and also in the official residences of the Premier and the Chancellor of the Exchequer.

That week 160 Suffragettes were arrested, but all except those charged with window-breaking or assault were discharged. This amazing court action established two things: First, that when the Home Secretary stated that he had no responsibility for the

prosecution and sentencing of Suffrage prisoners, he told a colossal falsehood; and second, that the Government fully realised that it was bad election tactics to be responsible for the imprisonment of women of good character who were struggling for citizenship.

CHAPTER VIII

Almost immediately after the events chronicled in the preceding chapter I sailed for my second tour through the United States. I was delighted to find a thoroughly alive and progressive suffrage movement, where before had existed with most people only an academic theory in favour of equal political rights between men and women. My first meeting, held in Brooklyn, was advertised by sandwich women walking through the principal streets of the city, quite like our militant suffragists at home. Street meetings, I found, were now daily occurrences in New York. The Women's Political Union had adopted an election policy, and throughout the country as far west as I travelled, I found women awakened to the necessity of political action instead of mere discussion of suffrage.

My second visit to America, like my first one, is clouded in my memory with sorrow. Very soon after my return to England a beloved sister, Mrs. Mary Clarke died. My sister, who was a most ardent suffragist and a valued worker in the Women's Social and Political Union, was one of the women who was shockingly maltreated in Parliament Square on Black Friday. She was also one of the women who, a few days later, registered their protest against the Government by throwing a stone through the window of an official residence. For this act she was sent to Holloway prison for a term of one month. Released on December 21st, it was plain to those who knew her best that her health had suffered seriously from the dreadful experience of Black Friday and the after experience of prison. She died suddenly on Christmas day, to the profound sorrow of all her associates. Hers was not the only life that was sacrificed as a result of that day. Other deaths occurred, mostly from hearts weakened by overstrain. Miss Henria Williams died on January 2nd, 1911, from heart failure. Miss Cecelia Wolseley Haig was another victim. Ill treatment on Black Friday resulted in her case in a painful illness which ended, after a year of intense suffering, in her death on December 21st, 1911.

It is not possible to publish a full list of all the women who have died or have been injured for life in the course of the suffrage agitation in England. In many cases the details have never been made public, and I do not feel at liberty to record them here. A very celebrated case, which is public property, is that of Lady Constance Lytton, sister of the Earl of Lytton, who acted as chairman of the Conciliation Committee. Lady Constance had twice in 1909 gone to prison as a result of suffrage activities, and on both occasions had been given special privileges on account of her rank and family influence. In spite of her protests and her earnest pleadings to be accorded the same treatment as other suffrage prisoners, the snobbish and cowardly authorities insisted in retaining Lady Constance in the hospital cells and discharging her before the expiration of her sentence. This was done on a plea of her ill health, and it was true that she suffered from a valvular disease of the heart.

[Illustration: RIOT SCENES ON BLACK FRIDAY

November, 1910]

Smarting under the sense of the injustice done her comrades in this discrimination, Lady Constance Lytton did one of the most heroic deeds to be recorded in the history of the suffrage movement. She cut off her beautiful hair and otherwise disguised herself, put on cheap and ugly clothing, and as "Jane Warton" took part in a demonstration at Newcastle, again suffering arrest and imprisonment. This time the authorities treated her as an ordinary prisoner. Without testing her heart or otherwise giving her an adequate medical examination, they subjected her to the horrors of forcible feeding. Owing to her fragile constitution she suffered frightful nausea each time, and when on one occasion the doctor's clothing was soiled, he struck her contemptuously on the cheek. This treatment was continued until the identity of the prisoner suddenly became known. She was, of course, immediately released, but she never recovered from the experience, and is now a hopeless invalid.[2]

I want to say right here, that those well-meaning friends on the outside who say that we have suffered these horrors of prison, of hunger strikes and forcible feeding, because we desired to martyrise ourselves for the cause, are absolutely and entirely mistaken. We never went to prison in order to be martyrs. We went there in order that we might obtain the rights of citizenship. We were willing to break laws that we might force men to give us the right to make laws. That is the way men have earned their citizenship. Truly says Mazzini that the way to reform has always led through prison.

The result of the general election, which took place in January, 1911, was that the Liberal Party was again returned to power. Parliament met on January 31st, but the session formally opened on February 6th with the reading of the King's speech. The programme for the session included the Lords' veto measure, Home Rule, payment for members of Parliament, and the

abolishment of plural voting. Invalid insurance was also mentioned and certain amendments to the old age pension bill. Women's suffrage was not mentioned. Nevertheless, we were singularly lucky, the first three places in the ballot being secured by members of the Conciliation Committee. Mr. Philips, an Irish member, drew the first place, but as the Irish party had decided not to introduce any bills that session, he yielded to Sir George Kemp, who announced that he would use his place for the purpose of taking a second reading debate on the new Conciliation Bill. The old bill had been entitled: "A Bill to give the Vote to Women Occupiers," a title that made amendment difficult. The new bill bore the more flexible title, "A Bill to Confer the Parliamentary Franchise on Women," thus doing away with one of Mr. Lloyd-George's most plausible objections to it. The L10 occupation clause was omitted, doing away with another objection, that of the possibility of "faggot voting," that is, of a rich man conferring the vote on a family of daughters by the simple expedient of making them tenants of slices of his own property. The Conciliation Bill now read: "1. Every woman possessed of a household qualification within the meaning of the Representation of the People Act (1884) shall be entitled to be registered as a voter, and when registered to vote in the county or borough in which the qualifying premises are situated.

"2. For the purposes of this Act a woman shall not be disqualified by marriage for being registered as a voter, provided that a husband and wife shall not both be registered as voters in the same Parliamentary borough or county division."

This bill met with even warmer approval than the first one, because it was believed that it would win votes from those members who felt that the original measure had fallen short of being truly democratic. Nevertheless, the Prime Minister showed from the first that he intended to oppose it, as he had all previous suffrage measures. He announced that all Fridays up to Easter and also all time on Tuesdays and Wednesdays usually allowed for private members' bills were to be occupied with consideration of Government measures. Hardly a Liberal voice was raised against this arbitrary ruling. The Irish members indeed were delighted with it, since it gave the Home Rule Bill an advantage. The Labour members seemed complacent, and the rest of the coalition were indifferent. One back bench Liberal went so far as to rise and thank the Prime Minister for the courtesy with which the gagging process was accomplished. There was some show of fight made by the Opposition, but Conservative indignation was tempered by the reflection that the precedent established might be followed to advantage when their party came into power.

Sir George Kemp then announced that he would take May 5th for the second reading of the Conciliation Bill, and the supporters of the bill, according to their various convictions, set to work to further its interests. The conviction of the W. S. P. U. was that Mr. Asquith's Government would never allow the bill to pass until they were actually forced to do so, and we adopted our own methods to secure a definite pledge from the Government that they would give facilities to the bill.

In April of that year the census was to be taken, and we organised a census resistance on the part of women. According to our law the census of the entire kingdom must be taken every ten years on a designated day. Our plan was to reduce the value of the census for statistical purposes by refusing to make the required returns. Two ways of resistance presented themselves. The first and most important was direct resistance by occupiers who should refuse to fill in the census papers. This laid the register open to a fine of L5 or a month's imprisonment, and thus required the exercise of considerable courage. The second means of resistance was evasion--staying away from home during the entire time that the enumerators were taking the census. We made the announcement of this plan and instantly there ensued a splendid response from women and a chorus of horrified disapproval from the conservative public. The _Times_ voiced this disapproval in a leading article, to which I replied, giving our reasons for the protest. "The Census," I wrote, "is a numbering of the people. Until women count as people for the purpose of representation in the councils of the nation as well as for purposes of taxation, we shall refuse to be numbered."

On the subject of laws made by men--without the assistance of women--for the protection of women and children, I have a very special feeling. From my experience as poor law guardian and as Registrar of Births and Deaths, I know how ridiculously, say rather how tragically, these laws fall short of protection. Take for instance the vaunted "Children's Charter" of 1906, the measure which spread Mr. Lloyd-George's fame throughout the world. A volume could be filled with the mistakes and the cruelties of that Act, the object of which is the preservation and improvement of child life. A distinguishing characteristic of the Act is that it puts most of the responsibility for neglect of children on the backs of the mothers, who, under the laws of England, have no rights as parents. Two or three especially striking cases of this kind came into notice about this time, and gave the census resistance an additional justification.

The case of Annie Woolmore was a very pitiful one. She was arrested and sentenced to Holloway for six weeks for neglecting her children. The evidence showed that the woman lived with her husband and children in a miserable hovel, which would have been almost impossible to keep clean even if there had been water in the house. As it was the poor soul, who was in ill health and weakened by deprivation, had to carry all the water she used across a great distance. The children as well as the house were very

dirty, it was true, but the children were well nourished and kindly treated. The husband, a labourer, out of work much of the time, testified that his wife "starved herself to feed the kids." Yet she had violated the terms of the "Children's Charter" and she went to prison. I am glad to say that owing to the efforts of suffragists she was pardoned and provided with a better home.

Another case was that of Helen Conroy, who was charged with living in one wretched room, with her husband and seven children, the youngest a month old. According to the law the mother was forbidden to have this infant in bed with her overnight, yet part of the charge against her was that the child was found sleeping in a box of damp straw. Doubtless she would have preferred a cradle, or even a box of dry straw. But direst poverty made the cradle impossible and the conditions of the tenement kept the straw damp. Both parents in this instance were sent to prison for three months at hard labour. The magistrate casually remarked that the house in which these poor people lived had been condemned two years before, but some respectable property owner was still collecting rents from it.

Another poor mother, evicted from her home because she could not pay the rent, took her four children out into the open country, and when found was sleeping with them in a gravel pit. She was sent to prison for a month and the children went to the workhouse.

These sorry mothers, logical results of the subjection of women, are enough in themselves to justify almost any defiance of a Government who deny the women the right to work out their destinies in freedom. No pledge having been secured from the Prime Minister by April 1st, we carried out, and most successfully, our census resistance. Many thousands of women all over the country refused or evaded the returns. I returned my census paper with the words "No vote no census" written across it, and other women followed that example with similar messages. One woman filled in the blank with full information about her one man servant, and added that there were many women but no more persons in her household. In Birmingham sixteen women of wealth packed their houses with women resisters. They slept on the floors, on chairs and tables, and even in the baths. The head of a large college threw open the building to 300 women. Many women in other cities held all night parties for friends who wished to remain away from home. In some places unoccupied houses were rented for the night by resisters, who lay on the bare boards. Some groups of women hired gipsy vans and spent the night on the moors.

In London we gave a great concert at Queen's Hall on Census night. Many of us walked about Trafalgar Square until midnight and then repaired to Aldwich skating rink, where we amused ourselves until morning. Some skated while others looked on, and enjoyed the admirable musical and theatrical entertainment that helped to pass the hours. We had with us a number of the brightest stars in the theatrical world, and they were generous in their contributions. It being Sunday night, the chairman had to call on each of the artists for a "speech" instead of a song or other turn. An all-night restaurant near at hand did a big business, and on the whole the resisters had a very good time. The Scala Theatre was the scene of another all-night entertainment.

There was a good deal of curiosity to see what the Government would devise in the way of a punishment for the rebellious women, but the Government realised the impossibility of taking punitive action, and Mr. John Burns, who, as head of the Local Government Board, was responsible for the census, announced that they had decided to treat the affair with magnanimity. The number of evasions, he declared, was insignificant. But every one knew that this was the exact reverse of the facts.

[Illustration: IN THIS MANNER THOUSANDS OF WOMEN THROUGHOUT THE KINGDOM SLEPT IN UNOCCUPIED HOUSES OVER CENSUS NIGHT]

The Conciliation Bill was debated on May 5th and passed its second reading by the enormous majority of 137. And now the public and a section of the press united in a strong demand that the Government yield to the undoubted will of the House and grant facilities to the bill. The Conciliation Committee sent a deputation of members to the Prime Minister to remind him of his pre-election promise that the House of Commons should have an opportunity of dealing with the whole question of woman suffrage, but they succeeded only in getting his assurance that he had the matter under consideration. Late in the month the announcement was made in the House that the Government would not grant facilities during that session, but, since the new bill fulfilled the conditions named by the Prime Minister, and was now capable of amendment, the Government recognised it to be their duty to grant facilities in some session of the present Parliament. They would be prepared next session, when the bill had been again read for the second time, either as a result of obtaining a good place in the ballot, or (if that did not happen) by a grant of a Government day for the purpose, to give a week, which they understood to be the time suggested as reasonable by the promoters for its further stages.

This pledge was made in order to deter the W. S. P. U. from making a militant demonstration in connection with the coronation of the King.

Keir Hardie asked if the Government would, by means of a closure or otherwise, make certain that the bill would go through in the week, and the Prime Minister replied, "No, I cannot give an assurance of that kind. After all, it is a problem of the very greatest magnitude."

This reply seemed to make the Government's pledge practically worthless. The Conciliation Committee also realised the possibilities of the bill being talked out, and Lord Lytton wrote to Mr. Asquith and asked him for assurances that the facilities offered were intended not for academic discussion but for effective opportunity for carrying the bill. He also asked that the week offered should not be construed rigidly but that, providing the committee stage were got through in the time, additional days for the report and third reading stages might be forthcoming. Reasonable opportunity for making use of the closure was also asked. To Lord Lytton's letter the Prime Minister replied as follows:

My dear Lytton--In reply to your letter on the subject of the Women's Enfranchisement Bill, I would refer you to some observations recently made in a speech at the National Liberal Club by Sir Edward Grey, which accurately expresses the intention of the Government.

It follows (to answer your specific inquiries), that the "week" offered will be interpreted with reasonable elasticity, that the Government will interpose no reasonable obstacle to the proper use of the closure, and that if (as you suggest) the bill gets through committee in the time proposed, the extra days required for report and third reading will not be refused.

The Government, though divided in opinion on the merits of the bill, are unanimous in their determination to give effect, not only in the letter but in the spirit, to the promise in regard to facilities which I made on their behalf before the last general election. Yours etc., H. H. ASQUITH.

Sceptical up to this point, the W. S. P. U. was now convinced that the Government were sincere in their promise to give the bill full facilities in the following year. We held a joyful mass meeting in Queen's Hall and I again declared that warfare against the Government was at an end. Our new policy was the inauguration of a great holiday campaign, with the object of making victory in 1912 absolutely certain. Electors must be aroused, members of Parliament held to their allegiance. Women must be organised in order that questions that vitally affect the social welfare of the country might be placed before them. I chose Scotland and Wales as the scenes of my holiday labours.

I may say that our confidence was fully shared by the public at large. The belief in Mr. Asquith's pledge was accurately reflected in a leader published in _The Nation_, which said: "From the moment the Prime Minister signed the frank and ungrudging letter to Lord Lytton which appeared in last Saturday's newspapers, women became, in all but the legal formality, voters and citizens. For at least two years, if not for longer, nothing has been lacking save a full and fair opportunity for the House of Commons to translate its convictions into the precise language of a statute. That opportunity has been promised for next session and promised in terms and under conditions which ensure success."

The only thing, as we thought, that we had to fear were wrecking amendments to the bill, and in the new by-election policy which we adopted we worked against all candidates of every party who would refuse to promise, not only to support the Conciliation Committee to carry the bill, but also to vote against any amendment the committee thought dangerous. We believed that we had covered every possibility of disaster. But we had something yet to learn of the treachery of the Asquith Ministry and their capacity for cold-blooded lying.

Mr. Lloyd-George from the first was an open enemy of the bill, but since we had no doubt of the sincerity of the Prime Minister, we could only conclude that Mr. Lloyd-George had detached himself from the main body of the Government and had become the self-constituted leader of the opposition. In an address to a large Liberal group Mr. Lloyd-George advised that Liberal members be asked to ballot for a place for a "democratic measure," in order that such a measure might claim the Prime Minister's pledge for facilities next session. In one or two other speeches he made vague allusions to the possibilities of introducing another suffrage bill. His own idea was to amend the bill to give a vote to wives of all electors--making married women voters in virtue of their husband's qualification. The inevitable effect of such an amendment would be to wreck the bill, since it would have enfranchised about 6,000,000 women in addition to the million and a half who would benefit by the original terms of the bill. Such a wholesale addition to the electorate was never known in England; the number enfranchised by the Reform Bill of 1832 being hardly more than half a million. The Reform Bill of 1867 admitted a million new voters, and that of 1884 perhaps two millions. The absurdity of Mr. Lloyd-George's proposition was such that we did not regard it seriously. We did not allow his opposition to give us serious alarm

until a day in August when a Welsh member, Mr. Leif Jones, asked the Prime Minister from the floor of the House, whether he was aware that his promise for facilities for the Conciliation Bill in the next session was being claimed exclusively for that bill, and asked further for a statement that the promised facilities would be equally granted to any other suffrage bill that might secure a second reading and was capable of amendment. Mr. Lloyd-George, speaking for the Government, replied that they could not undertake to give facilities to more than one bill on the same subject, but that any bill which, satisfying these tests, secured a second reading, would be treated by them as falling within their engagements.

Astounded at this plain evasion of a sacred promise, Lord Lytton again wrote to the Prime Minister, reviewing the entire matter, and asking for another statement of the Government's intentions. The following is the text of Mr. Asquith's reply:

My dear Lytton--I have no hesitation in saying that the promises made by, and on behalf of the Government, in regard to giving facilities to the Conciliation Bill, will be strictly adhered to, both in letter and in spirit. Yours sincerely, H. H. ASQUITH. August 23, 1911.

Again we were reassured, and our confidence in the Premier's pledge remained unshaken throughout the campaign, although Mr. Lloyd-George continued to throw out hints that the promises of facilities for the bill were altogether illusory. We could not believe him, and when, two months later, I was asked in America: "When will English women vote?" I replied with perfect conviction, "Next year."

This was in Louisville, Kentucky, where I attended the 1911 Annual Convention of the National American Woman Suffrage Association.

I remember this third visit to the United States with especial pleasure. I was the guest in New York of Dr. and Mrs. John Winters Brannan, and through the courtesy of Dr. Brannan, who is at the head of all the city hospitals, I saw something of the penal system and the institutional life of America. We visited the workhouse and the penitentiary on Blackwell's Island, and although I am told that these places are not regarded as model institutions, I can assure my readers that they are infinitely superior to the English prisons where women are punished for trying to win their political freedom. In the American prisons, much as they lacked in some essentials, I saw no solitary confinement, no rule of silence, no deadly air of officialdom. The food was good and varied, and above all there was an air of kindness and good feeling between the officials and the prisoners that is almost wholly lacking in England.

But, after all, in the United States as in other countries, the problem of the relations between unfranchised women and the State remains unsolved and unsatisfactory. One night my friends took me to that sombre and terrible institution, the Night Court for Women. We sat on the bench with the magistrate, and he very courteously explained everything to us. The whole business was heart-breaking. All the women, with one exception--an old drunkard--were charged with solicitation. Most of them were of high type by nature. It all seemed so hopeless, and it was clear that they were victims of an evil system. Their conviction was a foregone conclusion.

The magistrate said that in most cases the reason for their coming there was economic. One case of a little cigar maker, who said very simply that she only went on the streets when out of work, and that when in work she earned $8 a week, was very tragic and touching. I could not keep the Night Court out of my speeches after that. The whole dreadful injustice of women's lives seemed mirrored in that place.

I went as far west as the Pacific Coast on this visit, spending Christmas day in Seattle, and for the first time seeing a community where women and men existed on terms of exact equality. It was a delightful experience. As I wrote home to our members, the men of the western States seemed to my eyes eager, earnest, rough men, building a great community in a great hurry, but never have I seen greater respect, courtesy and chivalry shown to women than in that one Suffrage State it has been my privilege to visit.

I am getting a little ahead of my story, however. It was in November, when I was in the city of Minneapolis, that a crushing blow descended on the English suffragists. I learned of this through cabled despatches in the newspapers and from private cables, and was so staggered that I could scarcely command myself sufficiently to fill my immediate engagements. This was the news, that the Government had broken their plighted word and had deliberately destroyed the Conciliation Bill. My first wild thought, on hearing of this act of treachery, was to cancel all engagements and return to England, but my final decision to remain afterwards proved the right one, because the women at home, without a moment's loss of time, struck the answering blow, guided by that insight which has been characteristic of every act of the members of our Union. I did not return to England until January 11, 1912, and by that time great deeds had been done. Our movement had entered upon a new and more vigorous stage of militancy.

FOOTNOTE:

[2] Lady Constance Lytton's story has been thrillingly told in her book "Prisons and Prisoners," Heinemann.

BOOK III

THE WOMEN'S REVOLUTION

CHAPTER I

Parliament had reassembled on October 25th, 1911, and the first move on the part of the Government was, to say the least of it, rather unpropitious. The Prime Minister submitted two motions, the first one empowering them to take all the time of the House during the remainder of the session, and the second guillotining discussion on the Insurance Bill so as to force the measure through before Christmas. One day only was allotted to the clauses relating to women in that bill. These clauses were notoriously unfair; they provided for sickness insurance of about four million women and unemployment insurance of no women at all. Under the provision of the bill eleven million men were ensured against sickness and about two and a half million against unemployment. Women were given lower benefits for the same premium as men, and premiums paid out of the family income were credited solely to the men's account. The bill as drafted provided no form of insurance for wives, mothers and daughters who spent their lives at home working for the family. It penalised women for staying in the home, which most men agree is women's only legitimate sphere of action. The amended bill grudgingly allowed aside from maternity benefits, a small insurance, on rather difficult terms, for workingmen's wives.

Thus the re-elected Government's first utterance to women was one of contempt; and this was followed, on November 7th, by the almost incredible announcement that the Government intended, at the next session, to introduce a manhood suffrage bill. This announcement was not made in the House of Commons, but to a deputation of men from the People's Suffrage Federation, a small group of people who advocated universal adult suffrage. The deputation, which was very privately arranged for, was received by Mr. Asquith, and the then Master of Elibank (Chief Liberal Whip). The spokesman asked Mr. Asquith to bring in a Government measure for universal adult suffrage, including adult women. The Prime Minister replied that the Government had pledged facilities for the Conciliation Bill, which was as far as they were prepared to go in the matter of women's suffrage. But, he added, the Government intended in the next session to introduce and to pass through all its stages a genuine reform bill which would sweep away existing qualifications for the franchise, and substitute a single qualification of residence. The bill would apply to adult males only, but it would be so framed as to be open to a woman suffrage amendment in case the House of Commons desired to make that extension and amendment.

This portentous announcement came like a bolt from the blue, and there was strong condemnation of the Government's treachery to women. Said the _Saturday Review_:

With absolutely no demand, no ghost of a demand, for more votes for men, and with--beyond all cavil--a very strong demand for votes for women, the Government announce their Manhood Suffrage Bill and carefully evade the other question! For a naked, avowed plan of gerrymandering no Government surely ever did beat this one.

The _Daily Mail_ said that the "policy which Mr. Asquith proposes is absolutely indefensible." And the _Evening Standard and Globe_ said: "We are no friends of female suffrage, but anything more contemptible than the attitude assumed by the Government it is difficult to imagine."

If the Government hoped to deceive any one by their dishonest reference to the possibility of a woman suffrage amendment, they were disappointed. Said the _Evening News_:

Mr. Asquith's bombshell will blow the Conciliation Bill to smithereens, for it is impossible to have a manhood suffrage for men and a property qualification for women. True, the Premier consents to leave the question of women's suffrage to the House, but he knows well enough what the decision of the House will be. The Conciliation Bill had a chance, but the larger measure has none at all.

I have quoted these newspaper leaders to show you that our opinion of the Government's action was shared even by the press. Universal suffrage in a country where women are in a majority of one million is not likely to happen in the lifetime of any reader of

this volume, and the Government's generous offer of a possible amendment was nothing more than a gratuitous insult to the suffragists.

The truce, naturally, came to an abrupt end. The W. S. P. U. wrote to the Prime Minister, saying that consternation had been aroused by the Government's announcement, and that it had been decided accordingly to send a deputation representing the Women's Social and Political Union to wait upon himself and the Chancellor of the Exchequer, on the evening of November 21st. The purpose of the deputation was to demand that the proposed manhood suffrage bill be abandoned, and that in its place should be introduced a Government measure giving equal franchise rights to men and women. A similar letter was despatched to Mr. Lloyd-George.

Six times before on occasions of crisis had the W. S. P. U. requested an interview with Mr. Asquith, and each time they had been refused. This time the Prime Minister replied that he had decided to receive a deputation of the various suffrage societies on November 17th, "including your own society, if you desire it." It was proposed that each society appoint four representatives as members of the deputation which would be received by the Prime Minister and the Chancellor of the Exchequer.

Nine suffrage societies sent representatives to the meeting, our own representatives being Christabel Pankhurst, Mrs. Pethick Lawrence, Miss Annie Kenney, Lady Constance Lytton and Miss Elizabeth Robins. Christabel and Mrs. Lawrence spoke for the Union, and they did not hesitate to accuse the two Ministers to their faces of having grossly tricked and falsely misled women. Mr. Asquith, in his reply to the deputation, resented these imputations.

He had kept his pledge, he insisted, in regard to the Conciliation Bill. He was perfectly willing to give facilities to the Bill, if the women preferred that to an amendment to his reform bill. Moreover, he denied that he had made any new announcement. As far back as 1908 he had distinctly declared that the Government regarded it as a sacred duty to bring forward a manhood suffrage bill before that Parliament came to an end. It was true that the Government did not carry out that binding obligation, and it was also true that until the present time nothing more was ever said about a manhood suffrage bill, but that was not the Government's fault. The crisis of the Lord's veto, had momentarily displaced the bill. Now he merely proposed to fulfil his promise made in 1908, and also his promise about giving facilities to the Conciliation Bill. He was ready to keep both promises. Well he knew that those promises were incompatible, that the fulfilment of both was therefore impossible, and Christabel told him so bluntly and fearlessly. "We are not satisfied," she warned him, and the Prime Minister said acidly: "I did not expect to satisfy _you_."

The reply of the W. S. P. U. was immediate and forceful. Led by Mrs. Pethick Lawrence, our women went out with stones and hammers and broke hundreds of windows in the Home Office, the War and Foreign Offices, the Board of Education, the Privy Council Office, the Board of Trade, the Treasury, Somerset House, the National Liberal Club, several post offices, the Old Banqueting Hall, the London and South Western Bank, and a dozen other buildings, including the residence of Lord Haldane and Mr. John Burns. Two hundred and twenty women were arrested and about 150 of them sent to prison for terms varying from a week to two months.

One individual protest deserves mention because of its prophetic character. In December Miss Emily Wilding Davison was arrested for attempting to set fire to a letter box at Parliament Street Post Office. In court Miss Davison said that she did it as a protest against the Government's treachery, and as a demand that women's suffrage be included in the King's speech. "The protest was meant to be serious," she said, "and so I adopted a serious course. In past agitation for reform the next step after window-breaking was incendiarism, in order to draw the attention of the private citizens to the fact that this question of reform was their concern as well as that of women."

Miss Davison received the severe sentence of six months' imprisonment for her deed.

To this state of affairs I returned from my American tour. I had the comfort of reflecting that my imprisoned comrades were being accorded better treatment than the early prisoners had known. Since early in 1910 some concessions had been granted, and some acknowledgment of the political character of our offences had been made. During the brief period when these scant concessions to justice were allowed, the hunger strike was abandoned and prison was robbed of its worst horror, forcible feeding. The situation was bad enough, however, and I could see that it might easily become a great deal worse. We had reached a stage at which the mere sympathy of members of Parliament, however sincerely felt, was no longer of the slightest use. Reminding our members this, in the first speeches made after returning to England I asked them to prepare themselves for more action. If women's suffrage was not included in the next King's speech we should have to make it absolutely impossible for the Government to touch the question of the franchise.

The King's speech, when Parliament met in February, 1912, alluded to the franchise question in very general terms. Proposals, it was stated, would be brought forward for the amendment of the law with respect to the franchise and the registration of electors. This might be construed to mean that the Government were going to introduce a manhood suffrage bill or a bill for the abolition of plural voting, which had been suggested in some quarters as a substitute for the manhood suffrage bill. No precise statement of the Government's intentions was made, and the whole franchise question was left in a cloud of uncertainty. Mr. Agg Gardner, a Unionist member of the Conciliation Committee, drew the third place in the ballot, and he announced that he should reintroduce the Conciliation Bill. This interested us very slightly, for knowing its prospect of success to have been destroyed, for we were done with the Conciliation Bill forever. Nothing less than a Government measure would henceforth satisfy the W. S. P. U., because it had been clearly demonstrated that only a Government measure would be allowed to pass the House of Commons. With sublime faith, or rather with a deplorable lack of political insight, the Women's Liberal Federation and the National Union of Women's Suffrage Societies professed full confidence in the proposed amendment to a manhood suffrage bill, but we knew how futile was that hope. We saw that the only course to take was to offer determined opposition to any measure of suffrage that did not include as an integral part, equal suffrage for men and women.

On February 16th we held a large meeting of welcome to a number of released prisoners who had served two and three months for the window breaking demonstration that had taken place in the previous November. At this meeting we candidly surveyed the situation and agreed on a course of action which we believed would be sufficiently strong to prevent the Government from advancing their threatened franchise bill. I said on this occasion:

"We don't want to use any weapons that are unnecessarily strong. If the argument of the stone, that time-honoured official political argument, is sufficient, then we will never use any stronger argument. And that is the weapon and the argument that we are going to use next time. And so I say to every volunteer on our demonstration, 'Be prepared to use that argument.' I am taking charge of the demonstration, and that is the argument I am going to use. I am not going to use it for any sentimental reason, I am going to use it because it is the easiest and the most readily understood. Why should women go to Parliament Square and be battered about and insulted, and most important of all, produce less effect than when we throw stones? We tried it long enough. We submitted for years patiently to insult and assault. Women had their health injured. Women lost their lives. We should not have minded if that had succeeded, but that did not succeed, and we have made more progress with less hurt to ourselves by breaking glass than ever we made when we allowed them to break our bodies.

"After all, is not a woman's life, is not her health, are not her limbs more valuable than panes of glass? There is no doubt of that, but most important of all, does not the breaking of glass produce more effect upon the Government? If you are fighting a battle, that should dictate your choice of weapons. Well, then, we are going to try this time if mere stones will do it. I do not think it will ever be necessary for us to arm ourselves as Chinese women have done, but there are women who are prepared to do that if it should be necessary. In this Union we don't lose our heads. We only go as far as we are obliged to go in order to win, and we are going forward with this next protest demonstration in full faith that this plan of campaign, initiated by our friends whom we honour to-night, will on this next occasion prove effective."

Ever since militancy took on the form of destruction of property the public generally, both at home and abroad, has expressed curiosity as to the logical connection between acts such as breaking windows, firing pillar boxes, et cetera, and the vote. Only a complete lack of historical knowledge excuses that curiosity. For every advance of men's political freedom has been marked with violence and the destruction of property. Usually the advance has been marked by war, which is called glorious. Sometimes it has been marked by riotings, which are deemed less glorious but are at least effective. That speech of mine, just quoted, will probably strike the reader as one inciting to violence and illegal action, things as a rule and in ordinary circumstances quite inexcusable. Well, I will call the reader's attention to what was, in this connection, a rather singular coincidence. At the very hour when I was making that speech, advising my audience of the political necessity of physical revolt, a responsible member of the Government, in another hall, in another city, was telling his audience precisely the same thing. This Cabinet Minister, the right Honourable C. E. H. Hobhouse, addressing a large anti-suffrage meeting in his constituency of Bristol, said that the suffrage movement was not a political issue because its adherents had failed to prove that behind this movement existed a large public demand. He declared that "In the case of the suffrage demand there has not been the kind of popular sentimental uprising which accounted for Nottingham Castle in 1832 or the Hyde Park railings in 1867. There has not been a great ebullition of popular feeling."

The "popular sentimental uprising" to which Mr. Hobhouse alluded was the burning to the ground of the castle of the anti-suffrage Duke of Newcastle, and of Colwick Castle, the country seat of another of the leaders of the opposition against the franchise bill.

The militant men of that time did not select uninhabited buildings to be fired. They burned both these historic residences over their owners' heads. Indeed, the wife of the owner of Colwick Castle died as a result of shock and exposure on that occasion. No arrests were made, no men imprisoned. On the contrary the King sent for the Premier, and begged the Whig Ministers favourable to the franchise bill not to resign, and intimated that this was also the wish of the Lords who had thrown out the bill. Molesworth's History of England says:

These declarations were imperatively called for. The danger was imminent and the Ministers knew it and did all that lay in their power to tranquillise the people, and to assure them that the bill was only delayed and not finally defeated.

For a time the people believed this, but soon they lost patience, and seeing signs of a renewed activity on the part of the anti-suffragists, they became aggressive again. Bristol, the very city in which Mr. Hobhouse made his speech, was set on fire. The militant reformers burned the new gaol, the toll houses, the Bishop's Palace, both sides of Queen's Square, including the Mansion House, the custom house, the excise office, many warehouses, and other private property, the whole valued at over L100,000--five hundred thousand dollars. It was as a result of such violence, and in fear of more violence, that the reform bill was hurried through Parliament and became law in June, 1832.

Our demonstration, so mild by comparison with English men's political agitation, was announced for March 4th, and the announcement created much public alarm. Sir William Byles gave notice that he would "ask the Secretary of State for the Home Department whether his attention had been drawn to a speech by Mrs. Pankhurst last Friday night, openly and emphatically inciting her hearers to violent outrage and the destruction of property, and threatening the use of firearms if stones did not prove sufficiently effective; and what steps he proposes to take to protect Society from this outbreak of lawlessness."

The question was duly asked, and the Home Secretary replied that his attention had been called to the speech, but that it would not be desirable in the public interest to say more than this at present.

Whatever preparations the police department were making to prevent the demonstration, they failed because, while as usual, we were able to calculate exactly what the police department were going to do, they were utterly unable to calculate what we were going to do. We had planned a demonstration for March 4th, and this one we announced. We planned another demonstration for March 1st, but this one we did not announce. Late in the afternoon of Friday, March 1st, I drove in a taxicab, accompanied by the Hon. Secretary of the Union, Mrs. Tuke and another of our members, to No. 10 Downing Street, the official residence of the Prime Minister. It was exactly half past five when we alighted from the cab and threw our stones, four of them, through the window panes. As we expected we were promptly arrested and taken to Cannon Row police station. The hour that followed will long be remembered in London. At intervals of fifteen minutes relays of women who had volunteered for the demonstration did their work. The first smashing of glass occurred in the Haymarket and Piccadilly, and greatly startled and alarmed both pedestrians and police. A large number of the women were arrested, and everybody thought that this ended the affair. But before the excited populace and the frustrated shop owners' first exclamation had died down, before the police had reached the station with their prisoners, the ominous crashing and splintering of plate glass began again, this time along both sides of Regent Street and the Strand. A furious rush of police and people towards the second scene of action ensued. While their attention was being taken up with occurrences in this quarter, the third relay of women began breaking the windows in Oxford Circus and Bond Street. The demonstration ended for the day at half past six with the breaking of many windows in the Strand. The _Daily Mail_ gave this graphic account of the demonstration:

From every part of the crowded and brilliantly lighted streets came the crash of splintered glass. People started as a window shattered at their side; suddenly there was another crash in front of them; on the other side of the street; behind--everywhere. Scared shop assistants came running out to the pavements; traffic stopped; policemen sprang this way and that; five minutes later the streets were a procession of excited groups, each surrounding a woman wrecker being led in custody to the nearest police station. Meanwhile the shopping quarter of London had plunged itself into a sudden twilight. Shutters were hurriedly fitted; the rattle of iron curtains being drawn came from every side. Guards of commissionaires and shopmen were quickly mounted, and any unaccompanied lady in sight, especially if she carried a hand bag, became an object of menacing suspicion.

At the hour when this demonstration was being made a conference was being held at Scotland Yard to determine what should be done to prevent the smashing of windows on the coming Monday night. But we had not announced the hour of our March 4th protest. I had in my speech simply invited women to assemble in Parliament Square on the evening of March 4th, and they accepted the invitation. Said the _Daily Telegraph_:

By six o'clock the neighbourhood Houses of Parliament were in a stage of siege. Shop keepers in almost every instance barricaded their premises, removed goods from the windows and prepared for the worst. A few minutes before six o'clock a huge force of police, amounting to nearly three thousand constables, was posted in Parliament Square, Whitehall, and streets adjoining, and large reserves were gathered in Westminster Hall and Scotland Yard. By half past eight Whitehall was packed from end to end with police and public. Mounted constables rode up and down Whitehall keeping the people on the move. At no time was there any sign of danger....

The demonstration had taken place in the morning, when a hundred or more women walked quietly into Knightsbridge and walking singly along the streets demolished nearly every pane of glass they passed. Taken by surprise the police arrested as many as they could reach, but most of the women escaped.

[Illustration: THE ARGUMENT OF THE BROKEN WINDOW PANE]

For that two days' work something like two hundred suffragettes were taken to the various police stations, and for days the long procession of women streamed through the courts. The dismayed magistrates found themselves facing, not only former rebels, but many new ones, in some cases, women whose names, like that of Dr. Ethel Smyth, the composer, were famous throughout Europe. These women, when arraigned, made clear and lucid statements of their positions and their motives, but magistrates are not schooled to examine motives. They are trained to think only of laws and mostly of laws protecting property. Their ears are not tuned to listen to words like those spoken by one of the prisoners, who said: "We have tried every means--processions and meetings--which were of no avail. We have tried demonstrations, and now at last we have to break windows. I wish I had broken more. I am not in the least repentant. Our women are working in far worse condition than the striking miners. I have seen widows struggling to bring up their children. Only two out of every five are fit to be soldiers. What is the good of a country like ours? England is absolutely on the wane. You only have one point of view, and that is the men's, and while men have done the best they could, they cannot go far without the women and the women's views. We believe the whole is in a muddle too horrible to think of."

The coal miners were at that time engaging in a terrible strike, and the Government, instead of arresting the leaders, were trying to come to terms of peace with them. I reminded the magistrate of this fact, and I told him that what the women had done was but a fleabite by comparison with the miners' violence. I said further: "I hope our demonstration will be enough to show the Government that the women's agitation is going on. If not, if you send me to prison, I will go further to show that women who have to help pay the salaries of Cabinet Ministers, and your salary too, sir, are going to have some voice in the making of the laws they have to obey."

I was sentenced to two months' imprisonment. Others received sentences ranging from one week to two months, while those who were accused of breaking glass above five pounds in value, were committed for trial in higher courts. They were sent to prison on remand, and when the last of us were behind the grim gates, not only Holloway but three other women's prisons were taxed to provide for so many extra inmates.

It was a stormy imprisonment for most of us. A great many of the women had received, in addition to their sentences, "hard labour," and this meant that the privileges at that time accorded to Suffragettes, as political offenders, were withheld. The women adopted the hunger strike as a protest, but as the hint was conveyed to me that the privileges would be restored, I advised a cessation of the strike. The remand prisoners demanded that I be allowed to exercise with them, and when this was not answered they broke the windows of their cells. The other suffrage prisoners, hearing the sound of shattered glass, and the singing of the Marseillaise, immediately broke their windows. The time had long gone by when the Suffragettes submitted meekly to prison discipline. And so passed the first days of my imprisonment.

CHAPTER II

The panic stricken Government did not rest content with the imprisonment of the window breakers. They sought, in a blind and blundering fashion, to perform the impossible feat of wrecking at a blow the entire militant movement. Governments have always tried to crush reform movements, to destroy ideas, to kill the thing that cannot die. Without regard to history, which shows that no Government have ever succeeded in doing this, they go on trying in the old, senseless way.

For days before the two demonstrations described in the last chapter our headquarters in Clement's Inn had been under constant observation by the police, and on the evening of March 5th an inspector of police and a large force of detectives suddenly

descended on the place, with warrants for the arrest of Christabel Pankhurst and Mr. and Mrs. Pethick Lawrence, who with Mrs. Tuke and myself were charged with "conspiring to incite certain persons to commit malicious damage to property." When the officers entered they found Mr. Pethick Lawrence at work in his office, and Mrs. Pethick Lawrence in her flat upstairs. My daughter was not in the building. The Lawrences, after making brief preparations drove in a taxicab to Bow Street Station, where they spent the night. The police remained in possession of the offices, and detectives were despatched to find and arrest Christabel. But that arrest never took place. Christabel Pankhurst eluded the entire force of detectives and uniformed police, trained hunters of human prey.

Christabel had gone home, and at first, on hearing of the arrest of Mr. and Mrs. Pethick Lawrence, had taken her own arrest for granted. A little reflection however showed her the danger in which the Union would stand if completely deprived of its accustomed leadership, and seeing that it was her duty to avoid arrest, she quietly left the house. She spent that night with friends who, next morning, helped her to make the necessary arrangements and saw her safely away from London. The same night she reached Paris, where she has since remained. My relief, when I learned of her flight, was very great, because I knew that whatever happened to the Lawrences and myself, the movement would be wisely directed, this in spite of the fact that the police remained in full possession of headquarters.

The offices in Clement's Inn were thoroughly ransacked by the police, in a determined effort to secure evidence of conspiracy. They went through every desk, file and cabinet, taking away with them two cab loads of books and papers, including all my private papers, photographs of my children in infancy, and letters sent me by my husband long ago. Some of these I never saw again.

The police also terrorised the printer of our weekly newspaper, and although the paper came out as usual, about a third of its columns were left blank. The headlines, however, with the ensuing space mere white paper produced a most dramatic effect. "History Teaches" read one headline to a blank space, plainly indicating that the Government were not willing to let the public know some of the things that history teaches. "Women's Moderation" suggested that the destroyed paragraph called for comparison of the women's window breaking with men's greater violence in the past. Most eloquent of all was the editorial page, absolutely blank except for the headline, "A Challenge!" and the name at the foot of the last column, Christabel Pankhurst. What words could have breathed a prouder defiance, a more implacable resolve? Christabel was gone, out of the clutches of the Government, yet she remained in complete possession of the field. For weeks the search for her went relentlessly on. Police searched every railway station, every train, every sea port. The police of every city in the Kingdom were furnished with her portrait. Every amateur Sherlock Holmes in England joined with the police in finding her. She was reported in a dozen cities, including New York. But all the time she was living quietly in Paris, in daily communication with the workers in London, who within a few days were once more at their appointed tasks. My daughter has remained in France ever since.

Meanwhile, I found myself in the anomalous position of a convicted offender serving two months' prison sentence, and of a prisoner on remand waiting to be charged with a more serious offence. I was in very bad health, having been placed in a damp and unwarmed third division cell, the result being an acute attack of bronchitis. I addressed a letter to the Home Secretary, telling him of my condition, and urging the necessity of liberty to recover my health and to prepare my case for trial. I asked for release on bail, the plain right of a remand prisoner, and I offered if bail were granted now to serve the rest of my two months' sentence later on. The sole concessions granted me, however, were removal to a better cell and the right to see my secretary and my solicitor, but only in the presence of a wardress and a member of the prison clerical staff. On March 14th Mr. and Mrs. Pethick Lawrence, Mrs. Tuke and myself were brought up for preliminary hearing on the charge of having, on November 1, 1911, and on various other dates "conspired and combined together unlawfully and maliciously to commit damage, etc." The case opened on March 14th in a crowded courtroom in which I saw many friends. Mr. Bodkin, who appeared for the prosecution, made a very long address, in which he endeavoured to prove that the Women's Social and Political Union was a highly developed organisation of most sinister character. He produced much documentary evidence, some of it of such amusing character that the court rocked with stifled laughter, and the judge was obliged to conceal his smiles behind his hand. Mr. Bodkin cited our code book with the assistance of which we were able to communicate private messages. His voice sank to a scandalised half whisper as he stated the fact that we had presumed to include the sacred persons of the Government in our private code. "We find," said Mr. Bodkin portentously, "that public men in the service of His Majesty as members of the Cabinet are tabulated here under code names. We find that the Cabinet collectively has its code word "Trees," and individual members of the Cabinet are designated by the name, sometimes of trees, but I am also bound to say the commonest weeds as well." Here a ripple of laughter interrupted. Mr. Bodkin frowned heavily, and continued: "There is one," he said solemnly, "called Pansy; another one--more complimentary--Roses, another, Violets, and so on." Each of the defendants was designated by a code letter. Thus Mrs. Pankhurst was identified by the letter F; Mrs. Pethick Lawrence,

D; Miss Christabel Pankhurst, E. Every public building, including the House of Commons, had its code name. The deadly possibilities of the code were illustrated by a telegram found in one of the files. It read: "Silk, thistle, pansy, duck, wool, E. Q." Translated by the aid of the code book the telegram read: "Will you protest Asquith's public meeting to-morrow evening but don't get arrested unless success depends on it. Wire back to Christabel Pankhurst, Clements Inn."

More laughter followed these revelations, which after all proved no more than the business-like methods employed by the W. S. P. U. The laughter proved something a great deal more significant, for it was a plain indication that the old respect in which Cabinet Ministers had been held was no more. We had torn the veil from their sacro-sanct personalities and shown them for what they were, mean and scheming politicians. More serious from the point of view of prosecution was the evidence brought in by members of the police department in regard to the occurrences of March 1st and 4th. The policemen who arrested me and my two companions in Downing Street on March 1st, after we had broken the windows in the Premier's house, testified that following the arrest, we had handed him our reserve stock of stones, and that they were all alike, heavy flints. Other prisoners were found in possession of similar stones, tending to prove that the stones all came from one source. Other officers testified to the methodical manner in which the window breaking of March 1st and 4th was carried out, how systematically it had been planned and how soldierly had been the behaviour of the women. By twos and threes March 4th they had been seen to go to the headquarters at Clement's Inn, carrying handbags, which they deposited at headquarters, and had then gone on to a meeting at the Pavillion Music Hall. The police attended the meeting, which was the usual rally preceding a demonstration or a deputation. At five o'clock the meeting adjourned and the women went out, as if to go home. The police observed that many of them, still in groups of twos and threes, went to the Gardenia restaurant in Catherine Street, Strand, a place where many Suffragette breakfasts and teas had been held. The police thought that about one hundred and fifty women congregated there on March 4th. They remained until seven o'clock, and then, under the watching eyes of the police, they sauntered out and dispersed. A few minutes later, when there was no reason to expect such a thing, the noise was heard, in many streets, of wholesale window smashing. The police authorities made much of the fact that the women who had left their bags at headquarters and were afterwards arrested, were bailed out that night by Mr. Pethick Lawrence. The similarity of the stones used; the gathering of so many women in one building, prepared for arrest; the waiting at the Gardenia Restaurant; the apparent dispersal; the simultaneous destruction in many localities of plate glass, and the bailing of prisoners by a person connected with the headquarters mentioned, certainly showed a carefully worked out plan. Only a public trial of the defendants could establish whether or not the plan was a conspiracy.

On the second day of the Ministerial hearing, Mrs. Tuke, who had been in the prison infirmary for twenty days and had to be attended in court by a trained nurse, was admitted to bail. Mr. Pethick Lawrence made a strong plea for bail for himself and his wife, pointing out that they had been in prison on remand for two weeks and were entitled to bail. I also demanded the privileges of a prisoner on remand. Both of these pleas were denied by the court, but a few days later the Home Secretary wrote to my solicitor that the remainder of my sentence of two months would be remitted until after the conspiracy trail at Bow Street. Mr. and Mrs. Pethick Lawrence had already been admitted to bail. Public opinion forced the Home Secretary to make these concessions, as it is well known that it is next to impossible to prepare a defence while confined in prison. Aside from the terrible effect of prison on one's body and nerves, there is the difficulty of consulting documents and securing other necessary data to be considered.

On April 4th the Ministerial hearing ended in the acquittal of Mrs. Tuke, whose activities in the W. S. P. U. were shown to be purely secretarial. Mr. and Mrs. Pethick Lawrence and myself were committed for trial at the next session of the Central Criminal Court, beginning April 23rd. Because of the weak state of my health the judge was with great difficulty prevailed upon to postpone the trial two weeks and it was, therefore, not until May 15th that the case was opened.

The trial at Old Bailey is a thing that I shall never forget. The scene is clear before me as I write, the judge impressively bewigged and scarlet robed, dominating the crowded courtroom, the solicitors at their table, the jury, and looking very far away, the anxious pale faces of our friends who crowded the narrow galleries.

By the veriest irony of fate this judge, Lord Coleridge, was the son of Sir Charles Coleridge who, in the year 1867, appeared with my husband, Dr. Pankhurst, in the famous case of Chorlton v. Lings, and sought to establish that women were persons, and as such were entitled to the Parliamentary vote. To make the irony still deeper the Attorney General, Sir Rufus Isaacs, who appeared as Counsel for the prosecution against women militants, himself had been guilty of remarkable speeches in corroboration of our point of view. In a speech made in 1910, in relation to the abolition of the Lords' veto, Sir Rufus made the statement that, although the agitation against privilege was being peacefully conducted, the indignation behind it was very intense. Said Sir Rufus: "Formerly when the great mass of the people were voteless they had to do something violent in order to show what they felt; to-day the elector's bullet is his ballot. Let no one be deceived, therefore, because in this present struggle everything is peaceful and orderly,

in contrast to the disorderliness of other great struggles of the past." We wondered if the man who said these words could fail to realise that voteless women, deprived of every constitutional means of righting their grievances, were also obliged to do something violent in order to show how they felt. His opening address removed all doubt on that score.

Sir Rufus Isaacs has a clear-cut, hawk-like face, deep eyes, and a somewhat world worn air. The first words he spoke were so astoundingly unfair that I could hardly believe that I heard them aright. He began his address to the jury by telling them that they must not, on any account, connect the act of the defendants with any political agitation.

"I am very anxious to impress upon you," he said, "from the moment we begin to deal with the facts of this case, that all questions of whether a woman is entitled to the Parliamentary franchise, whether she should have the same right of franchise as a man, are questions which are in no sense involved in the trial of this issue.... Therefore, I ask you to discard altogether from the consideration of the matters which will be placed before you any viewpoint you may have on this no doubt very important political issue."

Nevertheless Sir Rufus added in the course of his remarks that he feared that it would not be possible to keep out of the conduct of the case various references to political events, and of course the entire trial, from beginning to end, showed clearly that the case was what Mr. Tim Healey, Mrs. Pethick Lawrence's counsel, called it, a great State Trial.

Proceeding, the Attorney General described the W. S. P. U., which he said he thought had been in existence since 1907, and had used what were known as militant methods. In 1911 the association had become annoyed by the Prime Minister because he would not make women's suffrage what was called a Government question. In November, 1911, the Prime Minister announced the introduction of a manhood suffrage bill. From that time on the defendants set to work to carry out a campaign which would have meant nothing less than anarchy. Women were to be induced to act together at a given time, in different given places, in such numbers that the police should be paralysed by the number of persons breaking the law, in order, to use the defendant's own words, "to bring the Government to its knees."

After designating the respective positions held by the four defendants in the W. S. P. U., Sir Rufus went on to relate the events which resulted in the smashing of plate glass windows valued at some two thousand pounds, and the imprisonment of over two hundred women who were incited to their deeds by the conspirators in the dock. He entirely ignored the motive of the acts in question, and he treated the whole affair as if the women had been burglars. This inverted statement of the matter, though accurate enough as to facts, was such as might have been given by King John of the signing of Magna Charta.

A very great number of witnesses were examined, a large number of them being policemen, and their testimony, and our cross examination disclosed the startling fact that there exists in England a special band of secret police entirely engaged in political work. These men, seventy-five in number, form what is known as the political branch of the Criminal Investigation Department of the Police. They go about in disguise, and their sole duty is to shadow Suffragettes and other political workers. They follow certain political workers from their homes to their places of business, to their social pleasures, into tea rooms and restaurants, even to the theatre. They pursue unsuspecting people in taxicabs, sit beside them in omnibuses. Above all they take down speeches. In fact the system is exactly like the secret police system of Russia.

Mr. Pethick Lawrence and I spoke in our own defence, and Mr. Healey M. P. defended Mrs. Pethick Lawrence. I cannot give our speeches in full, but I should like to include as much of them as will serve to make the entire situation clear to the reader.

Mr. Lawrence spoke first at the opening of the case. He began by giving an account of the suffrage movement and why he felt the enfranchisement of women appeared to him a question so grave that it warranted strong measures in its pursuit. He sketched briefly the history of the Women's Social and Political Union, from the time when Christabel Pankhurst and Annie Kenney were thrown out of Sir Edward Grey's meeting and imprisoned for asking a political question, to the torpedoing of the Conciliation Bill. "The case that I have to put before you," he said, "is that neither the conspiracy nor the incitement is ours; but that the conspiracy is a conspiracy of the Cabinet who are responsible for the Government of this country; and that the incitement is the incitement of the Ministers of the Crown." And he did this most effectually not only by telling of the disgraceful trickery and deceit with which the Government had misled the suffragists in the matter of suffrage bills, but by giving the plain words in which members of the Cabinet had advised the women that they would never get the vote until they had learned to fight for it as men had fought in the past.

When it came my turn to speak, realising that the average man is profoundly ignorant of the history of the women's movement--because the press has never adequately or truthfully chronicled the movement--I told the jury, as briefly as I could, the story of the forty years' peaceful agitation before my daughters and I resolved that we would give our lives to the work of getting the

vote for women, and that we should use whatever means of getting the vote that were necessary to success.

"We founded the Women's Social and Political Union," I said, "in 1903. Our first intention was to try and influence the particular political Party, which was then coming into power, to make this question of the enfranchisement of women their own question and to push it. It took some little time to convince us--and I need not weary you with the history of all that has happened--but it took some little time to convince us that that was no use; that we could not secure things in that way. Then in 1905 we faced the hard facts. We realised that there was a Press boycott against Women's Suffrage. Our speeches at public meetings were not reported, our letters to the editors, were not published, even if we implored the editors; even the things relating to Women's Suffrage in Parliament were not recorded. They said the subject was not of sufficient public interest to be reported in the Press, and they were not prepared to report it. Then with regard to the men politicians in 1905: we realised how shadowy were the fine phrases about democracy, about human equality, used by the gentlemen who were then coming into power. They meant to ignore the women--there was no doubt whatever about that. For in the official documents coming from the Liberal party on the eve of the 1905 election, there were sentences like this: 'What the country wants is a simple measure of Manhood Suffrage.' There was no room for the inclusion of women. We knew perfectly well that if there was to be franchise reform at all, the Liberal party which was then coming into power did not mean Votes for Women, in spite of all the pledges of members; in spite of the fact that a majority of the House of Commons, especially on the Liberal side, were pledged to it--it did not mean that they were going to put it into practice. And so we found some way of forcing their attention to this question.

"Now I come to the facts with regard to militancy. We realised that the plans we had in our minds would involve great sacrifice on our part, that it might cost us all we had. We were at that time a little organisation, composed in the main of working women, the wives and daughters of working men. And my daughters and I took a leading part, naturally, because we thought the thing out, and, to a certain extent, because we were of better social position than most of our members, and we felt a sense of responsibility."

I described the events that marked the first days of our work, the scene in Free Trade Hall, Manchester, when my daughter and her companion were arrested for the crime of asking a question of a politician, and I continued:

"What did they do next? (I want you to realise that no step we have taken forward has been taken until after some act of repression on the part of our enemy, the Government--because it is the Government that is our enemy; it is not the Members of Parliament, it is not the men in the country; it is the Government in power alone that can give us the vote. It is the Government alone that we regard as our enemy, and the whole of our agitation is directed to bringing just as much pressure as necessary upon those people who can deal with our grievance.) The next step the women took was to ask questions during the course of meetings, because, as I told you, these gentlemen gave them no opportunity of asking them afterwards. And then began the interjections of which we have heard, the interference with the right to hold public meetings, the interference with the right of free speech, of which we have heard, for which these women, these hooligan women, as they have been called--have been denounced. I ask you, gentlemen, to imagine the amount of courage which it needs for a woman to undertake that kind of work. When men come to interrupt women's meetings, they come in gangs, with noisy instruments, and sing and shout together, and stamp their feet. But when women have gone to Cabinet Ministers' meetings--only to interrupt Cabinet Ministers and nobody else--they have gone singly. And it has become increasingly difficult for them to get in, because as a result of the women's methods there has developed the system of admission by ticket and the exclusion of women--a thing which in my Liberal days would have been thought a very disgraceful thing at Liberal meetings. But this ticket system developed, and so the women could only get in with very great difficulty. Women have concealed themselves for thirty-six hours in dangerous positions, under the platforms, in the organs, wherever they could get a vantage point. They waited starving in the cold, sometimes on the roof exposed to a winter's night, just to get a chance of saying in the course of a Cabinet Minister's speech, 'When is the Liberal Government going to put its promises into practice?' That has been the form militancy took in its further development."

I went over the whole matter of our peaceful deputations, and of the violence with which they were invariably met; of our arrests and the farcical police court trials, where the mere evidence of policemen's unsupported statements sent us to prison for long terms; of the falsehoods told of us in the House of Commons by responsible members of the Government--tales of women scratching and biting policemen and using hatpins--and I accused the Government of making these attacks against women who were powerless to defend themselves because they feared the women and desired to crush the agitation represented by our organisation.

"Now it has been stated in this Court," I said, "that it is not the Women's Social and Political Union that is in the Court, but that it is certain defendants. The action of the Government, gentlemen, is certainly against the defendants who are before you here to-day, but it is also against the Women's Social and Political Union. The intention is to crush that organisation. And this intention

apparently was arrived at after I had been sent to prison for two months for breaking a pane of glass worth, I am told, 2s. 3d., the punishment which I accepted because I was a leader of this movement, though it was an extraordinary punishment to inflict for so small an act of damages as I had committed. I accepted it as the punishment for a leader of an agitation disagreeable to the Government; and while I was there this prosecution started. They thought they would make a clean sweep of the people who they considered were the political brains of the movement. We have got many false friends in the Cabinet--people who by their words appear to be well-meaning towards the cause of Women's Suffrage. And they thought that if they could get the leaders of the Union out of the way, it would result in the indefinite postponement and settlement of the question in this country. Well, they have not succeeded in their design, and even if they had got all the so-called leaders of this movement out of their way they would not have succeeded even then. Now why have they not put the Union in the dock? We have a democratic Government, so-called. This Women's Social and Political Union is not a collection of hysterical and unimportant wild women, as has been suggested to you, but it is an important organisation, which numbers amongst its membership very important people. It is composed of women of all classes of the community, women who have influence in their particular organisations as working women; women who have influence in professional organisations as professional women; women of social importance; women even of Royal rank are amongst the members of this organisation, and so it would not pay a democratic Government to deal with this organisation as a whole.

"They hoped that by taking away the people that they thought guided the political fortunes of the organisation they would break the organisation down. They thought that if they put out of the way the influential members of the organisation they, as one member of the Cabinet, I believe, said, would crush the movement and get it 'on the run.' Well, Governments have many times been mistaken, gentlemen, and I venture to suggest to you that Governments are mistaken again. I think the answer to the Government was given at the Albert Hall meeting held immediately after our arrest. Within a few minutes, without the eloquence of Mrs. Pethick Lawrence, without the appeals of the people who have been called the leaders of this movement, in a very few minutes L10,000 was subscribed for the carrying on of this movement.

"Now a movement like that, supported like that, is not a wild, hysterical movement. It is not a movement of misguided people. It is a very serious movement. Women, I submit, like our members, and women, I venture to say, like the two women, and like the man who are in the dock to-day, are not people to undertake a thing like this lightly. May I just try to make you feel what it is that has made this movement the gigantic size it is from the very small beginnings it had? It is one of the biggest movements of modern times. A movement which is not only an influence, perhaps not yet recognised, in this country, but is influencing the women's movement all over the world. Is there anything more marvellous in modern times than the kind of spontaneous outburst in every country of this woman's movement? Even in China--and I think it somewhat of a disgrace to Englishmen--even in China women have won the vote, as an outcome of a successful revolution, with which, I dare say, members of his Majesty's Government sympathise--a bloody revolution.

"One more word on that point. When I was in prison the second time, for three months as a common criminal for no greater offence than the issue of a handbill--less inflammatory in its terms than some of the speeches of members of the Government who prosecute us here--during that time, through the efforts of a member of Parliament, there was secured for me permission to have the daily paper in prison, and the first thing I read in the daily Press was this: that the Government was at that moment feting the members of the Young Turkish Revolutionary Party, gentlemen who had invaded the privacy of the Sultan's home--we used to hear a great deal about invading the privacy of Mr. Asquith's residence when we ventured to ring his door bell--gentlemen who had killed and slain, and had been successful in their revolution, while we women had never thrown a stone--for none of us was imprisoned for stone throwing, but merely for taking the part we had then taken in this organisation. There we were imprisoned while these political murderers were being feted by the very Government who imprisoned us, and were being congratulated on the success of their revolution. Now I ask you, was it to be wondered at that women said to themselves: 'Perhaps it is that we have not done enough. Perhaps it is that these gentlemen do not understand womenfolk. Perhaps they do not realise women's ways, and because we have not done the things that men have done, they may think we are not in earnest.'

"And then we come down to this last business of all, when we have responsible statesmen like Mr. Hobhouse saying that there had never been any sentimental uprising, no expression of feeling like that which led to the burning down of Nottingham Castle. Can you wonder, then, that we decided we should have to nerve ourselves to do more, and can you understand why we cast about to find a way, as women will, that would not involve loss of human life and the maiming of human beings, because women care more about human life than men, and I think it is quite natural that we should, for we know what life costs. We risk our lives when men are born. Now, I want to say this deliberately as a leader of this movement. We have tried to hold it back, we have tried to keep it from

going beyond bounds, and I have never felt a prouder woman than I did one night when a police constable said to me, after one of these demonstrations, 'Had this been a man's demonstration, there would have been bloodshed long ago.' Well, my lord, there has not been any bloodshed except on the part of the women themselves--these so-called militant women. Violence has been done to us, and I who stand before you in this dock have lost a dear sister in the course of this agitation. She died within three days of coming out of prison, a little more than a year ago. These are things which, wherever we are, we do not say very much about. We cannot keep cheery, we cannot keep cheerful, we cannot keep the right kind of spirit, which means success, if we dwell too much upon the hard part of our agitation. But I do say this, gentlemen, that whatever in future you may think of us, you will say this about us, that whatever our enemies may say, we have always put up an honourable fight, and taken no unfair means of defeating our opponents, although they have not always been people who have acted so honourably towards us.

"We have assaulted no one; we have done no hurt to any one; and it was not until 'Black Friday'--and what happened on 'Black Friday' is that we had a new Home Secretary, and there appeared to be new orders given to the police, because the police on that occasion showed a kind of ferocity in dealing with the women that they had never done before, and the women came to us and said: 'We cannot bear this'--it was not until then we felt this new form of repression should compel us to take another step. That is the question of 'Black Friday,' and I want to say here and now that every effort was made after 'Black Friday' to get an open public judicial inquiry into the doings of 'Black Friday,' as to the instructions given to the police. That inquiry was refused; but an informal inquiry was held by a man, whose name will carry conviction as to his status and moral integrity on the one side of the great political parties, and a man of equal standing on the Liberal side. These two men were Lord Robert Cecil and Mr. Ellis Griffith. They held a private inquiry, had women before them, took their evidence, examined that evidence, and after hearing it said that they believed what the women had told them was substantially true, and that they thought there was good cause for that inquiry to be held. That was embodied in a report. To show you our difficulties, Lord Robert Cecil, in a speech at the Criterion Restaurant, spoke on this question. He called upon the Government to hold this inquiry, and not one word of that speech was reported in any morning paper. That is the sort of thing we have had to face, and I welcome standing here, if only for the purpose of getting these facts out, and I challenge the Attorney General to institute an inquiry into these proceedings--not that kind of inquiry of sending their inspectors to Holloway and accepting what they are told by the officials--but to open a public inquiry, with a jury, if he likes, to deal with our grievances against the Government and the methods of this agitation.

"I say it is not the defendants who have conspired, but the Government who have conspired against us to crush this agitation; but however the matter may be decided, we are content to abide by the verdict of posterity. We are not the kind of people who like to brag a lot; we are not the kind of people who would bring ourselves into this position unless we were convinced that it was the only way. I have tried--all my life I have worked for this question--I have tried arguments, I have tried persuasion. I have addressed a greater number of public meetings, perhaps, than any person in this court, and I have never addressed one meeting where substantially the opinion of the meeting--not a ticket meeting, but an open meeting, for I have never addressed any other kind of a meeting--has not been that where women bear burdens and share responsibilities like men they should be given the privileges that men enjoy. I am convinced that public opinion is with us--that it has been stifled--wilfully stifled--so that in a public Court of Justice one is glad of being allowed to speak on this question."

The Attorney General's summing up for the prosecution was very largely a defence of the Liberal Party and its course in regard to woman suffrage legislation. Therefore, Mr. Tim Healey, in his defence of Mrs. Pethick Lawrence, did well to lay stress on the political character of the conspiracy charge and trial. He said:

"It is no doubt a very useful thing when you have political opponents to be able to set the law in motion against them. I have not the smallest doubt it would be a very convenient thing, if they had the courage to do it, to shut up the whole of His Majesty's Opposition while the present Government is in office--to lock up all the men of lustre and distinction in our public forum and on our public platforms--all the Carsons, F. E. Smiths, Bonar Laws, and so on. It would be a most convenient thing to end the whole thing, as it would be to end women's agitation in the form of the indictment. Gentlemen of the jury, whatever words have been spoken by mutual opponents, whatever instructions have been addressed, not to feeble females, but to men who boast of drilling and of arms, they have not had the courage to prosecute anybody, except women, by means of an indictment. Yet the Government of my learned friend have selected two dates as cardinal dates, and they ask you to pass judgment upon the prisoners at the bar, and to say that, without rhyme or reason, taking the course suggested without provocation, these responsible, well-bred, educated, University people, have suddenly, in the words of the indictment, wickedly and with malice aforethought engaged in these criminal designs.

"Gentlemen of the jury, the first thing I would ask in that connection is this: What is there in the course of this demand put forward by women which should have excited the treatment at the hands of His Majesty's Ministers which this movement, according to the documents which are in evidence before me, has received? I should suppose that the essence of all government is the smooth conduct of affairs, so that those who enjoy high station, great emoluments, should not be parties against whom the accusation of provoking civic strife and breeding public turmoil should be brought. What do we find? We find that, in regard to the treatment of the demand which had always been put forward humbly, respectably, respectfully, in its origin, by those who have received trade unionists, anti-vaccinators, deceased wife's sisters, and all other forms of political demand, and who have received them humbly and yielded to them, we find that when these people advocating this particular form of civic reform request an audience, request admission, request even to have their petitions respectfully received, they have met, judicially, at all events, with a flat and solemn negative. That is the beginning of this unhappy spirit bred in the minds of persons like the defendants, persons like those against whom evidence has been tendered--which has led to your being empanelled in that box to-day. And I put it to you when you are considering whether it is the incitement of my clients or the conduct of Ministers that have led to these events--whether I cannot ask you to say that even a fair apportionment of blame should not rest upon more responsible shoulders, and whether you should go out of your way to say that these persons in the dock alone are guilty."

In closing Mr. Healey reverted to the political character of the trial. "The Government have undertaken this prosecution," he declared, "to seclude for a considerable period their chief opponents. They hope there will be at public meetings which they attend no more inconvenient cries of 'Votes for Women.' I cannot conceive any other object which they could have in bringing the prosecution. I have expressed my regret at the loss which the shopkeepers, tradesmen and others have suffered. I regret it deeply. I regret that any person should bring loss or suffering upon innocent people. But I ask you to say that the law has already been sufficiently vindicated by the punishment of the immediate authors of the deed. What can be gained? Does justice gain?

"I almost hesitate to treat this as a legal inquiry. I regard it as a vindictive political act. Of all the astonishing acts that have ever been brought into a public court against a prisoner I cannot help feeling the charge against Mr. Pethick Lawrence is the most astonishing. He ventured to attend at some police courts and gave bail for women who had been arrested in endeavouring, as I understand, to present petitions to Parliament or to have resort to violence. I do not complain of the way in which my learned friend has conducted the prosecution, but I do complain of the police methods--inquiring into the homes and the domestic circumstances of the prisoners, obtaining their papers, taking their newspaper, going into their banking account, bringing up their bankers here to say what is their balance; and I do say that in none of the prosecutions of the past have smaller methods belittled a great State trial, because, look at it as you will, you cannot get away from it that this is a great State trial. It is not the women who are on trial. It is the men. It is the system of Government which is upon its trial. It is this method of rolling the dice by fifty-four counts in an indictment without showing to what any bit of evidence is fairly attributable; the system is on its trial--a system whereby every innocent act in public life is sought to be enmeshed in a conspiracy."

The jury was absent for more than an hour, showing that they had some difficulty in agreeing upon a verdict. When they returned it was plain from their strained countenances that they were labouring under deep feeling. The foreman's voice shook as he pronounced the verdict, guilty as charged, and he had hard work to control his emotion as he added: "Your Lordship, we unanimously desire to express the hope that, taking into consideration the undoubtedly pure motives that underlie the agitation that has led to this trouble, you will be pleased to exercise the utmost clemency and leniency in dealing with the case."

A burst of applause followed this plea. Then Mr. Pethick Lawrence arose and asked to say a few words before sentence was pronounced. He said that it must be evident, aside from the jury's recommendation, that we had been actuated by political motives, and that we were in fact political offenders. It had been decided in English Courts that political offenders were different from ordinary offenders, and Mr. Lawrence cited the case of a Swiss subject whose extradition was refused because of the political character of his offence. The Court on that occasion had declared that even if the crime were murder committed with a political motive it was a political crime. Mr. Lawrence also reminded the judge of the case of the late Mr. W. T. Stead, convicted of a crime, yet because of the unusual motive behind the crime, was allowed first division treatment and full freedom to receive his family and friends. Last of all the case of Dr. Jameson was cited. Although his raid resulted in the death of twenty-one persons and the wounding of forty-six more, the political character of his offence was taken into account and he was made a first division prisoner.

They were men, fighting in a man's war. We of the W. S. P. U. were women, fighting in a woman's war. Lord Coleridge, therefore, saw in us only reckless and criminal defiers of law. Lord Coleridge said: "You have been convicted of a crime for which the law would sanction, if I chose to impose it, a sentence of two years' imprisonment with hard labour. There are circumstances connected with your case which the jury have very properly brought to my attention, and I have been asked by you all three to treat you as first

class misdemeanants. If, in the course of this case, I had observed any contrition or disavowal of the acts you have committed, or any hope that you would avoid repetition of them in future, I should have been very much prevailed upon by the arguments that have been advanced to me."

No contrition having been expressed by us, the sentence of the Court was that we were to suffer imprisonment, in the second division, for the term of nine months, and that we were to pay the costs of the prosecution.

CHAPTER III

The sentence of nine months astonished us beyond measure, especially in view of certain very recent events, one of these being the case of some sailors who had mutinied in order to call attention to something which they considered a peril to themselves and to all seafarers. They were tried and found technically guilty, but because of the motive behind their mutiny, were discharged without punishment. Perhaps more nearly like our case than this was the case of the labour leader, Tom Mann, who, shortly before, had written a pamphlet calling upon His Majesty's soldiers not to fire upon strikers when commanded to do so by their superior officers. From the Government's point of view this was a much more serious kind of inciting than ours, because if it had been responded to the authorities would have been absolutely crippled in maintaining order. Besides, soldiers who refuse to obey orders are liable to the death penalty. Tom Mann was given a sentence of six months, but this was received, on the part of the Liberal Press and Liberal politicians, with so much clamour and protest that the prisoner was released at the end of two months. So, even on our way to prison, we told one another that our sentences could not stand. Public opinion would never permit the Government to keep us in prison for nine months, or in the second division for any part of our term. We agreed to wait seven Parliamentary days before we began a hunger strike protest.

It was very dreary waiting, those seven Parliamentary days, because we could not know what was happening outside, or what was being talked of in the House. We could know nothing of the protests and memorials that were pouring in, on our behalf, from Oxford and Cambridge Universities, from members of learned societies, and from distinguished men and women of all professions, not only in England but in every country of Europe, from the United States and Canada, and even from India. An international memorial asking that we be treated as political prisoners was signed by such great men and women as Prof. Paul Milyoukoff, leader of the Constitutional Democrats in the Duma; Signor Enrico Ferri, of the Italian Chamber of Deputies; Edward Bernstein, of the German Reichstag; George Brandes, Edward Westermarck, Madame Curie, Ellen Key, Maurice Maeterlinck, and many others. The greatest indignation was expressed in the House, Keir Hardie and Mr. George Lansbury leading in the demand for a drastic revision of our sentences and our immediate transference to the first division. So much pressure was brought to bear that within a few days the Home Secretary announced that he felt it his duty to examine into the circumstances of the case without delay. He explained that the prisoners had not at any time been forced to wear prison clothes. Ultimately, which in this case means shortly before the expiration of the seven Parliamentary days, we were all three placed in the first division. Mrs. Pethick Lawrence was given the cell formerly occupied by Dr. Jameson and I had the cell adjoining. Mr. Pethick Lawrence, in Brixton Gaol, was similarly accommodated. We all had the privilege of furnishing our cells with comfortable chairs, tables, our own bedding, towels, and so on. We had meals sent in from the outside; we wore our own clothing and had what books, newspapers and writing materials we required. We were not permitted to write or receive letters or to see our friends except in the ordinary two weeks' routine. Still we had gained our point that suffrage prisoners were politicals.

We had gained it, but, as it turned out, only for ourselves. When we made the inquiry, "Are all our women now transferred to the first division?" the answer was that the order for transference referred only to Mr. and Mrs. Pethick Lawrence and myself. Needless to say, we immediately refused to accept this unfair advantage, and after we had exhausted every means in our power to induce the Home Secretary to give the other suffrage prisoners the same justice that we had received, we adopted the protest of the hunger strike. The word flew swiftly through Holloway, and in some mysterious way travelled to Brixton, to Aylesbury, and Winson Green, and at once all the other suffrage prisoners followed our lead. The Government then had over eighty hunger strikers on their hands, and, as before, had ready only the argument of force, which means that disgusting and cruel process of forcible feeding. Holloway became a place of horror and torment. Sickening scenes of violence took place almost every hour of the day, as the doctors went from cell to cell performing their hideous office. One of the men did his work in such brutal fashion that the very sight of him provoked cries of horror and anguish. I shall never while I live forget the suffering I experienced during the days when those cries were ringing in my ears. In her frenzy of pain one woman threw herself from the gallery on which her cell opened. A wire netting eight feet below broke her fall to the iron staircase beneath, else she must inevitably have been killed. As it was she was frightfully hurt.

The wholesale hunger strike created a tremendous stir throughout England, and every day in the House the Ministers were harassed with questions. The climax was reached on the third or fourth day of the strike, when a stormy scene took place in the House of Commons. The Under Home Secretary, Mr. Ellis Griffith, had been mercilessly questioned as to conditions under which the forcible feeding was being done, and as soon as this was over one of the suffragist members made a moving appeal to the Prime Minister himself to order the release of all the prisoners. Mr. Asquith, forced against his will to take part in the controversy, rose and said that it was not for him to interfere with the actions of his colleague, Mr. McKenna, and he added, in his own suave, mendacious manner: "I must point out this, that there is not one single prisoner who cannot go out of prison this afternoon on giving the undertaking asked for by the Home Secretary." Meaning an undertaking to refrain henceforth from militancy.

Instantly Mr. George Lansbury sprang to his feet and exclaimed: "You know they cannot! It is perfectly disgraceful that the Prime Minister of England should make such a statement."

Mr. Asquith glanced carelessly at the indignant Lansbury, but sank into his seat without deigning to reply. Shocked to the depths of his soul by the insult thrown at our women, Mr. Lansbury strode up to the Ministerial bench and confronted the Prime Minister, saying again: "That was a disgraceful thing for you to say, Sir. You are beneath contempt, you and your colleagues. You call yourselves gentlemen, and you forcibly feed and murder women in this fashion. You ought to be driven out of office. Talk about protesting. It is the most disgraceful thing that ever happened in the history of England. You will go down to history as the men who tortured innocent women."

By this time the House was seething, and the indignant Labour member had to shout at the top of his big voice in order to be heard over the din. Mr. Asquith's pompous order that Mr. Lansbury leave the House for the day was probably known to very few until it appeared in print next day. At all events Mr. Lansbury continued his protest for five minutes longer. "You murder, torture and drive women mad," he cried, "and then you tell them they can walk out. You ought to be ashamed of yourself. You talk about principle--you talk about fighting in Ulster--you, too--" turning to the Unionist benches--"You ought to be driven out of public life. These women are showing you what principle is. You ought to honour them for standing up for their womanhood. I tell you, Commons of England, you ought to be ashamed of yourselves."

The Speaker came to Mr. Asquith's rescue at last and adjured Mr. Lansbury that he must obey the Prime Minister's order to leave the House, saying that such disorderly conduct would cause the House to lose respect. "Sir," exclaimed Mr. Lansbury, in a final burst of righteous rage, "it has lost it already."

This unprecedented explosion of wrath and scorn against the Government was the sensation of the hour, and it was felt on all sides that the release of the prisoners, or at least cessation of forcible feeding, which amounted to the same thing, would be ordered. Every day the Suffragettes marched in great crowds to Holloway, serenading the prisoners and holding protest meetings to immense crowds. The music and the cheering, faintly wafted to our straining ears, was inexpressibly sweet. Yet it was while listening to one of these serenades that the most dreadful moment of my imprisonment occurred. I was lying in bed, very weak from starvation, when I heard a sudden scream from Mrs. Lawrence's cell, then the sound of a prolonged and very violent struggle, and I knew that they had dared to carry their brutal business to our doors. I sprang out of bed and, shaking with weakness and with anger, I set my back against the wall and waited for what might come. In a few moments they had finished with Mrs. Lawrence and had flung open the door of my cell. On the threshold I saw the doctors, and back of them a large group of wardresses. "Mrs. Pankhurst," began the doctor. Instantly I caught up a heavy earthenware water jug from a table hard by, and with hands that now felt no weakness I swung the jug head high.

"If any of you dares so much as to take one step inside this cell I shall defend myself," I cried. Nobody moved or spoke for a few seconds, and then the doctor confusedly muttered something about to-morrow morning doing as well, and they all retreated.

I demanded to be admitted to Mrs. Lawrence's cell, where I found my companion in a desperate state. She is a strong woman, and a very determined one, and it had required the united strength of nine wardresses to overcome her. They had rushed into the cell without any warning, and had seized her unawares, else they might not have succeeded at all. As it was she resisted so violently that the doctors could not apply the stethoscope, and they had very great difficulty in getting the tube down. After the wretched affair was over Mrs. Lawrence fainted, and for hours afterwards was very ill.

This was the last attempt made to forcibly feed either Mrs. Lawrence or myself, and two days later we were ordered released on medical grounds. The other hunger strikers were released in batches, as every day a few more triumphant rebels approached the point where the Government stood in danger of committing actual murder. Mr. Lawrence, who was forcibly fed twice a day for more

than ten days, was released in a state of complete collapse on July 1st. Within a few days after that the last of the prisoners were at liberty.

As soon as I was sufficiently recovered I went to Paris and had the joy of seeing again my daughter Christabel, who, during all the days of strife and misery, had kept her personal anxiety in the background and had kept staunchly at her work of leadership. The absence of Mr. and Mrs. Pethick Lawrence had thrown the entire responsibility of the editorship of our paper, _Votes for Women_, on her shoulders, but as she has invariably risen to meet new responsibility, she conducted the paper with skill and discretion.

We had much to talk about and to consider, because it was evident that militancy, instead of being dropped, as the other suffrage societies were constantly suggesting, must go on very much more vigorously than before. The struggle had been too long drawn out. We had to seek ways to shorten it, to bring it to such a climax that the Government would acknowledge that something had to be done. We had already demonstrated that our forces were impregnable. We could not be conquered, we could not be terrified, we could not even be kept in prison. Therefore, since the Government had their war lost in advance, our task was merely to hasten the surrender.

The situation in Parliament, as far as the suffrage question was concerned, was clean swept and barren. The third Conciliation Bill had failed to pass its second reading, the majority against it being fourteen.

Many Liberal members were afraid to vote for the bill because Mr. Lloyd-George and Mr. Lewis Harcourt had persistently spread the rumour that its passage, at that time, would result in splitting the Cabinet. The Irish Nationalist members had become hostile to the bill because their leader, Mr. Redmond, was an anti-suffragist, and had refused to include a woman suffrage clause in the Home Rule Bill. Our erstwhile friends, the Labour members, were so apathetic, or so fearful for certain of their own measures, that most of them stayed away from the House on the day the bill reached its second reading. So it was lost, and the Militants were blamed for its loss! In June the Government announced that Mr. Asquith's manhood suffrage bill would soon be introduced, and very soon after this the bill did appear. It simplified the registration machinery, reduced the qualifying period of residence to six months, and abolished property qualifications, plural voting and University representation. In a word, it gave the Parliamentary franchise to every man above the age of twenty-one and it denied it to all women. Never in the history of the suffrage movement had such an affront been offered to women, and never in the history of England had such a blow been aimed at women's liberties. It is true that the Prime Minister had pledged himself to introduce a bill capable of being amended to include women's suffrage, and to permit any amendment that passed its second reading to become a part of the bill. But we had no faith in an amendment, nor in any bill that was not from its inception an official Government measure. Mr. Asquith had broken every pledge he had ever made the women, and this new pledge impressed us not at all. Well we knew that he had given it only to cover his treachery in torpedoing the Conciliation Bill, and in the hope of placating the suffragists, perhaps securing another truce to militancy.

If this last was his hope he was most grievously disappointed. Signs were constantly appearing to indicate that women would no longer be contented with the symbolic militancy involved in window breaking. For example, traces were found in the Home Secretary's office at Whitehall of an attempt at arson. On the doorstep of another Cabinet Minister similar traces were found. Had the Government acted upon these warnings, by giving women the vote, all the serious acts of militancy that have occurred since would have been averted. But like the heart of Pharaoh, the heart of the Government hardened, and militant acts followed one another in rapid succession. In July the W. S. P. U. issued a manifesto which set forth our intentions in that regard. The manifesto read in part as follows:

"The leaders of the Women's Social and Political Union have so often warned the Government that unless the vote were granted to women in response to the mild militancy of the past, a fiercer spirit of revolt would be awakened which it would be impossible to control. The Government have blindly disregarded the warning, and now they are reaping the harvest of their unstatesmanlike folly."

This was issued immediately after a visit paid by Mr. Asquith to Dublin. The occasion had been intended to be one of great pomp and circumstance, a huge popular demonstration in honour of the sponsor of Home Rule, but the Suffragettes turned it into the most lamentable fiasco imaginable. From the hour of Mr. Asquith's attempted secret departure from London until his return he lived and moved in momentary dread of Suffragettes. Every time he entered or left a railway carriage or a steamer he was confronted by women. Every time he rose to speak he was interrupted by women. Every public appearance he made was turned into a riot by women. As he left Dublin a woman threw a hatchet into his motor car, without, however, doing him any injury. As a final protest against his reception by Irishmen, the Theatre Royal was set on fire by two women. The theatre was practically empty at the time,

the performance having been completed, and the damage done was comparatively small, yet the two women chiefly concerned, Mrs. Leigh and Miss Evans, were given the barbarous sentences of five years each in prison. These were the first women sentenced to penal servitude in the history of our movement. Of course they did not serve their sentences. On entering Mountjoy Prison they put in the usual claim for first division treatment, and this being refused, they immediately adopted the hunger strike. A number of Irish Suffragettes were in Mountjoy at this time for a protest made against the exclusion of women from the Home Rule Bill. They were in the first division, and they were almost on the eve of their release, but such is the indomitable spirit of militancy that these women entered upon a sympathetic hunger strike. They were released, but the Government forbade the release of Mrs. Leigh and Miss Evans, that is, they ordered the authorities to retain the women as long as they could, by forcible feeding, be kept alive. After a struggle which, for fierceness and cruelty, is almost unparalleled in our annals, the two women fought their way out.

All during that summer militancy surged up and down throughout the Kingdom. A series of attacks on golf links was instituted, not at all in a spirit of wanton mischief, but with the direct and very practical object of reminding the dull and self-satisfied English public that when the liberties of English women were being stolen from them was no time to think of sports. The women selected country clubs where prominent Liberal politicians were wont to take their week-end pleasures, and with acids they burned great patches of turf, rendering the golf greens useless for the time being. They burned the words, Votes for Women, in some cases, and always they left behind them reminders that women were warring for their freedom. On one occasion when the Court was at Balmoral Castle in Scotland, the Suffragettes invaded the Royal golf links, and when Sunday morning dawned all the marking flags were found to have been replaced by W. S. P. U. flags hearing inscriptions such as "Votes for Women means peace for Ministers," "Forcible feeding must be stopped," and the like. The golf links were frequently visited by Suffragettes in order to question recreant ministers. Two women followed the Prime Minister to Inverness, where he was playing golf with Mr. McKenna. Approaching the men one Suffragette exclaimed: "Mr. Asquith, you must stop forcible feeding--" She got no farther, for Mr. Asquith, turning pale with rage--perhaps--retreated behind the Home Secretary, who, quite forgetting his manners, seized the Suffragette, crying out that he was going to throw her into the pond. "Then we will take you with us," the two retorted, after which a very lively scuffle ensued, and the women were not thrown into the pond.

[Illustration: A SUFFRAGETTE THROWING A BAG OF FLOUR AT MR. ASQUITH IN CHESTER]

This golf green activity really aroused more hostility against us than all the window-breaking. The papers published appeals to us not to interfere with a game that helped weary politicians to think clearly, but our reply to this was that it had not had any such effect on the Prime Minister or Mr. Lloyd-George. We had undertaken to spoil their sport and that of a large class of comfortable men in order that they should be obliged to think clearly about women, and women's firm determination to get justice.

I made my return to active work in the autumn by speaking at a great meeting of the W. S. P. U., held in the Albert Hall. At that meeting I had the announcement to make that the six years' association of Mr. and Mrs. Pethick Lawrence with the W. S. P. U. had ended.

Since personal dissensions have never been dwelt upon in the W. S. P. U., have never been allowed to halt the movement or to interfere for an hour with its progress, I shall not here say any more about this important dissension than I said at our first large meeting in Albert Hall after the holiday, on October 17th. That day a new paper was sold on the streets. It was called _The Suffragette_, it was edited by Christabel Pankhurst, and was henceforth to be the official organ of the Union. Both in this new paper and in _Votes for Women_, the following announcement appeared:

GRAVE STATEMENT BY THE LEADERS

At the first reunion of the leaders after the enforced holiday, Mrs. Pankhurst and Miss Christabel Pankhurst outlined a new militant policy which Mr. and Mrs. Pethick Lawrence found themselves altogether unable to approve.

Mrs. Pankhurst and Miss Christabel Pankhurst indicated that they were not prepared to modify their intentions, and recommended that Mr. and Mrs. Pethick Lawrence should resume control of the Paper, _Votes for Women_, and should leave the Women's Social and Political Union.

Rather than make schism in the ranks of the Union Mr. and Mrs. Pethick Lawrence consented to take this course.

This was signed by all four. That night at the meeting I further explained to the members that, hard as partings from old friends and comrades unquestionably were, we must remember that we were fighting in an army, and that unity of purpose and unity of policy

are absolutely necessary, because without them the army is hopelessly weakened. "It is better," I said, "that those who cannot agree, cannot see eye to eye as to policy, should set themselves free, should part, and should be free to continue their policy as they see it in their own way, unfettered by those with whom they can no longer agree."

Continuing I said: "I give place to none in appreciation and gratitude to Mr. and Mrs. Pethick Lawrence for the incalculable services that they have rendered the militant movement for Woman Suffrage, and I firmly believe that the women's movement will be strengthened by their being free to work for woman suffrage in the future as they think best, while we of the Women's Social and Political Union shall continue the militant agitation for Woman Suffrage initiated by my daughter and myself and a handful of women more than six years ago."

I then went on to survey the situation in which the W. S. P. U. now stood and to outline the new militant policy which he had decided upon. This policy, to begin with, was relentless opposition, not only to the party in power, the Liberal Party, but to all parties in the coalition. I reminded the women that the Government that had tricked and betrayed us and was now plotting to make our progress towards citizenship doubly difficult, was kept in office through the coalition of three parties. There was the Liberal Party, nominally the governing party, but they could not live another day without the coalition of the Nationalist and the Labour parties. So we should say, not only to the Liberal Party but to the Nationalist Party and the Labour Party, "So long as you keep in office an anti-suffrage Government, you are parties to their guilt, and from henceforth we offer you the same opposition which we give to the people whom you are keeping in power with your support." I said further: "We have summoned the Labour Party to do their duty by their own programme, and to go into opposition to the Government on every question until the Government do justice to women. They apparently are not willing to do that. Some of them tell us that other things are more important than the liberty of women--than the liberty of working women. We say, 'Then, gentlemen, we must teach you the value of your own principles, and until you are prepared to stand for the right of women to decide their lives and the laws under which they shall live, you, with Mr. Asquith and company, are equally responsible for all that has happened and is happening to women in this struggle for emancipation.'"

Outlining further our new and stronger policy of aggression, I said: "There is a great deal of criticism, ladies and gentlemen, of this movement. It always seems to me when the anti-suffrage members of the Government criticise militancy in women that it is very like beasts of prey reproaching the gentler animals who turn in desperate resistance when at the point of death. Criticism from gentlemen who do not hesitate to order out armies to kill and slay their opponents, who do not hesitate to encourage party mobs to attack defenceless women in public meetings--criticism from them hardly rings true. Then I get letters from people who tell me that they are ardent suffragists but who say that they do not like the recent developments in the militant movement, and implore me to urge the members not to be reckless with human life. Ladies and gentlemen, the only recklessness the militant suffragists have shown about human life has been about their own lives and not about the lives of others, and I say here and now that it has never been and never will be the policy of the Women's Social and Political Union recklessly to endanger human life. We leave that to the enemy. We leave that to the men in their warfare. It is not the method of women. No, even from the point of view of public policy, militancy affecting the security of human life would be out of place. _There is something that governments care far more for than human life, and that is the security of property, and so it is through property that we shall strike the enemy._ From henceforward the women who agree with me will say, 'We disregard your laws, gentlemen, we set the liberty and the dignity and the welfare of women above all such considerations, and we shall continue this war, as we have done in the past; and what sacrifice of property, or what injury to property accrues will not be our fault. It will be the fault of that Government who admit the justice of our demands, but refuses to concede them without the evidence, so they have told us, afforded to governments of the past, that those who asked for liberty were in earnest in their demands!"

I called upon the women of the meeting to join me in this new militancy, and I reminded them anew that the women who were fighting in the Suffragette army had a great mission, the greatest mission the world has ever known--the freeing of one-half the human race, and through that freedom the saving of the other half. I said to them: "Be militant each in your own way. Those of you who can express your militancy by going to the House of Commons and refusing to leave without satisfaction, as we did in the early days--do so. Those of you who can express militancy by facing party mobs at Cabinet Ministers' meetings, when you remind them of their falseness to principle--do so. Those of you who can express your militancy by joining us in our anti-Government by-election policy--do so. Those of you who can break windows--break them. Those of you who can still further attack the secret idol of property, so as to make the Government realise that property is as greatly endangered by women's suffrage as it was by the Chartists of old--do so. And my last word is to the Government: I incite this meeting to rebellion. I say to the Government: You have not dared to take the leaders of Ulster for their incitement to rebellion. Take me if you dare, but if you dare I tell you this, that so long as those who incited to armed rebellion and the destruction of human life in Ulster are at liberty, you will not keep me in prison. So

long as men rebels--and voters--are at liberty, we will not remain in prison, first division or no first division."

I ask my readers, some of whom no doubt will be shocked and displeased at these words of mine that I have so frankly set down, to put themselves in the place of those women who for years had given their lives entirely and unstintingly to the work of securing political freedom for women; who had converted so great a proportion of the electorate that, had the House of Commons been a free body, we should have won that freedom years before; who had seen their freedom withheld from them through treachery and misuse of power. I ask you to consider that we had used, in our agitation, only peaceful means until we saw clearly that peaceful means were absolutely of no avail, and then for years we had used only the mildest militancy, until we were taunted by Cabinet Ministers, and told that we should never get the vote until we employed the same violence that men had used in their agitation for suffrage. After that we had used stronger militancy, but even that, by comparison with the militancy of men in labour disputes, could not possibly be counted as violent. Through all these stages of our agitation we had been punished with the greatest severity, sent to prison like common criminals, and of late years tortured as no criminals have been tortured for a century in civilised countries of the world. And during all these years we had seen disastrous strikes that had caused suffering and death, to say nothing at all of the enormous economic waste, and we had never seen a single strike leader punished as we had been. We, who had suffered sentences of nine months' imprisonment for inciting women to mild rebellion, had seen a labour leader who had done his best to incite an army to mutiny released from prison in two months by the Government. And now we had come to a point where we saw civil war threatened, where we read in the papers every day reports of speeches a thousand times more incendiary than anything we had ever said. We heard prominent members of Parliament openly declaring that if the Home Rule Bill was passed Ulster would fight, and Ulster would be right. None of these men were arrested. Instead they were applauded. Lord Selborne, one of our sternest critics, referring to the fact that Ulstermen were drilling under arms, said publicly: "The method which the people of Ulster are adopting to show the depths of their convictions and the intensity of their feelings will impress the imagination of the whole country." But Lord Selborne was not arrested. Neither were the mutinous officers who resigned their commissions when ordered to report for duty against the men of Ulster who were actually preparing for civil war.

What does all this mean? Why is it that men's blood-shedding militancy is applauded and women's symbolic militancy punished with a prison cell and the forcible feeding horror? It means simply this, that men's double standard of sex morals, whereby the victims of their lust are counted as outcasts, while the men themselves escape all social censure, really applies to morals in all departments of life. Men make the moral code and they expect women to accept it. They have decided that it is entirely right and proper for men to fight for their liberties and their rights, but that it is not right and proper for women to fight for theirs.[3]

They have decided that for men to remain silently quiescent while tyrannical rulers impose bonds of slavery upon them is cowardly and dishonourable, but that for women to do that same thing is not cowardly and dishonourable, but merely respectable. Well, the Suffragettes absolutely repudiate that double standard of morals. If it is right for men to fight for their freedom, and God knows what the human race would be like to-day if men had not, since time began, fought for their freedom, then it is right for women to fight for their freedom and the freedom of the children they bear. On this declaration of faith the militant women of England rest their case.

FOOTNOTE:

[3] There is no question that a great deal of the animus directed against us during 1913 and 1914 by the Government was due to sex bitterness stirred up by a series of articles written by Christabel Pankhurst and published in _The Suffragette_. These articles, a fearless and authoritative expose of the evils of sexual immoralities and their blasting effect on innocent wives and children, have since been published in a book called "The Great Scourge, and how to end it," issued by David Nutt, New Oxford Street, London W. C.

CHAPTER IV

I had called upon women to join me in striking at the Government through the only thing that governments are really very much concerned about--property--and the response was immediate. Within a few days the newspapers rang with the story of the attack made on letter boxes in London, Liverpool, Birmingham, Bristol, and half a dozen other cities. In some cases the boxes, when opened by postmen, mysteriously burst into flame; in others the letters were destroyed by corrosive chemicals; in still others the addresses were rendered illegible by black fluids. Altogether it was estimated that over 5,000 letters were completely destroyed and many thousands more were delayed in transit.

It was with a deep sense of their gravity that these letter-burning protests were undertaken, but we felt that something drastic must be done in order to destroy the apathy of the men of England who view with indifference the suffering of women oppressed by unjust laws. As we pointed out, letters, precious though they may be, are less precious than human bodies and souls. This fact was universally realised at the sinking of the _Titanic_. Letters and valuables disappeared forever, but their loss was forgotten in the far more terrible loss of the multitude of human lives. And so, in order to call attention to greater crimes against human beings, our letter burnings continued.

In only a few cases were the offenders apprehended, and one of the few women arrested was a helpless cripple, a woman who could move about only in a wheeled chair. She received a sentence of eight months in the first division, and, resolutely hunger striking, was forcibly fed with unusual brutality, the prison doctor deliberately breaking one of her teeth in order to insert a gag. In spite of her disabilities and her weakness the crippled girl persisted in her hunger strike and her resistance to prison rules, and within a short time had to be released. The excessive sentences of the other pillar box destroyers resolved themselves into very short terms because of the resistance of the prisoners, every one of whom adopted the hunger strike.

Having shown the Government that we were in deadly earnest when we declared that we would adopt guerrilla warfare, and also that we would not remain in prison, we announced a truce in order that the Government might have full opportunity to fulfil their pledge in regard to a woman suffrage amendment to the Franchise Bill. We did not, for one moment, believe that Mr. Asquith would willingly keep his word. We knew that he would break it if he could, but there was a bare chance that he would not find this possible. However, our principal reason for declaring the truce was that we believed that the Prime Minister would find a way of evading his promise, and we were determined that the blame should be placed, not on militancy, but on the shoulders of the real traitor. We reviewed the history of past suffrage bills: In 1908 the bill had passed its second reading by a majority of 179; and then Mr. Asquith had refused to allow it to go on; in 1910 the Conciliation Bill passed its second reading by a majority of 110, and again Mr. Asquith blocked its progress, pledging himself that if the bill were reintroduced in 1911, in a form rendering it capable of free amendment, it would be given full facilities for becoming law; these conditions were met in 1911, and we saw how the bill, after receiving the increased majority of 167 votes, was torpedoed by the introduction of a Government manhood suffrage bill. Mr. Asquith this time had pledged himself that the bill would be so framed that a woman suffrage amendment could be added, and he further pledged that in case such an amendment was carried through its second reading, he would allow it to become a part of the bill. Just exactly how the Government would manage to wriggle out of their promise was a matter of excited speculation.

All sorts of rumours were flying about, some hinting at the resignation of the Prime Minister, some suggesting the possibility of a general election, others that the amended bill would carry with it a forced referendum on women's suffrage. It was also said that the intention of the Government was to delay the bill so long that, after it was passed in the House, it would be excluded from the benefits of the Parliament Acts, according to which a bill, delayed of passage beyond the first two years of the life of a Parliament, has no chance of being considered by the Lords. In order to become a law without the sanction of the House of Lords, a bill must pass three times through the House of Commons. The prospect of a woman suffrage bill doing that was practically nil.

To none of the rumours would Mr. Asquith give specific denial, and in fact the only positive utterance he made on the subject of the Franchise Bill was that he considered it highly improbable that the House would pass a woman suffrage amendment. In order to discourage woman suffrage sentiment in the House, Mr. Lloyd-George and Mr. Lewis Harcourt again busied themselves with spreading pessimistic prophecies of a Cabinet split in case an amendment was carried. No other threat, they well knew, would so terrorize the timid back bench Liberals, who, in addition to their blind party loyalty, stood in fear of losing their seats in the general election which would follow such a split. Rather than risk their political jobs they would have sacrificed any principle. Of course the hint of a Cabinet split was pure buncombe, and it deceived few of the members. But it established very clearly one thing, and this was that Mr. Asquith's promise that the House should be left absolutely free to decide the suffrage issue, and that the Cabinet stood ready to bow to the decision of the House was never meant to be fulfilled.

The Franchise Bill unamended, by its very wording, specifically denied the right of any woman to vote. Sir Edward Grey moved an amendment deleting from the bill the word male, thus leaving room for a women's suffrage amendment. Two such amendments were moved, one providing for adult suffrage for men and women, and the other providing full suffrage for women householders and wives of householders. The latter postponed the voting age of women to twenty-five years, instead of the men's twenty-one. On January 24th, 1913, debate on the first of the amendments was begun. A day and a half had been allotted to consideration of Sir Edward Grey's amendment, which if carried would leave the way clear for consideration of the other two, to each of which one-third of a day was allotted.

We had arranged for huge meetings to be held every day during the debates, and on the day before they were to open we sent a deputation of working women, led by Mrs. Drummond and Miss Annie Kenney, to interview Mr. Lloyd-George and Sir Edward Grey. We had asked Mr. Asquith to receive the deputation, but, as usual, he refused. The deputation consisted of the two leaders, four cotton mill operatives from Lancashire, four workers in sweated trades of London, two pit brow lassies, two teachers, two trained nurses, one shop assistant, one laundress, one boot and shoe worker and one domestic worker, twenty in all, the exact number specified by Mr. Lloyd-George. Some hundreds of working women escorted the deputation to the official residence of the Chancellor of the Exchequer and waited anxiously in the street to hear the result of the audience.

The result was, of course, barren. Mr. Lloyd-George glibly repeated his confidence in the "great opportunity" afforded by the Franchise Bill, and Sir Edward Grey, reminding the women of the divergence of view held by the members of Cabinet on the suffrage question, assured them that their best opportunity for success lay in an amendment to the present bill. The women spoke with the greatest candour to the two ministers and questioned them sharply as to the integrity of the Prime Minister's pledge to accept the amendments, if passed. To such depth of infamy had English politics sunk that it was possible for women openly to question the plighted word of the King's chief Minister! Mrs. Drummond, who stands in awe of no human being, in plain words invited the slippery Mr. Lloyd-George to clear his own character from obloquy. In the closing words of her speech she put the whole matter clearly up to him, saying: "Now, Mr. Lloyd-George, you have doggedly stuck to your old age pensions, and the insurance act, and secured them, and what you have done for these measures you can do also for the women."

The House met on the following afternoon to debate Sir Edward Grey's permissive amendment, but no sooner had the discussion opened than a veritable bombshell was cast into the situation. Mr. Bonar Law arose and asked for a ruling on the constitutionality of a woman's suffrage amendment to the bill as framed. The Speaker, who, besides acting as the presiding officer of the House, is its official parliamentarian, replied that, in his opinion, such an amendment would make a huge difference in the bill, and that he would be obliged, at a later stage of the debates, to consider carefully whether, if carried, any woman suffrage amendment would not so materially alter the bill that it would have to be withdrawn. In spite of this sinister pronouncement, the House continued to debate the Grey amendment, which was ably supported by Lord Hugh Cecil, Sir John Rolleston, and others.

During the intervening week-end holiday two Cabinet councils were held, and when the House met on Monday the Prime Minister called upon the Speaker for his ruling. The Speaker declared that, in his opinion, the passage of any one of the woman suffrage amendments would so alter the scope of the Franchise Bill as practically to create a new bill, because the measure, as it was framed, did not have for its main object the bestowal of the franchise on a hitherto excluded class. Had it been so framed a woman suffrage amendment would have been entirely proper. But the main object of the bill was to alter the qualification, or the basis of registration for a Parliamentary vote. It would increase the male electorate, but only as an indirect result of the changed qualifications. An amendment to the bill removing the sex barrier from the election laws was not, in the Speaker's opinion, a proper one.

The Prime Minister then announced the intentions of the Cabinet, which were to withdraw the Franchise Bill and to refrain from introducing, during that session, a plural voting bill. Mr. Asquith blandly admitted that his pledge in regard to women's suffrage had been rendered incapable of fulfilment, and he said that he felt constrained to give a new pledge to take its place. There were only two that could be given. The first was that the Government should bring in a bill to enfranchise women, and this the Government would not do. The second was that the Government agree to give full facilities as to time, during the next session of Parliament, to a private member's bill, so drafted as to be capable of free amendment. This was the course that the Government had decided to adopt. Mr. Asquith had the effrontery to say in conclusion that he thought that the House would agree that he had striven and had succeeded in giving effect, both in letter and in spirit, to every undertaking which the Government had given.

Two members only, Mr. Henderson and Mr. Keir Hardie had the courage to stand up on the floor of the House and denounce the Government's treachery, for treachery it unquestionably was. Mr. Asquith had pledged his sacred honour to introduce a bill that would be capable of an amendment to include women's suffrage, and he had framed a bill that could not be so amended. Whether he had done the thing deliberately, with the plain intention of selling out the women, or whether ignorance of Parliamentary rules accounted for the failure of the bill was immaterial. The bill need not have been drawn in ignorance. The fount of wisdom represented by Mr. Speaker could have been consulted at the time the bill was under construction quite as easily as when it had reached the debating stage. Our paper said editorially, representing and perfectly expressing our member's views: "Either the Government are so ignorant of Parliamentary procedure that they are unfit to occupy any position of responsibility, or else they are scoundrels of the worst kind."

I am inclined to think that the verdict of posterity will lean towards the later conclusion. If Mr. Asquith had been a man of honour he would have reframed the Franchise Bill in such a way that it could have included a suffrage amendment, or else he would have made amends for his stupendous blunder--if it was a blunder--by introducing a Government measure for women's suffrage. He did neither, but disposed of the matter by promising facilities for a private member's bill which he knew, and which everybody knew, could not possibly pass.

There was no chance for a private member's bill, even with facilities, because of a number of reasons, but principally because the torpedoing of the Conciliation Bill had destroyed utterly the spirit of conciliation in which Conservatives, Liberals and Radicals in the House of Commons, and militant and non-militant women throughout the Kingdom had set aside their differences of opinion and agreed to come together on a compromise measure. When the second Conciliation Bill, of 1911, was under discussion, Lord Lytton had said: "If this bill does not go through, the woman suffrage movement will not be stopped, but the spirit of conciliation of which this bill is an expression will be destroyed, and there will he war throughout the country, raging, tearing, fierce, bitter strife, though nobody wants it."

Lord Lytton's words were prophetic. At this last brazen piece of trickery on the part of the Government the country blazed with bitter wrath. All the suffrage societies united in calling for a Government measure for women's suffrage to be introduced without delay. The idle promise of facilities for a private member's bill was rejected with contumely and scorn. The Liberal women's executive committee met, and a strong effort was made to pass a resolution threatening the withdrawal from party work of the entire federation, but this failed and the executive merely passed a feeble resolution of regret.

The membership of the Women's Liberal Federation was, at that time, close to 200,000, and if the executive had passed the strong resolution, refusing to do any more work for the party until a Government measure had been introduced, the Government would have been forced to yield. They could not have faced the country without the support of the women. But these women, many of them, were wives of men in the service, the paid service of the Liberal Party. Many of them were wives of Liberal members. They lacked the courage, or the intelligence, or the insight, to declare war as a body on the Government. A large number of women, and also many men, did resign from the Liberal Party, but the defections were not serious enough to affect the Government.

The militants declared, and proceeded instantly to carry out, unrelenting warfare. We announced that either we must have a Government measure, or a Cabinet split--those men in the Cabinet calling themselves suffragists going out--or we would take up the sword again, never to lay it down until the enfranchisement of the women of England was won.

It was at this time, February, 1913, less than two years ago as I write these words, that militancy, as it is now generally understood by the public began--militancy in the sense of continued, destructive, guerilla warfare against the Government through injury to private property. Some property had been destroyed before this time, but the attacks were sporadic, and were meant to be in the nature of a warning as to what might become a settled policy. Now we indeed lighted the torch, and we did it with the absolute conviction that no other course was open to us. We had tried every other measure, as I am sure that I have demonstrated to my readers, and our years of work and suffering and sacrifice had taught us that the Government would not yield to right and justice, what the majority of members of the House of Commons admitted was right and justice, but that the Government would, as other governments invariably do, yield to expediency. Now our task was to show the Government that it was expedient to yield to the women's just demands. In order to do that we had to make England and every department of English life insecure and unsafe. We had to make English law a failure and the courts farce comedy theatres; we had to discredit the Government and Parliament in the eyes of the world; we had to spoil English sports, hurt business, destroy valuable property, demoralise the world of society, shame the churches, upset the whole orderly conduct of life--

That is, we had to do as much of this guerilla warfare as the people of England would tolerate. When they came to the point of saying to the Government: "Stop this, in the only way it can be stopped, by giving the women of England representation," then we should extinguish our torch.

Americans, of all people, ought to see the logic of our reasoning. There is one piece of American oratory, beloved of schoolboys, which has often been quoted from militant platforms. In a speech now included among the classics of the English language your great statesman, Patrick Henry, summed up the causes that led to the American Revolution. He said: "We have petitioned, we have remonstrated, we have supplicated, we have prostrated ourselves at the foot of the throne, and it has all been in vain. We must fight--I repeat it, sir, we must fight."

Patrick Henry, remember, was advocating killing people, as well as destroying private property, as the proper means of securing the political freedom of men. The Suffragettes have not done that, and they never will. In fact the moving spirit of militancy is deep and abiding reverence for human life. In the latter course of our agitation I have been called upon to discuss our policies with many eminent men, politicians, literary men, barristers, scientists, clergymen. One of the last named, a high dignitary of the Church of England, told me that while he was a convinced suffragist, he found it impossible to justify our doing wrong that right might follow. I said to him: "We are not doing wrong--we are doing right in our use of revolutionary methods against private property. It is our work to restore thereby true values, to emphasise the value of human rights against property rights. You are well aware, sir, that property has assumed a value in the eyes of men, and in the eyes of the law, that it ought never to claim. It is placed above all human values. The lives and health and happiness, and even the virtue of women and children--that is to say, the race itself--are being ruthlessly sacrificed to the god of property every day of the world."

To this my reverend friend agreed, and I said: "If we women are wrong in destroying private property in order that human values may be restored, then I say, in all reverence, that it was wrong for the Founder of Christianity to destroy private property, as He did when He lashed the money changers out of the Temple and when He drove the Gaderene swine into the sea."

It was absolutely in this spirit that our women went forth to war. In the first month of guerilla warfare an enormous amount of property was damaged and destroyed. On January 31st a number of putting greens were burned with acids; on February 7th and 8th telegraph and telephone wires were cut in several places and for some hours all communication between London and Glasgow were suspended; a few days later windows in various of London's smartest clubs were broken, and the orchid houses at Kew were wrecked and many valuable blooms destroyed by cold. The jewel room at the Tower of London was invaded and a showcase broken. The residence of H. R. H. Prince Christian and Lambeth Palace, seat of the Archbishop of Canterbury, were visited and had windows broken. The refreshment house in Regents Park was burned to the ground on February 12th and on February 18th a country house which was being built at Walton-on-the-Hill for Mr. Lloyd-George was partially destroyed, a bomb having been exploded in the early morning before the arrival of the workmen. A hat pin and a hair pin picked up near the house--coupled with the fact that care had been taken not to endanger any lives--led the police to believe that the deed had been done by women enemies of Mr. Lloyd-George. Four days later I was arrested and brought up in Epsom police court, where I was charged with having "counselled and procured" the persons who did the damage. Admitted to bail for the night, I appeared next morning in court, where the case was fully reviewed. Speeches of mine were read, one speech, made at a meeting held on January 22nd, in which I called for volunteers to act with me in a particular engagement; and another, made the day after the explosion, in which I publicly accepted responsibility for all militant acts done in the past, and even for what had been done at Walton. At the conclusion of the hearing I was committed for trial at the May Assizes at Guildford. Bail would be allowed, it was stated, if I would agree to give the usual undertaking to refrain from all militancy or incitement to militancy.

I asked that the case be set for speedy trial at the Assizes then in progress. I was entirely willing, I said, to give an undertaking for a short period, for a week, or even two weeks, but I could not possibly do so for a much longer period, looking at the fact that a new session of Parliament began in March, and was vitally concerned with the interests of women. The request was refused, and I was ordered to be taken to Holloway. I warned the magistrate that I should at once adopt the hunger strike, and I told him that if I lived at all until the summer it would be a dying woman who would come up for trial.

Arriving at Holloway I carried out my intention, but within twenty-four hours I heard that the authorities had arranged that my trial should take place on April 1st, instead of at the end of June, and at the Central Criminal Court, London, instead of the Guildford Court. I then gave the required under-takings and was immediately released on bail.

CHAPTER V

When I entered Old Bailey on that memorable Wednesday, April 2nd, 1913, to be tried for inciting to commit a felony, the court was packed with women. A great crowd of women who could not obtain the necessary tickets remained in the streets below for hours waiting news of the trial. A large number of detectives from Scotland Yard, and a still larger number of uniformed police were on duty both inside and outside the court. I could not imagine why it was considered necessary to have such a regiment of police on hand, for I had not, at that time, realised the state of terror into which the militant movement, in its new development, had thrown the authorities.

Mr. Bodkin and Mr. Travers Humphreys appeared to prosecute on behalf of the Crown, and I conducted my own case, in consultation with my solicitor, Mr. Marshall. The Judge, Mr. Justice Lush, having taken his seat I entered the dock and listened to

the reading of the indictment. I pled "not guilty," not because I wished to evade responsibility for the explosion,--I had already assumed that responsibility--but because the indictment accused me of having wickedly and maliciously incited women to crime. What I had done was not wicked of purpose, but quite the opposite of wicked. I could not therefore truthfully plead guilty. The trial having opened the Judge courteously asked me if I would like to sit down. I thanked him, and asked if I might also have a small table on which to place my papers. By orders of the Judge a table was brought me.

Mr. Bodkin opened the case by explaining the "Malicious Damages to Property Act" of 1861, under which I was charged, and after describing the explosion which had damaged the Lloyd-George house at Walton, said that I was accused of being in the affair an accessory before the fact. It was not suggested, he said, that I was present when the crime was committed, but it was charged that I had moved and incited, counselled and procured women whose names were unknown to carry out that crime. It would be for the jury to decide, after the evidence had been presented, whether the facts did not point most clearly to the conclusion that women, probably two in number, who committed the crime were members of the Women's Social and Political Union, which had its office in Kingsway in London, and of which the defendant was the head, moving spirit and recognised leader.

The blowing up of Mr. Lloyd-George's house was then described in detail. That the damage was intended as an act against Mr. Lloyd-George was clear, Mr. Bodkin said, from the malicious statements made against him by the prisoner. He produced a private letter written by me to a friend in which I had defended militancy, and said that not only had it become a duty but in the circumstances it had also become a political necessity. Said Mr. Bodkin:

"A letter of that kind proves very clearly several things. It shows that she is the leader. It shows her influence over the emotional members of this organisation. It shows that according to her, militancy can be withheld for a time and let loose upon society at another time. And it further shows that any person or any woman who wants to indulge in militancy, which is only a picturesque expression for committing crimes against society, has to communicate with her, and with her alone, by word of mouth or by letter. That is the Proclamation which went out to the members of this organisation. The plain language of that letter is, 'If we don't get what we want, the Government and their members will be responsible, and the Government and the public will be bullied into giving us what we want.'"

Many extracts from my speeches made in January and February were read, and the final speech made just before my arrest at Chelsea. But before they were read I said:

"I wish to lodge an objection now to the police reports of my speeches. They have been supplied to me, and the only report I accept is that of the journalist of Cardiff who is one of the witnesses. He has furnished a fairly accurate report of what I said in that town. The police reports I do not accept. They are grossly inaccurate and ignorant and ungrammatical, and they convey an absolutely wrong impression of what I said in many respects."

Witnesses were then examined; the carter who heard and reported the explosion; the foreman in charge of the damaged house, who told the cost of the damages, and described the explosives, etc., found on the premises; several police officers who told of finding hairpins and a woman's rubber golosh in the house, and so on. Absolutely nothing was brought out that tended to show that the Suffragettes had anything to do with the affair. The Judge noted this for he said to Mr. Bodkin:

"I am not quite sure how you present this case. There are two ways of looking at it. Do you only ask the jury to say that the defendant specifically counselled the perpetration of this crime, or do you also say that, looking at her speeches that you read--assuming you prove that they were uttered--that the language used being a general incitement to damage property, any one who acted on this invitation and perpetrated this outrage would be incited by her to do it?"

Mr. Bodkin replied that the latter assumption was correct.

"I say that the speeches generally are incitement to all kinds of acts of violence against property, and that they present evidence of attacks against property and a particular individual, and that there is evidence in the speeches which have been read, and which will be proved, of admissions by Mrs. Pankhurst of having been connected with the particular outrage in a way which makes her in law an accessory before the fact."

"But you do not confine the case to the latter way of putting it?"

"No," replied Mr. Bodkin.

"Even if the jury are satisfied," said the Judge, "that Mrs. Pankhurst was not directly connected with this outrage by counselling it, you still ask the jury to say that by counselling, as you say she had in the speeches, the destruction of property, especially that belonging to a particular gentleman, anybody who acted on that and committed this outrage would have been incited by her to do it?"

"Yes, my lord."

"I think, Mrs. Pankhurst, you now understand the way it is put?" asked the Judge.

"I understand it quite well, my lord," I replied.

Proceedings were resumed on the following day, and the examination of witnesses for the prosecution went on. At the close of the examination, the Judge inquired whether I desired to call any witnesses. I replied:

"I do not desire to give evidence or to call any witnesses, but I desire to address your Lordship."

I began by objecting to some of the things Mr. Bodkin had said in his speech which concerned me personally. He had referred to me--or at least his words conveyed the suggestion--that I was a woman riding about in my motor car inciting other women to do acts which entail imprisonment and great suffering, while I, perhaps indulging in some curious form of pleasure, was protected, or thought myself protected, from serious consequences. I said that Mr. Bodkin knew perfectly well that I shared all the dangers the other women faced, that I had been in prison three times, serving two of the sentences in full, and being treated like an ordinary felon--searched, put in prison clothes, eating prison fare, given solitary confinement and conforming to all the abominable rules imposed upon women who commit crimes in England. I thought I owed it to myself, especially as the same suggestions--in regard to the luxury in which I lived, supported by the members of the W. S. P. U.--had been made, not only by Mr. Bodkin in court, but by members of the Government in the House of Commons--I thought I owed it to myself to say that I owned no motor car and never had owned one. The car in which I occasionally rode was owned by the organisation and was used for general propaganda work. In that car, and in cars owned by friends I had gone about my work as a speaker in the Woman Suffrage movement. It was equally untrue, I said, that some of us were making incomes of L1,000 to L1,500 a year out of the suffrage movement, as had actually been alleged in the debates in the House in which members of Parliament were trying to decide how to crush militancy. No woman in our organisation was making any such income, or anything remotely like it. Myself, I had sacrificed a considerable portion of my income because I had to surrender a very important part of it in order to be free to do what I thought was my duty in the movement.

Addressing myself to my defence I told the Court that it was a very serious condition of things when a large number of respectable and naturally law abiding people, people of upright lives, came to hold the law in contempt, came seriously to making up their minds that they were justified in breaking the law.

"The whole of good government," I said, "rests upon acceptance of the law, upon respect of the law, and I say to you seriously, my lord, and gentlemen of the jury, that women of intelligence, women of training, women of upright life, have for many years ceased to respect the laws of this country. It is an absolute fact, and when you look at the laws of this country as they effect women it is not to be wondered at."

At some length I went over these laws, laws that made it possible for the Judge to send me, if found guilty, to prison for fourteen years, while the maximum penalty for offences of the most revolting kind against little girls was only two years' imprisonment. The laws of inheritance, the laws of divorce, the laws of guardianship of children--all so scandalously unjust to women, I sketched briefly, and I said that not only these laws and others, but the administration of the laws fell so far short of adequacy that women felt that they must be permitted to share the work of cleaning up the entire situation. I tried here to tell of certain dreadful things that I had learned as the wife of a barrister, things about some of the men in high places who are entrusted with the administration of the law, of a judge of Assizes where many hideous crimes against women were tried, this judge himself being found dead one morning in a brothel, but the Court would not allow me to go into personalities, as he called it, with regard to "distinguished people," and told me that the sole question before the jury was whether or not I was guilty as charged. I must speak on that subject and on no other.

After a hard fight to be allowed to tell the jury the reasons why women had lost respect for the law, and were making such a struggle in order to become law makers themselves, I closed my speech by saying:

"Over one thousand women have gone to prison in the course of this agitation, have suffered their imprisonment, have come out of prison injured in health, weakened in body, but not in spirit. I come to stand my trial from the bedside of one of my daughters, who

has come out of Holloway Prison, sent there for two months' hard labour for participating with four other people in breaking a small pane of glass. She has hunger-struck in prison. She submitted herself for more than five weeks to the horrible ordeal of feeding by force, and she has come out of prison having lost nearly two stone in weight. She is so weak that she cannot get out of her bed. And I say to you, gentlemen, that is the kind of punishment you are inflicting upon me or any other woman who may be brought before you. I ask you if you are prepared to send an incalculable number of women to prison--I speak to you as representing others in the same position--if you are prepared to go on doing that kind of thing indefinitely, because that is what is going to happen. There is absolutely no doubt about it. I think you have seen enough even in this present case to convince you that we are not women who are notoriety hunters. We could get that, heaven knows, much more cheaply if we sought it. We are women, rightly or wrongly, convinced that this is the only way in which we can win power to alter what for us are intolerable conditions, absolutely intolerable conditions. A London clergyman only the other day said that 60 per cent. of the married women in his parish were breadwinners, supporting their husbands as well as their children. When you think of the wages women earn, when you think of what this means to the future of the children of this country, I ask you to take this question very, very seriously. Only this morning I have had information brought to me which could be supported by sworn affidavits, that there is in this country, in this very city of London of ours, a regulated traffic, not only in women of full age, but in little children; that they are being purchased, that they are being entrapped, and that they are being trained to minister to the vicious pleasures of persons who ought to know better in their positions of life.

"Well, these are the things that have made us women determined to go on, determined to face everything, determined to see this thing out to the end, let it cost us what it may. And if you convict me, gentlemen, if you find me guilty, I tell you quite honestly and quite frankly, that whether the sentence is a long sentence, whether the sentence is a short sentence, I shall not submit to it. I shall, the moment I leave this court, if I am sent to prison, whether to penal servitude or to the lighter form of imprisonment--because I am not sufficiently versed in the law to know what his lordship may decide; but whatever my sentence is, from the moment I leave this court I shall quite deliberately refuse to eat food--I shall join the women who are already in Holloway on the hunger strike. I shall come out of prison, dead or alive, at the earliest possible moment; and once out again, as soon as I am physically fit I shall enter into this fight again. Life is very dear to all of us. I am not seeking, as was said by the Home Secretary, to commit suicide. I do not want to commit suicide. I want to see the women of this country enfranchised, and I want to live until that is done. Those are the feelings by which we are animated. We offer ourselves as sacrifices, just as your forefathers did in the past, in this cause, and I would ask you all to put this question to yourselves:--Have you the right, as human beings, to condemn another human being to death--because that is what it amounts to? Can you throw the first stone? Have you the right to judge women?

"You have not the right in human justice, not the right by the constitution of this country, if rightly interpreted, to judge me, because you are not my peers. You know, every one of you, that I should not be standing here, that I should not break one single law--if I had the rights that you possess, if I had a share in electing those who make the laws I have to obey; if I had a voice in controlling the taxes I am called upon to pay, I should not be standing here. And I say to you it is a very serious state of things. I say to you, my lord, it is a very serious situation, that women of upright life, women who have devoted the best of their years to the public weal, that women who are engaged in trying to undo some of the terrible mistakes that men in their government of the country have made, because after all, in the last resort, men are responsible for the present state of affairs--I put it to you that it is a very serious situation. You are not accustomed to deal with people like me in the ordinary discharge of your duties; but you are called upon to deal with people who break the law from selfish motives. I break the law from no selfish motive. I have no personal end to serve, neither have any of the other women who have gone through this court during the past few weeks, like sheep to the slaughter. Not one of these women would, if women were free, be law-breakers. They are women who seriously believe that this hard path that they are treading is the only path to their enfranchisement. They seriously believe that the welfare of humanity demands this sacrifice; they believe that the horrible evils which are ravaging our civilisation will never be removed until women get the vote. They know that the very fount of life is being poisoned; they know that homes are being destroyed; that because of bad education, because of the unequal standard of morals, even the mothers and children are destroyed by one of the vilest and most horrible diseases that ravage humanity.

"There is only one way to put a stop to this agitation; there is only one way to break down this agitation. It is not by deporting us, it is not by locking us up in gaol; it is by doing us justice. And so I appeal to you gentlemen, in this case of mine, to give a verdict, not only on my case, but upon the whole of this agitation. I ask you to find me not guilty of malicious incitement to a breach of the law.

"These are my last words. My incitement is not malicious. If I had power to deal with these things, I would be in absolute obedience to the law. I would say to women, 'You have a constitutional means of getting redress for your grievances; use your votes, convince

your fellow-voters of the righteousness of your demands. That is the way to obtain justice.' I am not guilty of malicious incitement, and I appeal to you, for the welfare of the country, for the welfare of the race, to return a verdict of not guilty in this case that you are called upon to try."

After recapitulating the charge the Judge, in summing up, said:

"It is scarcely necessary for me to tell you that the topics urged by the defendant in her address to you with regard to provocation by the laws of the country and the injustice done to women because they are not given the vote as men are, have no bearing upon the question you have to decide.

"The motive at the back of her mind, or at the back of the minds of those who actually did put the gunpowder there, would afford no defence to this indictment. I am quite sure you will deal with this case upon the evidence, and the evidence alone, without regard to any question as to whether you think the law is just or unjust. It has nothing to do with the case. I should think you will probably have no doubt that this defendant, if she did these things charged against her, is not actuated by the ordinary selfish motive that leads most of the criminals who are in this dock to commit the crimes that they do commit. She is none the less guilty if she did these things which are charged against her, although she believes that by means of this kind the condition of society will be altered."

The jury retired, and soon after the afternoon session of the court opened they filed in, and in reply to the usual question asked by the clerk of arraigns, said that they had agreed upon a verdict. Said the clerk:

"Do you find Mrs. Pankhurst guilty or not guilty?"

"Guilty," said the foreman, "with a strong recommendation to mercy."

I spoke once more to the Judge.

"The jury have found me guilty, with a strong recommendation to mercy, and I do not see, since motive is not taken into account in human laws, that they could do otherwise after your summing up. But since motive is not taken into account in human laws, and since I, whose motives are not ordinary motives, am about to be sentenced by you to the punishment which is accorded to people whose motives are selfish motives, I have only this to say: If it was impossible for a different verdict to be found; if it is your duty to sentence me, as it will be presently, then I want to say to you, as a private citizen, and to the jury as private citizens, that I, standing here, found guilty by the laws of my country, I say to you it is your duty, as private citizens, to do what you can to put an end to this intolerable state of affairs. I put that duty upon you. And I want to say, _whatever the sentence you pass upon me, I shall do what is humanly possible to terminate that sentence at the earliest possible moment. I have no sense of guilt. I feel I have done my duty. I look upon myself as a prisoner of war. I am under no moral obligation to conform to, or in any way accept, the sentence imposed upon me._ I shall take the desperate remedy that other women have taken. It is obvious to you that the struggle will be an unequal one, but I shall make it--I shall make it as long as I have an ounce of strength left in me, or any life left in me.

"I shall fight, I shall fight, I shall fight, from the moment I enter prison to struggle against overwhelming odds; I shall resist the doctors if they attempt to feed me. I was sentenced last May in this court to nine months' imprisonment. I remained in prison six weeks. There are people who have laughed at the ordeal of hunger-striking and forcible feeding. All I can say is, and the doctors can bear me out, that I was released because, had I remained there much longer, I should have been a dead woman.

"I know what it is because I have gone through it. My own daughter[4] has only just left it. There are women there still facing that ordeal, facing it twice a day. Think of it, my lord, twice a day this fight is gone through. Twice a day a weak woman resisting overwhelming force, fights and fights as long as she has strength left; fights against women and even against men, resisting with her tongue, with her teeth, this ordeal. Last night in the House of Commons some alternative was discussed, or rather, some additional punishment. Is it not a strange thing, my lord, that laws which have sufficed to restrain men throughout the history of this country do not suffice now to restrain women--decent women, honourable women?

"Well, my lord, I do want you to realise it. I am not whining about my punishment, I invited it. I deliberately broke the law, not hysterically or emotionally, but of set serious purpose, because I honestly feel it is the only way. Now, I put the responsibility of what is to follow upon you, my lord, as a private citizen, and upon the gentlemen of the jury, as private citizens, and upon all the men in this court--what are you, with your political powers, going to do to end this intolerable situation?

"_To the women I have represented, to the women who, in response to my incitement, have faced these terrible consequences, have broken laws, to them, I want to say I am not going to fail them, but to face it as they face it, to go through with it, and I know that they will go on with the fight whether I live or whether I die._

"_This movement will go on and on until we have the rights of citizens in this country, as women have in our Colonies, as they will have throughout the civilised world before this woman's war is ended._

"That is all I have to say."

Mr. Justice Lush, in passing sentence, said: "It is my duty, Mrs. Emmeline Pankhurst, and a very painful duty it is, to pass what, in my opinion, is a suitable and adequate sentence for the crime of which you have been most properly convicted, having regard to the strong recommendation to mercy by the jury. I quite recognise, as I have already said, that the motives that have actuated you in committing this crime are not the selfish motives that actuate most of the persons who stand in your position, but although you blind your eyes to it, I cannot help pointing out to you that the crime of which you have been convicted is not only a very serious one, but, in spite of your motives, it is, in fact, a wicked one. It is wicked because it not only leads to the destruction of property of persons who have done you no wrong, but in spite of your calculations, it may expose other people to the danger of being maimed or even killed. It is wicked because you are, and have been, luring other people--young women, it may be--to engage in such crimes, possibly to their own ruin; and it is wicked, because you cannot help being alive to it if you would only think.

"You are setting an example to other persons who may have other grievances that they legitimately want to have put right by embarking on a similar scheme to yours, and trying to effect their object by attacking the property, if not the lives, of other people. I know, unfortunately--at least, I feel sure--you will pay no heed to what I say. I only beg of you to think of these things."

"I have thought of them," I interjected.

"Think, if only for one short hour, dispassionately," continued the majesty of law, "I can only say that, although the sentence I am going to pass must be a severe one, must be adequate to the crime of which you have been found guilty, if you would only realise the wrong you are doing, and the mistake you are making, and would see the error you have committed, and undertake to amend matters by using your influence in a right direction, I would be the first to use all my best endeavours to bring about a mitigation of the sentence I am about to pass.

"I cannot, and I will not, regard your crime as a merely trivial one. It is not. It is a most serious one, and, whatever you may think, it is a wicked one. I have paid regard to the recommendation of the jury. You yourself have stated the maximum sentence which this particular offence is by the legislature thought to deserve. The least sentence I can pass upon you is a sentence of three years' penal servitude."

As soon as the sentence was pronounced the intense silence which had reigned throughout the trial was broken, and an absolute pandemonium broke out among the spectators. At first it was merely a confused and angry murmur of "Shame!" "Shame!" The murmurs quickly swelled into loud and indignant cries, and then from gallery and court there arose a great chorus uttered with the utmost intensity and passion. "Shame!" "Shame!" The women sprang to their feet, in many instances stood on their seats, shouting "Shame!" "Shame!" as I was conducted out of the dock in charge of two wardresses. "Keep the flag flying!" shouted a woman's voice, and the response came in a chorus: "We will!" "Bravo!" "Three cheers for Mrs. Pankhurst!" That was the last I heard of the courtroom protest.

Afterwards I heard that the noise and confusion was kept up for several minutes longer, the Judge and the police being quite powerless to obtain order. Then the women filed out singing the Women's Marseillaise--

"March on, march on, Face to the dawn, The dawn of liberty."

The Judge flung after their retreating forms the dire threat of prison for any woman who dared repeat such a scene. Threat of prison--to Suffragettes! The women's song only swelled the louder and the corridors of Old Bailey reverberated with their shouts. Certainly that venerable building had never in its checkered history witnessed such a scene. The great crowd of detectives and police who were on duty seemed actually paralysed by the audacity of the protest, for they made no attempt to intervene.

At three o'clock, when I left the court by a side entrance in Newgate Street, I found a crowd of women waiting to cheer me. With the two wardresses I entered a four wheeler and was driven to Holloway to begin my hunger strike. Scores of women followed in

taxicabs, and when I arrived at the prison gates there was another protest of cheers for the cause and boos for the law. In the midst of all this intense excitement I passed through the grim gates into the twilight of prison, now become a battle-ground.

FOOTNOTE:

[4] Sylvia Pankhurst, who was forcibly fed for five weeks, during an original sentence of two months imposed for breaking one window.

CHAPTER VI

Prison had indeed been for us a battle-ground ever since the time when we had solemnly resolved that, as a matter of principle, we would not submit to the rules that bound ordinary offenders against the law. But when I entered Holloway on that April day in 1913, it was with full knowledge that I had before me a far more prolonged struggle than any that the militant suffragists had hitherto faced. I have described the hunger strike, that terrible weapon with which we had repeatedly broken our prison bars. The Government, at their wits' end to cope with the hunger strikers, and to overcome a situation which had brought the laws of England into such scandalous disrepute, had had recourse to a measure, surely the most savagely devised ever brought before a modern Parliament.

In March of that year, while I was waiting trial on the charge of conspiring to destroy Mr. Lloyd-George's country house, a bill was introduced into the House of Commons by the Home Secretary, Mr. Reginald McKenna, a bill which had for its avowed object the breaking down of the hunger strike. This measure, now universally known as the "Cat and Mouse Act," provided that when a hunger striking suffrage prisoner (the law was frankly admitted to apply only to suffrage prisoners) was certified by the prison doctors to be in danger of death, she could be ordered released on a sort of a ticket of leave for the purpose of regaining strength enough to undergo the remainder of her sentence. Released, she was still a prisoner, the prisoner, or the patient, or the victim, as you may choose to call her, being kept under constant police surveillance. According to the terms of the bill the prisoner was released for a specified number of days, at the expiration of which she was supposed to return to prison on her own account. Says the Act:

"The period of temporary discharge may, if the Secretary of State thinks fit, be extended on a representation of the prisoner that the state of her health renders her unfit to return to prison. If such representation be made, the prisoner shall submit herself, if so required, for medical examination by the medical officer of the above mentioned prison, or other registered medical practitioner appointed by the Secretary of State.

The prisoner shall notify to the Commissioner of Police of the Metropolis the place of residence to which she goes on her discharge. She shall not change her residence without giving one clear day's notice in writing to the Commissioner, specifying the residence to which she is going and she shall not be temporarily absent from her residence for more than twelve hours without giving a like notice," etc.

The idea of militant suffragists respecting a law of this order is almost humorous, and yet the smile dies before the pity one feels for the Minister whose confession of failure is embodied in such a measure. Here was a mighty Government weakly resolved that justice to women it would not grant, knowing that submission of women it could not force, and so was willing to compromise with a piece of class legislation absolutely contrary to all of its avowed principles. Said Mr. McKenna, pleading in the House for the advancement of his odious measure: "At the present time I cannot make these prisoners undergo their sentences without serious risk of death and I want to have power to enable me to compel a prisoner to undergo the sentence, and I want that power in all cases where the prisoner adopts the system of the hunger strike. At the present moment, although I have the power of release, I cannot release a prisoner without a pardon, and I have to discharge them for good. I want the power of releasing a prisoner without a pardon, with the sentence remaining alive.... I want to enforce the Law, and I want, if I can, to enforce it without forcible feeding, and without undergoing the risk of some one else's life."

Interrogated by several members, Mr. McKenna admitted that the "Cat and Mouse" bill, if passed, would not inevitably do away with forcible feeding, but he promised that the hateful and disgusting process would be resorted to only when "absolutely necessary." We shall see later how hypocritical this representation was.

Parliament, which had never had time to consider, beyond its initial stages, a women's suffrage measure, passed the Cat and Mouse Act through both houses within the limits of a few days. It was already law when I entered Holloway on April 3rd, 1913, and I

grieve to state that many members of the Labour Party, pledged to support woman suffrage, helped to make it into law.

Of course the Act was, from its inception, treated by the suffragists with the utmost contempt. We had not the slightest intention of assisting Mr. McKenna in enforcing unjust sentences against soldiers in the army of freedom, and when the prison doors closed behind me I adopted the hunger strike exactly as though I expected it to prove, as formerly, a means of gaining my liberty.

That struggle is not a pleasant one to recall. Every possible means of breaking down my resolution was resorted to. The daintiest and most tempting food was placed in my cell. All sorts of arguments were brought to bear against me--the futility of resisting the Cat and Mouse Act, the wickedness of risking suicide--I shall not attempt to record all the arguments. They fell against a blank wall of consciousness, for my thoughts were all very far away from Holloway and all its torments. I knew, what afterwards I learned as a fact, that my imprisonment was followed by the greatest revolutionary outbreak that had been witnessed in England since 1832. From one end of the island to the other the beacons of the women's revolution blazed night and day. Many country houses--all unoccupied--were fired, the grand stand of Ayr race course was burned to the ground, a bomb was exploded in Oxted Station, London, blowing out walls and windows, some empty railroad carriages were blown up, the glass of thirteen famous paintings in the Manchester Art Gallery were smashed with hammers--these are simply random specimens of the general outbreak of secret guerilla warfare waged by women to whose liberties every other approach had been barricaded by the Liberal Government of free England. The only answer of the Government was the closing of the British Museum, the National Gallery, Windsor Castle, and other tourist resorts. As for the result on the people of England, that was exactly what we had anticipated. The public were thrown into a state of emotion of insecurity and frightened expectancy. Not yet did they show themselves ready to demand of the Government that the outrages be stopped in the only way they could be stopped--by giving votes to women. I knew that it would be so. Lying in my lonely cell in Holloway, racked with pain, oppressed with increasing weakness, depressed with the heavy responsibility of unknown happenings, I was sadly aware that we were but approaching a far goal. The end, though certain, was still distant. Patience, and still more patience, faith and still more faith, well, we had called upon these souls' help before and it was certain that they would not fail us at this greatest crisis of all.

Thus in great anguish of mind and body passed nine terrible days, each one longer and more acutely miserable than the preceding. Towards the last, I was mercifully half unconscious of my surroundings. A curious indifference took possession of my over-wrought mind, and it was almost without emotion that I heard, on the morning of the tenth day, that I was to be released temporarily in order to recover my health. The Governor came to my cell and read me my licence, which commanded me to return to Holloway in fifteen days, and meanwhile to observe all the obsequious terms as to informing the police of my movements. With what strength my hands retained I tore the document in strips and dropped it on the floor of the cell. "I have no intention," I said, "of obeying this infamous law. You release me knowing perfectly well that I shall never voluntarily return to any of your prisons."

They sent me away, sitting bolt upright in a cab, unmindful of the fact that I was in a dangerous condition of weakness, having lost two stone in weight and suffered seriously from irregularities of heart action. As I left the prison I was gratefully aware of groups of our women standing bravely at the gates, as though enduring a long vigil. As a matter of fact, relays of women had picketed the place night and day during the whole term of my imprisonment. The first pickets were arrested, but as others constantly arrived to fill their places the police finally gave in and allowed the women to march up and down before the prison carrying the flag.

At the nursing home to which I was conveyed I learned that Annie Kenney, Mrs. Drummond, and our staunch friend, Mr. George Lansbury,[5] had been arrested during my imprisonment, and that all three had adopted the hunger strike. I also learned on my own account how desperately the Government were striving to make their Cat and Mouse Act--the last stand in their losing campaign--a success. Without regard to the extra expense laid on the unfortunate tax payers of the country, the Government employed a large extra force of police especially for this purpose. As I lay in bed, being assisted by every medical resource to return to life and health, these special police, colloquially termed "Cats," guarded the nursing home as if it were a besieged castle. In the street under my windows two detectives and a constable stood on guard night and day. In a house at right angles to my refuge three more detectives kept constant watch. In the mews at the rear of the house were more detectives, and diligently patrolling the road, as if in expectation of a rescuing regiment, two taxicabs, each with its quota of detectives, guarded the highways.

All this made recovery slow and difficult. But worse was to come. On April 30th, just as I was beginning to rally somewhat, came the news that the police had swooped down on our headquarters in Kingsway and had arrested the entire official force. Miss Barrett, associate editor of _The Suffragette_; Miss Lennox, the sub-editor; Miss Lake, business manager; Miss Kerr, office manager, and Mrs. Sanders, financial secretary of the Union, were arrested, although not one of them had ever appeared in any militant action. Mr. E. G. Clayton, a chemist, was also arrested, accused of furnishing the W. S. P. U. with explosive materials. The offices were

thoroughly searched, and, as on a former occasion, stripped of all books and papers. While this was being done another party of police, armed with a special warrant, proceeded to the printing office where our paper, _The Suffragette_, was published. The printer, Mr. Drew, was placed under arrest and the material for the paper, which was to appear on the following day, was seized. By one o'clock in the afternoon the entire plant and the headquarters of the Union were in the hands of the police, and to all appearances the militant movement--temporarily at least--was brought to a full stop. In my state of semi-prostration it at first seemed to me best to let the week's issue of the paper lapse, but on second thought I decided that even the appearance of surrender was not to be thought of. How we managed it need not here be told, but we actually did, overnight, with hardly any material, except Christabel's leading article, and with hastily summoned helpers, get out the paper as usual, and side by side with the morning journals which bore front page stories of the suppression of the Suffragette organ, our paper sellers sold _The Suffragette_. The front page bore, instead of the usual cartoon, the single word in bold faced type--

"RAIDED,"

the full story of the police search and the arrests being related in the other pages. Our headquarters, I may say in passing, remained closed less than forty-eight hours. We are so organised that the arrest of leaders does not seriously cripple us. Every one has an understudy, and when one leader drops out her substitute is ready instantly to take her place.

In this emergency there appeared as chief organiser in Miss Kenney's place, Miss Grace Roe, one of the young Suffragettes of whom I, as belonging to the older generation, am so proud. Faced by difficulties as great as the Government could make them, Miss Roe at once showed herself to be equal to the situation, and to have the gift of unswerving loyalty combined with a strong and rapid judgment of things and people. Aiding her was Mrs. Dacre Fox, who surprised us all by her amazing ability to act as assistant editor of _The Suffragette_, manage a host of affairs in the office, and preside at our weekly meetings. Another member of the Union who came prominently to the front at the time of this crisis was Mrs. Mansel.

In two days' time the office was open and running quite as usual, no outward sign showing the grief and indignation felt for our imprisoned comrades. Most of them refused bail and instantly hunger struck appearing in court for trial three days later in a pitiful state. Mrs. Drummond was so obviously ill and in need of medical attention that she was discharged and was very soon afterwards operated upon. Mr. Drew, the printer, was forced to sign an undertaking not to publish the paper again. The others were sentenced to terms varying from six to eighteen months. Mr. Clayton was sentenced to twenty-one months, and after desperate resistance, during which he was forcibly fed many times, escaped his prison. The others, following the same example, starved their way to liberty, and have ever since been pursued at intervals and rearrested under the Cat and Mouse Act.

After my discharge, April 12th, I remained in the nursing home until partially restored, then, under the eyes of the police, I motored out to Woking, the country home of my friend, Dr. Ethel Smyth. This house, like the nursing home, was guarded by a small army of police. I never went to the window, I never took the air in the garden without being conscious of watching eyes. The situation became intolerable, and I determined to end it. On May 26th there was a great meeting at the London Pavillion, and I gave notice that I would attend it. Supported by Dr. Flora Murray, Dr. Ethel Smyth and my devoted Nurse Pine, I walked downstairs, to be confronted at the door by a detective, who demanded to know where I was going. I was in a weak state, much weaker than I had imagined, and in refusing the right of a man to question my movements I exhausted the last remnant of my strength and sank fainting in the arms of my friends. As soon as I recovered I got into the motor car. The detective instantly took his place beside me and told the chauffeur to drive to Bow Street Station. The chauffeur replied that he took his orders only from Mrs. Pankhurst, whereupon the detective summoned a taxicab and, placing me under arrest, took me to Bow Street.

Under the Cat and Mouse Act a paroled prisoner can be thus arrested without the formality of a warrant, nor does the time she has spent at liberty, in regaining her health, count off from her prison sentence. The magistrate at Bow Street was therefore quite within his legal rights when he ordered me returned to Holloway. I felt it my duty, nevertheless, to point out to him the inhumanity of his act. I said to him: "I was released from Holloway on account of my health. Since then I have been treated exactly as if I were in prison. It has become absolutely impossible for any one to recover health under such conditions, and this morning I decided to make this protest against a state of affairs unparalleled in a civilised country."

[Illustration: RE-ARREST OF MRS. PANKHURST AT WOKING

May 26, 1913]

The magistrate replied formally: "You quite understand what the position is. You have been arrested on this warrant and all I have to do is to make an order recommending you to prison."

"I think" I said, "that you should do so, with a full sense of responsibility. If I am taken to Holloway on your warrant I shall resume the protest I made before which led to my release, and I shall go on indefinitely until I die, or until the Government decide, since they have taken upon themselves to employ you and other people to administer the laws, that they must recognise women as citizens and give them some control over the laws of this country."

It was a five days' hunger strike this time, because the extreme weakness of my condition made it impossible for me to endure a longer term. I was released on May 30th on a seven days' licence, and in a half-alive state was again carried to a nursing home. Less than a week later, while I was still bed-ridden, a terrible event occurred, one that should have shaken the stolid British public into a realisation of the seriousness of the situation precipitated by the Government. Emily Wilding Davison, who had been associated with the militant movement since 1906, gave up her life for the women's cause by throwing herself in the path of the thing, next to property, held most sacred to Englishmen--sport. Miss Davison went to the races at Epsom, and breaking through the barriers which separated the vast crowds from the race course, rushed in the path of the galloping horses and caught the bridle of the King's horse, which was leading all the others. The horse fell, throwing his jockey and crushing Miss Davison in such shocking fashion that she was carried from the course in a dying condition. Everything possible was done to save her life. The great surgeon, Mr. Mansell Moullin, put everything aside and devoted himself to her case, but though he operated most skilfully, the injuries she had received were so frightful that she died four days later without once having recovered consciousness. Members of the Union were beside her when she breathed her last, on June 8th, and on June 14th they gave her a great public funeral in London. Crowds lined the streets as the funeral car, followed by thousands of women, passed slowly and sadly to St. George's Church, Bloomsbury, where the memorial services were held.

Emily Wilding Davison was a character almost inevitably developed by a struggle such as ours. She was a B. A. of London University, and had taken first class honours at Oxford in English Language and Literature. Yet the women's cause made such an appeal to her reason and her sympathies that she put every intellectual and social appeal aside and devoted herself untiringly and fearlessly to the work of the Union. She had suffered many imprisonments, had been forcibly fed and most brutally treated. On one occasion when she had barricaded her cell against the prison doctors, a hose pipe was turned on her from the window and she was drenched and all but drowned in the icy water while workmen were breaking down her cell door. Miss Davison, after this experience, expressed to several of her friends the deep conviction that now, as in days called uncivilised, the conscience of the people would awaken only to the sacrifice of a human life. At one time in prison she tried to kill herself by throwing herself head-long from one of the upper galleries, but she succeeded only in sustaining cruel injuries. Ever after that time she clung to her conviction that one great tragedy, the deliberate throwing into the breach of a human life, would put an end to the intolerable torture of women. And so she threw herself at the King's horse, in full view of the King and Queen and a great multitude of their Majesties' subjects, offering up her life as a petition to the King, praying for the release of suffering women throughout England and the world. No one can possibly doubt that that prayer can forever remain unanswered, for she took it straight to the Throne of the King of all the worlds.

The death of Miss Davison was a great shock to me and a very great grief as well, and although I was scarcely able to leave my bed I determined to risk everything to attend her funeral. This was not to be, however, for as I left the house I was again arrested by detectives who lay in waiting. Again the farce of trying to make me serve a three years' sentence was undertaken. But now the militant women had discovered a new and more terrible weapon with which to defy the unjust laws of England, and this weapon--the thirst strike--I turned against my gaolers with such effect that they were forced within three days to release me.

The hunger strike I have described as a dreadful ordeal, but it is a mild experience compared with the thirst strike, which is from beginning to end simple and unmitigated torture. Hunger striking reduces a prisoner's weight very quickly, but thirst striking reduces weight so alarmingly fast that prison doctors were at first thrown into absolute panic of fright. Later they became somewhat hardened, but even now they regard the thirst strike with terror. I am not sure that I can convey to the reader the effect of days spent without a single drop of water taken into the system. The body cannot endure loss of moisture. It cries out in protest with every nerve. The muscles waste, the skin becomes shrunken and flabby, the facial appearance alters horribly, all these outward symptoms being eloquent of the acute suffering of the entire physical being. Every natural function is, of course, suspended, and the poisons which are unable to pass out of the body are retained and absorbed. The body becomes cold and shivery, there is constant headache and nausea, and sometimes there is fever. The mouth and tongue become coated and swollen, the throat thickens and the voice sinks to a thready whisper.

When, at the end of the third day of my first thirst strike, I was sent home I was in a condition of jaundice from which I have never completely recovered. So badly was I affected that the prison authorities made no attempt to arrest me for nearly a month after my release. On July 13th I felt strong enough once more to protest against the odious Cat and Mouse Act, and, with Miss Annie Kenney, who was also at liberty "on medical grounds," I went to a meeting at the London Pavillion. At the close of the meeting, during which Miss Kenney's prison licence was auctioned off for L12, we attempted for the first time the open escape which we have so frequently since effected. Miss Kenney, from the platform, announced that we should openly leave the hall, and she forthwith walked coolly down into the audience. The police rushed in in overwhelming numbers, and after a desperate fight, succeeded in capturing her. Other detectives and policemen hurried to the side door of the hall to intercept me, but I disappointed them by leaving by the front door and escaping to a friend's house in a cab.

The police soon traced me to the house of my friend, the distinguished scientist, Mrs. Hertha Ayrton, and the place straightway became a besieged fortress. Day and night the house was surrounded, not only by police, but by crowds of women sympathisers. On the Saturday following my appearance at the Pavillion we gave the police a bit of excitement of a kind they do not relish. A cab drove up to Mrs. Ayrton's door, and several well-known members of the Union alighted and hurried indoors. At once the word was circulated that a rescue was being attempted, and the police drew resolutely around the cab. Soon a veiled woman appeared in the doorway, surrounded by Suffragettes, who, when the veiled lady attempted to get into the cab, resisted with all their strength the efforts of the police to lay hands upon her. The cry went up from all sides: "They are arresting Mrs. Pankhurst!" Something very like a free fight ensued, occupying all the attention of the police who were not in the immediate vicinity of the cab. The men surrounding that rocking vehicle succeeded in tearing the veiled figure from the arms of the other women and piling into the cab ordered the chauffeur to drive full speed to Bow Street. Before they reached their destination, however, the veiled lady raised her veil--alas, it was not Mrs. Pankhurst, who by that time was speeding away in another taxicab in quite another direction.

Our ruse infuriated the police, and they determined to arrest me at my first public appearance, which was at the Pavillion on the Monday following the episode just related. When I reached the Pavillion I found it literally surrounded by police, hundreds of them. I managed to slip past the outside cordon, but Scotland Yard had its best men inside the hall, and I was not permitted to reach the platform. Surrounded by plain clothes men, batons drawn, I could not escape, but I called out to the women that I was being taken, and so valiantly did they rush to the rescue that the police had their hands full for nearly half an hour before they got me into a taxicab bound for Holloway. Six women were arrested that day, and many more than six policemen were temporarily incapacitated for duty.

By this time I had made up my mind that I would not only resist staying in prison, I would resist to the utmost of my ability going to prison. Therefore, when we reached Holloway I refused to get out of the cab, declaring to my captors that I would no longer acquiesce in the slow judicial murder to which the Government were subjecting women. I was lifted out and carried into a cell in the convicted hospital wing of the gaol. The wardresses who were on duty there spoke with some kindness to me, suggesting that, as I was very apparently exhausted and ill, I should do well to undress and go to bed. "No," I replied, "I shall not go to bed, not once while I am kept here. I am weary of this brutal game, and I intend to end it."

Without undressing, I lay down on the outside of the bed. Later in the evening the prison doctor visited me, but I refused to be examined. In the morning he came again, and with him the Governor and the head wardress. As I had taken neither food nor water since the previous day my appearance had become altered to such an extent that the doctor was plainly perturbed. He begged me, "as a small concession," to allow him to feel my pulse, but I shook my head, and they left me alone for the day. That night I was so ill that I felt some alarm for my own condition, but I knew of nothing that could be done except to wait. On Wednesday morning the Governor came again and asked me with an assumption of carelessness if it were true that I was refusing both food and water. "It is true," I said, and he replied brutally: "You are very cheap to keep." Then, as if the thing were not a ridiculous farce, he announced that I was sentenced to close confinement for three days, with deprivation of all privileges, after which he left my cell.

Twice that day the doctor visited me, but I would not allow him to touch me. Later came a medical officer from the Home Office, to which I had complained, as I had complained to the Governor and the prison doctor, of the pain I still suffered from the rough treatment I had received at the Pavillion. Both of the medical men insisted that I allow them to examine me, but I said: "I will not be examined by you because your intention is not to help me as a patient, but merely to ascertain how much longer it will be possible to keep me alive in prison. I am not prepared to assist you or the Government in any such way. I am not prepared to relieve you of any responsibility in this matter." I added that it must be quite obvious that I was very ill and unfit to be confined in prison. They hesitated for a moment or two, then left me.

Wednesday night was a long nightmare of suffering, and by Thursday morning I must have presented an almost mummified appearance. From the faces of the Governor and the doctor when they came into my cell and looked at me I thought that they would at once arrange for my release. But the hours passed and no order for release came. I decided that I must force my release, and I got up from the bed where I had been lying and began to stagger up and down the cell. When all strength failed me and I could keep my feet no longer I lay down on the stone floor, and there, at four in the afternoon, they found me, gasping and half unconscious. And then they sent me away. I was in a very weakened condition this time, and had to be treated with saline solutions to save my life. I felt, however, that I had broken my prison walls for a time at least, and so this proved. It was on July 24th that I was released. A few days later I was borne in an invalid's chair to the platform of the London Pavillion. I could not speak, but I was there, as I had promised to be. My licence, which by this time I had ceased to tear up because it had an auction value, was sold to an American present for the sum of one hundred pounds. I had told the Governor on leaving that I intended to sell the licence and to spend the money for militant purposes, but I had not expected to raise such a splendid sum as one hundred pounds. I shall always remember the generosity of that unknown American friend.

A great medical congress was being held in London in the summer of 1913, and on August 11th we held a large meeting at Kingsway Hall, which was attended by hundreds of visiting doctors. I addressed this meeting, at which a ringing resolution against forcible feeding was passed, and I was allowed to go home without police interference. It was, as a matter of fact, the second time during that month that I had spoken in public without molestation. The presence of so many distinguished medical men in London may have suggested to the authorities that I had better be left alone for the time being. At all events I was left alone, and late in the month I went, quite publicly, to Paris, to see my daughter Christabel and plan with her the campaign for the coming autumn. I needed rest after the struggles of the past five months, during which I had served, of my three years' prison sentence, not quite three weeks.

FOOTNOTE:

[5] Mr. Lansbury shortly before this had resigned his seat in Parliament and had gone to his constituents on the question of women's suffrage. Both the Liberal and the Conservative parties had united against him, with the result that a Unionist candidate was returned in his place. Mr. Lloyd-George publicly rejoiced in the result of this election, saying that Mr. Marsh, the Conservative candidate, had been his man. The Labour Party, in Parliament and out, meekly accepted this piece of Liberal chicanery without protest.

CHAPTER VII

The two months of the summer of 1913 which were spent with my daughter in Paris were almost the last days of peace and rest I have been destined since to enjoy. I spent the days, or some hours of them, in the initial preparation of this volume, because it seemed to me that I had a duty to perform in giving to the world my own plain statement of the events which have led up to the women's revolution in England. Other histories of the militant movement will undoubtedly be written; in times to come when in all constitutional countries of the world, women's votes will be as universally accepted as men's votes are now; when men and women occupy the world of industry on equal terms, as co-workers rather than as cut-throat competitors; when, in a word, all the dreadful and criminal discriminations which exist now between the sexes are abolished, as they must one day be abolished, the historian will be able to sit down in leisurely fashion and do full justice to the strange story of how the women of England took up arms against the blind and obstinate Government of England and fought their way to political freedom. I should like to live long enough to read such a history, calmly considered, carefully analysed, conscientiously set forth. It will be a better book to read than this one, written, as it were, in camp between battles. But perhaps this one, hastily prepared as it has been, will give the reader of the future a clearer impression of the strenuousness and the desperation of the conflict, and also something of the heretofore undreamed of courage and fighting strength of women, who, having learned the joy of battle, lose all sense of fear and continue their struggle up to and past the gates of death, never flinching at any step of the way.

Every step since that meeting in October, 1912, when we definitely declared war on the peace of England, has been beset with danger and difficulty, often unexpected and undeclared. In October, 1913, I sailed in the French liner, _La Provence_, for my third visit to the United States. My intention was published in the public press of England, France and America. No attempt at concealment of my purpose was made, and in fact, my departure was witnessed by two men from Scotland Yard. Some hints had reached my ears that an attempt would be made by the Immigration Officers at the port of New York to exclude me as an undesirable alien, but I gave little credit to these reports. American friends wrote and cabled encouraging words, and so I passed

my time aboard ship quite peacefully, working part of the time, resting also against the fatigue always attendant on a lecture tour.

[Illustration: MRS. PANKHURST AND CHRISTABEL IN THE GARDEN OF CHRISTABEL'S HOME IN PARIS]

We came to anchor in the harbour of New York on October 26th, and there, to my astonishment, the Immigration authorities notified me that I was ordered to Ellis Island to appear before a Board of Special Inquiry. The officers who served the order of detention did so with all courtesy, even with a certain air of reluctance. They allowed my American travelling companion, Mrs. Rheta Childe Dorr, to accompany me to the Island, but no one, not even the solicitor sent by Mrs. O. H. P. Belmont to defend me, was permitted to attend me before the Board of Special Inquiry. I went before these three men quite alone, as many a poor, friendless woman, without any of my resources, has had to appear. The moment of my entrance to the room I knew that extraordinary means had been employed against me, for on the desk behind which the Board sat I saw a complete _dossier_ of my case in English legal papers. These papers may have been supplied by Scotland Yard, or they may have been supplied by the Government. I cannot tell, of course. They sufficed to convince the Board of Special Inquiry that I was a person of doubtful character, to say the least of it, and I was informed that I should have to be detained until the higher authorities at Washington examined my case. Everything was done to make me comfortable, the rooms of the Commissioner of Immigration being turned over to me and my companion. The very men who found me guilty of moral obloquy--something of which no British jury has ever yet accused me--put themselves out in a number of ways to make my detention agreeable. I was escorted all over the Island and through the quarters assigned detained immigrants, whose right to land in the United States is in question. The huge dining-rooms, the spotless kitchens and the admirably varied bill of fare interested and impressed me. Nothing like them exists in any English institution.

I remained at Ellis Island two and a half days, long enough for the Commissioner of Immigration at Washington to take my case to the President who instantly ordered my release. Whoever was responsible for my detention entirely overlooked the advertising value of the incident. My lecture tour was made much more successful for it and I embarked for England late in November with a very generous American contribution to our war chest, a contribution, alas, that I was not permitted to deliver in person.

The night before the White Star liner _Majestic_ reached Plymouth a wireless message from headquarters informed me that the Government had decided to arrest me on my arrival. The arrest was made, under very dramatic conditions, the next day shortly before noon. The steamer came to anchor in the outer harbour, and we saw at once that the bay, usually so animated with passing vessels, had been cleared of all craft. Far in the distance the tender, which on other occasions had always met the steamer, rested at anchor between two huge grey warships. For a moment or two the scene halted, the passengers crowding to the deckrails in speechless curiosity to see what was to happen next. Suddenly a fisherman's dory, power driven, dashed across the harbour, directly under the noses of the grim war vessels. Two women, spray drenched, stood up in the boat, and as it ploughed swiftly past our steamer the women called out to me: "The Cats are here, Mrs. Pankhurst! They're close on you--" Their voices trailed away into the mist and we heard no more. Within a minute or two a frightened ship's boy appeared on deck and delivered a message from the purser asking me to step down to his office. I answered that I would certainly do nothing of the kind, and next the police swarmed out on deck and I heard, for the fifth time that I was arrested under the Cat and Mouse Act. They had sent five men from Scotland Yard, two men from Plymouth and a wardress from Holloway, a sufficient number, it will be allowed, to take one woman from a ship anchored two miles out at sea.

Following my firm resolve not to assist in any way the enforcing of the infamous law, I refused to go with the men, who thereupon picked me up and carried me to the waiting police tender. We steamed some miles up the Cornish coast, the police refusing absolutely to tell me whither they were conveying me, and finally disembarked at Bull Point, a Government landing-stage, closed to the general public. Here a motor car was waiting, and accompanied by my bodyguard from Scotland Yard and Holloway, I was driven across Dartmoor to Exeter, where I had a not unendurable imprisonment and hunger strike of four days. Everyone from the Governor of the prison to the wardresses were openly sympathetic and kind, and I was told by one confidential official that they kept me only because they had orders to do so until after the great meeting at Empress Theatre, Earls Court, London, which had been arranged as a welcome home for me. The meeting was held on the Sunday night following my arrest, and the great sum of L15,000 was poured into the coffers of militancy. This included the L4,500 which had been collected during my American tour.

Several days after my release from Exeter I went openly to Paris to confer with my daughter on matters relating to the campaign about to open, returning to attend a W. S. P. U. meeting on the day before my license expired. Nevertheless the boat train carriage in which I travelled with my doctor and nurse was invaded at Dover town by two detectives who told me to consider myself under arrest. We were making tea when the men entered, but this we immediately threw out of the window, because a hunger strike always began at the instant of arrest. We never compromised at all, but resisted from the very first moment of attack.

The reason for this uncalled for arrest at Dover was the fear on the part of the police of the body guard of women, just then organised for the expressed purpose of resisting attempts to arrest me. That the police, as well as the Government were afraid to risk encountering women who were not afraid to fight we had had abundant testimony. We certainly had it on this occasion, for knowing that the body guard was waiting at Victoria Station, the authorities had cut off all approaches to the arrival platform and the place was guarded by battalions of police. Not a passenger was permitted to leave a carriage until I had been carried across the arrival platform between a double line of police and detectives and thrown into a forty horse power motor car, guarded within by two plain clothes men and a wardress, and without by three more policemen. Around this motor car were twelve taxi-cabs filled with plain clothes men, four to each vehicle, and three guarding the outside, not to mention the driver, who was also in the employ of the police department. Detectives on motor cycles were on guard at various points ready to follow any rescuing taxicab.

Arrived at Holloway I was again lifted from the car and taken to the reception room and placed on the floor in a state of great exhaustion. When the doctor came in and told me curtly to stand up I was obliged to tell him that I could not stand. I utterly refused to be examined, saying that I was resolved to make the Government assume full responsibility for my condition. "I refuse to be examined by you or any prison doctor," I declared, "and I do this as a protest against my sentence, and against my being here at all. I no longer recognise a prison doctor as a medical man in the proper sense of the word. I have withdrawn my consent to be governed by the rules of prison; I refuse to recognise the authority of any prison official, and I therefore make it impossible for the Government to carry out the sentence they have imposed upon me."

Wardresses were summoned, I was placed in an invalid chair and so carried up three flights of stairs and put into an unwarmed cell with a concrete floor. Refusing to leave the chair I was lifted out and placed on the bed, where I lay all night without removing my coat or loosening my garments. It was on a Saturday that the arrest had been made, and I was kept in prison until the following Wednesday morning. During all that time no food or water passed my lips, and I added to this the sleep strike, which means that as far as was humanly possible I refused all sleep and rest. For two nights I sat or lay on the concrete floor, resolutely refusing the oft repeated offers of medical examination. "You are not a doctor," I told the man. "You are a Government torturer, and all you want to do is to satisfy yourself that I am not quite ready to die." The doctor, a new man since my last imprisonment, flushed and looked extremely unhappy. "I suppose you do think that," he mumbled.

On Tuesday morning the Governor came to look at me, and no doubt I presented by that time a fairly bad appearance. At least I gathered as much from the alarmed expression of the wardress who accompanied him. To the Governor I made the simple announcement that I was ready to leave prison and that I intended to leave very soon, dead or alive. I told him that from that moment I should not even rest on the concrete floor, but should walk my cell until I was released or until I died from exhaustion. All day I kept to this resolution, pacing up and down the narrow cell, many times stumbling and falling, until the doctor came in at evening to tell me that I was ordered released on the following morning. Then I loosened my gown and lay down, absolutely spent, and fell almost instantly into a death-like sleep. The next morning a motor ambulance took me to the Kingsway headquarters where a hospital room had been arranged for my reception. The two imprisonments in less than ten days had made terrible drafts on my strength, and the coldness of the Holloway cell had brought on a painful neuralgia. It was many days before I recovered even a tithe of my usual health.

These two arrests resulted exactly as the Government should have known that they would result, in a great outbreak of fresh militancy. As soon as the news spread that I had been taken at Plymouth a huge fire broke out in the timber yards at Richmond Walk, Devenport, and an acre and a half of timber, beside a pleasure fair and a scenic railway adjacent, to the value of thousands of pounds was destroyed. No one ever discovered the cause of the fire, the greatest that ever occurred in the neighbourhood, but tied to one of the railings was a copy of the _Suffragette_ and to another railing two cards, on one of which was written a message to the Government: "How dare you arrest Mrs. Pankhurst and allow Sir Edward Carson and Mr. Bonar Law to go free?" The second card bore the words: "Our reply to the torture of Mrs. Pankhurst, and her cowardly arrest at Plymouth."

Besides this fire, which waged fiercely from midnight until dawn, a large unoccupied house at Bristol was destroyed by fire; a fine residence in Scotland, also unoccupied, was badly damaged by fire; St. Anne's Church in a suburb of Liverpool was partly destroyed; and many pillar boxes in London, Edinburgh, Derby and other cities were fired. In churches all over the Kingdom our women created consternation by interpolating into the services reverently spoken prayers for prisoners who were suffering for conscience' sake. The reader no doubt has heard of these interruptions, and if so he has read of brawling, shrieking women, breaking into the sanctity of religious services, and creating riot in the House of God. I think the reader should know exactly what does happen when militants, who are usually religious women, interrupt church services. On the Sunday when I was in Holloway,

following my arrest at Dover, certain women attending the afternoon service at Westminster Abbey, chanted in concert the following prayer: "God save Emmeline Pankhurst, help us with Thy love and strength to guard her, spare those who suffer for conscience' sake. Hear us when we pray to Thee." They had hardly finished this prayer when vergers fell upon them and with great violence hustled them out of the Abbey. One kneeling man, who happened to be near one of the women, forgot his Christian intercessions long enough to beat her in the face with his fists before the vergers came.

Similar scenes have taken place in churches and cathedrals throughout England and Scotland, and in many instances the women have been most barbarously treated by vergers and members of the congregations. In other cases the women not only have been left unmolested, but have been allowed to finish their prayers amid deep and sympathetic silence. Some clergymen have even been brave enough to add a reverent amen to these prayers for women in prison, and it has happened that clergymen have voluntarily offered prayers for us. The Church as a whole, however, has undoubtedly failed to live up to its obligation to demand justice for women, and to protest against the torture of forcible feeding. During the year just closing we sent many deputations to Church authorities, the Bishops, one after another having been visited in this manner. Some of the Bishops, including the reactionary Archbishop of Canterbury, refused to accord the desired interview, and when that happened, the answer of the deputation was to sit on the doorstep of the episcopal residence until surrender followed--as it invariably did.

As Holloway Gaol is within his diocese, the Bishop of London was visited by the W. S. P. U. and the demand was made that the Bishop himself should witness forcible feeding in order to realise the horror of the proceeding. He did visit two of the tortured women, but he did not see them forcibly fed, and when he came out he gave the public an account of his interview with them which was in effect the Government's version of the facts. The W. S. P. U. was naturally indignant, while all the Government's friends hailed the Bishop as a supporter of the policy of torture. Only those who have suffered the pain and agony, not to speak of the moral humiliation of forcible feeding can realise the depths of the iniquity which the Bishop of London was manoeuvred by the Government to whitewash. It may be true, as the Bishop comforted himself by saying, that the victims of forcible feeding suffered the more because they struggled under the process. But, as Mary Richardson wrote in the _Suffragette_, to expect a victim not to struggle was the same as telling her that she would suffer less if she did not jump on getting a cinder in her eye. "The principle," declared Miss Richardson, "is the same. One struggles because the pain is excruciating, and the nerves of the eyes, ears and face are so tortured that it would be impossible not to resist to the uttermost. One struggles, also, because of another reason--a moral reason--for forcible feeding is an immoral assault as well as a painful physical one, and to remain passive under it would give one the feeling of sin; the sin of concurrence. One's whole nature is revolted; resistance is therefore inevitable."

I think it proper here to explain also the policy upon which we embarked in 1914 of taking our cause directly to the King. The reader has perhaps heard of Suffragette "insults" to King George and Queen Mary, and it is but just that he should hear a direct account of how these "insults" are offered. Several isolated attempts had been made to present petitions to the King, once when he was on his way to Westminster to open Parliament, and again on an occasion when he paid a visit to Bristol. On the latter occasion the woman who tried to present the petition was assaulted by one of the King's equerries, who struck her with the flat of his sword.

We finally resolved on the policy of direct petition to the king because we had been forced to abandon all hope of successful petitioning to his Ministers. Tricked and betrayed at every turn by the Liberal Government, we announced that we would not again put even a pretence of confidence in them. We would carry our demand for justice to the throne of the Monarch. Late in December, 1913, while I was in prison for the second time since my return to England, a great gala performance was given at Covent Garden, the opera being the Jeanne d'Arc of Raymond Roze. The King and Queen and the entire Court were present, and the scene was expected to be one of unusual brilliance. Our women took advantage of the occasion to make one of the most successful demonstrations of the year. A box was secured directly opposite the Royal Box, and this was occupied by three women, beautifully gowned. On entering they had managed, without attracting the slightest attention, to lock and barricade the door, and at the close of the first act, as soon as the orchestra had disappeared, the women stood up, and one of them, with the aid of a megaphone, addressed the King. Calling attention to the impressive scenes on the stage, the speaker told the King that women were to-day fighting, as Joan of Arc fought centuries ago, for human liberty, and that they, like the maid of Orleans, were being tortured and done to death, in the name of the King, in the name of the Church, and with the full knowledge and responsibility of established Government. At this very hour the leader of these fighters in the army of liberty was being held in prison and tortured by the King's authority.

The vast audience was thrown into a panic of excitement and horror, and amid a perfect turmoil of cries and adjurations, the door of the box was finally broken down and the women ejected. As soon as they had left the house others of our women, to the number of forty or more, who had been sitting quietly in an upper gallery, rose to their feet and rained suffrage literature on the heads of the

audience below. It was fully three quarters of an hour before the excitement subsided and the singers could go on with the opera.

The sensation caused by this direct address to Royalty inspired us to make a second attempt to arouse the King's conscience, and early in January, as soon as Parliament re-assembled, we announced that I would personally lead a deputation to Buckingham Palace. The plan was welcomed with enthusiasm by our members and a very large number of women volunteered to join the deputation, which was intended to make a protest against three things--the continued disfranchisement of women; the forcible feeding and the cat and mouse torture of those who were fighting against this injustice; and the scandalous manner in which the Government, while coercing and torturing militant women, were allowing perfect freedom to the men opponents of Home Rule in Ireland, men who openly announced that they were about to carry out a policy, not merely of attacking property, but of destroying human life.

I wrote a letter to the King, conveying to him "the respectful and loyal request of the Women's Social and Political Union that Your Majesty will give audience to a deputation of women." The letter went on: "The deputation desire to submit to Your Majesty in person their claim to the Parliamentary vote, which is the only protection against the grievous industrial and social wrongs that women suffer; is the symbol and guarantee of British citizenship; and means the recognition of women's equal dignity and worth, as members of our great Empire.

"The Deputation will further lay before Your Majesty a complaint of the mediaeval and barbarous methods of torture whereby Your Majesty's Ministers are seeking to repress women's revolt against the deprivation of citizen rights--a revolt as noble and glorious in its spirit and purpose as any of those past struggles for liberty which are the pride of the British race.

"We have been told by the unthinking--by those who are heedless of the constitutional principles upon which is based our loyal request for an audience of Your Majesty in person--that our conversation should be with Your Majesty's Ministers.

"We repudiate this suggestion. In the first place, it would not only be repugnant to our womanly sense of dignity, but it would be absurd and futile for us to interview the very men against whom we bring the accusations of betraying the Women's Cause and torturing those who fight for that Cause.

"In the second place, we will not be referred to, and we will not recognise the authority of men who, in our eyes, have no legal or constitutional standing in the matter, because we have not been consulted as to their election to Parliament nor as to their appointment as Ministers of the Crown."

I then cited as a precedent in support of our claim to be heard by the King in person, the case of the Deputation of Irish Catholics, which, in the year 1793, was received by King George III in person.

I further said:

"Our right as women to be heard and to be aided by Your Majesty is far stronger than any such right possessed by men, because it is based upon our lack of every other constitutional means of securing the redress of our grievances. We have no power to vote for Members of Parliament, and therefore for us there is no House of Commons. We have no voice in the House of Lords. But we have a King, and to him we make our appeal.

"Constitutionally speaking, we are, as voteless women, living in the time when the power of the Monarch was unlimited. In that old time, which is passed for men though not for women, men who were oppressed had recourse to the King--the source of power, of justice, and of reform.

"Precisely in the same way we now claim the right to come to the foot of the Throne and to make of the King in person our demand for the redress of the political grievance which we cannot, and will not, any longer tolerate.

"Because women are voteless, there are in our midst to-day sweated workers, white slaves, outraged children, and innocent mothers and their babes stricken by horrible disease. It is for the sake and in the cause of these unhappy members of our sex, that we ask of Your Majesty the audience that we are confident will be granted to us."

It was some days before we had the answer to this letter, and in the meantime some uncommonly stirring and painful occurrences attracted the public attention.

CHAPTER VIII

For months before my return to England from my American lecture tour, the Ulster situation had been increasingly serious. Sir Edward Carson and his followers had declared that if Home Rule government should be created and set up in Dublin, they would--law or no law--establish a rival and independent Government in Ulster. It was known that arms and ammunition were being shipped to Ireland, and that men--and women too, for that matter--were drilling and otherwise getting ready for civil war. The W. S. P. U. approached Sir Edward Carson and asked him if the proposed Ulster Government would give equal voting rights to women. We frankly declared that in case the Ulster men alone were to have the vote, that we should deal with "King Carson" and his colleagues exactly in the same manner that we had adopted towards the British Government centred at Westminster. Sir Edward Carson at first promised us that the rebel Ulster Government, should it come into existence, would give votes to Ulster women. This pledge was later repudiated, and in the early winter months of 1914 militancy appeared in Ulster. It had been raging in Scotland for some time, and now the imprisoned Suffragettes in that country were being forcibly fed as in England. The answer to this was, of course, more militancy. The ancient Scottish church of Whitekirk, a relic of pre-Reformation days, was destroyed by fire. Several unoccupied country houses were also burned.

It was about this time, February, 1914, that I undertook a series of meetings outside London, the first of which was to be held in Glasgow, in the St. Andrews Hall, which holds many thousands of people. In order that I might be free on the night of the meeting, I left London unknown to the police, in a motor car. In spite of all efforts to apprehend me I succeeded in reaching Glasgow and in getting to the platform of St. Andrews' where I found myself face to face with an enormous, and manifestly sympathetic audience.

As it was suspected that the police might rush the platform, plans had been made to offer resistance, and the bodyguard was present in force. My speech was one of the shortest I have ever made. I said:

"I have kept my promise, and in spite of His Majesty's Government I am here to-night. Very few people in this audience, very few people in this country, know how much of the nation's money is being spent to silence women. But the wit and ingenuity of women is overcoming the power and money of the British Government. It is well that we should have this meeting to-night, because to-day is a memorable day in the annals of the United Kingdom of Great Britain and Ireland. To-day in the House of Commons has been witnessed the triumph of militancy--men's militancy--and to-night I hope to make it clear to the people in this meeting that if there is any distinction to be drawn at all between militancy in Ulster and the militancy of women, it is all to the advantage of the women. Our greatest task in this women's movement is to prove that we are human beings like men, and every stage of our fight is forcing home that very difficult lesson into the minds of men, and especially into the minds of politicians. I propose to-night at this political meeting to have a text. Texts are usually given from pulpits, but perhaps you will forgive me if I have a text to-night. My text is: 'Equal justice for men and women, equal political justice, equal legal justice, equal industrial justice, and equal social justice.' I want as clearly and briefly as I can to make it clear to you to-night that if it is justifiable to fight for common ordinary equal justice, then women have ample justification, nay, have greater justification, for revolution and rebellion, than ever men have had in the whole history of the human race. Now that is a big contention to make, but I am going to prove it. You get the proof of the political injustice--"

As I finished the word "injustice," a steward uttered a warning shout, there was a tramp of heavy feet, and a large body of police burst into the hall, and rushed up to the platform, drawing their truncheons as they ran. Headed by detectives from Scotland Yard, they surged in on all sides, but as the foremost members attempted to storm the platform, they were met by a fusillade of flower-pots, tables, chairs, and other missiles. They seized the platform railing, in order to tear it down, but they found that under the decorations barbed wires were concealed. This gave them pause for a moment.

Meanwhile, more of the invading host came from other directions. The bodyguard and members of the audience vigorously repelled the attack, wielding clubs, batons, poles, planks, or anything they could seize, while the police laid about right and left with their batons, their violence being far the greater. Men and women were seen on all sides with blood streaming down their faces, and there were cries for a doctor. In the middle of the struggle, several revolver shots rang out, and the woman who was firing the revolver--which I should explain was loaded with blank cartridges only--was able to terrorise and keep at bay a whole body of police.

I had been surrounded by members of the bodyguard, who hurried me towards the stairs from the platform. The police, however, overtook us, and in spite of the resistance of the bodyguard, they seized me and dragged me down the narrow stair at the back of the hall. There a cab was waiting. I was pushed violently into it, and thrown on the floor, the seats being occupied by as many constables as could crowd inside.

The meeting was left in a state of tremendous turmoil, and the people of Glasgow who were present expressed their sense of outrage at the behavior of the police, who, acting under the Government's instructions, had so disgraced the city. General Drummond, who was present on the platform, took hold of the situation and delivered a rousing speech, in which she exhorted the audience to make the Government feel the force of their indignation.

I was kept in the Glasgow police-cells all night, and the next morning was taken, a hunger and thirst striking prisoner, to Holloway, where I remained for five memorable days. This was the seventh attempt the Government had made to make me serve a three years' term of penal servitude on a conspiracy charge, in connection with the blowing up of Mr. Lloyd-George's country house. In the eleven and a half months since I had received that sentence I had spent just thirty days in prison. On March 14th I was again released, still suffering severely, not only from the hunger and thirst strike, but from injuries received at the time of my brutal arrest in Glasgow.

The answer to that arrest had been swift and strong. In Bristol, the scene of great riots and destruction when men were fighting for votes, a large timber-yard was burnt. In Scotland a mansion was destroyed by fire. A milder protest consisted of a raid upon the house of the Home Secretary, in the course of which eighteen windows were broken.

The greatest and most startling of all protests hitherto made was the attack at this time on the Rokeby "Venus" in the National Gallery. Mary Richardson, the young woman who carried out this protest, is possessed of a very fine artistic sense, and nothing but the most compelling sense of duty would have moved her to the deed. Miss Richardson being placed on trial, made a moving address to the Court, in the course of which she said that her act was premeditated, and that she had thought it over very seriously before it was undertaken. She added: "I have been a student of art, and I suppose care as much for art as any one who was in the gallery when I made my protest. But I care more for justice than I do for art, and I firmly believe than when a nation shuts its eyes to justice, and prefers to have women who are fighting for justice ill-treated, mal-treated, and tortured, that such action as mine should be understandable; I don't say excusable, but it should be understood.

"I should like to point out that the outrage which the Government has committed upon Mrs. Pankhurst is an ultimatum of outrages. It is murder, slow murder, and premeditated murder. That is how I have looked at it....

"How you can hold women up to ridicule and contempt, and put them in prison, and yet say nothing to the Government for murdering people, I cannot understand....

"The fact is that the nation is either dead or asleep. In my opinion there is undoubted evidence that the nation is dead, because women have knocked in vain at the door of administrators, archbishops, and even the King himself. The Government have closed all doors to us. And remember this--a state of death in a nation, as well as in an individual, leads to one thing, and that is dissolution. I do not hesitate to say that if the men of the country do not at this eleventh hour put their hand out and save Mrs. Pankhurst, before a few more years are passed they will stretch out their hand in vain to save the Empire."

In sentencing Miss Richardson to six month's imprisonment the Magistrate said regretfully that if she had smashed a window instead of an art treasure he could have given her a maximum sentence of eighteen months, which illustrates, I think, one more queer anomaly of English law.

A few weeks later another famous painting, the Sargent portrait of Henry James, was attacked by a Suffragette, who, like Miss Richardson, was sent through the farce of a trial and a prison sentence which she did not serve. By this time practically all the picture galleries and other public galleries and museums had been closed to the public. The Suffragettes had succeeded in large measure in making England unattractive to tourists, and hence unprofitable to the world of business. As we had anticipated, the reaction against the Liberal Government began to manifest itself. Questions were asked daily, in the press, in the House of Commons, everywhere, as to the responsibility of the Government in the Suffragette activities. People began to place that responsibility where it belonged, at the doors of the Government, rather than at our own.

Especially did the public begin to contrast the treatment meted out to the rebel women with that accorded to the rebel men of Ulster. For a whole year the Government had been attacking the women's right of free speech, by their refusal to allow the W. S. P. U. to hold public meetings in Hyde Park. The excuse given for this was that we advocated and defended a militant policy. But the Government permitted the Ulster militants to advocate their war policy in Hyde Park, and we determined that, with or without the Government's permission, we should, on the day of the Ulster meeting, hold a suffrage meeting in Hyde Park. General Drummond was announced as the chief speaker at this meeting, and when the day came, militant Ulster men and militant women assembled in

Hyde Park. The militant men were allowed to speak in defence of bloodshed; but General Drummond was arrested before she had uttered more than a few words.

Another proof that the Government had a law of leniency for militant men and a law of persecution for militant women was shown at this time by the case of Miss Dorothy Evans, our organiser in Ulster. She and another Suffragette, Miss Maud Muir, were arrested in Belfast charged with having in their possession a quantity of explosives. It was well known that there were houses in Belfast that secreted tons of gunpowder and ammunition for the use of the rebels against Home Rule, but none of those houses were entered and searched by the police. The authorities reserved their energies in this direction for the headquarters of the militant women. Naturally enough the two suffrage prisoners, on being arraigned in court, refused to be tried unless the Government proceeded also against the men rebels. The prisoners throughout the proceedings kept up such a disturbance that the trial could not properly go on. When the case was called Miss Evans rose and protested loudly, saying: "I deny your jurisdiction entirely until there are in the dock beside us men who are well known leaders of the Ulster militant movement." Miss Muir joined Miss Evans in her protest and both women were dragged from the court. After an hour's adjournment the trial was resumed, but the women again began to speak, and the case was hurried through in the midst of indescribable din and commotion. The women were sent to prison on remand, and after a four days' hunger and thirst strike were released unconditionally.

The result of this case was a severe outbreak of militancy, three fires destroying Belfast mansions within a few days. Fires blazed almost daily throughout England, a very important instance being the destruction of the Bath Hotel at Felixstowe, valued at L35,000. The two women responsible for this were afterwards arrested, and as their trials were delayed, they were, although unconvicted prisoners, tortured by forcible feeding for several months. This occurred in April, a few weeks before the day appointed for our deputation to the King.

I had appointed May 21st for the deputation, in spite of the fact that the King had, through his Ministers, refused to receive us. Replying to this I had written, again directly to the King, that we utterly denied the constitutional right of Ministers, who not being elected by women were not responsible to them, to stand between ourselves and the Throne, and to prevent us from having an audience of His Majesty. I declared further that we would, on the date announced, present ourselves at the gates of Buckingham Palace to demand an interview.

Following the despatch of this letter my life was made as uncomfortable and as insecure as the Government, through their police department, could contrive. I was not allowed to make a public appearance, but I addressed several huge meetings from the balcony of houses where I had taken refuge. These were all publicly announced, and each time the police, mingling with crowds, made strenuous efforts to arrest me. By strategy, and through the valiant efforts of the bodyguard, I was able each time to make my speech and afterwards to escape from the house. All of these occasions were marked by fierce opposition from the police and splendid courage and resistance on the part of the women.

The deputation to the King was, of course, marked by the Government as an occasion on which I could be arrested, and when, on the day appointed, I led the great deputation of women to the gates of Buckingham Palace, an army of several thousand police were sent out against us. The conduct of the police showed plainly that they had been instructed to repeat the tactics of Black Friday, described in an earlier chapter. Indeed, the violence, brutality and insult of Black Friday were excelled on this day, and at the gates of the King of England. I myself did not suffer so greatly as others, because I had advanced towards the Palace unnoticed by the police, who were looking for me at a more distant point. When I arrived at the gates I was recognised by an Inspector, who at once seized me bodily, and conveyed me to Holloway.

"ARRESTED AT THE KING'S GATE!" _May, 1914_]

Before the Deputation had gone forth, I had made a short speech to them, warning them of what might happen, and my final message was: "Whatever happens, do not turn back." They did not, and in spite of all the violence inflicted upon them, they went forward, resolved, so long as they were free, not to give up the attempt to reach the Palace. Many arrests were made, and of those arrested many were sent to prison. Although for the majority, this was the first imprisonment, these brave women adopted the hunger strike, and passed seven or eight days without food and water before they were released, weak and ill as may be supposed.

CHAPTER IX

In the weeks following the disgraceful events before Buckingham Palace the Government made several last, desperate efforts to crush the W. S. P. U., to remove all the leaders and to destroy our paper, the _Suffragette_. They issued summonses against Mrs. Drummond, Mrs. Dacre Fox and Miss Grace Roe; they raided our headquarters at Lincolns Inn House; twice they raided other headquarters temporarily in use, not to speak of raids made upon private dwellings where the new leaders, who had risen to take the places of those arrested, were at their work for the organisation. But with each successive raid the disturbances which the Government were able to make in our affairs became less, because we were better able, each time, to provide against them. Every effort made by the Government to suppress the _Suffragette_ failed, and it continued to come out regularly every week. Although the paper was issued regularly, we had to use almost super-human energy to get it distributed. The Government sent to all the great wholesale news agents a letter which was designed to terrorise and bully them into refusing to handle the paper or to sell it to the retail news agents. Temporarily, at any rate, the letter produced in many cases the desired effect, but we overcame the emergency by taking immediate steps to build up a system of distribution which was worked by women themselves, independently of the newspaper trade. We also opened a "Suffragette Defence Fund," to meet the extra expense of publishing and distributing the paper.

Twice more the Government attempted to force me to serve the three years' term of penal servitude, one arrest being made when I was being carried to a meeting in an ambulance. Wholesale arrests and hunger strikes occurred at the same time, but our women continued their work of militancy, and money flowed into our Protest and Defence Fund. At one great meeting in July the fund was increased by nearly L16,000.

But now unmistakable signs began to appear that our long and bitter struggle was drawing to a close. The last resort of the Government of inciting the street mobs against us had been little successful, and we could see in the temper of the public abundant hope that the reaction against the Government, long hoped for by us, had actually begun.

Every day of the militant movement was so extraordinarily full of events and changes that it is difficult to choose a point at which this narrative should be brought to a close. I think, however, that an account of a recent debate which took place in the House of Commons will give the reader the best idea of the complete breakdown of the Government in their effort to crush the women's fight for liberty.

On June 11th, when the House of Commons had gone into a Committee of Supply, Lord Robert Cecil moved a reduction of 100 pounds on the Home Office vote, thus precipitating a discussion of militancy. Lord Robert said that he had read with some surprise that the Government were not dissatisfied with the measures which they had taken to deal with the violent suffragists, and he added with some asperity that the Government took a much more sanguine view of the matter than anybody else in the United Kingdom. The House, Lord Robert went on to declare, would not be in a position to deal with the case satisfactorily unless they realised the devotion of the followers to their leaders, who were almost fully responsible for what was going on. Ministerial cheers greeted this utterance, but they ceased suddenly when the speaker went on to say that these leaders could never have induced their followers to enter upon a career of crime but for the serious mistakes which had been made over and over again by the Government. Among these mistakes Lord Robert cited the shameful treatment of the women on Black Friday, the policy of forcible feeding and the scandal of the different treatment accorded Lady Constance Lytton and "Jane Warton." There were Opposition cheers at this, and they were again raised when Lord Robert deplored the terrible waste of energy, and "admirable material" involved in the militant movement. Although Lord Robert Cecil deemed it unjust as well as futile for Suffragist Members to withhold their support from the woman suffrage movement on account of militancy he himself was in favor of deportation for Suffragettes. At this there were cries of "Where to?" and "Ulster!"

Mr. McKenna replied by first calling attention to the fact that in the militant movement they had a phenomenon "absolutely without precedent in our history." Women in numbers were committing crimes, beginning with window breaking, and proceeding to arson, not with the motives of ordinary criminals, but with the intention of advertising a political cause and of forcing the public to grant their demands. Mr. McKenna continuing said:

"The number of women who commit crimes of that kind is extremely small, but the number of those who sympathise with them is extremely large. One of the difficulties which the police have in detecting this form of crime and in bringing home the offence to the criminal is that the criminals find so many sympathisers among the well-to-do and thoroughly respectable classes that the ordinary administration of the law is rendered comparatively impossible. Let me give the House some figures showing the number of women who have been committed to prison for offences since the beginning of the militant agitation in 1906. In that year the total number of commitments to prison was 31, all the persons charged being women. In 1909 the figure rose to 156; in 1911 to 188 (182 women

and six men); and in 1912 to 290 (288 women and two men). In 1913 the number dropped to 183, and so far this year it has dropped to 108. These figures include all commitments to prison and rearrests under the Cat and Mouse Act. What is the obvious lesson to be drawn? Up to 1912 the number of offences committed for which imprisonment was the punishment was steadily increasing, but since the beginning of last year--that is to say, since the new Act came into force--the number of individual offences has been very greatly reduced. On the other hand, we see that the seriousness of the offences is much greater."

This statement, that the number of imprisonments had decreased since the adoption of the Cat and Mouse Act, was of course, incorrect, or at best misleading. The fact was that the number of imprisonments decreased because, where formerly the militants went willingly to prison for their acts, they now escaped prison wherever possible. A comparatively small number of "mice" were ever rearrested by the police.

Mr. McKenna went on to say that he realised fully the growing sense of indignation against the militant suffragists and he added, "Their one hope is, rightly or wrongly, that the well advertised indignation of the public will recoil on the head of the Government."

"And so it will," interpolated a voice.

"My honourable friend," replied Mr. McKenna, "says so it will. I believe that he is mistaken." But he gave no reasons for so believing. Referring to what he called the "recent grave rudenesses which have been committed against the King," Mr. McKenna said: "It is true that all subjects have the right of petitioning His Majesty, providing the petition is couched in respectful terms, but there is no right on the part of the subjects generally to personal audience for the purpose of the presentation of the petition or otherwise. It is the duty of the Home Secretary to present all such petitions to the King, and further to advise His Majesty what action should be taken. It was therefore ridiculous for any Suffragist to assert that there had been any breach of constitutional propriety on the part of the King in refusing, on the advice of the Home Secretary to receive the deputation."

Also, said Mr. McKenna, in view of the fact that the petition for an audience was sent by a person under sentence of penal servitude--myself--it was the plain duty of the Home Secretary to advise the King not to grant it. He referred to the incident, he said, only because it was illustrative of the militant's methods of advertising their cause. He gave them credit, he was bound to say, for a certain degree of intelligence in adopting their methods. "No action has been so fruitful of advertisement as the recent absurdities which they have perpetrated in relation to the King."

Coming down to the question of methods of meeting and overcoming militancy, Mr. McKenna said that he had received an almost unlimited correspondence on the subject from every section of the public. "Four methods were suggested," said he. "The first is to let them die. (Hear, hear.) That is, I should say, at the present moment, the most popular (laughter), judging by the number of letters I have received. The second is to deport them. (Hear, hear.) The third is to treat them as lunatics. (Hear, hear.) And the fourth is to give them the franchise. (Hear, hear, and laughter.) I think that is an exhaustive list. I notice each one of them is received with a certain very moderate amount of applause in this House. I hope to give reason why at the present time I think we should not adopt any one of them."

The first suggestion was usually, not always, based on the assumption that the women would take their food if they knew that the alternative was death. Mr. McKenna read to the House in opposition to that view "the opinion of a great medical expert who had had intimate knowledge of the Suffragettes from the first." "We have to face the fact, therefore, that they would die," continued Mr. McKenna.

"Let me say, also, with actual experience of dealing with suffragists, in many cases they have got in their refusal of food and water beyond the point when they could help themselves, and they have clearly done all that they could do to show their readiness to die.... There are those who hold another assumption. They think that after one or two deaths in prison militancy would cease. In my judgment there was never a greater delusion. I readily admit that this is the issue upon which I stand and upon which I feel I would fight to the end those who would adopt as their policy to let the prisoners die. So far from putting an end to militancy, I believe it would be the greatest incentive to militancy which could ever happen. For every woman who dies, there would be scores of women who would come forward for the honour, as they would deem it, of earning the crown of martyrdom."

"How do you know?" called out an Opposition member.

"How do I know?" retorted the Home Secretary. "I have had more to do with these women than the honourable member, much more. Those who hold that opinion leave out of account all recognition of the nature of these women. I do not speak in admiration of them. They are hysterical fanatics, but, coupled with their hysterical fanaticism, they have a courage, part of their fanaticism, which

undoubtedly stands at nothing, and the honourable member who thinks that they would not come forward, not merely to risk death, but to undergo it, for what they deem the greatest cause on earth is making, in my judgment, a profound mistake.... They would seek death, and I am sure that however strong public opinion outside might be to-day in favour of allowing them to die, when there were twenty, thirty, forty, or more deaths in prison, you would have a violent reaction of public opinion, and the honourable gentleman who now so glibly says 'Let them die' would be among the first to blame the Government for what he would describe as the inhuman attitude they had adopted.

"That policy," continued Mr. McKenna, "could not be adopted without an Act of Parliament. For the reason I have given I have not asked Parliament to remove from prison officials the responsibility under which they now rest for doing their best to keep those committed to their charge alive. But, supposing this legal responsibility were removed from the prison officials, let honourable members for a moment transport themselves in imagination to a prison cell and conceive of a prison doctor, a humane man, standing by watching a woman slowly being done to death by starvation and thirst, knowing that he could help her and that he could keep her alive. Did they think that any doctor would go on with such action, or that we should be able to retain medical men under such conditions in our service? I do not believe it.

"The doctor would think, as I should think if I saw a woman lying there, 'What has been this woman's offence?' It may have been obstructing the police, coupled with the obstinacy derived from fanaticism which leads her to refuse food and water. Obstructing the police and she is to die! I could not distinguish, and no Home Secretary could ever say, that this woman should be left to die and that that woman should not. Once we were committed to a policy of allowing them to die if they did not take their food we should have to go on with it, and we should have woman after woman whose only offence may have been obstructing the police, breaking a window, or even burning down an empty house, dying because she was obstinate. I do not believe that that is a policy which on consideration will ever recommend itself to the British people, and I am bound to say for myself I could never take a hand in carrying that policy out." (Cheers.)

Lord Robert Cecil's favourite remedy of deportation Mr. McKenna dismissed on the grounds that this would be merely removing the difficulty to some other country than Great Britain. If the suggested distant island were treated as a prison the women would hunger strike there as they did in English prisons. If the island were not treated as a prison, the Suffragettes' rich friends would come and rescue them in yachts.

The suggestion that the militants be treated as lunatics was also dismissed as impossible. Admitting that he had tried to get them certified as lunatics and had failed because the medical profession would not consent to such a course, Mr. McKenna said that he could not, contrary to the advice of the doctors, get certification by Act of Parliament. "There remains," said Mr. McKenna, "the last proposal, that we should give them the franchise."

"That is the right one," exclaimed Mr. William Redmond, but the Home Secretary replied:

"Whatever may be said as to the merits or demerits of that proposal, it is clearly not one I can discuss now in Committee of Supply. I am not responsible, as Home Secretary, for the state of the law on the franchise, nor is there any occasion for me to express or conceal my own opinions on the point; but I certainly do not think, and I am sure the Committee will agree with me, that that could be seriously treated as a remedy for the existing state of lawlessness."

Coming at last to the constructive part of his speech Mr. McKenna told the House of Commons that the Government had one last resort, which was to take legal proceedings against subscribers to the funds of the W. S. P. U. The funds of the society, he said, were undoubtedly beyond the arm of the British law. But the Government were in hopes of stopping future subscriptions. "We are now not without hope," he concluded, "that we have evidence which will enable us to proceed against the subscribers" (loud cheers) "in civil action, and if we succeed the subscribers will become personally liable for all the damage done." (Cheers.) "It is a question of evidence.... I have further directed that the question should be considered whether the subscribers could not be proceeded against criminally as well as by civil action." (Cheers.) "We have only been able to obtain this evidence by our now not infrequent raids upon the offices, and such property as we can get at of the society.... A year ago a raid was made on the offices of the society, but we obtained no such evidence. If we succeed in making the subscribers personally responsible individually for the whole damage done I have no doubt that the insurance companies will quickly follow the example set them by the Government, and in turn bring actions to recover the cost which has been thrown upon them. If that is done I have no doubt the days of militancy are over.

"The militants live only by the subscriptions of rich women" (cheers) "who themselves enjoy all the advantages of wealth secured for them by the labour of others" (cheers) "and use their wealth against the interests of society, paying their unfortunate victims to undergo all the horrors of a hunger and thirst strike in the commission of a crime. Whatever feelings we may have against the wretched women who for 30s. and L2 a week go about the country burning and destroying, what must our feelings be for the women who give their money to induce the perpetration of these crimes and leave their sisters to undergo the punishment while they live in luxury?" (Cheers.) "If we can succeed against them we will spare no pains. If the action is successful in the total destruction of the means of revenue of the Women's Social and Political Union I think we shall see the last of the power of Mrs. Pankhurst and her friends." (Cheers.)

In the general debate which followed the Government were obliged to listen to very severe criticisms of their past and present policy towards the militant women. Mr. Keir Hardie said in part:

"We may not to-day discuss the question of the franchise, but surely it was possible for the Home Secretary, without any transgression on the rules of the House, to have held out just a ray of hope for the future as to the intentions of the Government in regard to this most urgent question. On that point, may I say that I am not one of those who believe that a right thing should be withheld because some of the advocates of it resort to weapons of which we do not approve. That note has been sounded more than once, and if it be true, and it is true, that a section of the public outside are strongly opposed to this conduct, it is equally true that the bulk of the people look with a very calm and indifferent eye upon what is happening so long as the vote is withheld from women."

Mr. Hardie concluded by regretting that the House, instead of discussing Woman Suffrage, was discussing methods of penalising militant women.

Mr. Rupert Gwynne said: "Nobody is in a more ridiculous position than the members on the Treasury Bench. They cannot address a meeting, or go to a railway station, or even get into a taxicab, without having detectives with them. Even if they like it, we, the public do not, because we have to pay for it. It is not worth the expense that it costs to have a detective staff following Cabinet Ministers wherever they go, whether in a private or a public capacity.

"Further," said Mr. Gwynne, "if the Home Secretary is correct in saying that these women are prepared to die, and invite death, in order to advertise their devotion to their cause, does he really think they are going to mind if their funds are attached?"

Another friend of the Suffragists, Mr. Wedgwood said: "We are dealing with a problem which is a very serious one indeed. To my mind, when you find a large body of public opinion, and a large number of people capable of going to these lengths, there is only one thing for a respectable House of Commons to do, and that is to consider very closely and clearly whether the complaints of those who complain are or are not justified. We are not justified in acting in panic. What it is our duty to do is to consider the rights and wrongs of these people who have acted in this way. I attribute myself no value to the vote, but I do think that when we seriously consider the question of Woman Suffrage, which has not been done by this House up to the present, we should remember that when you see people capable of this amount of self-sacrifice, that the one duty of the House of Commons is not to stamp the iron heel upon them, but to see how far their cause is just, and to act according to justice."

When such a debate as this was possible in the House of Commons, it must be plain to every disinterested reader that militancy never set the cause of suffrage back, but on the contrary, set it forward at least half a century. When I remember how that same House of Commons, a few years ago, treated the mention of woman suffrage with scorn and contempt, how they permitted the most insulting things to be said of the women who were begging for their political freedom, how, with indecent laughter and coarse jokes they allowed suffrage bills to be talked out, I cannot but marvel at the change our militancy so quickly brought about. Mr. McKenna's speech was in itself a token of the complete surrender of the Government.

Of course the promise of the Home Secretary that subscribers to our funds should, if possible, be held legally responsible for damage done to private property by the Suffragettes, was never meant to be adhered to. It was, in fact, a perfectly absurd promise, and I think that very few Members of Parliament were deceived by it. Our subscribers can always remain anonymous if they choose, and if it should ever be possible to attack them for our deeds, they would naturally take refuge behind that privilege.

Our battles are practically over, we confidently believe. For the present at least our arms are grounded, for directly the threat of foreign war descended on our nation we declared a complete truce from militancy. What will come out of this European war--so terrible in its effects on the women who had no voice in averting it--so baneful in the suffering it must necessarily bring on innocent

children--no human being can calculate. But one thing is reasonably certain, and that is that the Cabinet changes which will necessarily result from warfare will make future militancy on the part of women unnecessary. No future Government will repeat the mistakes and the brutality of the Asquith Ministry. None will be willing to undertake the impossible task of crushing or even delaying the march of women towards their rightful heritage of political liberty and social and industrial freedom.

THE END

==========
